FOREWORD

The Annual Conference of the EuroMed Academy of Business aims to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations on building new business models for success through innovation, competitiveness and responsibility.

It is acknowledged that the conference has established itself as one of the major conferences of its kind in the EuroMed region, in terms of size, quality of content, and standing of attendees. Many of the papers presented contribute significantly to the business knowledge base.

The conference attracts hundreds of leading scholars from leading universities and principal executives and politicians from all over the world with the participation or intervention of Presidents, Prime Ministers, Ministers, Company CEOs, Presidents of Chambers, and other leading figures.

This year the conference attracted over 200 people from over 50 countries. Academics, practitioners, researchers and Doctoral students throughout the world submitted original papers for conference presentation and for publication in this Book. All papers and abstracts were double blind reviewed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the 5th Annual Conference of the EuroMed Academy of Business.

Special thanks go to the Conference Chairs (Dr Ruth Rios Morales and Dr Ian Jenkins), the Conference Organising Committee and the Faculty of Les Roches-Gruyere, University of Applied Sciences and Glion Institute of Higher Education, in Switzerland, for accomplishing an excellent job.

It is acknowledged that a successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

The last but not the least important acknowledgment goes to all those who submitted their work to be considered for presentation at the conference.

Table of Papers

AN EXPLORATORY STUDY ON SWITCHING COSTS IN FAMILY TAKAFUL	19
<i>Ab Ghani, Hartini¹; Abd Rahman, Sofiah²</i>	<i>19</i>

Abstract

Takaful company has been in Malaysia since 1984. Syarikat Takaful Malaysia is the first Takaful company established. There are two types of Takaful businesses; General Takaful and Family Takaful. General Takaful is a contract of joint-guarantee on a short-term basis (normally one year). It is designed to meet the needs for protection of individuals and corporate bodies in relation to material loss or damage to their properties. Whereas, Family Takaful plan is a long term in nature. A family takaful is life insurance protection provided to the Muslim as the conventional life insurance is unlawful to the Muslim scholars. However, despite the unlawful elements of conventional life insurance, most Muslims in Malaysia still do not participate in Family Takaful. Previous studies indicate that one of the reasons is already having life insurance. The gap between the conventional life insurance is very huge with the penetration rate of Family Takaful of only ten percent as compared to conventional life insurance of forty two percent in year 2010. In view of the large gap, this study was conducted with the objective to explore the switching costs elements that influence the policyholders from participating in Family Takaful. Interviews were conducted with few professionals using convenience sampling. The results of the interview revealed that some switching costs dimensions have more impact on Takaful participation readiness than the others.

Keywords : Family Takaful, switching costs and relational loss costs

Introduction

Takaful was introduced as an alternative to conventional. This is because majority of Shariah scholars believed that the conventional is unlawful to the Muslims due to involvement of Riba (usury/interest), Maisir (gambling) and Gharar (uncertainty).

Riba means an increment, excess or addition to the amount lent such as the money added on the loan. The Quran states that whoever is involved in the usury is waging war against Allah and his Prophet (pbuh). The element of riba exists in the profit of investments used for the payment of policyholders' claims by the conventional insurance companies. This is because most of the insurance funds are invested by them in financial instruments such as bonds and stocks which may contain elements of Riba (usury/interest). The insured in life insurance contract is expected to pay an indefinite

number of premiums to cover the risk of life. But this risk may not exist at any one given point of time as such it is interpreted as Riba (interest or usury) in Islam and is, therefore altogether forbidden. (Choundhury., 1993)

Insurance contract contains gharar (uncertainty) because, when a claim is not made, one party (insurance company) may acquire all the profits (premium) gained whereas the other party (participant) may not obtain any profit whatsoever.

Maysir exists in an insurance contract when the policy holder contributes a small amount of premium in the hope to gain a larger sum; the policy holder loses the money paid for the premium when the event that has been insured for does not occur; the company will be in deficit if the claims are higher than the amount contributed by the policyholder.

http://www.islamic-banking.com/prohibition_of_gharar_masir_riba.aspx

In the case of Takaful, it is based on the concept of social solidarity, cooperation and mutual indemnification of losses of members. In order to eliminate the element of uncertainty in the Takaful contract, the concept of "Tabarru" (to donate or give away) is incorporated in it. In relation to this, a participant agrees to relinquish as Tabarru certain proportion of his Takaful instalments or contributions that he agrees or undertakes to pay thus enabling him to fulfil his obligation of mutual help and joint guarantee, should any of his fellow participants suffer a defined loss. In essence, Tabarru' would enable the participants to perform their deeds sincerely in assisting fellow participants who might suffer a loss or damage due to a catastrophe or disaster. The sharing of profit or surplus that may emerge from the operations of Takaful is made only after the obligation of assisting the fellow participants has been fulfilled.

However, despite the unislamic element of conventional life insurance, most Muslims in Malaysia have yet to participate in Family Takaful. Among the reasons for this behavior is, they had subscribed to conventional life insurance. Statistics showed a huge gap between the penetration rates of conventional life insurance to that of Family Takaful that is forty two percent as compared to 10 percent in year 2010. In view of the large gap, this study was conducted with the objective to explore the influence of switching costs in Family Takaful.

This study is different from other Takaful study as this study is looking at the switching costs dimensions that influence participation readiness. It has never been studied before even though they are few empirical studies such as Redzuan (2009), Abdul Hamid (2009(a)), Salleh (2011), Mohd Noor (2005), Abdul Rahman (2010), Abdul Rahman (2008), Abdul Hamid (2009(b)) and Ab Rahman (2008). Previous empirical research on Takaful contributing the body of knowledge has focused on the concept of Takaful and Takaful awareness.

It is important to study switching cost in Takaful as studying switching costs leads to specific selection patterns as consumers and marketplace change over time (Handel, 2011). Switching costs are measured as the consumer's perceived difficulty in switching (Lee et al., 2001). This study hence explored in detail the switching costs dimensions by interviewing thirty conventional life insurance policyholders.

This paper is organised as follows: the next section will review the literature related to studies on switching costs and followed by a discussion on research methods and an analysis of the result then, finally, the conclusions.

The Literature Reviews

Switching costs

A rise in switching cost deters consumers from initiating any search activity of another products (Wilson, 2009). There are few definitions of switching costs. One definition is the costs that are incurred by buyers for terminating some business transaction and initiating a new business relation (Oyeniya, 2010). Burnham (2003), defines switching costs as the onetime costs that customers associated with the switching process and need not be incurred immediately upon switching. Wilson (2009) defines switching costs as the costs incurred by a consumer in changing supplier that do not act to improve the consumer's pre-purchase information such as the costs from arranging the actual switch, lost compatibility or lost loyalty discounts. It is the cost that anticipated will be incurred in the future (Lee and Cunningham.L.F, 2001)

Switching costs dimensions

Among the earliest study on switching cost was Klemperer, 1987. Klemperer (1987) introduced three switching costs dimensions: transaction costs, learning costs and artificial costs. Transaction costs are costs that occur to start a new relationship with a provider and sometimes also include the cost necessary to terminate an existing relationship. Transaction costs are the most commonly cited potential source of switching in the theoretical and empirical literatures (Handel, 2011). Learning costs represents the effort required by the customer to reach the same level of comfort or facility with a new product as they had for an old product. Artificial switching costs are created by deliberate action of firms such as the frequent flyer programs, repeat purchase discounts and "clickthrough" rewards (Pei-Yu (Sharon) Chen and Hitt, 2002).

Fornel (1987) has comes out with different switching costs constructs. The construct listed by (Fornell, 1987) are search costs, transaction cost, learning costs, loyal customer discounts, customer habit, emotional costs, cognitive efforts & financial, social.

Another study by Perera & Kim (2007) classifies switching costs psychological costs, procedural costs and lost cost. Perera and Kim (2007) define psychological costs as the costs arising from mind or emotions associated with the switching. Procedural cost is defined as the costs arising from the monetary and non-monetary spending associated with the switching. Loss costs mean the costs arising from the loss incurred from abandoning the status quo. They classify the uncertainty costs and emotional costs to be under psychological costs, learning costs and set up costs are under procedural. For the lost cost they identified the lost performance costs and the sunk cost.

Ozer (2009) has classifies switching costs under three major dimensions: financial switching costs, procedural switching costs, and psychological switching costs. Financial switching costs consist of monetary lost costs and benefit loss costs. Monetary loss costs are the payment that is incurred in switching providers. Benefits loss costs are the costs associated with contractual linkages that create economic benefits for staying with an incumbent firm.

Procedural switching costs consist of evaluation costs, set-up costs and learning costs. Evaluation cost is the time and effort costs required before making a switching to a new brand (Burnham et al., 2003). Set-up cost: is the time and effort cost related to the process of initiating a relationship with a new service provider or brand (Burnham et al., 2003) and Learning costs: is the time and effort of acquiring new skills or know-how in order to use a new product or service effectively (Burnham et al., 2003).

Psychological switching costs include relational costs and uncertainty costs. It consisting of personal relationship loss and brand loss costs which involves psychological or emotional discomfort to the loss of identity and the breaking bonds. Interpersonal relationship refer to the strength of personal bonds that develop between customers and their service employees (Berry and Parasuraman, 1991 as cited in (Jones et al., 2000).When customer dissatisfaction is an ongoing phenomenon, customer may remain due to high switching barriers. ((Jones et al., 2000)

Uncertainty costs: Costs of which the customer faces switching to the new brand as the customer cannot evaluate the brand's performance or quality before using it. Klemperer 1995 and few others classify it as economic risk costs. They define it is as the cost of accepting uncertainty with the potential for a negative outcome when adopting a new provider in which the consumer has insufficient information (Burnham et al., 2003). Jones (2002), treat relational costs as sunk costs and defined it as customer perceptions of the non-recoupable time, money and effort invested in establishing and maintaining a relationship.

Switching costs study in insurance

Despite a large theoretical literature on switching costs, there are only a few empirical studies especially concerning insurance. The previous switching costs study for insurance industry was on the

switching barriers. Different types of insurance lead to different kind of switching behaviour. For example a motor insurance will have different switching barrier from life insurance (Roos, 2004). The other study that relate to insurance was conducted by Posey (2003). His only looking at the switching costs involved in property and casualty insurance market for large commercial accounts.

Readiness

According to Abdul Rahim Abdul Wahab et al. (2007), readiness is “prepared mentally and physically for an experience or action” as such readiness is always associated with change, that is readiness to change. In the context of this study, readiness is considered as willingness to engage in the process of switching process from conventional insurance to Takaful. Readiness to participate in the Takaful scheme is indicated by individual action seeking for information and negotiating on terms.

Methodology

A qualitative methodology was chosen in this study because study on switching costs in insurance has not been fully explored. It is believed that the interviews were consistent with the notion that customers might have positive and negative feelings about Takaful. Further in-depth interview methodology was expected to be helpful in discovering the switching costs dimensions to Takaful readiness as it has never been addressed in Takaful research. The primary population of interest comprised only conventional life insurance policyholders. A purposive sampling technique was used, whereby the sample thought to be relevant to the research topic was chosen. The data collection targeted selected users who meet the criteria of this study. Only those meeting the criteria were interviewed further. The selected participants had a range of ages working as an executive and above.

To qualify in this study, the respondents needed to have a conventional life insurance policy holder for at least 1 year. Those eligible will then be interviewed further. The respondents interviewed must at least an executive position or a professional by their nature of work. This criteria is taken into consideration based on the previous research on Takaful study that individual earned below certain of income not interested to take up insurance due to their financial constraint and as they do not see the importance of having an insurance cover for themselves or their family. Professional inclination of respondents influence attitudes towards insurance (Yusuf et al., 2009). From the total individual of thirty, twenty were conducted over the phone and ten were conducted in person.

The interviews were initiated with a brief and broadly stated explanation of the study. The respondents were ask few basic questions such as age range, income range, current policy provider, the source of information about the insurance and few others. However, respondents profile is not reported in this study. The interview average range in length is about 20 minutes per session. Since this study is exploratory in nature, no rigorous statistical technique was used in analyzing the result.

Results

List of questions asked is tabulated in Table 1 below.

QUESTIONS	ANSWERS
<i>Do you have life insurance or Family Takaful?</i>	<i>Respondents confirmed that they have conventional Life insurance</i>
<i>Do you deal with the insurance company directly or through agent?</i>	<i>"Yes, I deal direct with the insurance company" "No, I was approached by agent"</i>
<i>Do you go to the agent or the agent comes to you?</i>	<i>"The agent call me and explain to me"</i>
<i>Do you have any relationship with the agent?</i>	<i>"Yes, the agent is my sister" "Yes. My friend" "No, I was introduced by a friend"</i>
<i>Do you prefer to deal with the Malay agent or you are ok if they are not of the same race as you?</i>	<i>"Race does not matter to me" "I don't think so" "No, I prefer somebody that I trust"</i>
<i>What is your reason for taking up life insurance?</i>	<i>" For savings and investment". " I took up for my children education" "It's for my retirement"</i>
<i>Have you heard about Family Takaful?</i>	<i>"Yes, it is the same as conventional life, right?" "I only heard about Motor Takaful" "Yes, somebody mentioned about the Education plan Islamic way".</i>
<i>Would you switch to Family Takaful?</i>	<i>" I do not mind switching if my agent proposed" "I will switch if it does not incurred any cost" "I want to continue with my current insurance, I don't see a different between conventional and Takaful" "I don't want to switch, conventional gives me better return for my investment" "I don't think I want to switch, I think conventional is more established, they can pay my claims and give good return to my policy investment" "I will consider if the package is attractive" "I don't think I want to switch, I will consider buying another plan" " I will switch due to the Islamic factor of Takaful"</i>
<i>Do you wish to find out more information about Takaful ?</i>	<i>"No" " No, because I already have life insurance"</i>

	<i>"No, what for? It's the same, the different is just Takaful is Islamic insurance just like the Islamic banking and conventional banking"</i>
<i>Do you think it will cause so much hassle to switch to Takaful?</i>	<i>" I have no idea" "Maybe" "I certainly feel it will create so much problem" " I am not sure about the procedures, I will leave it to my agent to decide what is best"</i>
<i>Will you consider Family Takaful if the agent approached?</i>	<i>"I might consider provided the agent is somebody that I know well" "I will not consider it at all" "I prefer to maintain what I already have" "I might consider participating in Education Takaful which I have not yet take up"</i>
<i>Do the service provider (in this case insurance company/Takaful operator) of which you are insure with important to you?</i>	<i>"Yes, it is important as it will guarantee that the company will be there to pay for my claims in the future" "Yes, conventional is more established compared to Takaful"</i>

Table 1: Interview questions

The questions about the race of the agent asked as Hendon Redzuan et al. (2009) posits that individual form social connections with person of the same race.

Researcher obtained varies answers for question on intention to switch. From the interviews, we also identify that majority of the respondents take up the children education plan policy followed by for savings purposes.

It was notable that this group of respondents prefer to deal with somebody that they know at the same time concern about the establishment of the company. They will be considering Family Takaful as an additional policy on top of the conventional life insurance policy they already have.

Lack of knowledge about Takaful leads to low participation. Respondents do not really keen to gather more information about Takaful. They rely most to their agent to feed them with the information about life insurance. Agents play a vital role in disseminating the knowledge about insurance to the policyholders.

Theoretical Framework

From the above results, researcher is proposing the following theoretical framework.

This proposed theoretical framework is adopting the research framework based on the Theory of Reasoned Action (TRA) developed by Fishbein and Ajzen 1975. It modifies the TRA by including switching costs and knowledge variable. Knowledge has been one of the factors contributed to the low Takaful penetration from the previous research findings. We believed that if the Muslims have more knowledge about Takaful, the penetration rate will increase. However, it will also be influenced by the switching costs.

Conclusions

The exploratory studies on switching costs which relate to Takaful readiness do not discover any results that are different from the categories previously found in the literature. However, some categories have more influence compared to the other dimensions of switching costs and some seem do not relevant to Takaful.

The study reveals that life insurance cannot be separated from agent. The relational cost in insurance is divided into 3: whether the agent has blood relationship whether the agent is friends and whether the agent is introduced by a friend. The results of this study suggest that the relational cost has influence Takaful participation readiness the most. Relational cost as defined from the literature as personal relationship loss costs which involves psychological or emotional discomfort to the loss of identity and the breaking bonds. In other words, the respondents are very concerned of their relationship with the person whom services them.

THE EFFECT OF STRUCTURAL DESIGN ON EXPORT STRATEGY IN THE WINE INDUSTRY

Afxentiou, Georgios¹

¹ DBA Student at the University of Gloucestershire. Email: Georgiosa40@yahoo.com

Abstract

The purpose of this paper is to present the different perspectives on pursuing this research. The author explains the reasons for choosing the research topic and implementing a specific approach to fulfill the research objectives. A variety of different approaches are analyzed and presented of how effectively could be used to support the researcher's position. A comparison analysis in different sections shows the advantages and disadvantages of each approach. Non quantitative and non qualitative are only some of the approaches studied for the construction of this paper. An interventionist approach in conjunction with the factors that might affect export strategy is studied to support the researcher's choice for a specific research approach and epistemological position.

Keywords: Action Research, Structural Design, Wines, Exports, Interventionist, Qualitative

Introduction

Action research is the study of a subject where participants are actively involved in the research design and process. According to Meyer (2000) action research was first used in 1946 by Kurt Lewin, a social scientist concerned with intergroup relations and minority problems in the United States. Its strength lies in its focus on generating solutions to practical problems and its ability to empower practitioners to engage with research and subsequent development or implementation activities. Also Meyer (2000) supported that action research incorporate three important elements; its participatory character, its democratic impulse, and its simultaneous contribution to social science and social change.

The wine industry is a sector in the national economy that needs considerable support to gain a place in the international market. Private institutions and the government need to support the large and small wine companies to promote and to establish their wine brands overseas. Brand awareness is a powerful promotion tool for the wine businesses to use in order to increase product sales. The consumers' product recognition might help to the selection and purchase of Cyprus wines from retail shops and other shopping places. Also the managers of wholesale businesses would probably choose Cyprus wines by knowing their value and quality in the international market. Brand building, reduction of purchasing cost, improvement of quality and distribution are only some of the factors affecting the exportation of Cyprus wines overseas. The structural design of the wine businesses is also a factor that might affect the deployment of an export strategy. The businesses' emphasis on the

allocation of resources to search for prospective international markets is a crucial step to form an export strategy. The placement of skillful personnel to specialized posts such as marketing officer for exports, salesman for international market, risk assessor by the management might lead to a stronger international presence of the wine brand. The researcher will also investigate a variety of factors that contribute to the limited international wine access but more specifically the structural design in order to make recommendations to the affected businesses. A recommended well thought strategic approach would most probably benefit the owners, executives and the society as a whole to succeed entering the international wine market.

According to Vrontis, Paliwoda (2008) the last few years regional wineries were also developed close to where the grapes were produced to avoid the quality problems associated with transportation over long distances. These actions reveal that Cyprus is seeking to become internationally competitive both in terms of quality and price. Branding has progressively become more and more important to the Cyprus wine industry as a means of differentiation and competitive advantage. Beside businesses' attempt to improve branding, quality and price; there are also some other factors that affect executives' decision to engage in the foreign trade such as commitment of resources, acquisition of knowledge, employment of specialized personnel, investment and implementation of information technology among others. As previously stated the structural design of these wine companies might also play a vital role to the success entering the international market. Most of the wine businesses in Cyprus followed an informal or loose design scheme due to the fact that family members are involved in the businesses.

A recent consulting project with a large wine company that was undertaken by the author shed some light concerning the structural design and its influence on export strategy. The arrangement of the departments in the company reveals the lack of dedicated and specialized personnel to form and to implement a corporate export strategy. The organizational arrangement with limited resources contributes to a blurry international focus of the specific wine business. A collective decision making to shape an accurate strategy might be a necessary step to enter the international trade stage. The absence of specialized personnel might be substituted by drawing expertise from managers of different posts such as marketing, logistics and sales. The contribution of these managers could support the development of an export strategy of the specific large wine business. Nevertheless the creation and deployment of specialized departments can not be substituted in the long term by a temporary selected group of managers. The reason is that the dedicated personnel know well the search and promotion methods in the international market. Another factor of ineffective international marketing is the promotion of wines produced by foreign vine varieties and therefore they can not compete over traditional classic wines. Also the marketing department might play a major role when collaborating with the executive management to design a pricing policy for the export strategy.

Bjorkman, Sundgren (2005) stated that the traditional action research methodology initially proposed by Lewin (1973) incorporates the researcher in a collaborative context which includes problem-solving, collaborative cycles of planning, taking action and evaluating in an organization. The researcher and the participants attempt to identify the problem, recognize the actors, suggest and implement solutions to potential problems. First, the action research methodology involves some kind of change experiments on real problems in organizations. Second, it aims to provide assistance using a number of iterative cycles such as problem identification, planning, acting and evaluating. Third, action research aims to challenge the status quo from a participative perspective and is thus concerned about the change intended. Finally, action research intends to contribute simultaneously to basic knowledge, which not only includes knowledge for the academy, but also the creation of actionable knowledge for the client organization and social action in everyday life.

The structural design problem of the wine business involves many actors that they might be able to shape the corporate export strategy. Therefore the philosophical and the action research approach to this research is the adaptation of constructivism. It is a position that supports the collection, analysis of data field and the formation of a theory. The use of interview as a research tool could possibly support the construction of a theoretical framework. The collection of data, organization of thoughts and presentation of the findings and outcomes to the interested wine businesses might provide an innovative pathway to the international market. In contrast to relativism that supports no difference among countries and wine industries constructivism emphasizes the need to investigate further the differences. Also positivism as a position emphasizes the objectivity of the research. The difference between constructivism and positivism is the engagement with the affected parties (subjectivity) of the former ontological position.

Non Action Research Qualitative Approach

Interpretivism is a research approach in social science that can be considered as a non action case research qualitative approach. According to Walsham (1995) interpretive methods of research adopt the position that our knowledge of reality is a social construction by human actors. In this view, value-free data cannot be obtained, since the enquirer uses his or her preconceptions in order to guide the process of enquiry, and furthermore the researcher interacts with the human subjects of the enquiry, changing the perceptions of both parties. Walsham (1995) stated that interpretivism contrasts with positivism, where it is assumed that the "objective" data collected by the researcher can be used to test prior hypotheses or theories.

Walsham (1995) and Lee (1991) support that positivist and interpretive approaches are not opposed and irreconcilable. Lee (1991) suggests three "levels of understanding," namely the subjective understanding of the human participants in any social situation, the interpretive understanding of the researcher arising from the researcher's in-depth contact with the participants, and the positivist

understanding arising from formal testing in an “objective” way by the researcher. Lee then argues that the levels of knowledge are complementary, and that positivist and interpretive approaches can be combined. He declares that “an interpretive organizational researcher who needs to choose among competing interpretive understandings might narrow down the possibilities with the help of the empirical and logical rigors of positivism. Based on each of the interpretive understandings, the interpretive organizational researcher could develop alternative positivist understandings and then rule out the ones whose consequent predictions are disconfirmed through controlled empirical testing”.

Positivism supports that the research must be undertaken in a value-free way (Saunders et al. 2007). According to Saunders et al. (2007) the researcher's resources would be external to the process of data collection taking into consideration that little can be done to alter the data collection. Positivism focuses on the generation of research by developing hypotheses. “The hypotheses will be tested and confirmed, in whole or part, or refuted, leading to the further development of theory which then may be tested by further research” (Saunders et al. 2007 p:103).

Also constructivism is an ontological position that asserts that social phenomena and their meanings are continually being accomplished by social actors (Bryman, 2004). A constructivist assesses the situation in the environment and develops a possible solution to an existing problem. The understanding of the surroundings and contribution to the findings are two key components of constructivism. Analysis of the economic environment in the Cyprus wine industry is the first step of this research. Robson (2002) states that constructivism supports that reality is socially constructed and also constructivist researchers consider that the researcher is to understand the multiple social constructions of meaning and knowledge.

The author of the paper on **The effect of structural design on export strategy** is concerned with the understanding and development of a theoretical framework that is constructed from the research findings. The collection and analysis of accurate data taken from wine executive teams is one of the main activities of this research. The participation of executives would probably provide recent and valid information about the structural design of their organizations and the exportation of wines overseas. It is essentially important to understand the design of their organizations and its effect on the promotion of wines abroad. The formation of a structural design where the executive management dedicates human and technological resources to achieve international market penetration is worth investigating. Index A and Index B at the end of this paper support that the executives would probably provide some valuable insights to the decline of the export sales. A verification and validation of the information would greatly support the analysis and development of this research study.

Non Action Research Quantitative Approach

A non action research quantitative approach for the selected case topic is the application of relativism. Relativism is an ontological position supporting that “there is no external reality independent of human consciousness; there are only different sets of meanings and classifications which people attached to the world” (Robson 2002). This philosophical position belongs to social science and supports that the existence of an external reality independent of our theoretical beliefs and concepts is denied. Also Sankey (2012) stated that “truth relativism is the claim that a non-indexical claim, e.g. an empirical claim about a contingent matter of fact, is true relative to the context within which the claim is endorsed or asserted. Here context is not to be construed as the immediate physical environment of the speaker, but the broader cultural or historical setting within which the speaker is situated”. Both researchers agree that relativism is true and acceptable by people where a subject is related to their knowledge and their living setting. Nevertheless both researchers support that a further investigation is needed in order to find the true meaning of a subject. The deployment of hypotheses would support the foundation of relativism that uses quantitative methods.

On the other hand a successful qualitative research and more specifically grounded theory, requires unique information processing abilities in order to make constant comparisons, collect data and analyze it simultaneously, create categories that “may have ‘subcategories’ and associated ‘dimensions’ and ‘properties’, which are gradually elaborated and refined as specific incidents are examined, systematically coded, and compared” (Langley, 1999). Also Langley (1999) added that qualitative research aims to attract people whose information processing abilities include interpretive abilities, paying attention to multiple cues and considering broad categories of information.

The adaptation and implementation of relativism and quantitative methods is a way to investigate the structural design of the wine businesses and its effect on export strategy. The realization of the actual situation and identification of the factors contributing to the limited exportation of Cyprus wines to other countries is important to this research. The selection of an ideal ontological position would probably provide a valuable insight about the current situation in the wine industry. The development of a set of hypothesis might pave a way to identify and resolve problems that prohibit wine businesses to engage in the international trade. A hypothesis scheme with a testing theory is an approach that many researchers use to draw a conclusion to their research. Relativism uses many quantitative methods such as survey, questionnaires that are easily measurable. The case study of the wine business might be researched with questionnaires and surveys to employees, management, suppliers and wine consumers. The answers of these methods could be run on SPSS software tool to generate some results.

Even though relativism is an ontological position that offers many methods to measure the factors of structural design that affect exportation of wines the researcher would probably use a constructivism

position. The collection and analysis of data is a main concern for this research. It is imperative to select data that is relevant to the wine industry in Cyprus. Some of the parameters for this research are the vine growing areas, professional expertise, design of the organization's departments and communication. An adoption of constructivism would support the analysis and development of a theory about the weakness of wine businesses to promote their wines abroad. Relativism might not support the researcher's logic to develop a theoretical framework and practical methods to fill in the gaps in the Cyprus wine environment. The limited wine research by Cyprus researchers and institutions creates a void of knowledge and practical implementations in the Cyprus wine industry.

Research Findings and Outcomes

The researcher with an in depth study could propose some solutions concerning the obstacles faced by the wine businesses. A thorough investigation of the structural design and verification of the factors contributing to the limited access to the international wine market is essential for the Cyprus wine industry. The research might contribute to the academic and business communities and at the same time cover the theoretical and practical gaps. The tracing of gaps in the academia concerning the methods of forming a successful export strategy in the wine sector might introduce an innovative way for the executives in the wine industry. The formation of a theory and recommendation of practical methods would greatly benefit the professionals and institutions in the country. One of the researcher's aims is to cover the practical gaps by introducing practical and flexible ways to enter the international wine market. For example social networking and electronic commerce websites are some of these practical methods to promote the wines overseas. Further analysis and presentation of the practical methods to fill the gaps will be introduced on an ongoing research development. Also the grounded theory method would support the harvesting of data and formation of a conceptual framework for academic review.

In order to meet the research objectives it is desirable to engage the actors; businesses, employees and business partners. This involvement might create a three dimensional perspective of the failing reasons to deploy a successful export strategy. The comments, suggestions and recommendations by the actors might support the formation of a scientific framework. The importance of professional experiences to this research is a key element. The collection of thoughts and experiences would probably create a three dimensional image of the situation. By mentioning a three dimensional perspective or image I mean the construction of a platform with inputs from professionals, businesses, employees and customers. The detailed data analysis and construction of a theory would create a complete framework.

A possible achievement of businesses to promote Cyprus wines abroad could lead to a worthwhile study of their export strategy. A thorough design and execution of a plan by the management would

probably promote the products overseas. Therefore the *expected research findings and outcomes* of this case study are provided below:

Research findings:

- The structural design of the wine business does not support the exportation of wines
- Inadequate marketing methods to promote wines overseas
- Limited human capabilities and technical resources to export wines abroad
- There is no blue print for a thoughtful and solid export strategy

Research outcomes:

- Formation of a corporate export strategy
- Implementation of a structural design that supports the exportation of wines abroad
- Synchronization and improvement of the marketing and management activities to export abroad
- Improvement of the partners' network overseas
- Promotion of good quality wine brands to prospective customers
- Increase export sales with improved marketing techniques

These are some of the prospective findings and outcomes of the research. It should be considered that this is an ongoing search for the factors affecting the exportation of Cyprus wines abroad. The factors found must be compared to those of successful wine export countries. The researcher must be open to investigate all factors affecting the export strategy and especially those that are related to the structural design. The author believes that the structural design might influence the formation and execution of the export strategy of the wine businesses.

Interventionist vs Non Interventionist Approach

The philosophic and paradigmatic discussion of interventionist research has its roots in the anthropological field of culture studies in social science (Westin, Roberts, 2010). Intervention is an approach where a researcher deploys mechanisms to change an existing situation. The evaluation of a condition and the implementation of solutions are all parts of these mechanisms. The choice of the researcher to intervene in a situation proclaims an intention to set the guidelines of the outcome. Also Ikeda (2004) supports that the theory of interventionism, the use of political power to intervene into the market process generates a dynamic that ultimately causes the actual outcome of that intervention to diverge significantly from the intended outcome. According to Westin, Roberts (2010) the aim of intervention research is to meld theory and practice together, two kinds of imprints that express an

entity of use and of explanation as the two sides of the same coin. They both agree that if a researcher succeeds to combine theory and practice then he/she would make a full epistemological contribution. They also support that the combination of theory and practice can create an explanation of why and how practical matters, or actions taken, are appropriate. There is a fit between theory and practice and we can further elaborate the matter theoretically on solid ground.

The survey of the economic and political environment in Cyprus would greatly contribute to the development of a theory concerning the exportation of goods. To be more specific the political decision making process in the country and the economic situation of the wine businesses might provide a valuable insight of the reasons why Cyprus lacks behind traditional and new countries on wine exportation. The generation of knowledge from researching and work experiences in the wine sector could support the formation of a well designed theoretical framework and practical recommendations to the Ministry of Commerce and the wine businesses. The emphasis is on the structural design of wine businesses and its effect on the export strategy. The evaluation of the structural design and the creation of knowledge by performing research would provide the necessary tools to make recommendations and present a credible research. The arrangement of the departments, the allocation of resources, the abilities of the personnel are only some of the aspects that will be investigated and further analyzed for the purpose of this research. The quality and ability of management personnel in each department and the communications are also factors that would be analyzed in order to form a complete set of recommendations.

Westin, Roberts (2010) and Kolb (1984) supported that there are two primary sources available to create meaning and knowledge of practice, according to the experiential learning model. The first source is a construct originating from the concrete experiences of practice, while the second source is as an abstract conceptualization expressed by the spoken or written word. Taken together, they constitute the input of understanding, which could be used mentally for building theory and/or to produce concrete practical insights through active experimentation. In addition to these statements the adaptation of grounded theory on the research on structural design would strengthen the argument about its effect on executive decision making on the exportation of wines. The harvest of verbal data by interviewing executives and written data by working in the wine industry would create a solid knowledge mix. Both Westin and Roberts (2010) noted that knowledge and experiences are enriched and adapted in practice by human interaction and communication. Learning is one of the key issues in obtaining knowledge from research, not solely as a quest of learning from research but, most important from the researcher's point of view, how to learn to formulate a trustworthy explanation of "what is going on here," the latter specifically when practice is constantly moving and changing. It is agreeable that the changing conditions in the economic environment play a major role to the construction of knowledge. The researcher has to be prepared to understand the variable

factors and to be alert to foreseen and unforeseen consequences that can change the framework of knowledge and set of recommendations. An example of these variable factors is the quality of Cyprus wines that had been improved in the last 10 years. This is a main factor to convince foreign traders to purchase the product at a certain amount of money. Nevertheless if the executive management does not decide to expand abroad then there will not be able to generate income from overseas markets.

According to Westin, Roberts (2010) the dynamic world of interventionist research implies continuous participation in doing research in practice, to be at the centre of events to learn and know “what is going on” because, as Hastrup (2005, p. 141) suggests, “We cannot get in touch with reality without making ourselves part of it.” On the research on structural design might be necessary for the researcher to intervene in order to prove the validity of his findings to government officials and wine industry executives. And especially the sensitive matter of structural design and resource allocation to specific departments in order to shape an export strategy to capture part of the international wine market. Also the structural design types such as hierarchical, horizontal and hybrid are part of the main investigation of the variables that affect the formation of an export strategy. The hierarchical design involves all business managers in the export strategy process that slows the decision making process. The horizontal design simplifies the decision making process in shaping an export strategy. The hybrid design combines partial hierarchical management structure and flexible decision making that might be the ideal model for the wine businesses in Cyprus. It is therefore necessary to study further and recommend a structural design type that is suitable for the Cyprus wine businesses.

Nevertheless a direct involvement of the researcher is vital to the verification and validation of the findings of this research. An idle situation concerning political and executive decision would not support the wine businesses or the wine industry as a whole. The investigation of the factors and development of a set of recommendations would probably support than harm the wine businesses.

A non-interventionist approach could be applied by a researcher when the situation is positively affected without interference. A researcher must evaluate a situation in order to decide whether to intervene or not. For example traditional wine producing countries like France, Italy and Spain do not need to begin a research concerning the difficulties involved with the exportation of wines overseas. These countries have already developed a brand in the world wine market with quality wines. Their efforts paid off by capturing a large market share of the international wine market without significant promotion. Needless to say that the wine businesses in these countries would probably investigate the success factors in wine exportation without intervening in the market as such. Concerning the situation in the Cyprus wine industry is quite different compared to the traditional and new wine producing countries. A research must be contacted to investigate the reasons that Cyprus wine businesses are not as successful as French wine businesses or Italian wine businesses. A non-intervention approach in the Cyprus wine business environment would not support the attempt to

build a brand name in the international market but also to promote the Cyprus wines in the international market. If a researcher retains the current economic stage of the Cyprus wine industry he/she would probably contribute little or nothing to the academic and business sectors. Therefore a researcher should intervene in the Cyprus wine industry in order to support their efforts to capture a share of the world wine market. The investigation of the structural design of the wine business is a step forward to identify the root factors for failing to entry the foreign markets. It is desirable to begin a research about the exportation of Cyprus wines. A successful entry in foreign markets would generate income not only for the wine businesses but also for the country as a whole.

The role of researcher values

The researcher's ethical contribution to this paper is vital to the professional development. The implementation of a professional coding system concerning the commitment to research could create transparency and accuracy on the findings and outcomes. According to Meyer (2000) the research design must be continually negotiated with participants, and the researchers need to agree an ethical code of practice with the participants. This is especially important as participation in the research, and in the process of change, can be threatening. Conflicts may arise in the course of the research: outside researchers working with practitioners must obtain their trust and agree rules on the control of data and their use and on how potential conflict will be resolved within the project. The way in which such rules are agreed demonstrates its democratic impulse. In addition to Meyer (2000) statements the researcher could design an ethical coding system involving all actors; business, employees and business partners that are abide by the rules. As previously stated the introduction and observation of the rules of the coding system would promote transparency, accuracy and a valuable contribution to the academic and business communities.

The prevention of personal and professional conflicts could lay out a strong foundation for the research. A close understanding and collaboration with all involved parties could create a well studied research. The main concern of the researcher is the participation of the actors that would contribute unbiased data concerning the case topic. Of course it is the responsibility of the researcher to recognize and verify the data in order to draw concrete conclusions. The selection criteria for the participating businesses on this study are equally important. A more freely and voluntary participation of wine businesses would greatly support the study. For example a good choice of wine businesses are those interested in exporting wines overseas but they do not have the necessary human and material resources. A weak choice of wine businesses is the selection of businesses that are opposed to international promotion of wines for their own reasons. Professionals that are selected to participate at the research must have adopted work ethics and are well respected in the wine industry.

An ethical research approach could provide a valuable contribution to the academic and business communities. A clear vision, objectives and understanding of the purpose of this study are also

important to the completion of this research. The researcher's values and ethics would probably set a solid framework. The researcher's role is extremely important to the selection of the participants; wine businesses, employees and professional and also to the evaluation of the selected data. It is imperative to verify and validate the information and the research sources. The selected sources and data are chosen with accuracy and must be unbiased in order to construct a well accepted research paper. Also the researcher's ethical coding system might be implemented on the proposed academic study and the recommended solutions.

Required skills needed for different methods

The adoption and use of constructivism philosophical position could present a different view of the problems faced by the wine businesses. The understanding of the different levels of this multiplex situation by the researcher would possibly help him introduce a new theory to export wines abroad. The inductive nature of qualitative research "involves researchers working back and forth between the themes and the database until they establish a comprehensive set of themes" (Creswell, 2007, p. 39). In addition to this statement the researcher of this study would apply grounded theory to construct and present a theoretical framework to the affected parties. The selection and verification of data with different methods would greatly support this effort. The continuous quality improvement of the study must be set as one of the foundation elements. The genuine participation of the actors and the adaptation of methodology are also strong elements. Langley (1999) supported that the information processing task for qualitative researchers involves attending to multiple items at one time – data and theory, collection and analysis, themes and sub-themes. Further, the data collected in qualitative studies have characteristics identified by Langley that make them hard to analyze and manipulate: they deal with ambiguous events, involve multiple units and levels of analysis, are temporally imprecise, and are eclectic. As stated before the researcher would apply a grounded theory as a qualitative method to collect data. The researcher's ability to gather data by interviewing executives and to analyze the most important information is a key skill for the completion of this study. The use of technology such as a digital recorder and Nvivo software would support the gathering and analysis of the primary data. The technical skills of the researcher are also essential to the collection and verification of the information. Also the critical skills of the researcher would play a crucial role on the implementation of the qualitative method.

The research will be better supported with the use of triangulation method. As stated earlier the adaptation of constructivism position and the application of a qualitative method such as grounded theory will be the primary approach to this research. Nevertheless the use of a quantitative method such as questionnaires and analysis of secondary data from the Cyprus Statistics Agency and the Cyprus Wine Products Council are to be considered as an advantage to this study. The combination of the qualitative and quantitative methods would probably produce more accurate and credible

results. The verification and validation of the factors affecting the export strategy can be performed with the triangulation method. The use of a quantitative method requires the analytical skills of the researcher. The ability of the researcher to perform mathematical functions and statistical graphs would strengthen the argument of the research concerning the effect of structural design on export strategy. The combination of the analytical and critical skills is a solid way to provide practical solutions and a theoretical framework to the interested parties.

Reflections on the choice of research approach

The choice to research the structural design will be an exhausting but hopefully a rewarding effort. The main idea is to explore the business' structural design that might affect the outward looking for foreign markets by executives to promote the Cyprus wines. The understanding of the way of thinking of the wine businesses' executives is a key element for analyzing the business structure. Even though so many factors affect the exportation of wines the researcher will focus on the business organization of the departments and the managers' abilities to engage in the international wine market. An attempt to compare wine businesses or businesses in other sections might shed some light for the success reasons on exportation.

The intention of the researcher is to intervene in the wine industry by interviewing executives and constructing a theoretical framework. There will be an attempt to analyze the present situation and make recommendations for a successful exportation of wines from Cyprus. The selection of constructivism philosophical approach would provide a strong argument concerning the reasons that the wine businesses do not engage on foreign exports. The deployment of a triangulation method to the research might provide solid evidences and conclusions about the factors affecting foreign trade. Interviews and questionnaires are some of the methods to be used on accessing data from the wine businesses. The selection of a qualitative and a quantitative method will fulfill this approach.

The researcher will construct a theoretical framework and develops a set of recommendations for the wine businesses. The triangulation method is the main venue to collect and analyze data regarding the structural design, export strategy and the wine industry. It is a huge attempt to research, evaluate, and develop a platform that the Cyprus wine businesses and academic institutions will benefit from the outcomes.

ASSESSING THE IMPLEMENTATION OF E-GOVERNANCE IN ARAB COUNTRIES

Al Athmay, Alaa-Aldin Abdul Rahim A.¹

¹ Department of Management, Marketing and Public Administration, University of Sharjah, Sharjah, United Arab Emirates. Email: aathmay@sharjah.ac.ae

Abstract

This is an exploratory study aimed at assessing the implementation of e-governance in Arab countries and to review and analyze the current status and challenges facing those countries in e-governance implementation. E-governance is a concept aimed at building better relationship with the public with purpose to achieve efficient, speedy, transparent and accountable government. This paper reviews data on global ranking of Arab countries performance on e-governance and analyze data and information extracted from relevant literatures on e-governance. The data reveals discrepancies in performance among Arab countries on all indices used in this study. On the e-participation index, with exception of few countries such as Bahrain, Egypt and Tunisia, the average score of most Arab countries is only 0.10 out of the maximum score of 1.0. The result indicates that Arab countries do not place emphasis on e-participation. The state of the E-Governance Readiness of Arab Countries is explained through the force-field diagram.

Key Words: E-government, E-governance, Governance, Arab Countries, ICT

Introduction

E-government is an institutional approach focuses on carrying out decisions related to the use of information and communication technology (ICT) to transact the business of government and promising better delivery of its services to citizens, improved interactions with businesses and empowering citizens through access to information. It uses (ICT) to transform the traditional public sector by making it more accessible, transparent, effective and accountable. The end result of the adoption of e-government is to create a more satisfied picture of government business processes. E-government is not only putting a computer on the desk of bureaucrats, rather, it aims to change the mentality of those bureaucrats so that they treat citizens as valued customers of government or important participants in decision-making (Shakya & Sigdel, 2007). E-governance is wider concept which reflects the relationships between government employees, elected or appointed, and the wider society. As interpreted by Heeks (2003) e-governance goes beyond the provision of simple service and builds an external interaction with the diverse stakeholders of government. E-governance means building positive relationship between the governing and the governed through the integration of people, processes, information and technology to achieve governance objectives. Successful implementation of e-governance requires the movement from passive information society to an active

engagement of citizens. While the definitions of e-government and e-governance overlap (UN Global E-Readiness Reports, 2005; Gartner Group, 2003; Adeyemo, 2011; Fraga, 2002), there is a significant differences between the two terms. E-government involves using ICT, especially the Internet, to improve and transform the traditional way of providing government services to citizens, businesses and other government agencies, while E-governance is wider concept which goes beyond the simple provision of services through the use electronic mean by building an external interaction with diverse stakeholders in the external environment. E-governance involves the usage of ICTs at various levels of government and public sector organizations for purpose of enhancing governance (Heeks, 2003; Holms, 2001, Bin Salamat, Bin Hassan & Bin Muhammad, 2011).

There is a need for understanding the developments of e-governance initiative of the Arab countries. I investigated the current performance of the Arab Countries in e-government development and e-participation. The United Nations E-Government Survey 2005, 2008 and 2010 has been used as the main reference document in writing this paper. The Author uses some indices of E-Government Development (EGDI) to shed light on how far Arab Countries have used the information and communication technology to facilitate an efficient, speedy and transparent process of disseminating and exchanging services and information to the public and other organizations. The paper seeks to provide an assessment of the implementation of e-governance in Arab countries. In addition, semi-structured interviews with a sample of Arab expatriates working in the field of academia were conducted to gather additional information on obstacles facing Arab countries in their endeavor to achieve the e-governance objectives. This paper is organized as follows. First, a discussion of the meaning and benefits of e-governance is presented followed by the literature review of extant literature. Then, the current performance of Arab countries in three indices which constitute the backbone of the e-governance practices is presented alongside the e-participation. Towards the end, the analysis of realities and the obstacles of e-governance in Arab countries is presented along with the force-field model of the E-Governance Readiness of Arab Countries.

Meaning of E-Governance

E-governance nowadays becomes the mantra and the key success factor for governments in the presence of increased citizen's expectations, evolving societies, fiscal demands and fierce competitive era. E-government is the use of internet by public sector organizations with aims of better access and delivery of services to its clients. It marks the most revolutionary shift in governance and the fundamental institutional change of the way government operates and transforms its relationship with citizens, businesses and other governments. Government bureaucracies are typically described as rules, processes, and input oriented. E- Government has been perceived as a reply to such issues. Accenture, a leading consulting, technology, and outsourcing, viewed e- governance as using new technologies to strengthen relationships with citizens. E-governance defines and assesses the impacts

of ICT on the practices, attitudes and behaviors on different spectrum of the society. E-governance is not only concerning the provision of services through the application of electronic means but rather entails building external interactions (Heeks, 2001), enhancing democracy and trust of the political institutions of government (Lenihan 2002, The Gartner Group, 2003). According to UNESCO, "E-governance is the public sector's use of information and communication technologies with the aims of improving information and service delivery, encouraging citizen participation in the decision-making process and making government more accountable, transparent and effective. The UN Global E-government readiness report (2005) provides broad definition of e-government. E-government according to this report entails not only the process of services and information delivery but also include the involvement and empowerment of the public through better access and participation in decision making process. E-governance involves new styles of leadership, new ways of debating and deciding policy and investment, new ways of accessing education, new ways of listening to citizens and new ways of organizing and delivering information and services.

E-governance is generally considered as a wider concept than e-government, since it can bring about a change in the way citizens relate to governments and to each other. E-governance can bring forth new concepts of citizenship, both in terms of citizen needs and responsibilities. Its objective is to engage, enable and empower the citizen. It is assumed that the adoption of information and communication technology by government organizations can enhance the practice of e-governance. E-Governance integrates the human and the human side of technology. It integrates people, processes, information, cultural, and environment in achieving the governance objectives. Through this integration, e-governance can contribute towards enhancing the democracy, transparency, accountability and respect of the rights of the citizens. E-governance is the continuous improvements of service delivery, citizens' engagement and governance by providing new information flows from citizens to government. The government through the adoption of ICT can provide its citizens, as consumers of public service, with details of public sector operations and therefore provide more legitimacy to its existence (Heeks, 2001). The e-governance can support and sustain good governance by providing all stakeholders (citizens and businesses) of better public service delivery, a better transparent information and easier access to the political authorities. E-governance may be seen as a wider concept that goes beyond the simple service provision to build external interactions. The principal indicators of e-governance are efficiency, effectiveness, and rule of law, trust, participation, democracy, transparency, accountability and respect of human rights. The main aims of e-governance are to make public administration more transparent, speedy and accountable, while addressing the society's needs and expectations through efficient public services and effective interaction between the people, businesses and government (Farooque, 2011).

Governance was defined as the process by which individuals and institutions, public and private, manage their common affairs (United Nation, 2002). It is a collective process resulted from the interaction of the public sector and civil society for purpose to simplify governance for government, citizens and businesses. E-Governance is a wider concept that encompasses all forms of governance that can be undertaken not only by government authority but by businesses, non-governmental organizations and citizens (Keohane & Nye, 2000). There are various features which describe the good governance. Good governance is participatory, consensus oriented, accountable, transparent, effective and efficient, equitable and inclusive and follows the rule of law (Sardi and Mlikota, 2002). E-governance is the application of ICTs at various levels of government and by various public and private agencies for purpose to achieve governance objectives. The most important utilities of e-governance in developing countries include features such as accountability, transparency, participation, equity, promotion of the rule of law and decentralization (UN e-government survey 2008, 2010). The adoption of information and communication technology (ICT) has added value to the practices of good governance. With emergence of ICT it is possible to locate service centers closer to the clients. Some authors contend that E-governance may be seen as a wider concept that goes beyond the simple service provision to build external interactions. It is an integrated approach that not only integrates the internal processes of government but also people (citizens, Businesses, Non-government organizations) in the service of achieving good governance objectives (Howard, 2001 and Bannister and Walsh, 2002). E-governance promises to deliver to all citizens improved services, reliable information and greater knowledge in order to facilitate access to the governing process and encourage better citizen participation.

E-government has broken the barriers within the government and between the governments. The rise of digital economy and the globalization of information knowledge, compel governments around the globe to meet new expectations and priorities of citizens and businesses. E-governance should help in empowering citizens, businesses, and workers.

Literature Review

There is a paucity of research exploring E-Governance in Arab countries. Many authors have pointed out digital divide (Chatfield & Alhujran, 2009) and also underlined various others impediments such as highly bureaucratic nature of government agencies and rarely trained human resource (Al-Nuaim, 2008). The study conducted by Al-Nuaim (2009) also found that Arab municipal Web sites were not citizen centered, suffered from fundamental problems and had limited interactive services. Ciborra and Navarra (2005) examined the early design of e-government solutions in Jordan and found that implementing a general standardized ICT portfolio to support good governance proved to be a difficult task. Awan (2007) studied the government-to-business (G2B) aspect of Dubai

e-government and found that businesses often didn't use e-government services for business transactions. One of the reasons include that online response to business queries was very slow.

Chatfield and Alhujran (2009) conducted a cross-country comparison of e-government websites and portals in 16 Arab countries. It was revealed that Arab countries lag behind more developed nations in terms of e-government service delivery capability. A wide digital divide was found among the Arab countries in terms of advanced e-government services. Zaid, Khairalla, and Al-Rashed (2007) investigated the perceptions of towards the IT environment in public organizations in Kuwait and found that less than half of the participants agreed that their organizations had adequate appropriate connectivity, infrastructure, and IT human skills to implement the e-government system. Belwal and Al-Zoubi (2008) assessed the public centric e-governance in Jordan and highlighted many impeding forces such as digital divide, corruption, social bottlenecks, lack of marketing to stakeholders, citizen's lack of adoption of technology.

The review of above studies underscores the challenges faced by Arab countries with regard to the e-governance readiness. Though there is debate on the factors which restrain the e-readiness of Arab countries, however, there is a need to take a consolidated view of the state of the Arab world e-readiness. The current study presents a conceptual model (see Figure 1) in order to improve our understanding of restraining and driving forces which may impede or facilitate the Arab world e-readiness.

Method

The current study draws upon both secondary and primary data. The sources of secondary data include reports published by the United Nation Survey (2005, 2008 & 2010), the Department of Economic and Social Affairs (DESA) in order to assess the e-governance readiness of the governments of Arab World. Another purpose of this approach is to use this assessment as a benchmark tool to monitor the advancement of Arab governments in implementing e-governance services.

Interview Protocol & Data Analysis Procedure

The sources of primary data include semi-structured face-to-face interviews with professional expatriates and locals in the UAE. A total of thirty individuals were interviewed. The interviewees included IT Director, project managers, operational staff, and academicians. Each interview lasted on an average of one and half hour. An interview protocol was developed containing a variety of open-ended questions. The questions were developed considering different dimensions of e-governance readiness. The data were collected over the period of two months during Jan and Feb 2011. During the interview, detailed notes were taken.

In order to assess the e-governance readiness of Arab world, a thematic analysis of interview transcripts was performed in order to find common themes. Thematic analysis helps in identifying

common themes through in-depth examination of data (Gifford, 1998). The review of the interview transcripts revealed statements that linked to the identified themes.

Selected Indices

The following indices were some of E-government development indices (EGDI) which were chosen to shed light on how far the application of information and communication technologies among Arab States has improved accessibility of services to citizens, improved the transactions with citizens and business, and the involvement of citizens in public policy through better access to information:

- E-Government Readiness
- Web Measurement Assessment
- E-Participation

E-government Readiness Index in Arab World

The use of modern information and communication technologies (ICTS) in the public sector has created new perceptions about government and governance. Governments are looking for e-government to provide support for public sector reforms and good governance. E-government as a concept integrates the internal and the external components of connected governance. Internally, it has helped of creating more efficient functioning of government operations and externally had improved the interaction with citizens and businesses (United Nation Survey, 2008, 2010). Because of such promising benefits of e-government, this study has added this indicator for purpose to provide a comparative analysis of the extent by which the application of ICTs among Arab governments has contributed to building a better system of service delivery, improved transactions with citizens and businesses, and the empowerment of citizens through better access to information. In this section, I divide the Arab countries by Sub region and provided evidence of their readiness toward the interaction and transaction with citizens and the private sector.

The E-government index of Arab countries in Tables (1,2, and 3) is shown by two groups, the Western Asian Arab countries and the North African Arab countries. The E-government index (EGI) of the Western Asian Arab countries increased from 0.4384 in 2005 to 0.4857 in 2008 and then declined slightly to 0.4757 in 2010 (Table 3). As a group they are above World average (0.4267, 0.4514, and 0.4406) of the same period. When compared to World average in 2010, 7 out of 11 Western Asian Arab countries managed to exceed the World average. The EGI of the North African Arab countries also increased during the same period but their averages were below their Arab counterpart in Western Asian and World average (Table 3). The breakdown of e-government readiness Arab countries by these two Sub regions is shown in Table 1 and 2. Within those two sub regions, there was significant gap between countries in e-government readiness index. United Arab Emirates (UAE), Bahrain,

Jordan, Kuwait and Saudi Arabia showed significant progress compared to other Arab countries in the same Sub region and their scores in EGI exceeded the World average (Table 1). Arab countries within the North African Sub region showed inconsistent progress, with exception of Egypt which shows better score compared to rest of countries in that Sub region (Table 2). Contrasting Arab countries by region, Table 3 shows significant gap in performance with Arab countries located in Western Asian outperform their counterpart in North African region by more than (10) points. Most Arab countries in the Western Asian Sub region improved their e-government readiness indexes for aforementioned period with exception of Syria, Iraq and Yemen. Among the Arab North African Sub region only Egypt and Tunisia show good progress in score compared to World average score in e-government readiness. The EGI for both countries in 2010 was 0.4518 and 0.4826 respectively. Tunisia and Bahrain are the most prominent countries among all Arab list to move up 58 positions and 39 positions respectively from their 2008 ranks of 124th and 42nd. The data in Tables (1,2,and 3) indicates that most Arab countries have recognized the essential role of using technology to modernize the public sector's view of the needs of the citizens and the private sector. In order to document the real transformation of the public sector in Arab countries from a bureaucratic form to a people-centric view, the next section assesses the national web sites of these countries and evaluates their online service delivery index.

No.	Country	Index 2005	Index 2008	Index 2010	Global Ranking in

Web Measure and Online services

The strategic objective of web measurement assessment is to measure the online presence of government national websites. It is intended to provide governments with a comparative ranking on their abilities to deliver services to its citizens. There are a couple of models that have proposed to

capture the evolution of e-government services (Benchmarking e-government, 2002; Matthias and Gaele, 2003; Kaaya, 2004; Okot-Uma and Rogers 2004). In order to demonstrate the ability by which national Arab States provide online services to their citizens, this study has adopted the five stage of e-governance model of the United Nations e-government surveys 2005, 2008 and 2010*. These surveys provides a comparative assessment of the performance and ranking of 192 United Nations Member States on how the public sector has responded to the demands of citizens for excellent services and products through the use of the most innovative ICTs (Kerby, 2010). To assess the online presence of national websites and to meet the growing needs of citizens for different types of information and services, the author gathered and displayed two types of data. Table 4 shows the scores and ranking of Arab States by web Measure index and Table 5 presents the percentage and points of utilization and ranking of online service delivery. Table 4 shows the progress made by Arab States in Web Measure Index. Most Arab States with exception of Lebanon, Iraq and Yemen, have made good improvement on the online presence of their national Websites. Some Arab countries have made good improvements in Web Measure Index and climbed in their positions in 2008 compared with 2005. Those are UAE, Bahrain, Jordan, Qatar, Kuwait and Oman. UAE followed by Jordan lead other Arab States in this index. Based on United Nations e-government survey of 2008, the Highest Score in this Index is 1.0 which has obtained by USA. This survey shows that UAE and Jordan have scored (0.7157), (0.6054) respectively in Web measure index and this means that both have undertaken a good renovation of their national portal since the last survey in 2005. Other Arab States which reflect renovation in their national portals in 2008 in descending orders are Bahrain (0.5201), Oman (0.4849), Saudi Arabia (0.4649), Kuwait (0.4147), Qatar (0.3913) and Syria (0.2408). These improvements can be interpreted of the good efforts by the governments of these countries in investing in infrastructure, education, citizen-friendly portals and online applications. As 2010 e-government survey by UN contains no data on Web Measure Index, I used the online service index to show the ability of Arab States of providing online services to their citizens. The data were extracted from E-government development index which was measured by four components which all together have been summed to 1.0. One of these components was online service. The Republic of South Korea got the highest score in the World of (0.3400), and accumulated 0.8785 in e-government development index. South Korea scored full mark of (1.0) in online services based on 2010 UN e-government survey. Countries with highest scores in online services reflect their strengths in online service provision, social networking with citizens, engaging and empowering them to be part of the governance process. Three Arab States Bahrain (0.2883), Jordan (0.1813) and Kuwait (0.1565) maintained good presence of online data and information to their citizens (table 4 & 5). Although the data in Table 4 & 5 showed some modest progress of some Arab States, but overall Arab States still lagging behind the World trend toward more and better interaction with their citizens.

No.	Country	Index 2005	Index 2008	Online service Index 2010	Global Ranking in		
					2005	2008	Online service 2010

Table 5: Online Service Index

- The UN e-Government survey 2005 contains data on Web Measure Index and Ranking.
- The UN e-government survey 2008 contains data on Web Measure index. The ranking is calculated by the Author.
- The UN e-government survey 2010 contains no data on Web Measure Index and ranking. The UN replaced the Web Measure Index with Online service Index. The Author used Online Service index as approximate measure of the ability of Member States to deliver online services to their citizens and calculate the online service index ranking.

E – Participation

E-participation opens the gate toward knowledge sharing attitude on the part of government employees and the citizens' rights for information. E-participation is meant to assess the quality, usefulness and relevancy of the information and the willingness of governments to involve citizens in public policy making through the use of e-government initiatives (Kerby, 2008). It is not only to locate service centers and to carry out decisions related to service provisions but to simplify governance for government, citizens and businesses. While the Web Measure index assesses the availability of information and services to the public, e-participation measures the usefulness of these services to fulfill the public's needs and expectations and to facilitate a speedy, transparent and accountable government administration. E-participation index contains three benchmarks, namely E-information, E-consultation, and E-decision making. Taken together, these benchmarks measure the degree of the country strength in e-participation. E-information measure the extent to which the national government provide information on the internet to be used as the basis of citizens' participation. E-consultation is the back and forth interaction between the government and its citizens. The focus is on the stakeholder interaction. E-decision making provides evidence of the real changes in public policies as resulted from citizens' inputs and feedback (Kerby, 2008; Adeyemo, 2011). This section uses the UN e-participation index (UN e-government survey, 2005, 2008, 2010) as an important and valuable means to provide an overview of the current performance of the Arab countries in e-participation. Breakdown of data on each component of e-participation are only found for specific selected countries and most of them are Western countries and therefore the data are not shown a breakdown by these three benchmarks rather it shows one single score referring to e-participation index. The author uses UN, EPI (E-Participation Index) for the above period to gauge the best performing Arab countries on this index with the reference to the best practices found in other countries.

Table (6) below shows how Arab governments have performed in EPI in 2010 compared to 2008 and 2005. The highest value of EPI is 1.0 and was earned by the Republic of South Korea in 2010 and came second in 2008 after USA. Most European countries, including, Canada are among the top 20 countries in EPI in 2008 and 2010. Bahrain is the only Arab countries stand out for embracing the concept of e-participation and show a remarkable move in the global ranking and moved 25 steps in EPI between the period 2008 and 2010. Bahrain led other developing countries and Arab States and climbed from 36 to 11 globally in this index. As can be seen in Table 6, about 65% of the Arab countries surveyed in this study were found in the score ranges between 0.00 and 0.20 in 2010. This percentage was shrunken in 2008 by the margin of more than 25% of the majority of Arab countries. In 2005, the highest score in EPI was recorded by UAE and it was 0.1270. In this same year, almost all Arab States were showing a poor score in EPI and they were far from incorporating the online services tools to promote the participation and engagement of their citizens in public policy process (See Table 6). The

number of the Arab countries in the score ranges 0.20 – 0.29 has dropped by 7 countries in 2010 compared to 2008. Despite of the overall decline in EPI in most of the Arab countries in 2010 compared to 2008, however there were remarkable achievements of some Arab countries. The top 6 Arab countries measured by EPI global ranks from 2008 to 2010 are compared over time in Table 6. The range of the 2010 EPI global ranks of the Arab countries in Table 6 is between 11 (Bahrain) and 53 (Kuwait). The number of Arab countries in the top 6 EPI performers list which showed strong performance by climbing in a range of 7 positions (Egypt) and 113 positions (Tunisia) between 2008 and 2010 is 6; whereas, 11 countries recorded declines between 5 positions (Algeria) and 75 positions (Iraq) in their global ranks in the same period. Among the Arab countries in the top 6 EPI performers list, the most attractive-attention performance came from Tunisia by rising 113 positions from 152nd place in 2008 to 39th place in 2010, followed by Kuwait which climbed 63 positions from 116th place in 2008 to 53rd in 2010. When the EPI Global rank changes of the Arab Countries from 2008 to 2010 considered; only 7 out of the 17 countries surveyed increased their ranks. The remaining 10 out of 17 recorded falls in their ranks. Table 6 also reveals that there is no association between the financial position of the country and the EPI. With exception of Bahrain, Kuwait, most oil rich countries such as (Iraq, UAE, Saudi Arabia, Qatar, Oman, Libya, and Algeria) have not fare well in EPI.

No.	Country	2005		2008		2010	
		Index Value	Global Rank	Index Value	Global Rank	Index Value	Global Rank

Table 6: E-participation Index in Arab Countries

E-Governance in Arab Countries: Reality and Challenges

This section discusses and analyzes two issues of e-governance in Arab countries. The current status of e-governance in Arab countries which relies on data and information published in relevant articles and UN reports of 2008 & 2010. The second issue covers the challenges which are extracted through face to face interaction with some professional expatriates and locals in UAE.

With advent of information age, the rise of digital economy, and the globalization of knowledge, governments around the World are modernizing themselves to meet the new expectations of citizens and businesses. The UN broad definition of e-government emphasized the dynamics role of governments to meet not only the citizen's need of information and services but their active engagement and participation on EG initiative. Most of developing countries in general and Arab States in particular have enacted of an e-government policy focusing mainly on service delivery process with almost complete ignorance to the role of the public on decision making process (Bin Salamat, Bin Hassan and Bin Muhammed, 2011, UN Report, 2010). The establishment of a democratic culture means creating institutional framework that encourages day-to-day interactions between both the public and private institutions to better manage the resources of a country at all levels, national and local. In a study by D. Kaufman, et.al., from the World Bank (2001) of the Mediterranean countries which include 8 Arab States, has constructed six indicators of such culture, namely: voice and accountability; political stability; government effectiveness; regulatory quality; rule of law; and control of corruption. All Arab countries under this study scored low in all indicators. According to this study, political participation is limited and citizens' ability to participate in the selection of the government is restricted. As Tables 1 through 5, reveal some good efforts made by few Arab countries in e-government readiness and web measure index but this does not commensurate with the performance of Western democratic countries and some well practices of some developing countries and at the same time does not guarantee the real involvement of the public in decision making process. This finding is substantiated in Table 6 which reveals that most Arab countries have showed low penetration of the public in e-government initiative. With exception of Bahrain, none of the Arab countries reached the level of 0.6 in e-government readiness index. The Web Measure Index which reflects the five stages of e-government model reveals that some progress made by few Arab countries such UAE, Bahrain, Jordan, Qatar, Oman and Egypt where government services and information are now delivered, but again the delivery of services without encouraging participatory deliberative decision making means that Arab Websites are still not fully integrated. With exception of UAE, and Egypt, the scores of most Arab countries ranged between 0.06 Sudan and 0.52 Bahrain (United Nations Survey, 2008).

Another index used by UN to measure the online presence of the home pages of government institutions is Online Service Index (OSI). In 2010, the OSI was substituting the formerly known index called "Web Measure Index". This index is one among three components of the E-Government Development Index (EGDI). South Korea held the first position by scoring a full mark of (1.0000). The top 20 countries are all from Western countries, except Singapore, Malaysia beside South Korea. A country strength in online service provision correlates positively with its use of e-participation or what some literature call e-dormancy, e-consultation or online public engagement (Whyte & Macintosh, 2002; Coleman & Gotze, 2001; Bin Salamat, Bin Hassan and Bin Muhammed, 2011). Table 5

exhibits the Arab countries in term of their OSI rank changes from 2005 to 2010. Of the 17 Arab countries, 8 of them managed to move their positions upwards, while the other 9 recorded decline in their online presence performance. From the 9 countries recorded increase in OSI, four countries have made remarkable recognition, namely, Bahrain, Jordan, Egypt & Tunisia. The last three countries are not among oil rich Arab countries. Bahrain is the only Arab country in the Top list which has global rank of 8 in 2010. Bahrain was cited by UN E-government survey of 2010 among the seven countries in which citizens can pay registration fees, fines, etc. via transactional e-services that cater to many segments of its society. Other cited examples of online payments were the e-dirham initiative in UAE and e-payment gateway in Jordan (Sha'ban, 2006). Jordan, Egypt and Tunisia are also among Arab countries which showed good improvements in the online services and ranked 22nd, 23rd and 30th respectively. Tunisia is the most notable climber in the top 10 list to move up 119 positions from 149th in 2008 to 30th in 2010. Despite the enactment of e-payment in the some Arab countries, however, the percentage of the transactions conducted through the e-services is low. In UAE only 9% of the total transactions are performed using e-services (UAEInteract, 2009). Some Interviewees attributed this low level of utilizing online transactions to the lack of regulations for electronic payment or data transfer and to the role the public sector marketing in enhancing the awareness and the trust among the users of the e-transactions. With exception of few countries noticed above, the global United Nation reports of 2005, 2008, and 2010, cited a static to low achievement of Arab States from the perspective of people participation. In 2005 the highest score in EPI was 0.12 and in 2010 the average score of more than 65% of Arab Countries was only 0.10. According to one scholar, most Arab countries have tried to deliver their services to citizens through ICT, however, the implementation focused on publishing information and services with little actual transactional services. The non exhaustive infrastructure in term of access facility and lack of awareness were cited as the obstacles that complicate the delivery of a service and prevent the people feedback of government e-services. Good governance should proceeds the application of ICTs and technology should be used as a means of achieving governance objectives. According to one interviewee, governments in Arab countries are still far behind a normative framework of good governance. Lack of stable politics, unclear macro-economic policy, and the dominant of the personalized leadership and the marginalization of legislative and judicial branches are among the cited obstacles for full utilization of e-governance. The recent events demonstrate that there is gap within Arab countries in e-governance and good governance. In other words, the public in these countries are far from real engagement in policy formulation and decision making process and there is a need for using ICTs as a tool for reengineered information systems to meet the governance demands (Sardi & Mlikota, 2002). Few Arab countries have been cited to utilize the e-participation as integral part of e-government and by creating a transparent and an open public administration systems. According to A. Fadi Salem, the Director of the Governance and Innovation Program at Dubai School of Government, only two countries namely,

Bahrain and UAE are utilizing the participatory technologies or social networking in governance. Mr. Salem has cited the changing of mindset towards both engaging citizens in policy making and public service delivery as the main obstacle of using technologies in interactions between societies in Arab countries and governments (Moore, 2011). The other cited challenge to e-governance, according to another interviewee is “lack of back-office capability in most Arab public sector organizations”. According to another interviewee, public administration workforces lack the required ICTs skills to support accessibility, trust and citizens confidence of e-government initiative. Some Interviewees have casted doubt in staff readiness to handle well the new duties stipulated in e-government projects. According to them, agencies’ staffs were not properly trained to use and digitize the available information and make it accessible on-line. Therefore, there is a need to change the internal operations of government organizations for purpose to support the core process of information and service providers and facilitate the interaction between government and both citizens and businesses. Some examples of such accompanying process changes are integrated human resources and payroll system, integrated financial management systems, web-based data resources to improve decision making and intranet system to improve information flows within governmental institutions. The support of back-office and the creation of agile and adaptable workforces were recognized as precondition for developing online services and e-participation (Sardi & Mlikota, 2002; Janowski, 2005). Al-Hiram reported of the slow pace of e-government transformation (UAEInteract, 2009) “... With the exception of high performing nations, on average less than 50 per cent of all internet users access eGovernment data and less than 20 per cent undertake online transactions.....” Such slow pace can also be inferred in Humaidan’s statement that “... We aim to include more government departments and agencies in Dubai and achieve integration in the delivery of services through a unified platform, which we believe will contribute significantly to realizing the Dubai Strategic Plan 2015.” This is a problem that can and must be addressed, in our view, by extensive skilling of public sector marketing in the UAE in particular and region at large.

Another challenging issue in most Arab countries is the absence of legislation and rules that specify citizens’ rights with the respect to information provision and request. In most Western countries, the public access to information and the duties of agencies to inform citizens about processing personal information was well stipulated in laws and regulations (Garson, 2006), while in most Arab countries, according to some interviewees, there is either an absence of such laws and most citizens are not aware of their rights and duties with respect to the provision or request of information. Citizens of these countries are ignorant about their rights of asking the government agencies to rectify data concerning them or requesting data related to economic, social or securities issues. Therefore, institutions wishing to have personal information or using such information must inform individuals of the use of these data. Another related which missing in Arab countries is the role of national parliaments in establishing a website to inform and engage citizens in the democratic process. Some

interviewees have raised concern about the lack of citizens' engagement in public policy process. In Arab countries, according to them, the citizens have little awareness about their parliaments; have no direct participation in boards' discussions; and with exception of few countries individuals' voice are never heard. Rectifying such challenges will definitely, enhance the public trust with rule of law, bring more legitimacy of government decisions and provide support for public sector reform.

It appears that in most of the Arab countries, there is clear absence of laws which allow the general public to gain online access of government deliberation of public policies. The weak parliaments and strong executive leaders in most developing countries and particularly in Arab nations render to the ineffectiveness of the information systems to better represent and connect with the general public. The information systems should be designed within the context of the law to make top-level decision-making process rely on the online environment and to leave space to change these systems in years later. Other challenges to e-governance or in other words to citizen participation and engagement are:

Proposed Model- Force-Field Diagram

The proposed model draws upon the force-field analysis approach discussed by Palmer, Dunford, and Akin (2009). The force-field analysis is a model which underscores the factors which could hinder or facilitate change. The hindering forces are labeled as restraining forces and forces which facilitate change are named as driving forces. The main force-field arrow (see Figure 1) underpins the issue of e-governance readiness of the Arab countries. Drawing upon the secondary and primary data, I have compiled the list of restraining and driving forces as shown in Figure 1. Each restraining and driving forces carries an assigned number which depicts the strength of each force. If the number is high, it means that the factor is stronger and if the assigned number is low, the relative strength of that factor is weak.

As shown in the figure 1, the restraining forces are stronger and driving forces are relatively weak. This has resulted in low e-readiness of Arab countries. Potentially, the proposed model will trigger future debates on the restraining and driving forces with particular focus on Arab countries. It suggests actions that can be taken by Arab governments such as decreasing restraining forces increasing driving forces.

THE QUALITY OF FINANCIAL SERVICE DELIVERY IN KUWAIT'S FINANCIAL INSTITUTIONS

Alghanim, Bashar

Abstract

Service quality has become an important issue internationally in business, and the improvement of financial services quality is considered an important challenge facing the financial service providers in Kuwait. Lusch et al. (2004) acknowledged, services are deeds, processes and performances; therefore, everyone performing a service is a marketer, and must take notice of the shortcomings of their business in order to improve the quality of service delivered.

The development of Kuwait's financial industry will cultivate its economic growth. And the development in service and transparency will improve allocating people's investments efficiently. Countries with enhanced financial systems direct people investments to its most fruitful utilization, which will eventually experience swift economic growth.

Essentially, continuous service quality enhancement in Kuwait's financial industry is considered a necessity, especially at times when the financial sector is undergoing an extraordinary rate of transformation in products and service delivery. The sustainability of various effective service delivery methods is vital to the success of financial institutions.

Customers' expectations are subjective on service quality, since the escalation level of services provided develops into standardized expectations; however, customers' embrace expectations with higher confidence. Therefore, the expected service quality delivery from financial institutions has considerable results on customers' commitment towards the business.

Keywords: service quality, customer satisfaction, financial services, financial institutions, financial regulation.

Introduction

Customers most often drive the market and customers everywhere are becoming increasingly sophisticated in their expectations with services delivered. These expectations are based on their previous service and cumulative life experiences, as been affirmed by Berry et al. (2001: 35) "...it is the customer's definition of quality, not management's that counts."

According to Verma (2003) in 'Customer Outrage and Delight', service quality is a key business issue in every business sector in the global marketplace and has come to occupy a top position in the economy. It is common knowledge in the financial sector that customer satisfaction is the ultimate differentiator between a successful financial outcome of a commercial venture and a poor one.

Financial service providers are a significant market because of the multi-billion dollar profits this business generates. In essence, the financial industry emphasizes on conducting financial activities that are generated by the economy demands. Financial institutions provide different services that ease the operations between the service provider and the customer in the economy.

Customer satisfaction and service quality are persuading the consideration of all financial institutions around the world, and Kuwait is not an exception, since outstanding service quality is fundamental to the business profitability and effectiveness. Panda (2001) acknowledged that “the success of a business enterprise is guided by the strategic orientation of the organization towards its customers, competitors and internal customers (employees) and the relationship between these significant components.”

Nowadays the significance of service quality is changing. Excellent service quality delivery back then was intended to verify output requirements set by the service deliverer. In the present days, the perception of service quality is developing to signify consistency of perfect service quality outputs that have values instigate by the customer.

The Importance of Customers’ Satisfaction

The financial service industry is generally customer driven, and their continued existence primarily depends on the quality of financial services provided to their customers, where their satisfaction, retention and acquisition are the main key factors. Therefore, financial institutions must be insightful to their customers’ satisfactions when they provide services to them.

Customers now a day start to lose confidence in Kuwait’s financial services sector, poor experience of financial services and products led many customers to stop using financial services. Financial service providers must be aware that investors’ satisfaction is mainly based on service quality delivery; as Siddiqui and Sharma (2010) affirmed, “assurance of the service quality is the most important predictor of satisfaction.”

Nevertheless, the financial sector generally requires a long-term relation between the investor and the service provider, where the quality of the service delivered has a predominantly considerable burden on investors’ satisfaction. Hence, service quality magnitudes influences customer satisfaction based on functional services with the service provider, which eventually, has an impact on overall satisfaction, Siddiqui and Sharma (2010).

More to the point, if clients are disappointed or inconvenient with their service provider, the entire relationship will be jeopardized; and failing to understand the client’s requirements will cause major competitive disadvantages to the business. Murtagh (2008) stated that “see your customers as they are, not as you wish them to be. All customers start with an awareness of a need.”

Many successful businesses have strategies that cater for the needs and satisfaction of esteemed clientele in a variety of ways, through emphasizing quality of service to facilitate customer retention while raising profits. However, service quality performance should be measured in order to recognize the factors that drive it.

In recent times, both business managers and academics have become interested in developing methodologies to evaluate customer satisfaction as a way to shape marketing strategies. Frei et al. (1997) agreed that “when the dimensions or performance of a service output exceed allowable limits, the variation needs to be identified so the problem can be corrected.” It is now considered important to assess customers' perceptions and expectations concerning quality of service in different ways on a regular basis in order to improve service in all areas relevant to a company's business concerns.

Domazet et al. (2010) confirmed, “clients are increasingly focusing on strategic selection of providers of financial services.” For financial institutions to have a perfect service quality delivery, it must focus on developing customer satisfaction, and on augmenting the clients' perception of high service quality.

In order to continue to exist and compete effectively, financial institutions must be acquainted with the customer insights of the service quality, by that, the management will have the impetus to identify problem areas in their business practices, and be able to quickly solve them. It is therefore of the fundamental nature that companies should focus on winning service quality issues, in order to drive high levels of customer satisfaction, Ouyang (2010).

The stability of the financial system will endow to the basis of economic expansion, and can therefore succeed to its development. Quintyn (2007) acknowledged that “financial institutions play a key role in attaining and preserving a country's financial stability, generally accepted as an important public good.” Therefore, financial institutions should be more conscious and have to constantly develop and add new services in order to maintain and attract new customers.

Furthermore, Llewellyn (2006) stated that “a stable and efficient financial system has a potentially powerful influence on a country's economic development not the least because it may have an impact on the level of capital formation, efficiency in the allocation of capital between competing claims, and also the confidence that end-users (consumers) have in the integrity of the financial system.” Therefore, it is essential to recognize how the entire financial system in Kuwait functions, and how a problem in one area can have an effect on the stability of the financial system somewhere else.

The Ineffectiveness and Failure of Financial Service Providers in Kuwait

In the last few years, Kuwait's financial sector encountered many impacts. The failure of financial institutions activities is increasingly evident; it has spread beyond the heart of the country's economy; the latest financial crises caused many investment companies in Kuwait to default on their debts.

Domazet et al. (2010) elaborated that the “effectiveness and efficiency have become an indispensable criterion of market economy that caused organizations, especially in financial sector, to direct their marketing activities on developing relationships with their customers and on analyzing their needs and wants. To become successful in the dynamic financial services market, companies must deliver superior service to targeted customers, which are becoming more demanding over time.”

Emerging Markets Monitor (2010) announced in their report of Kuwait on 15 March that “the Investment Dar (TID), was the first GCC financial to default in the wake of the global recession, having announced its inability to repay a US\$100mn sukuk back in May 2009.”

Financial institutions in Kuwait have large debts with foreign creditors, and those creditors are unwilling to extend credit or restructure debt to defaulted companies. Abotalaf (2011) confirmed that “the global financial crisis caused many firms in Kuwait to default. Also, many companies in Kuwait had outstanding debt with banks and financial institutions in Europe.” And Dawber (2008) affirmed, “GIH, Kuwait's sixth biggest company, is the first borrower from the region to default on a debt facility provided by western banks.” Financial institutions in Kuwait now cannot have new financiers, and creditors out of Kuwait are reluctant to restructure debt to defaulted companies; they have rejected their requests for additional funding to pay their debts.

Furthermore, many investment companies did not publish their financial results after the crises; they are now threatened to be delisted from Kuwait Stock Exchange, in which the associated risk to investors has increased. Saleem (2012) affirmed that “most firms to be delisted are investment companies that have struggled to meet debt obligations since the global financial crisis and their shares have been suspended for failing to report earnings on time.” And Saleem (2012) also confirmed that “International Investment Group, which defaulted on a \$200 million Islamic bond in April 2010, is another ordered to delist.”

The ineffectiveness of any financial institution will result in destructive consequences for clients who rely on their services. Therefore, investors need to be guaranteed the sentiments of security that come from power and resources; because if people's money is at risk, then their security eventually is at risk. Ultimately, Kuwait needs to implement the necessary scheme in order to build a robust and resilient financial system.

Customers' satisfaction and low service quality standards in Kuwait's financial sector are undoubtedly evident. Investors' satisfaction with financial services is the principal determinant of the relationship with service providers; at the same time as, clients primarily want these services to be provided to them competently. Customers insist on flexible resolutions and changeable options associated to their investment options, and accordingly they want the offered services to be tailored in an efficient manner relative to their changing preferences.

The Need for Financial Regulation and Supervision in Kuwait

Nowadays investors are more conscious, they demand financial regulation, and this demand must be rational by providing complete information. Moreover, customers insist on assurance of transactions conducted within their service providers, which was based on previous bad experiences. Customers want to be prevented from risky actions by financial institutions, they need their activities to be monitored. Thus, to pursue a more sound, competitive, and efficient financial system, is to have a regulatory authority in Kuwait that enhances consumers' confidence.

In order to have prudent financial services, there is a need for regulation, which can be accomplished by making certain that the financial sector have an effective system that detects and reports suspicious financial transactions; because there is a need to re-establish the public's confidence in the financial sector. Lumpkin (2010) stated, "prudential regulation, thus, serves the dual objective of maintaining the integrity and stability of the financial system and protecting consumers of financial services."

The objective of financial stability is a general purpose of both regulation and supervision; in which regulation should have the intention of safeguarding a stable financial system, and at the same time securing investors assets, making Kuwait's financial institutions subject to prudential regulation and supervision. Beck (2006) stated that "stability is a prerequisite for financial development and a first building block for an effective financial system." Hence, identifying potential risks or vulnerabilities is vital, given that financial stability requires continues monitoring.

Furthermore, there are many frustrated investors in Kuwait's financial sector, there are many complaints expressing dissatisfaction with the existing structure of the market reliability. Business Monitor International (2011) asserted, "the troubled state of the financial services sector has also had a negative impact on Kuwait Stock Exchange."

Hence, the conduct of financial businesses in Kuwait requires regulation that is designed to create rules and guiding principles concerning appropriate practices in dealing with customers. Quintyn (2007) stated that "better regulatory governance principles lead to better supervisory practices which have a beneficial impact of financial sector soundness." Thus, clients that invest their money need to be indulgenced with fairness and honesty, in order to achieve higher level of satisfaction that have a tendency that encompasses greater value and closer investor's awareness.

To ensure a superior service quality delivery and investors' satisfaction, the regulatory authority in Kuwait should work with international regulatory and financial bodies to gain expertise that will offer overall protection to investors. Alexander et al. (2006) avowed, "without such international regulatory efforts, the failure of domestic regulators to require financial firms to properly price risk will provide fertile ground for the generation of more international financial crises."

For the ultimate customer satisfaction and a fruitful service delivery, there is an essential and critical need to create a regulatory authority whose principle is to guard customers from risky financial proposals. The latest financial damage accentuates the need to come across methods that need to make Kuwait's financial system more secured. The current economic system is not critically dependent on sound financial institutions. Crotty (2008) consented to this assertion that "financial institutions were increasingly successful in evading regulatory constraints, in large part because political commitment to a strong regulatory system had weakened over the decades."

It is therefore essential for Kuwait's financial sector to have a regulatory authority with the best assortment of rules, sanctions, compulsory disclosure requirements, the establishment of principles and guidance of orderly conduct financial transactions, and the monitoring of financial institutions activities.

The Essence of Transparency and Discipline

The financial system in Kuwait is fragmented, and it has lacked transparency and sufficient accountability, it had led investors to uncertainty, undermining their investments confidence. According to Abotalaf (2011) "transparency standards in Kuwait are weak in comparison to international standards." Hence, transparency is the necessary corollary to market discipline.

On March 27, 2012, the Central Bank of Kuwait board has ruled to remove the Chairman and Vice Chairman of "Noor Investment", and the Chairman of another investment company "Athman", and no longer consider them active members of the board of directors. The Bank has prevented them from future positions as board members, so as not to tamper with the interests of the company and its shareholders. The decision was based after the Central Bank has conducted routine inspection on these two companies, where it was founded many irregularities and violations of ethical business conducts, Argaam (2012).

The government cannot impose market discipline, but it can enhance its effectiveness by promoting transparency, it will lessen uncertainty and thereby promotes stability to the entire financial system. Therefore, financial institutions should be held for a greater standard of care to clients, which calls for them to identify sound and sufficient financial positions, and accordingly recommend them to their clients. Cho and Haiyan (2009) stated, "a consumer's evaluation of the service quality plays a key role in his/ her perceptual judgments and behavioral intentions involving a transaction, such as satisfaction and intention to come back."

However, not succeeding to present greater financial services may not be readily perceptible to customers. It is by all means that the assessment of processes of all financial products would have to be experimented prior to selling them to customers. Frei et al. (1997) stated, "an individual customer is herself an important input to the delivery of services."

Furthermore, clients' preferences of financial service providers are increasing, and they probably choose a provider that offers the best return on their investment. Today, there is a large range of financial products in Kuwait's financial sector, and therefore financial institutions are now endowed with a different array of information sources that give them the competitive advantage. Bresser-Pereira (2010) stated that "money depends essentially on confidence or trust. Trust is the cement of every society, but when confidence loses a standard or a foundation, it becomes fragile and ephemeral."

Nevertheless, new financial products and services are complex, and therefore should be dealt with prudence. Because in today's world of financial services extraordinary customer service is a rarity, Murtagh (2008) acknowledged, "long-term companies should invest in service and quality improvements that increase repeat business." Therefore, customers need to notice the differentiated services and products that appeal to their desire in order for them to have repeated services.

The Importance of Preserving Customers

Grewal et al. (2008) recognized that "customer satisfaction is a dynamic market asset, shaped over time by the actions of firms and customers in the marketplace." Therefore, customers' satisfaction is the principal for preservation, and thereby financial service providers should progress their products and services quality for a better delivery. Significantly, service providers must become skilled at the primary rule of customer satisfaction, because customer satisfaction is the input for success of any business, and today investors in the financial sector, becoming familiar with the experience they encounter with services delivery.

It is acknowledged that business augmentation and shareholder significance are set based on investments intended to attain and preserve clients. Therefore, for financial institutions and investment banks to be successful, they must have the tendency to maintain strong relations with their stakeholders. These businesses when they conserve the relationship, they will reinforce their competitive advantage, and thereby can maintain success in the financial industry. Thus, the quality of service is the basis for competition, and competition is the motivating factor that results in innovative technology and promotional ideas that benefit the consumer.

In order to retain customers, financial institutions should have excellent services that satisfy them, which can be generated by improving courtesy and timeliness. Frei, et al. (1997) realized that "the financial performance of a financial service institution is driven to a large extent by its ability to attract and retain customers." Essentially, customers need to be valued by the way service is provided to them, they need to be cared; they want their problems to be resolved quickly, and be provided with adequate information when requested.

Financial services amount to a large and increasing sector in Kuwait's economy, in which the value and success of the provided financial service are the backbone of a vigorous economic system since the last decade. Yet, the stream of financial services and products has been increasing swiftly among the materialization of innovative and developing institutions in Kuwait. This was sustained by the transformation of revolutionized financial instruments liberalization, with the support of prolong drives and rewards towards business growth.

Listening to clients needs and analyzing them will enable service providers to gain clients recognition. Therefore, financial institutions need to know that their workforce are the one who makes the business work; and accordingly they need to treat them well and endow them with the essential tools for efficient and utmost productivity. By that, the client's opinion of the service quality will certainly be associated with his level of reliance to the service provided, because higher levels of trust, eventually, will be related to higher levels of commitment to the relationship with the service provider.

Yet, experienced employees are essential to the client's satisfaction. Employees who meet clients' needs by being knowledgeable, cooperative, and reactive to clients' demands are major factors to expand and preserve the business. Therefore, progressing clients satisfaction is the primary motivation from employees, rather than increasing revenue or profits, because satisfaction leads towards high positive clients' response.

Furthermore, financial service people serving investors do not put all their efforts every time. Financial service providers in today's competitive environment cannot continue to exist without appealing on service; they should progress their awareness on high levels of service quality delivery. No matter how good the business products or services are, the level of client's satisfaction will be drastically diminished if the delivery of the service is poor.

However, for some investors, better right of entry to, and selection of financial products and guidance will indicate that they will gradually be competent, to recognize products and services that correspond to the best value for the money; this will also be relevant to their preference of service provider. Allen and Higgins discussed the pivotal factors that motivate research into quality of service: "Customers are growing more service-oriented in that they are demanding a much smoother and better experience from the companies they choose to do business with" (Allen and Higgins, 2006: 5).

Essentially, financial institutions depend on two major determinants for the accomplishment of triumphal financial services. They are clients' satisfaction, and the quality of products offered, in order to satisfy their clients' objectives.

Hence, building clients' relationship and sustaining the competitive advantages should be apparent, in order to recognize the main aspects of an excellent service quality. Ouyang (2010) substantiated, "service quality had a direct significant effect on "trust", moreover, service quality had an indirect significant effect on "customer loyalty" via "trust". This also confirmed that "service quality" played an important role in client-firm relationships." Accordingly, clients who differentiate service quality should be recognized, in which they can build greater relationships and have competitive advantages for the business.

Conclusion

Investor's satisfaction and protection depends on the distinction between expectation and experience. It is extremely vital to align clients' expectations and institutions principles in this regard, because businesses accomplishments typically depend on how effectively it meets its clients' needs, where retaining investors has its exigent circumstances.

Effectively, the survival of financial businesses today, depends on client's satisfaction as the ultimate goal, based on a number of studies in the financial industry that substantiates service quality, and it is the predecessor towards customer satisfaction. Because service quality expectation, is generally influenced by the character of the financial services provider, and the risks correlated with it.

Thus, to augment investor's satisfaction and protection, financial service providers in Kuwait should utterly evaluate and develop the approaches of prudent service delivery. As well, it is compulsory that financial institutions establish search measures for the significant quality magnitudes in the financial sector.

IN THE SHADOW OF OFFSHORING: AN EXPLORATORY STUDY OF THE EXPECTATIONS OF PROVIDERS

Almeida, Mariana¹; Meneses, Raquel²

Abstract

Offshoring strategies are an emerging trend in the context of global business. Although the literature on this subject is vast, very scarce research has been made to understand the providers' perspective of an offshoring relationship. The goal of our study is to fill this gap in the literature through an exploratory research based on grounded theory, enabling us to understand the expectations of providers when they started working with foreign firms and compare those expectations with their perceptions of reality. A purposive theoretical sampling technique was used to select 7 Portuguese offshoring providers, from different sectors, sizes and ages. Data collected was then coded and analysed using and three broad categories of expectations and perceptions of reality emerged: business-related, firm-related and client-related. Creation of business and acquisition of skills were the most referred categories, both as expectations and as perceptions of reality. However, several expectations don't match the providers' perceptions of reality, as well as some perceptions weren't part of the providers' initial expectations.

Keywords: Offshoring, Offshore Outsourcing, Providers, Expectations

Introduction

Multinational organizations are continuously transforming themselves into nimble, global competitors, through a process that is enabled by the practice of outsourcing and offshoring strategies (Couto et al., 2008).

Offshoring refers to the completion of business tasks, functions or processes outside the firm's home country, but it is no longer just a labour arbitrage strategy. For more and more companies, offshoring is turning into a means to gain access to qualified personnel and to increase organizational flexibility and competitiveness (Farrell et al., 2006; Lewin and Peeters, 2006; Lewin and Couto, 2007; Bunyaratavej et al., 2007; Manning et al. 2008; Couto et al. 2008; Lahiri and Kedia, 2011).

Despite the extant literature, to our best knowledge, the complex dynamics of this phenomenon is not well understood (Manning et al. 2008). Although providers play a crucial role determining the success of an offshoring partnership (Lahiri and Kedia, 2009; Lahiri et al., 2012), most of the published

research is focused on the clients' perspective and unnoticed the dimension of the providers (Mao et al., 2008; Lahiri and Kedia, 2009; Aundhe and Mathew, 2009; Lahiri et al., 2012).

Considering this gap in the literature, the goal of our research is to analyse the context of the Portuguese providers, which is particularly pertinent after the identification of the country as one of the eleven developed countries better prepared to receive globally sourced services in the IT sector¹. Particularly, we would like to analyse the expectations of these providers, when they engaged in offshoring activities.

Given the absence in the literature of formal theories addressing the particular case of the expectations of offshoring providers we propose an exploratory approach, based on Grounded Theory.

This paper is divided into five main sections. In Section 1 we introduce the research subject. In Section 2 we make a literature review on Offshoring: first by defining its key concepts (2.1), and then by analysing the main aspects framed in the literature (2.2). In Section 3 we present the methodological approach we propose to apply in our research; in Section 4 we describe our main findings; and in Section 5 we conclude.

Literature Review on Offshoring

Definition of key concepts

Globalization has been influencing the competitive behaviour of firms in their different aspects: supply chain, marketing, corporate strategy and organizational structure (Bunyatarajev et al., 2007). Particularly, the increasingly competitive global business environment led companies to focus on cost-cutting strategies, such as offshoring (Lewin and Peeters, 2006). However, nowadays reducing labour costs is no longer the single strategic driver behind offshoring implementations, and other factors like assessing pools of highly-skilled workforce, or increasing organizational flexibility are gaining importance (Farrell et al., 2006; Lewin and Peeters, 2006; Bunyaratavej et al., 2007; Lewin and Couto, 2007; Manning et al. 2008; Couto et al. 2008; Lahiri and Kedia, 2011).

Likewise, literature has revealed that companies are increasingly recurring to outsourced activities to create value and to fuel their accelerated innovation needs (Couto et al. 2008; Manning et al. 2011), and therefore outsourcing "has expanded rapidly in recent years, offering client firms the opportunity to select from a range of full-service and specialist providers for specific needs" (Manning et al., 2011, p. 382).

¹ Source: Gartner, Inc., Gartner's 30 Leading Locations for Offshore Services, 2012, Ian Marriot, January 16, 2012.

Thus, these two concepts, offshoring and outsourcing, are occasionally confused (Bunyatarajev et al., 2007; Manning et al. 2008). While offshoring denotes the performance of tasks and business functions across national borders (Manning et al., 2008); outsourcing consists on the delivery of products or services of the firm by a specialist third-party provider, within or outside of the firm's national border (Manning et al., 2008; Lahiri and Kedia, 2009).

In this work we propose to analyse providers whose foreign clients have outsourced their activities in Portugal. This means we will be dealing with the concept of offshore outsourcing, which according to Manning et al. (2011, pp. 382) "means that client companies choose to source functions and processes supporting domestic and global operations from outside their home countries, using third-party service providers".

Considering that the goal of our study is to gain further understanding of the offshoring phenomenon through assessing the expectations of the providers, the analysis of the concept of expectations is also of crucial importance.

The concept of expectations is greatly studied in the marketing literature about service quality, since service quality has been defined as the difference between the perceptions and the expectations of service level (Parasuraman et al., 1985; Parasuraman et al., 1988; Brown and Swartz, 1989; Carman, 1990; Teas, 1993; Parasuraman et al., 1994; Donthu and Yoo, 1998). Considering the gap in the offshoring literature with regards to the conceptualization of expectations, we analysed the service quality literature, aiming to find a definition of expectations to be used in the context of our study.

If we analyse the service quality conceptualization of expectations under the light of the thematic of our study, we reach our own definition of providers' expectations. Thus, providers' expectations may be defined as believes, predictions, desires or wants of providers, i.e., what they feel an offshore outsourcing relationship should offer them or what are the desired attributes of that relationship. These expectations function as standards or reference points against which performance is judged. Plus, providers may form their expectations either on the basis of their own past experience, or by observing or being informed about other provider's experience in offshoring.

The definition of these two key concepts, offshoring and expectations, play a very important role in the subsequent sections of our study. First, because we limit our concept of offshoring to offshore outsourcing, that is, to the performance of outsourced activities by a third-party supplier located outside the home country. Second, because from now on we bear in mind that the expectations of the providers are believes, desires and standards that emerge both from the provider experience and also from observation and exchange of experiences with other providers. We should take this into account in our following literature review.

Main aspects framed in the literature

This section continues our literature review, by analyzing the main aspects framed in the offshoring literature. Our goal is first to investigate the generic literature about offshoring, identifying the seminal aspects and the more recent trends; and then to give a special attention on the scarce literature focusing on the dimension of the providers.

Offshoring research has given place to extent literature (Lahiri and Kedia, 2009). Farrell et al. (2006) point out that this subject causes controversy among policy makers, business executives and thought leaders. Much has been said, for instance, about the past, the present and possible future of offshoring and the drivers behind its decisions (Lewin and Peeters, 2006). Lewin is also the lead principle investigator at Offshoring Research Network (ORN), an annual survey conducted since 2004, that collects firm-level data on the offshoring experiences of companies across industries, aiming to track: the drivers behind offshoring decisions, the impact on employment, the drivers behind location choices and the risks firms perceive before and during their engagement in offshoring activities (Lewin and Couto, 2007).

But the scope of literature is wide. Other questions, like the factors that contribute to the location choices (Bunyatarajev et al., 2007); the unbalanced dynamics for supply and demand for offshore service talent (Farrell et al., 2006); the use of offshoring to globally source Science and Engineering talent (Manning et al., 2008); the stability of offshoring relationships (Manning et al., 2011); or the impact of trust (Lee and Choi, 2011) and control (Mao et al., 2008) in offshore outsourcing relationships, have also been deeply analyzed. Although these studies have dealt with relevant aspects of offshoring, Manning et al. (2008) claim that the complex dynamics of this phenomenon is not well understood. A fact that stands out is that most of the published research has focused on the clients' perspective and unnoticed the dimension of the providers (Mao et al., 2008; Aundhe and Mathew, 2009; Lahiri and Kedia, 2009; Lahiri et al., 2012). Table 2, gives us an overview of the reviewed literature about offshoring.

From Table 1, we understand that the offshoring literature focusing on the providers is not only scarce, but it is also somehow disintegrated, making it difficult to find connections between researchers.

For instance, some authors (Lahiri and Kedia, 2011; Lee and Choi, 2011; Manning et al., 2011) chose to analyse both the dimensions of the client and the provider to understand the offshoring phenomenon. While Lahiri and Kedia (2011) developed a framework to explain the co-evolution of institutional and organizational factors in offshoring, Lee and Choi (2011) focused on the impact of trust in IT outsourcing relationships, and Manning et al. (2011) analysed the role of relation specificity and client control.

In the same vein, Mao et al. (2008) had already focused on the impact of trust and control in offshore outsourcing, but in this case the authors analysed only the vendor's perspective. Also, the remaining authors who focused only on the perspective of the providers, analysed unrelated subjects: while Lahiri and Kedia (2009) investigated the impact of resources and partnership quality on the provider's performance, Aundhe and Mathew (2009) shed light on the risks in offshore IT outsourcing, and Lahiri et al. (2012) assessed the impact of management capability on the performance of offshoring providers.

This disintegration and shortage of literature about offshoring focusing on the dimension of the providers increases the relevance of our study, and supports the conduction of an exploratory approach.

However, to refute this tendency in the literature, in 2008 the Offshoring Research Network launched a report based on a survey conducted in the previous year to offshoring service providers. It was "the first comprehensive examination of offshoring from the service provider perspective" (Couto et al. 2008).

Following the same line of thought, Lahiri and Kedia (2011) also suggest that more than simply analysing the drivers behind offshoring, it is of crucial importance to study the factors that are present both on the client and on the provider side, that together explain the decisions to engage and continue offshore outsourcing activities. Therefore they developed a framework based on the coevolution perspective aiming to explain how institutional and organizational factors coevolve and contribute to the engagement in offshore outsourcing (both for clients and providers).

Their position is that clients and providers are interdependent actors and their behaviour influences and is influenced by the interaction of environmental determinism resulting from institutional and organizational factors.

If we use these insights of Lahiri and Kedia (2011) to shed light on the focus of our study that is analyzing the perspective of the providers, we recognize that providers must continuously evaluate their client's environment to track changes, specific requirements and needs. This allows them to improve its own resources and capabilities and to take corrective actions, based on the feedback and on the knowledge transferred through client interactions, in the constant attempt to be the clients' dependable business partner.

Table 1: Overview of the empiric literature about offshoring.

Source: own elaboration

Nonetheless, in 2012, Lahiri et al. still argue that “very little attention, however, has been accorded to understand the context of offshore service providers” (Lahiri et al., 2012, pp. 1). In the same vein, we can argue that very little attention has been accorded to understand the context of offshore providers in general, which further enhances the relevance of our study.

To fill this gap in the literature, Lahiri and Kedia (2009) and later Lahiri et al. (2012), intended to broaden the understanding of offshoring, through analyzing the factors that allowed providers to better respond to their client’s needs.

It is their belief that offshore providers contribute to the value creation mechanism of their clients and that the success of offshoring relies on their performance. Particularly, they analyzed the effects of internal resources of the company, such as human capital, organizational capital and management capability, and its interaction with partnership quality (between client and provider) and measured their impact in the performance of the company (Lahiri and Kedia, 2009; Lahiri et al., 2012).

Thus, we may conclude that, first Lahiri and Kedia (2009), and then Lahiri et al. (2012), considered that it was important to fill the gap in the literature about the offshoring providers, through assessing the factors that affect the provider’s performance.

Previously, Mao et al. (2008) had already analyzed the impact of the vendors’ trust in their client and the client’s control over the vendor affecting the vendor’s performance, in a study conducted with Chinese outsourcers working for clients in Japan. They claim that the interactions between clients and providers are of crucial importance to determine the success of an offshore outsourcing relationship. Likewise, we can argue that the expectations of the providers may impact their performance.

Mao et al. (2008) researched the practices and behaviours that influenced a vendor’s perception of trust and identified a number of trust building mechanisms: information sharing, communication quality and inter-firm adaptation. They argue that the client’s willingness to be open in sharing domain and process information (information sharing); the importance the client’s personnel attach to the communication with the vendor (communication quality); and the efforts of the client in adapting to the vendor’s constraints (inter-firm adaptation) influence the vendor’s perception of the relationship and have a positive impact on the vendor’s trust in the client.

The findings of Mao et al. (2008), about the impact of trust and control on the performance of the suppliers, make us believe that to fully understand the complexity of the offshoring phenomenon, multiple dimensions should be looked at, which enhances the relevance of studying the expectations of providers and the role they play.

Another of these dimensions framed in the offshore outsourcing literature is the risk involved in offshoring partnerships. Given our focus on the providers, the work of Aundhe and Mathew (2009) about the risks in offshore IT outsourcing on a provider perspective is particularly relevant.

Aundhe and Mathew (2009) believe that “outsourcing partnerships carry risks as evidenced by reported failures of such engagements” (p. 419). These risks are mostly caused by the assumptions (or expectations) taken into account in the definition of outsourcing contracts, that carry a limited understanding about the future. Therefore, the success of offshoring engagements will depend on the understanding of the risks involved in the partnership and on the strategies to attenuate those risks.

To prove this belief, Aundhe and Mathew (2009) collected data from five Indian providers, which allowed them to identify three categories of risk faced by the offshore service providers: project specific, relationship specific and macroeconomic risks.

Aundhe and Mathew (2009) argue that it is important to understand the categories and contents of risk involved in offshoring, because only through that comprehension it is possible to draw the above mentioned risk mitigation strategies, with significant managerial implications. We may argue that the importance of studying the expectations of providers in offshoring is based on the same belief.

Research Method

To the best of our knowledge, not only has very few attention been drawn to understanding the provider’s perspective in offshoring, but also their expectations when engaging this type of partnerships haven’t been analysed at all. For this reason, we conducted an exploratory approach based on Grounded Theory (GT), which is “used to generate theory where little is already known or to provide a fresh slant on existing knowledge” (Goulding, 1998, p. 51).

A purposive sampling technique was applied to select the firms to be approached and finally seven were interviewed. This selection aimed to include companies from different sectors, from different sizes and from different ages. One of the interviewed firms had already ceased its activity. Two of the interviewed firms were also producing for their own brands, while the others devoted all their production to outsourcing clients. Since our goal was to study the Portuguese providers, we restricted our analysis to companies totally owned by Portuguese capital, who had been providing offshore outsourcing activities for foreign clients for at least 3 years, which was the period used by Aundhe and Mathew (2009).

Data was collected via unstructured interviews to the managers of each firm. However, a protocol was employed to ensure the same themes were covered on each interview. The aim was to assess what were their previous expectations and their perceptions of the current reality of their firms. After seven interviews, theoretical saturation was reached: no new or relevant categories of data emerged

from the final interview. For triangulation purposes additional information was collected via alternative sources, such as news in the press. The characteristics of the firms are presented in Table 2.

	<i>Sector</i>	<i>Year of Establishment</i>	<i>No. of workers</i>
<i>Alpha</i>	<i>Plastic Injection</i>	1993	60
<i>Beta</i>	<i>Textile</i>	1972	250
<i>Gamma</i>	<i>Footwear</i>	1947	108
<i>Delta</i>	<i>Pharmaceutical</i>	2001	180
<i>Epsilon</i>	<i>Textile</i>	1997 (<i>ceased activity</i>)	30
<i>Zeta</i>	<i>Textile</i>	1984	490
<i>Eta</i>	<i>Health & Beauty car and packaging</i>	1965	3680*

Table 2. Firms' characteristics
*887 in Portugal + 2793 worldwide

Our analysis procedure consisted on the content analysis of the transcription of each interview, using QSR NVivo9 software. Initially, data was classified into nodes, corresponding to categories of expectations and perceptions of reality. The categories resulting from this initial coding were then grouped into broader categories: business-related, firm-related and client-related.

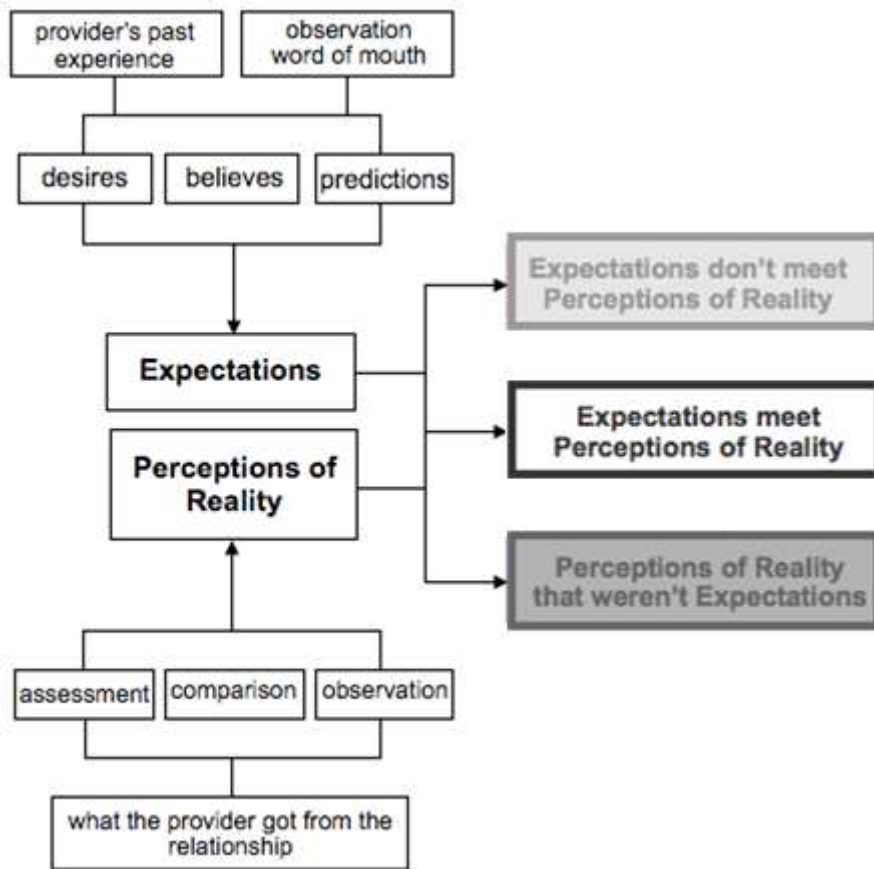

Figure 1. Framework for comparison between expectations and perceptions of reality

Following these coding, we then compared the expectations and perceptions of reality of each category, to assess which ones matched or not, but also to identify the perceptions of reality that the providers didn't have as initial expectations. Figure 1 represents the framework used for this comparison. This framework was then applied to the three categories of expectations and perceptions of reality.

Research Findings

The major expectation revealed by the firms we interviewed was to create business. This was what they most expected when starting an offshoring relationship with a new client. Figure 2 shows comparison framework applied to the business-related categories.

Figure 2.

Comparison between business-related expectations and perceptions of reality

Other significant nodes emerging as business-related expectations are the exposure to additional opportunities, the performance of additional tasks and to have long lasting relationships. These expectations, along with getting certain types of orders, are the ones that meet the perceptions of reality.

Although the expectations to avoid difficulties in the market and to dilute the production throughout the year don't meet the perceptions of reality, these nodes have only few references. We stress the fact that only one firm identified the insurance of the continuity of the company and the payment of expenses as expectations for new offshoring relationships. This was firm Epsilon that eventually ceased activity, and these expectations didn't meet any perception of reality.

The creation of business is also the more relevant perception of reality from all three categories. Besides, firms reveal that the offshoring relationships have allowed them to have important business, to complete their production capacity, to increase their margin, to ensure stock flow and to outsource their production to other suppliers. These were aspects that they didn't initially expect.

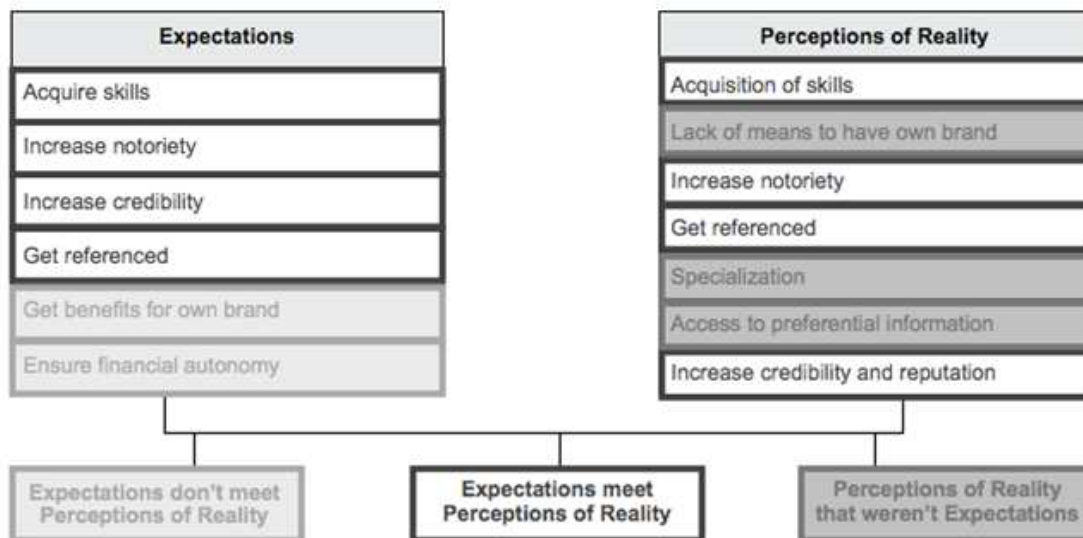

Figure 3. Comparison between firm-related expectations and perceptions of reality

On the firm-related level (Figure 3), the acquisition of skills was the expectation and perception that was referred the most. Firms revealed the belief that they would become a more capable company if they worked as offshore outsourcing providers and, looking back, this is something they perceive as having achieved. This expectation, along with the notoriety and credibility increase, and the reference to other clients, are the ones that meet the perceptions of reality.

While the insurance of financial autonomy was an expectation that wasn't mentioned as a perception of reality, the hope for benefits for own brand, mentioned by the two firms that had own brands, might be indirectly represented in the perceptions of acquisition of skills, increased notoriety and credibility, get references and access to preferential information, that may benefit an own brand, although this wasn't directly mentioned as a perception of reality.

Plus, although a few firms revealed lack of means to have a brand, only firm Epsilon mentioned an increase in its degree of specialization.

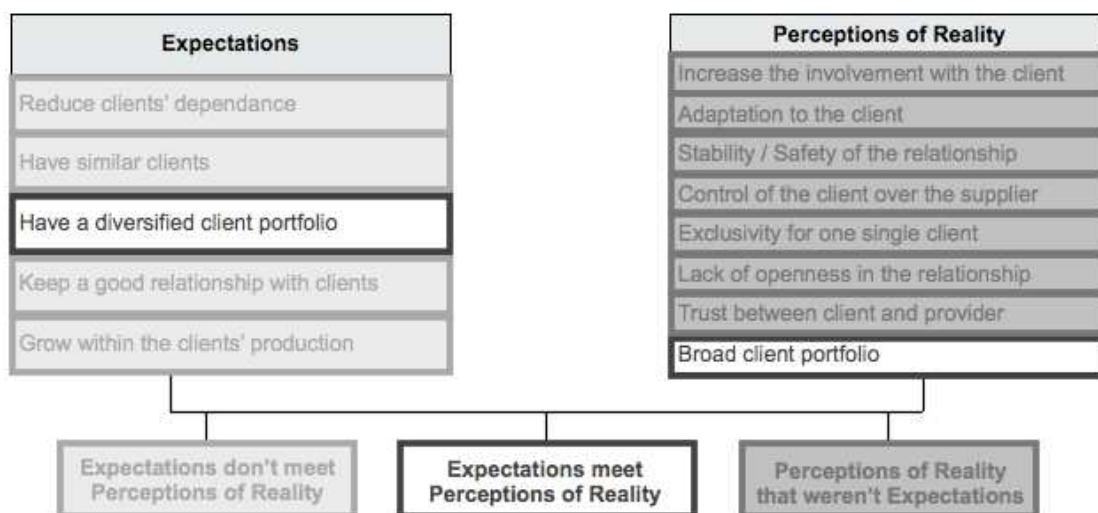

Figure 4. Comparison between client-related expectations and perceptions of reality

The client-related (Figure 4) category is the one where there is less matching between expectations and perceptions of reality, only one category matches: having a diversified client portfolio.

Still, we believe that although the expectations of reducing clients' dependence, having similar clients, keeping a good relationship with clients and growing within the clients' production don't show up as perceptions of reality, this doesn't mean they didn't happen at all, but only that providers don't perceive them, or didn't mention them.

However, several perceptions of reality that weren't initial expectations emerge; most mentioned being the increased involvement with the client. Besides, some of the other perceptions that appear may be considered divergent: adaptation to the client, stability/safety of the relationship, control of the client over the supplier, exclusivity for one single client, lack of openness in the relationship and trust

between client and provider. This may happen because of the different typology of clients each case had.

Conclusions and Implications

The goal of our research was to fill that gap in the literature regarding the impacts of offshoring in a provider-perspective. Specifically, we would like to assess the case of Portuguese providers, following Lahiri et al. (2012) suggestion of future research, in the form of a qualitative study.

Given the absence of formal theories in the literature regarding this subject, we carried out an exploratory approach on the expectations of providers and compared them with their perceptions of reality, aiming to extend the literature about this matter. We identified three broad categories of expectations and perceptions of reality: business-related, firm-related and client-related.

Our study revealed that both on the business-related and firm-related categories, there isn't a major gap between expectations and perceptions of reality, with a considerable number of matching categories. From these, we highlight the creation of business and the acquisition of new skills, as the more significant categories emerging in the data.

On the other hand, on the client-related categories, there is one single match, in an inexpressive category: diversified client portfolio. By contrast, the more significant category of expectations for providers starting new offshoring relationships was to reduce their dependence to their current clients. However, interviewees revealed an increased involvement with their clients as their main perception of reality in client-related category.

The implications of these findings are wide: offshoring providers may be a source of competitiveness for one economy, since they are bringing business and promoting the acquisition of skills in the country and so, Governments may want to stimulate this business model.

However, it would be interesting if further studies could research the reason why some expectations don't meet reality: are there gaps of communications between clients and providers? Or is it a matter of perception and management of expectations? We believe a clear empirical investigation of these aspects would give us an even broader understanding of the offshoring phenomenon in the provider-perspective.

TIME VALUE MANAGEMENT IN THE ITALIAN HEALTH SYSTEM: PROBLEM ANALYSIS AND ECONOMIC BUSINESS PROSPECTS

Amatucci, Fabio Michele¹; Esposito, Paolo²

¹ Associate Professor of Business Administration – University of Sannio amatucci@unisannio.it

² PhD, Adjunct Professor of Business Administration - University of Sannio - pesposito@unisannio.it and Department of Economic, Legal and Social System Analysis (SEGIS) University of Sannio – Benevento (BN) - Italy

Abstract

In the last decades, at the center of the debate and the political and institutional framework of the European Union and our country, there are the growth trends of late payments by the Public Administration in respect of companies which supply goods and services, even more accentuated in the health sector. The payments are delayed, partly as a consequence of a pathological financial dysfunctionality of management of the system for the protection of the health of regional health deficits (Amatucci, Borgonovi, Lecci, 2007; Ricci, 2010; Cuccurullo, Lega, Longo, Ferrè, 2010) and of a structural imbalance in public sanitary spending generally (Meneguzzo, Fiorani, 2008; Marsilio Mele 2010), partly the result of bad practices or practices now dominant bad and blurry, of professional and organizational shortcomings, of weaknesses in the governance of certain regions (especially southern ones); of uncertainties in the legal traffic produced by a frantic regulatory isomorphism by the legislator at the central level and asynchronous managerial paradoxes locally. The establishment of the so-called financial outlook (Giannessi, 1982), also produces more damage in terms of a blurry and distorted reading of reality and of the decisions to be implemented, overestimating the financial performance and neglecting economic ones (Poddighe, Madonna, 2006). The paper aims to highlight - in a context of predictive changes of economic and financial equilibria (Gertstenberg, 1928), resulting from lack of financial resources and of optimal choices for their allocation - the logic and tools of local governance and of interinstitutional relationships with the market of local suppliers throughout the time of payment such as strategic levers of market distortion in favor of certain business entities and / or groups, organizations, parties, clans, patronage for the promotion, protection and preservation of the interests at stake and of electoral support by public decision makers.

Keywords: time value management, financial crisis, public health

A first stretch of the conceptualization. Theoretical outlines, dynamics, evolutionary trajectories of the search path.

In the last decades, at the center of the debate and the political and institutional framework of the European Union and our country, there are the growth trends of late payments by the Public

Administration in respect of companies which supply goods and services, even more accentuated in the health sector.

The payments are delayed, partly as a consequence of a pathological financial dysfunctionality of management of the system for the protection of the health of regional health deficits (Amatucci, Borgonovi, Lecci, 2007; Ricci, 2010; Cuccurullo, Lega, Longo, Ferrè, 2010) and of a structural imbalance in public sanitary spending generally (Meneguzzo, Fiorani, 2008; Marsilio Mele 2010), partly the result of bad practices or practices now dominant bad and blurry, of professional and organizational shortcomings, of weaknesses in the governance of certain regions (especially southern ones); of uncertainties in the legal traffic produced by a frantic regulatory isomorphism by the legislator at the central level and asynchronous managerial paradoxes locally.

The establishment of the so-called financial outlook (Giannessi, 1982), also produces more damage in terms of a blurry and distorted reading of reality and of the decisions to be implemented, overestimating the financial performance and neglecting economic ones (Poddighe, Madonna, 2006).

The paper aims to highlight - in a context of *predictive changes* of economic and financial equilibria (Gertstenberg, 1928), resulting from lack of financial resources and of optimal choices for their allocation - the logic and tools of local governance and of interinstitutional relationships with the market of local suppliers throughout the time of payment such as strategic levers of market distortion in favor of certain business entities and / or groups, organizations, parties, clans, patronage for the promotion, protection and preservation of the interests at stake and of electoral support by public decision makers.

The first part of the research, the first two paragraphs, in the first place wants to offer a conceptual frame work on *causae causarum* of "late payments" of the National Health System, through an 'analysis of the economic business literature and of public management, useful for the second part where will be discussed a *discrepancy* analysis between norms and behavior detected, with particular reference to the forthcoming federal structure and the existing disparities in terms of time for payment of services and medical supplies to private companies operating in the sector of the NHS (Court of Auditors, 2010), in the different regions surveyed. DiS.p.A.rities which emerge from the Italian regions with delays in payments more than double those of other countries in conflict with the EU willing and full risk of default and *loss given default* for the companies involved (Zanda, 2007)

The second part of the work (paragraphs 3, 4 and 5), will be dedicated to the presentation of preliminary results of an empirical survey trying to assess the main determinants of regional sub-regional and interterritorial differences of time of payment of supplies of goods and services rendered by the local health authorities to the health sector companies, through a comparative analysis of the

regional DSO (Days Sales Outstanding) of the last twenty years until May 2011, which allows a taxonomic representation of the conditions examined.

This part of the work still in evolution has been developed by analyzing the generic and specific determinants of delays in time of payment by the Campania Region and needs further investigation.

In the following analysis of the research that will involve all the regions covered by the Repayment Plan of health deficits, the detection of emerging practices will aim to investigate in detail each of the regional cases of the selected sample, to provide a clue even partial, about the critical determinants of the time delays of payment and of the effects of strategic choices of the various *economic actors* involved in national and regional level (Ricci, 2010).

The methodological approach adopted for the research is theoretical/deductive through the systematization of the theories, empirical tests will be conducted on the evolution of the models adopted by Local Health Authorities, on the coping of the "management of the time delays of payment", to define new possible paradigms and perspectives (Ricci, 2010).

The European and national regulatory framework about timing of payments of the national government body

The Directive of 16 2011/7/UE 02 2011 strengthens the protection of companies against late payment in commercial transactions. Among the positive developments (OECD, 2011) we point out the duty of the public administrations within the EU to provide for payments to businesses within a maximum standard of 60 days. The directive must be transposed by Member States by 16 March 2013 and will replace the EU Directive 2000/35/EC.

European legislation

Directive 2000/35/EC, implemented in Italy by Legislative Decree 231/2002, applies to commercial transactions between companies or between companies and public administrations. For commercial transaction means the supply of goods or the provision of a service against payment of a price.

Directive 2000/35/EC does not provide harmonized or peremptory terms of payment within the EU. However, within the EU has introduced the right of creditors to increased interest in the event of late payment, without the need for a reminder.

If the date or period for payment is not fixed by contract, such interest accrues after 30 days from the date of (Article 3, paragraph 1):

- receipt of the invoice or equivalent request for payment

- receipt of goods or provision of services if the invoice or request for payment are ahead of delivery of goods or of the provision of services or the date of receipt of such documents is not certain
- acceptance or verification of conformity of goods or services provided by law or by contract, if the debtor receives the invoice prior to the date of such acceptance or verification of compliance.

The parties may agree contractually longer payment periods.

The rate of arrears paid by the debtor are equal to the rate applied by the European Central Bank to its most recent main refinancing operations, the first working day of the reference period, plus at least 7 percentage points (Article 3, paragraph of Article. d). Although the possibility for Member States to set a higher rate, Italy has transposed into its legislation the rate of arrears (periodically published in the Official Gazette by ministerial decree), except for the payment of perishable food products whose interest on arrears shall be increased by nine percentage points and is mandatory (Article 4 of Legislative Decree no. 231/2002). The Directive aims to improve the current framework 2011/7/UE principally for the benefit of SMEs, less equipped to cope with delays in payment of their customers, especially in periods of recession (World Bank, 2011). The new Directive provides for a separate discipline:

- for payments in commercial transactions between companies
- for those between public administrations and enterprises.

In commercial transactions between companies, the new directive reproduces the provisions of Directive 2000/35/EC without providing for a payment term harmonized within EU. The new directive states that it is desirable that the terms of payment agreed upon by contract between the companies generally do not exceed 60 days and that any agreed longer terms are seriously unfair to the creditor pursuant to art. 7 of the new Directive ("Recital" 13).

In transactions between businesses and public administrations are expected to hand a real European harmonization of payment terms and the introduction of a binding maximum period of 60 calendar days for contracts with public administrations of Member States (Article 4 , paragraph 6), after which interest shall accrue to firms. In the absence of a contractual provision, the term of payment is instead of 30 days (Article 4, paragraph 3).

Companies remain free to determine the extent of the contractual interest on arrears in their commercial transactions. Any contractual terms or practices that would exclude the application are invalid, however, as grossly unfair to the creditor (Article 7, paragraph 2). In addition, they may be declared grossly unfair (and therefore invalid) the terms or practices that differ from the legal rates of

interest on arrears for late payment without an objective reason in favor of the debtor (Article 7, paragraph 1, lett. C).

The late payment in commercial transactions between companies and public administrations will qualify without a reminder, a legal interest on arrears corresponding to the rate applied by the European Central Bank to its most recent main refinancing operations, the first working day of reference period, plus at least 8 percentage points (Article 2, paragraph 6). This, provided that the creditor company is to have fulfilled the contract and the payment delay is attributable to the debtor Public Administration (Art. 4, paragraph 1).

Compared to the Directive 2000/35/EC, the creditor firm is entitled, in addition to interest of late payment, even to pay the costs of recovery within a minimum lump sum of 40 euros, except for reimbursement of the cost of activities entrusted to lawyers or debt collection company. We assume grossly unfair contractual practices or agreements that exclude the compensation for such costs (Article 7, paragraph 3).

Member States and the European Commission will ensure appropriate publication of data on applicable legal rates of interest on arrears. Member States should encourage a culture of prompt payment, including the publication of lists of good paying ("Whereas" No 30). In addition, as previously mentioned, the new directive strengthens both in court and in administrative offices, including by means of associations of undertakings (Article 7, paragraph 5), the creditor protection against unfair terms or unfair (Article . 7 and "whereas" paragraphs. 28-29) practices designed to extend the payment period and to exclude or limit the interest for late payment or compensation for recovery costs of credit.

Like the previous, the new directive states that the EU creditors may enforce the retention of title clause in the contract they agreed upon before the delivery of goods unless the same is valid under the national provisions of applicable law according to the private international laws (Article 9).

Moreover, in addition to the Community instruments for the protection of the recovery of credit (in particular EC Regulation No 1896/2006 on the European order for payment), each Member State must ensure an accelerated national procedure that allows the creditor to obtain an Enforcement normally within 90 days of submission of claim or demand, if not disputed the claim or procedural aspects (Article 10).

In Italy, the creditor can already obtain from the judge, within 30 days of the filing of the appeal, an injunction for the amounts specified therein (if available and supported by written test). In general, the injunction is enforced 40 days elapsed from the notification that the debtor has not opposed. The Italian procedure should therefore already complies with the requirements at Community level by the new directive.

The management of "financial unsustainability" and the planning of equalization policies.

The purpose of this research is precisely to investigate in detail some regional cases, to describe in details health public organizations in the eight regions covered by Regional Repayment Plans and make a contribution, albeit partial, to the study of the determinants of the relationship between time of payment delays and the same deficits that contribute in feeding a vicious circle of financial asphyxia able to generate insolvency conditions and *decoction of domino effect*.

The invoices are paid after many months. The record belongs to Calabria with 912 days of average in delays.

Figure 1: Debts of Regions for medical supplies - Assobiomedica, 2011

Companies that provide electrical-medical devices to hospitals and local health authorities record strong delays in payment. In particular, the higher levels of delays belongs to Calabria with 912 days of average delays, with 765 followed by Campania and Lazio with 403 days.

The claims of the companies amounted to 5 billion and 350 million euros. Small and medium-sized enterprises are forced to avoid bankruptcy to require discounts bills to the bank choosing so to cash quickly, despite the renunciation to the collection in less than 3 percent of their loans.

The dynamics on the delays in payment, however, appear to be atypical in the same region. In Emilia, for example, as Reggio Emilia maintains almost virtuous trend, in Modena the situation worsens.

The findings of Farmindustria, however, at the end of December 2010 show an overdraft of around 4 billion with an average of 224 days late (+11% over December 2009), but with peaks of 607 in Molise and 604 in Calabria. The regions that increase the time of payment worth 75% of the public market of the pharmaceutical industry. And still on the slope of the drugs, then, there have been delays in the payment of private pharmacies. The overdraft in March 2011 is 1.33 billion, which focuses on all five regions as shown by the next box.

A "overview" of the findings of the decision-making and strategic determinants of the speed of payment

The delayed payments are partly a consequence of the structural imbalance of Italian public accounts, that is of the enormous debt accumulated in past decades.

For another part they can be attributed, as appropriate, to inefficiencies, procedural *bad practices*, organizational shortcomings of many health care companies, as well as to weaknesses in the governance of certain regions. Certain regions and health care companies still glimpse the delayed payment of its suppliers a convenient way to finance themselves at costs systematically downloaded on suppliers, thanks to the fact that they can count:

- On the one hand, on interventions of extrema *ratio* which the rules *ad entem* of some time ago, and especially on the most recent block of foreclosures;

- The long time of civil justice that characterize our country (410 to 460 days for an injunction to become immediately enforceable; Istat, 2006, 2010).

In this way we got to the point that the total debt of the public health system now amounts to over 40 billion euros (about 60% of the total debt of the PA, estimated at 70 billion euros); of this debt, at

least 5 billion is to suppliers of diagnostic and biomedical technologies. And these firms are among the suppliers of goods and services, those who suffer more from delayed payments of late payment of health facilities, having in the health care system their principal if not the only target market.

From the tables analyzed in the previous paragraph, it appears that the "debt management" means management of delays in time paying of suppliers, which in some cases reach very high values. It 'was then carried out a' survey of average time of payment.

In particular, an indicator was analyzed, consisting of the average time of collection (DSO - Days of Sales Outstanding), which represents the more sensitive measure of the effectiveness in debt recovery, since it expresses the actual deferral granted to customers.

This indicator is usually calculated as the ratio of total loans to a certain date and the turnover achieved in the twelve previous months:

$$D. S. O. = (Loans/turnover) \times 365$$

The D.S.O. measures, in essence, the average time it takes to repay the company of its exposure to commercial loans, ie how many days on average elapse between the date of the invoice charge to the customer and the date of discharge due to collection (how many days, the turnover of the company becomes flush). This measurement is performed on the total commercial loans of the company, or on significant sub-aggregates, but do not make much sense to apply the system to measure the performance of individual customers.

This methodology is the subject of strong concern in economic business literature (Gazzaniga, 1998); (Coronella, 2003); (Poddighe, 2001); (Poddighe, Madonna, 2006); (Amatucci, Borgonovi, Lecci, 2007).

The DSO can be applied in a simplified analysis, if the object is a company with known data only from the budget and therefore the values of sales and loans, with no information on the dynamics of turnover.

Analysis of the Sector Study

The analysis of time to pay suppliers was carried out with specific focus on the supply of medical devices, favored by the strong focus on the reconstruction of data provided by the Center for Studies in Assobiomedica through a series on the average time of payment of the last twenty years (source used even by the Judiciary accounting). Reconstruction useful for the analysis of the research topic, considering also the absence of a public database on time delays in payment by the PA.

The analysis focused in a first step is an overview of the average time of payment in the eight regions covered by the Health Plans to reduce the deficit.

Figure 2: Regions with repayment plans

First, you should look at the national and regional level in the last decade, from 1991 until 2011 (the updating data refers to June 2011) of the eight regions that are subject to Ministerial monitoring for compliance with the regional repayment health plans of Health Deficits.

In the Piedmont Region, there is a reduction in the time of payment after 2007, however it is not less than 228 days.

Figure 3: DSO - Piedmont Region

The average time vendor payments increased by 100% in the Lazio region, despite the significant

decrease from peak recorded in 2000 and 2007.

Figure 4: DSO - Lazio Region

In Campania the situation is serious: here "times" are double compared to EU countries in default (like Greece); the highest point of the delays, amounting to 755 days (more than two years), was recorded just during the commissioner in October 2010. Note, however, the reduction from 859 days of 2007.

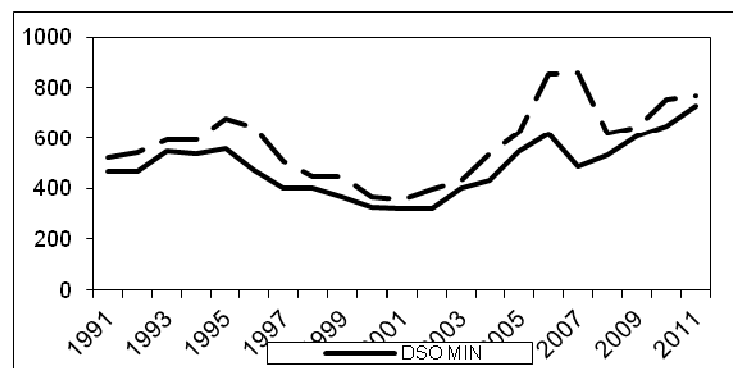

Figure 5: DSO - Campania Region

Even worse than the situation in Campania is the case of the regional Health Organisation in Calabria with "931 days" of late (almost three years) just recorded in June 2011, also in violation of the "incipit" set by the repayment plans established for the various regional deficit

Figure 6: DSO - Calabria Region

Although time delays in payment are serious in the Sicilian Regional Health Organisation, they have almost halved compared to the nearly 500 days of the mid-90s.

Figure 7: DSO - Sicily Region

In Molise region suppliers of NHS local businesses times of waiting are more than two years , equal to 830 days of delays, despite the reduction compared to the 920 days of time in 2008.

Figure 8: DSO - Molise Region

Are largely "outside" the EU legal regulations of 30 days in respect of payments to local suppliers, the Local Health in Puglia region with their 300 days of delay; however, they have almost halved the delay of the early 90s.

Figure 9: DSO - Puglia Region

Among the Regional Governments, subject to monitoring by the Repayment Plans of Regional Healthcare Deficits, the days of delay time for payment of Health Organisation in Abruzzo Region, appear to be just over six months, drastically reduced compared to the 590 days in 2005.

Figure 10: DSO - Abruzzo Region

Conclusions

From the examination of the facts of the case of Campania, emerge "not yet conclusive observations" on the determinants of a dramatic situation with regard to "time delays of payment" that the southern regions such as Campania, have almost twice as high as the EU countries in default such as Greece (Calabria, Campania, Molise).

These delays are in complete violation of the European "incipit" and constraints of containment of public spending set by the Regional Plans Repayment to Regional health deficits, through the activity of the strong and consistent ministerial monitoring.

The analysis of the sector study conducted shows that late payments are in part a consequence of a *pathological financial dysfunction* of managing the system to protect the health of regional health deficits (Amatucci, Borgonovi, Lecci, 2007) and of a structural imbalance of public health spending in general (Meneguzzo, 2008), partly the result of *bad practices or practices now dominant bad and blurry*, of professional and organizational deficiencies (Amatucci, Borgonovi, Lecci, 2007), of weaknesses in the governance of certain regions (especially southern) ; of uncertainties in the legal traffic produced by a frantic regulatory isomorphism by the legislature at the central level and managerial asynchronous paradoxes locally.

The establishment of the so-called *financial outlook* (Giannessi, 1982, p. 16)., However, produces more damage in terms of focus and distorted reading of reality and the decisions to be implemented, overestimating the financial performance and neglecting economic ones (Poddighe, Madonna , 2006).

With the introduction of D. Of Decree 23 June 2011 No. 118 and the "incipit" willing to Title II, a solution to the stages of business decoction from time delayed payment by the government body of the NHS, could be the *clearing house* activities - State \ Regions of compensation claims from suppliers of the NHS and local tax liabilities accrued over the years and enrolled in part, subject to the tax claim by the various local collection agents.

This situation reveals the conditions created by financial asphyxiation generated by the vicious circle of bad "debt management", whose structural and pathologists robust delays in payment, are only the tip of the iceberg and how a "defective" financial self-supply system at the central level and injuries by domino effect, falling in particular:

- a) on industries that do not qualify for deferred taxation and VAT until the suspension of payments;
- b) on the employees which are not subject to contribution and social security payments every 30 days;
- c) on State that is the subject that actually keeps track of the major delays in the average payment by the companies (ordinary taxation - sales and advances) or even the absolute insolvency;

Self-supply does not find, today, in the progressive deferred tax (VAT suspension, for example) or evasive activity of the companies involved directly and / or indirectly from delays, its ability to meet the financial sustainability of the government system of health protection.

Analysis of the mechanisms for determining the balances of public finance at the regional level (internal Stability Pact) shows the exclusion from the calculation of health spending. Hence, two new Research Questions:

RQ1: How does the *temporal asynchronous paradox* take place between Internal Stability Pact and the Stability Pact for the determination of public finance balances considering the exclusion of the share of health care?

RQ2: How is it that despite the health expenditure is not subject to the "rules" and "management and accounting trick '(move out of the financial output of the cash in subsequent years) of the Internal Stability Pact, in Regions such as Campania times payment of local NHS providers reach close to three years time (in spite of 60 days in regions such as Trentino, Valle D'Aosta or 100 days for Lombardia?)

These research questions, will help us in the following research to focus on different determinants of the time delays of payment such as:

a) criteria for determining the National Health Fund to be distributed to different regions in a new federal framework (choice of economic entities);

b) analysis of the temporal determinants of delays in the transfer of resources derived from the State to finance the Regions (choices of the Economic Entity and institutional relationships between various economic entities ideologically "assonant" or "dissonant");

The determinants on the delays in the average time of payment should be also identified in the inability of the few financial resources resulting from a regional division of the Regional Health Fund or too less compared to a gigantic historical expenditure consolidated in the last twenty years.

In this analysis, it is not possible to offer some concluding remarks. The perimetral area of the research to patrol will be characterized by the development of such distortionary dynamic in a new federal framework (*pay or perish*) with a country at different speeds (or countries) and a multifaceted differentiation in the protection of the rights to health and protection competitiveness and to competition in favor of the market and of the State.

Abstract

The authors investigate the role of corporate associations, Corporate Ability (CA) and Corporate Social Responsibility (CSR), after a crisis situation in the hotel industry. The findings of an experimental study indicate that hotels characterized by CA will have higher visiting intentions, lower negative and higher positive word-of mouth after a crisis situation than hotels described as protagonists in CSR initiatives. On the other hand, socially responsible hotels will enjoy higher sympathy than hotels characterized by CA. The study has important strategic implications for hotel's corporate branding since it sets the priority to CA corporate associations, not only in routine and everyday situations but also crisis situations.

Keywords: Crisis, Corporate Associations, Hotels

Introduction

Imagine that you are reading a newspaper article under one of the following headlines: Customers of well-known hotel complain about food poisoning; Child drowns in hotel swimming pool; Customers hospitalized with serious injuries after hotel fire; Two customers die after fatal hotel gas leak. All the above mentioned headlines can illustrate real tragic events able not only to break the everyday routine operation of a hotel, but also to pose a threat to customers' life and health and finally ruin the customer's holidays. In other words, all the aforementioned events are crises and it is a matter of time for an organization to face one (Kash and Darling, 1998).

When it comes to the tourism industry, it is widely argued that all parts of the tourism system are very vulnerable to crises such as economic downturns, natural disasters, epidemic disease, and international conflicts (Somnez at al. 1999). Especially, in the hotel sector the inevitability of more or less severe crisis situations is reinforced by the fact that service sectors are considered to be more crisis-prone than the sectors dealing with the tangible goods (Martin, 2005). Despite the importance of

this topic, our understanding of how consumers react after hotel crises is limited. Therefore, the aim of this paper is to attempt to fill this gap in empirical research relating to consumer reactions after crises in the hotel industry by exploring the impact of corporate associations on various important variables, such as consumer emotions, brand evaluation, visiting intentions and negative and positive word-of-mouth (WOM).

Conceptual Background

Crisis is defined by Fearn-Banks (2007, 8) as a “major occurrence with a potentially negative outcome affecting an organization, company, industry, as well as its publics, products, services, or good name”. There are many factors that influence consumer reactions after a crisis but the most explored and one of the most influential is the public’s perception of the company. It has been found that corporate reputation (Coombs and Holladay, 2006) and CSR (Klein & Dawar, 2004) can affect consumers’ reactions positively. Likewise, in the context of tourism and hotel sector researchers have emphasized the positive role of hotel reputation and favorable images created by the media (Henderson, 2003). Correspondingly, Vassilikopoulou et al. 2009 suggest that consumers will have a more positive impression of highly reputable hotels after incidents such as fires.

Generally, it is widely argued that the way the public perceives a company is decisive in determining its success (e.g. Brown, 1998). This is also true for the hotel sector whereas it has been suggested that reputation influences consumer behaviour and especially purchase intentions (Christou, 2003). It should be emphasized that, over the past twenty-five years, the value of branding has been warmly embraced and accepted as an essential component of the marketing strategy (Dev et al. 2009). Indeed, hotel brands have been shown to play an important role in creating value for guests by helping to assure them of a uniform level of quality and of added value to both guests and hotel companies, in large part because they foster brand loyalty (O’Neill and Xiao, 2006). In support of this, O’Neil and Mattila (2010) observed that long-established brands such as Hilton, Hyatt, InterContinental, Marriott, and Wyndham have all grown through brand extensions over the past two decades.

Accordingly, the popularity of CSR is rising nowadays among customers, stakeholders and investors (Du et al. 2007). The travel industry could not be an exception, especially because it depends heavily on environmental and cultural resources (Sheldon and Park, 2011). Recently, the literature on CSR has increased by exploring various issues of tourism sustainability considering not only the hotel units but also the other important components of the tourism system such as tour operators, travel agents and means of transportation. Particularly, the hotel sector has drawn the attention of many researchers who have observed that the level of commitment, structures, policies and amount of invested money among hotels is different (McGehee et al. 2009; Holcomb et al. 2007). From another perspective, according to Henderson (2007), hotels should be ready to contribute with various CSR

initiatives to the recovery of communities after natural disasters as in the case of hotels in Phuket during the Tsunami in 2004.

It is obvious from the relevant literature that it is undeniably positive for a company to be regarded by the public as reputable, capable and corporate responsible. But what is the answer when it comes to the following dichotomous question: "*Being Capable or Responsible?*" In crisis management literature, there is not a clear answer on that question and our paper hopes to give some first results. In order to explore the aforementioned question, we use the conceptual framework of corporate associations. Corporate associations as defined by Brown (1998) are the cognitions, affects, evaluations (attaching to specific cognitions or affects), summary evaluations, and/or patterns of associations (eg, schemata, scripts) with respect to a particular company. According to the seminal work of Brown and Dacin (1997), corporate associations can be of two basic types: CA and CSR. CA refers to a firm's capability to produce quality products, while CSR associations are related to the firm's commitment to its societal obligations.

We conceptualize and test our hypotheses against previous research which compares corporate associations. The initial empirical evidence that CA has an almost four times greater effect than positive CSR on the company evaluation comes from the seminal work of Brown and Dacin (1997). From another perspective, Kim et al. (2009) explored the effectiveness of CA and CSR messages in crisis responses. The authors prove that CA-focused responses reduce the attribution of responsibility, when the crisis is for a high-tech product but when it comes to food positioning crises, CA-focused responses reduce the attribution of responsibility only if the crisis is an accident and not a transgression. Likewise, Whalen et al. (1991) found that in cases of unethical behavior, consumers firstly consider their personal interests and secondly the consequences on the well-being of their society. Therefore, the abovementioned results leads to the following hypotheses:

H1: Angry will be lower for the Hotel with CA association than CSR

H2: Sympathy will be higher for the Hotel with CA association than CSR

H3: Brand Evaluation will be higher for the Hotel with CA association than CSR

H4: Buying Intention will be higher for the Hotel with CA association than CSR

H5: Negative WOM (NWOM) will be lower for the Hotel with CA association than CSR

H6: Positive WOM (PWOM) will be higher for the Hotel with CA association than CSR.

Methodology

In keeping with the objectives of this study and with the aim to explore discussed literature gaps, an experimental approach was used. In order to compare the impact of CA and CSR on consumer reactions after crises situations in the hotel industry, two different scenarios were designed. First of

all, the following background information about the company was presented to two treatment groups: *“The following information is about a real and well known hotel in a very famous Greek island. For the purposes of this study we call the hotel as Hotel A”*. The first scenario included the following description of hotel’s CSR performance: *“In 2010 Hotel A ranked 1st among the major hotels on CSR Index. This index illustrates how the companies understand and meet stakeholders’ expectations and the environmental protection policies employed. Indeed, in 2010 a series of actions, which required the use of new environmentally friendly systems, was undertaken to protect the environment, which has reduced water and electricity consumption by 35% and 25% respectively”*. The second scenario included the following description for hotel’s CA performance: *“In 2010 Hotel A was selected for sixth consecutive time as the Best Hotel in Greece from the most reliable international magazine of tourism industry, the Best Hotels in World. Hotel A is a customer oriented organization and always aims to offer services that meet and surpass customers’ needs and desires. For the last 6 years, the Hotel A has always been within the top hotels list in Greece in Customer Satisfaction Research”*.

After the background information, the crisis situations were printed and presented as short news published in a national and highly circulated Greek newspaper under the following headline: *“52 People with Food Poisoning at Hotel A”*. Food poisoning was selected as the main crisis because after a exploratory internet research it was found that it is a very common and frequent crisis in the hotel sector. The following description was presented to both treatment groups: *“52 members of a tourist group staying at Hotel A complained about symptoms of food poisoning. The 52 tourists, including 5 children, suffered from symptoms of diarrhea and vomiting, whereas 18 of them had to be treated at the island’s hospital. The causes of the poisoning are not clear whereas the tourist group had a number of meals not only at the hotel restaurant but also at other restaurants on the island. The Hotel A’s spokesperson responded that there was no problem whatsoever with the hotel restaurant and that the food poisoning was probably caused by a meal that the group had enjoyed elsewhere”*.

Having read the information about CA and CSR associations of the hotel and the crisis, respondents answered questions concerning anger, sympathy, brand evaluation, buying intentions and positive and negative word of mouth (WOM). With regard to anger and sympathy, the measures used were adopted from Jorgansen (1996). Cronbach’s alpha were .883 and .707 respectively. Brand evaluation and buying intentions measures were identical with Klein and Dawar’s (2004) study and positive and negative WOM similar with Coombs and Holladay’s (2008) study. For the above questions, 7 point semantic scales were used.

We randomly assigned 200 undergraduate and post graduate students of one of the biggest Greek business schools to one of the two experimental groups. On average, 10 minutes were needed to complete the questionnaire. Having eliminated the invalid questionnaires, 196 valid questionnaires were analyzed. Of the respondents, 40.8 % were male and 59.2 % were female; 72 % of the sample were undergraduate students and the rest postgraduate.

Results

The manipulation checks provide strong evidence that the subjects did not have any difficulty in identifying intended situations. Subjects in the CA condition rated the hotel as more able than socially responsible whereas the opposite happened in the case of CSR condition ($F=4648.88$; $p<0.001$, $F=2706.27$; $p<0.001$ respectively). The analysis of variance (ANOVA) was used to examine and determine respondents' reactions (anger, sympathy, evaluation, visiting intention, negative and positive word of mouth) regarding the Company's prior CSR and CA corporate brand associations. Hypothesis 1 (H1) predicted that consumers' anger will be lower for the hotel with associations based on CA than the hotel with CSR associations. However, the hypothesis was not confirmed [$F(1,083)$; $p=.299$]. H2 anticipated that sympathy will be higher for the hotel with CA associations than CSR. As revealed by the analysis of variance, the respondents in CSR condition expressed more sympathy ($m=3.54$) than did the respondents in the CA condition ($m=3.10$) [$F(6,007)$, $p<0.05$]. This leads us to reject H2 because the result contradicted what was foreseen. Contrary to our expectations, H3 is not supported, because the results for brand evaluation indicate no significant differences between the CA and CSR hotels for store attributions [$F(2,311)$, $p > 0.05$]. Concerning H4, the results confirm that visiting intention will be higher for the hotel with CA associations ($m=4.34$) than the hotel with CSR ($m=3.77$) [$F(6,999)$, $p<0.05$]. Hypotheses 5 and 6 predicted that the NWOM will be lower for the hotel with CA association than CSR and PWOM will be higher for the Hotel with CA association than CSR. Consistent with H5, respondents for the hotel with CA association expressed less intention for NWOM ($m=3.53$) than the CSR ($m=4.16$) [$F(6,997)$, $p<0.05$]. Finally, as expected, PWOM will be higher for the Hotel with CA ($m=4.15$) than CSR ($m=3.65$). [$F(4,921)$, $p<0.05$].

Discussion & Conclusion

The point of departure for this study is the desire among researchers to move beyond one-dimensional examination of the way people perceive a company and its role in crisis situations. To the best of our knowledge, this study is the first to examine the impact of CA and CSR on consumer reactions after crisis situations in the hotel industry. Overall, this study replicates, in the hotel industry and under crisis situations, the pattern found in the Brown and Dacin (1997) study that CA has higher impact on consumer reactions than CSR.

The results clearly show that after a crisis situation CA focused hotels tend to have better consumer reactions than the CSR focused. Brown and Dacin (1997) indicated that CA has an almost four times greater effect than positive CSR on the company evaluation; our findings support this notion while we have also found evidence that CA has greater effect than CSR even after a crisis situation. This is also reasonable given the fact that visiting intentions will be higher for the hotel described by CA than CSR information. Furthermore, our research indicates that PWOM will be higher and NWOM will be lower for hotel with CA associations than CSR. Therefore, it seems that generally the halo effect of CA is

stronger not only in routine situations but also in non routine ones such as crises. Kim et al. (2009) hypothesized that the stronger impact of CA could be explained by the consumers' belief that CA decreases in direct proportion to the investment of corporate money in CSR initiatives. The only case wherein the CSR is more effective than CA is when it comes to the emotion of sympathy. It seems that social responsibility initiatives work better in increasing or keeping the positive consumer emotions for the company in a good level.

The broadest managerial implication arising from this study is that the marketing managers of hotels should take into consideration the fact that consumers react more positively to corporate ability than social responsibility, especially when the social initiatives are focused on the general well being of the society. These findings indicate that companies should firstly build their corporate brands on CA and secondly on CSR. However, it should not be disregarded that CSR is first of all a societal obligation for the companies and our results do not suggest that the companies should not be involved in CSR initiatives.

Limitations & Future Research Directions

The most significant limitation encountered in this study is the simultaneous act of reading about a company's corporate associations and passing judgment when a crisis arises. In a real world, consumers tend to evaluate company's associations over time and use this evaluation as a halo effect when and if a crisis erupts. However, this is a common problem in experimental studies with fictitious organizations and events. Thus, the limitations regarding the external validity of our results can be overcome in a future research by using real hotel brands and other types of crises. Another limitation emerged is the implementation of convenience sampling. Moreover, research is needed to bring the impact of other significant variables such as crisis response strategies, crisis severity and customer loyalty to light. Finally, new promising avenues to further research can be opened by exploring important moderator variables such as the level of consumers' CSR skepticism and CSR importance and other important travelers' characteristics such as travel experience, risk attitude and risk perception.

Abstract

The objective of the present research is to uncover the impact of different crises on various destination image elements, the general destination image and attitude, visiting intention and Word of Mouth (WOM). The contribution of this paper primarily lies in the empirical confirmation that tourism destinations suffer from serious decreases in all the aforementioned variables after a crisis. However, the impact on travelers' perceived image elements is less negative after an airplane crash or an earthquake than in crises characterized by more generalized impacts such as terrorist attacks or epidemics. Furthermore, responders perceive a destination as slightly more friendly after an airplane accident. Finally, the results demonstrate that the crisis type that leads to the highest decrease in visiting intention is an epidemic.

Keywords: Crises, Tourism Destinations, Consumer Behaviour

Introduction

Tourism is one of the fastest growing industries in the world. In 2011 alone, its total contribution to the global Gross Domestic Product (GDP) is expected to reach 9.1% (6 billion), employing approximately 99 million people (World Travel and Tourism Council, 2011). Tourism contributes significantly to the development of many places, comprising for some of them the only prime mover of economic growth and welfare. At the same time, tourism is highly vulnerable to crises such as economic downturns, natural disasters, epidemic disease, and international conflicts (Sönmez, Apostolopoulos and Tarlow, 1999). During the previous decade, tourism industry has faced a series of crises such as the 921 Earthquake, the terrorist attack of 9/11 in New York and Washington, the Bali bombings in 2002, the tsunami of 25/12/2005 and many other natural disasters or political crises. Most recently, the Icelandic volcanic plume and the political instability in the Arabic world strongly confirm that tourism industry should prepare to operate under many different types of crises.

Therefore, the knowledge of travelers' behaviour during and after crises should be an essential tool in the destination crisis management. In the relevant literature, it is widely argued that the aforementioned crises have significant effects on the destinations, in terms of travelers' destination image, visiting intention and Word-of-Mouth (WOM). However, despite the importance of this topic, the experimental researches that prove the causality of the previous statements are limited. In addressing this void, the current experimental research measures the impact on various travelers' destination image elements, the general destination image, the attitude, visiting intention and WOM, following the most common tourism crises such as terrorism attacks, riots, transportation accidents, epidemics and earthquakes.

Conceptual Background and Research Questions

Pauchant and Mitroff (1992, p. 15) define crisis as a "distortion that physically affects a system as a whole and threatens its basic assumptions, its subjective sense of self, its existential core". According to Faulkner (2001), a crisis is a triggering, fluid, unstable, dynamic event that surprises an organization while at the same time challenges its survival, needs urgent decisions, creates the perception of inability to cope and finally, gives pressure and occasion for changes. Generally, tourism's vulnerability to different types of crisis is higher than that of a simple organization, resulting from the great tourism sensitivity to internal and exogenous changes (Laws, Faulkner, and Moscardo, 1998). Indeed, Hall (2010) anticipates that the crisis negative effects on international tourism are enhanced due to the increased tourism hyper-mobility and the operation in a highly globalized economy.

Henderson (2007) proposes that tourism crises are triggered by economic, political, socio-cultural, environmental and technological events. Natural disasters, terrorist attacks, transportation accidents, political instability and severe health issues such as epidemics or pandemics are among the most common tourism destination crises. First of all, natural disasters such as hurricanes, typhoons and cyclones, earthquakes, storms, volcanic eruptions and torrential rains have a severe impact on tourism infrastructure and consequently influence the safety and security image of the tourist destinations (Beirman, 2003). Moreover, terrorist attacks, dramatically increased the last two decades in number and consequences, constitute a crisis type that has seriously hurt many tourism destinations. Many authors have argued that it is not coincidental that terrorists target more often than before tourism destinations, since by targeting tourists terrorists achieve strategic and ideological objectives (Hall and O'Sullivan, 1996). The example of September 11 attacks in the US underlines the negative impact that terrorism has on tourism, especially shortly after the event. Finally, other types of crises like riots, civil wars coups or strikes, reveal how much tourism can be impacted by political instability (Alsarayreh, Jawabreh and Helalat, 2010).

It is widely held that destinations hit by a crisis face a significant decrease in the number of tourist arrivals. As Sönmez, Backman and Allen (1994) point out, tourism destinations suffer from a

downturn in terms of tourist arrivals and expenditures after crises, given that “*travelers will shy away from afflicted areas*” (Sönmez et al. 1999, p.14). An extensive literature has arisen showing that tourists substitute risky destinations with safer choices. Indeed, Ioannides and Apostolopoulos (1999) support that tourist destinations plagued by political instability or terrorism are less popular among visitors. For example, due to the terrorist attacks which began in 1992 in Egypt, the contribution of tourism on the Egyptian economy was decreased by 43% the first years (Wahab, 1996). Generally, if a crisis involves body harm or loss of life, it will affect the tourism industry of a destination, and tourist arrivals will decline. It should be emphasized that because of SARS, Singapore’s business and leisure travelers demand was decreased to the half (Henderson and Ng, 2004). Generally, SARS hit all the tourism industry sectors and contributed to a major downturn in tourism in several places during the first semester of 2003 (Mason, Grabowski, and Du, 2005). Nevertheless, it seems that in times of pandemics tourism demand declines, while in times of terrorist activity, Taylor (2006) argues, tourists shift rather than cancel destination plans.

It has to be noted, however, that the negative impact of a crisis does not confine only to tourist arrivals, but it has wider impacts on destination image and attitude. There is evidence from both research and practice clearly suggesting that destination images can be negatively biased after negative political, social, or natural events occurring at that destination. (Dimanche and Lepetic, 1999; Mansfeld, 1999; Milo and Yoder, 1991). As Sommez et al. (1999) point out, the destination image of safety is the first destination image element that suffers from a mismanaged crisis or disaster. Most interestingly, destinations should sometimes anticipate apart from short-term negative effects, a long-term damage to their destination image (Baral, Baral and Morgan, 2004). Having pondered all that, we can reach to the conclusion that though it is hard for a destination to build its destination image, it is quite easy to have it damaged by a crisis. As Sönmez et al. (1999, p.16) note, “*it is imperative for destinations to augment their crisis management plans with marketing efforts, to recover lost tourism by rebuilding a positive image.*”

Tourists are the main destination customers and it is undeniably valuable for crisis management and DMO to know what their reactions are after crises. Huang, Tseng and Petrick (2008) highlight the pivotal importance of understanding tourist perception after crises, in order to transmit promotional messages that address tourists’ concerns, change false perceptions, and reinforce positive ones. Additionally, Ritchie’s (2004) strategic crisis management framework for tourism destinations emphasizes the importance of understanding and collaborating with stakeholders such as tourists. Therefore, this research aims to enhance the knowledge that we have on travellers’ behaviour after crisis situations, by trying to answer two research questions: *RQ1: Does a crisis situation have an impact on consumers’ perceptions and reactions towards a destination; RQ2: Do different types of crises have the same or different impact.*

Methodology

An experimental approach was used to explore the foresaid research questions. Egypt was selected as the tourism destination facing crisis situations, since it is one of the most important tourism destinations, that has been hit several times by different types of crises in the past. Another reason for that selection was the respondents' high familiarity with Egypt, allowing the measurement of destination image. The main research idea was to measure several destination image elements, the general destination image and attitude, visiting intention and WOM, before and after different types of crises had occurred. Therefore, we selected five different scenarios referring to the most common crises types. More specifically, we described crisis situations such as terrorist attacks, riots, an earthquake, an airplane accident and an epidemic.

All the crisis scenarios started by the following description: *"The Ministry of Health announced that 68 people died and 527 remain in hospitals for treatment in the capital of Egypt..."* The epidemics scenario continued with the following description: *"...after the outbreak of a new type of flu that hit the country. The authorities say that this is the greatest epidemic in the last decade».* The earthquake scenario continued with the following description: *"...after yesterday's disastrous earthquake. The epicentre of the earthquake that was measured above 7.0 in the Richter scale is near the capital of Egypt, Cairo. At least 150 buildings have undergone severe damages and the city has entered a state of emergency".* The riots scenario continued with the following description: *"...during yesterday's conflicts between police and anti-government demonstrators in the capital of Egypt, Cairo. The episodes began yesterday between protesters requesting the resignation of the government".* The terrorist attacks scenario continued with the following description: *"...after yesterday's terrorist attacks from extremists in the capital of Egypt, Cairo. The suicide attacks targeted buildings of multinational corporations".* The airplane crash scenario continued with the following description: *"...after the crash of Egyptian Airlines' aircraft close to a touristic area of Cairo. Cause of tragic crash seems to be a blackout in the Control Tower of the Airport».* All the scenarios shared the closing sentence: *« Apart from Cairo, emergency is also extended to other major cities of Egypt in fear of similar problems/events. The situation has raised the international attention of the Media and a warning has been issued by the Greek Government for the Greek tourists".*

The respondents initially evaluated Egypt's various destination image elements and the general opinion in terms of image and attitude. Furthermore, two behavioral intentions were measured, the visiting intention and the intention to speak positively for the destination. After presenting the scenarios, the questions were repeated in order to compare the impact of each crisis on their general opinion. We used the Russell's (1980) four bipolar affective items and the Ong and Horbunluekit's (1997) 17 bipolar cognitive image items as those were modified by Hosany, Ekinci and Uysal (2007) in order to measure the elements of destination image. We adopted the measures for general destination image and attitude, visiting intention and WOM from Hosany, et al. (2007). We randomly assigned

330 undergraduate and post graduate students of one of the biggest Greek business schools to the five experimental groups. It should be clarified that the research was conducted in September 2010, before the highly publicized political turbulence in Egypt and other Arabic countries. After eliminating the invalid questionnaires, 300 valid questionnaires were analyzed and in our sample, 43.9 % of the respondents were male and 56.1 % were female; 49.7% were undergraduate students and the rest were postgraduate.

Results

We employed a series of paired samples t tests in order to evaluate the decreases on various destinations image elements, the general destination image, attitude, visiting intention and WOM towards the destination after the crisis. At this stage of analysis we didn't compare the differential impact of each crisis type but we globally analyzed the results. As expected, the results confirm that almost all the elements of destination image decrease after a crisis situation. Exception to that norm are the destination image elements of easily accessible, sparse, simple and poor which haven't statistically significant decreases after the crises. The highest decrease is noted in gloomy/exciting and unpleasant/pleasant bipolar questions. Egypt appears as a less exciting destination after a crisis situation, with a total mean difference reaching the -1.26. Likewise, Egypt's image of pleasant destination has the highest observed decrease (-1,30). Moreover, the crises have significant negative impact on destination image, attitude, visiting intention and WOM. Table I shows in detail the means before the crisis, the means after the crisis, the mean differences and t values.

Moreover, in order to explore the second research question, we conducted a series of analyses of variance (ANOVA) with the crisis types as the independent variables and the destinations image elements, destination image, attitude, visiting intention and the WOM as the dependent ones. The crisis type has a significant impact on the destination image elements of relaxing, pleasant, friendly and safe. The accident crisis type seems to have less strong impacts than the other types on the aforementioned destination image elements. More specifically, as revealed by LSD post-hoc tests, respondents' perception of Egypt as a relaxing destination decreases less after an airplane accident than after a terrorist attack, while their perception of Egypt being a pleasant destination decreases more after an epidemic or an earthquake (-1,58 and -1,64 respectively) than after an accident (-0,75). Likewise, Egypt's image of safety after an accident doesn't decrease at the same level as after other types of crises. On the other hand, Egypt's image of a friendly destination is slightly enhanced after an airplane accident but without significant differences with the other crisis types, according to LSD post-hoc test. Accordingly, terrorist attacks seem to create the strongest impact on the general destination image and attitude (-1,52 and -1,49 respectively), contrary to an accident and an earthquake that have significant lower impacts. Finally, visiting intention falls less when the crisis is an accident or riots, especially when compared to an epidemic which results to the highest decrease in visiting intention.

Table I: Means Before and After Crises, Mean Differences and t-values

Discussion, Limitations & Future Research Directions

This study offers empirical confirmation of the generally expressed opinion that crises have negative impact on destination image, attitude and behavioral intentions such as visiting intention and WOM. Results also indicate that consumers' reactions vary according to the crisis types. Generally, the crisis type that has the lowest negative impact on consumers' reactions is transportation accidents. A possible explanation is that transportation accidents such as airplane crashes are severe events that don't have an impact that could be generally affect the destination. On the other hand, terrorist attacks have the highest impact, maybe because severe terrorist attacks have occurred with great frequency during the last decade, with the known destructive consequences. When it comes to visiting intention,

the epidemic is the crisis type that leads to the lowest intention, given that such a crisis has direct impact on tourists' health. The limitations of the method used in this study should not be disregarded. The experiment is characterized by high internal validity and low external validity at the same time. Finally, future research should focus on the confirmation of these results regarding other destinations. Possibly, the most promising avenue for future work is to investigate other variables that could explain the tourists' behaviour during and after crises, formulating in that way an integrated model.

Type of Crisis	Relaxing	Pleasant	Friendly	Safe	Image	Attitude	Visiting Intention

THE INNOVATIVE MODEL OF QUALITY MANAGEMENT IN TELECOMMUNICATION SERVICES SECTOR

Babenko, Ekaterina¹

¹ National Research University, "Higher School of Economics", Head of Strategic Management Department

Abstract

Today the increasing number of constant consumers is a strategic aim for any organization which is possible to be achieved only under condition of continuous perfection of organizational activity quality. If the service representation doesn't correspond to the consumers' expectations they lose their interest to the service organization, if it does correspond or surpass their expectations they probably would readdress to service provider. For this reason the service organization should more precisely reveal consumers requirements and expectations, namely provider should constantly measure its service quality.

In the given work approaches by the Russian and foreign researchers in the field of quality management are studied and analyzed in details, namely:

- Approaches to the « service quality» definition;

- The basic components of service quality management process;
- Service organization quality model.

The purpose of research work consists of ISQM (Innovation System of Quality Management) model creation taking into account features of TCS providing, which, in turn, is targeted on TCS company purposes achievement in the field of quality by means of:

- setting the control values of TCS quality indicators;
- measuring of the reached results and their comparison with expected results;
- effective management decision making as a result of carrying out the analysis of managerial activity in the field of quality on the basis of the report containing recommendations for the company activity improvement, prepared due to the results of measuring and collecting quality indicators.

Keywords: Innovative activity, innovation, quality management, organizational processes, service provided, consumer.

Introduction

Each organization enters the market for the further development purpose. In due course it can pass to a policy of the won market share deduction or protection. However, in both cases competitors' actions can prevent these organizational purposes realization (J.O. Shonessi, 2002). In order to cope with the given situation, it is necessary either to satisfy current requirements, or to surpass consumers' expectations for goods (and/or services) made (and/or provided) by the organization. Today the increasing number of constant consumers is a strategic aim for any organization which is possible to be achieved only under condition of continuous perfection of organizational activity quality. If the service representation doesn't correspond to the consumers' expectations they lose their interest to the service organization, if it does correspond or surpass their expectations they probably would readdress to service provider. For this reason the service organization should more precisely reveal consumers requirements and expectations, namely provider should constantly measure its service quality (A. P. Chelenkov).

«Quality of services» is considered as a set of service characteristics defining its ability to satisfy established or prospective consumer needs and requirements. In addition the quality level is defined by the degree to which the integral properties (attributes) of service, desired by the consumer, are revealed and included in service process, and the degree in which desirable attributes levels are perceived by the consumer as reached (R. Johnston, 1995).

Considering the importance of systematic approach to quality management in the organization, it is not enough just to know what types of activity are necessary to be engaged. Actions of the organization within the limits of each element of management should be identically oriented and should not cause internal contradictions.

For this purpose it is necessary to submit data elements within the limits of uniform consecutive process where each element logically follows the previous one.

The authors suggest to be guided by the following service quality management process model (fig.

1):

Fig. 1. Service Quality Management Process.

The offered quality management process model shows that interested parties – consumers - provide organizations with the requirements as the input data. At the quality planning stage the given requirements are estimated and transformed into the quality purposes of the organization in whole (the purpose hierarchy is constructed). In order to provide objects achievement service rendering standards are developed, the system of the specified standards documentation is accepted. The standardization of service rendering process corresponds to the quality maintenance, i.e. provides internal and external interested parties with confidence that the purposes are understandable and achievable. Considering such service feature as inseparability, it is important to notice that quality should be monitored simultaneously with service rendering process. It is impossible to return service after reception, therefore the executor should take care of the established requirements realization, and also immediately react to discrepancies occurrence. The authors have defined the consumer satisfaction with rendered service as an output of quality management process, since it is a quality

management ultimate goal. All revealed discrepancies should be not only corrected, but also considered at the further service rendering by means of plans/purposes updating, that provides quality management process recurrence. Besides, it is important to consider consumer satisfaction with the rendered service at system transition to the second cycle and repeated realization of quality planning stage. The «quality improvement» element is expedient for being endured beyond the sequence frameworks, because quality improvement is a stage standing on higher level. Not current but future/expected consumer requirements would be considered as an input of quality improvement process. The definition of the future requirements should be constructed not simply on the basis of clients current requirements estimation, but on the basis of forecasting taking into account a current situation and possible changes. The improvement purposes also should be transformed to specifications, and realized within the service rendering process. The consumers expectations anticipation and new requirements formation are considered as an output of quality improvement process.

In practical sense, the priority direction definition in quality management should be based on consumer opinion research results with application of various methods of qualitative and quantitative estimation and the subsequent analysis of the received information.

From the point of view of service quality planning, the quality estimation means an estimation of quality degree, i.e. definition of the degree in which the service characteristic, desirable for the consumer, are revealed and included in service process, and the degree in which the desirable attributes levels are perceived by the consumer as reached. Besides, the estimation consists in comparison of individual indicators of estimated service type quality to corresponding indicators of the base sample – expected service.

The quality management process model presented in work has found practical application in an example of TCS organization activity. As a result of the given model application the necessity for working out of universal quality control system model for the organization has been revealed, which has allowed to carry out a high-grade TCS quality estimation.

The creation of innovation control system assumes the system approach application on the basis of coordination and integration of all kinds of activity of the organization. In this connection, there is a necessity of continuous perfection of the organizational processes presented in management models.

The information, data and the results received by means of ISQM application allowed to start the process directed on strengthening the competitive advantages of the TCS organization, through introduction of the innovations, satisfying the requirements of all interested parties.

The main task of innovation control system is in organization transfer from its present condition in the desirable future.

It is expedient to present the Innovation Control system in the service organization as set of results of its various levels activity with purposeful influence on organizational processes as a whole, and with a view of new products (and/or the services) creation corresponding to the organization external and internal environment requirements (Fig. 2).

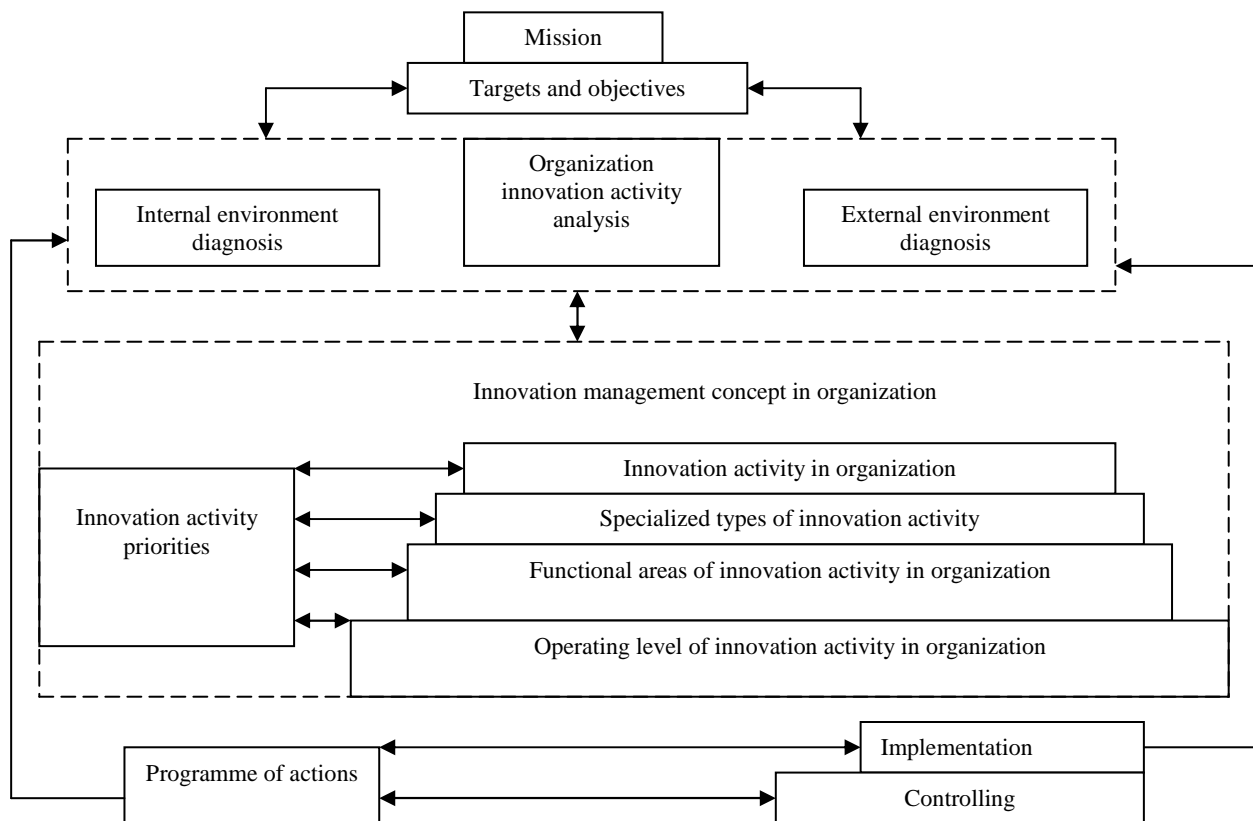

Fig. 2. The Innovation Control System at all organizational levels.

Organizational innovative activity is aimed at creation of the innovations which allows the company to get global competitive advantages shown in lower costs and distinctive quality.

Nowadays functioning of the TCS organizations occurs in dynamically developing branch that demands constant innovation introduction in their activity for the purpose of their competitiveness maintenance on the basis of continuous quality management process.

Telecommunication service is a product of operator activity including reception, transfer, signal and other types of information processing through telecommunication networks (V.I. Bitner, G.N. Popov, 2004).

It is necessary to underline that telecommunication services have peculiar features and characteristics inherent from their economic nature and branch specialty.

It is accepted to understand telecommunication service quality as a «set of the specific parameters defined by network activity quality which characterize service consumer properties in terms, clear to users, and which do not depend on the assumptions concerning internal network structure» (B.I. Kurk, V.P. Shuvalov, 2003).

Specific features of telecommunication services providing are considered by authors at ISQM (Innovation System of Quality Management) model creation, which in turn, is targeted on TCS company purposes achievement in the field of quality by means of:

- setting the control values of TCS quality indicators;
- measuring of the reached results and their comparison with expected results;
- effective management decision making as a result of carrying out the analysis of managerial activity in the field of quality on the basis of the report containing recommendations for the company activity improvement, prepared due to the results of measuring and collecting quality indicators.

The essence of ISQM consists in calculation of actual values of service quality indicators, and in correlation of these indicators with standard values, while the large or small deviation shows a service quality level. Thus, ISQM defines the system of TCS quality indicators, and also an order and formulas of actual values of indicators calculation.

All quality indicators according to Gronroos model have been divided on two basic groups: technical and functional.

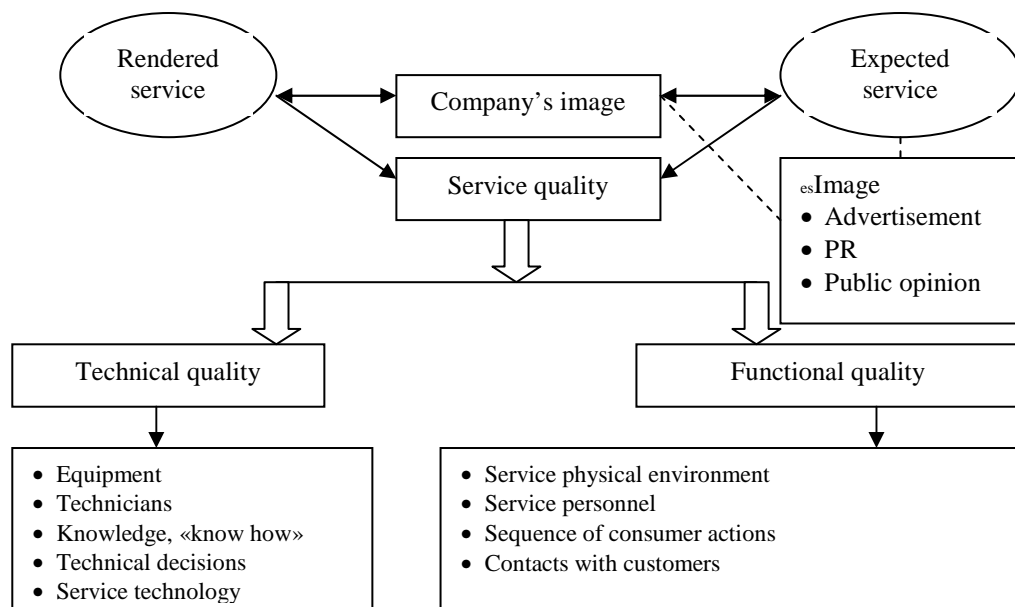

Fig. 3. Gronroos Quality Model (C. Gronroos, 1982).

Gronroos defined technical quality as what consumers receive from interaction with service firm. The technical component of quality represents an invisible part for the consumer, containing the equipment, cars, tools, the premises, special knowledge, technologies, and also technicians which are necessary for service realization. Thus, technical indicators are used in estimating equipment work quality and quality of the TCS providing processes.

Functional quality explains how consumers receive services. Functional quality can be estimated objectively, hence it represents part of service quality which directly provides interaction with the client (service contacts). It is a visible component for the consumer. It concerns the service material/physical environment, the service personnel directly serving the consumer, consumer actions, and also the process of service rendering in which the consumer participates. Functional indicators allow considering consumer opinion on the service quality.

All criteria in the *Technical Indicators* group can be conditionally divided into five basic subgroups:

1. preliminary service quality, which underline actual maximum time for the answer about technical possibility from the service organization starting from the filing the TCS reception application by the user;
2. TCS connection quality, which underline an actual maximum subscriber waiting time for access granting starting from the moment of the TCS granting contract conclusion and-or payment for connection receipt from the subscriber;
3. Availability – quality of technical support service work organization;
4. Reliability – quantity of technological discipline infringements that has caused service downtime/lay-up;
5. The termination of service granting.

According to the ISQM the initial data for technical indicators of rendered service quality calculation are daily indicators of networks equipment self-diagnostics, the operative information given by operational administration service, quarterly and other forms of the reporting, the data of marketing researches received by means of telephone surveys, questionnaires fillings by users in places of service selling, the central repair bureau information, the technical support service data on users references.

Five groups of technical indicators in model are supplemented with two groups of functional indicators which assume the consumer opinion taking into account. The first group allows to estimate the degree of consumer satisfaction of given services, and another – quantity and the importance of consumers claims on unsatisfactory quality of telecommunication services.

The first group «The satisfaction degree» includes four basic indicators of users satisfaction degree:

- of service quality within interaction with the personnel;
- of information and material maintenance quality;
- in technical parameters of service quality;
- of technical support service quality.

The second group estimates consumers claims and includes following indicators:

- a share of well-founded references on TCS quality in total amount of references,
- a share of answers to written references, given with control terms infringement in total amount of written references answers in a quarter,
- a degree of consumers' satisfaction of quality of company's work with subscribers claims.

The indicators described above are considered in calculation of the aggregated TCS quality indicator. The aggregated indicator value is in direct ratio with TCS quality degree (high value – high level, low value - low level). Accordingly, on the basis of aggregated indicator the quality of organization structural divisions activity assessment is carried out, which directly defines the size of employees awarding. The dependence of the size of the employees award on service quality indicators allows to stimulate workers to achieve the organization quality purposes that in turn raises a service quality degree and as a consequence increases consumer satisfaction.

Thus, the achieved research results have allowed to create systematic approach in quality management which begins with requirements to organization activity promoted by consumers. These requirements are the entrance data of service quality planning process. The data in the subsequent are transformed into the organizational quality purposes. The quality purposes afterwards are transformed into the organizational specifications, realized in providing services to the consumer with constant high quality maintenance, assuming continuous process perfection on the basis of a constant result estimation on the separate service process stages. As an output of service quality improvement process the consumer expectation anticipation and formation of new requirements are considered, that lead to the further organizational plans and purposes updating and provide the recurrence of quality management process. Thus, there is the system transition into the second cycle that assumes repeated realization of all basic stages, begging with planning and finishing with service quality improvement.

LEGITIMACY AND REPUTATION: KEY FACTORS FOR CORPORATE SOCIAL STATUS AND COMPETITIVE ADVANTAGE

Basile, Gianpaolo¹; Kaufmann, Hans Ruediger²

Abstract

This paper aims at filling a gap we think exists in scientific literature with relation to the notions of legitimacy and reputation, in order to contribute to the discussion on the current role of companies, seen both as parts of a context and as vital systems that survive thanks to their competing skills.

This work is based on an effort that is both methodological and interdisciplinary, and takes into account Institutional and Neo-Institutionalist theories, the Viable System Approach, the Stakeholder Theory and Organizational Branding studies within the broader line of Corporate Branding.

The conceptual basis of our work is the assumption that both legitimacy and reputation can become 'institutions', ie conditions useful to acquire both social status and competitive advantage, that are key factors for corporate survival.

We shall try to clarify the notion that legitimacy is not, both in theory and in practice, synonymous with reputation, like many works suggest, but it is instead a condition that can support the company's social survival and the creation or the consolidation of its reputation, in turn an essential competitive factor.

We think that acknowledging the substantial difference between legitimacy and reputation becomes important when carrying out governance activities and when planning segmentation and positioning strategies, which are essential to corporate marketing and communications policies referred to the different stakeholders, either social or economic ones.

Keywords: legitimacy, isomorphism, reputation, corporate/organization branding

Literature Review – Introduction

Parsons (1956, 1960) and then Weber (1978) wrote about legitimacy, defining it as congruence towards laws, rules and social values. Afterwards, scholars of social theory, organization, and Resource-Based View Theory introduced the notion of legitimacy in their theories (Johnson et al., 2006; Ruef and Scott, 1998; Suchman, 1995; Salancik and Pfeffer, 1978).

In the late '70s pioneers of the Neo-Institutional approach, such as Meyer and Rowan (1977) and Zucker (1977), while analyzing the ability of an organization to achieve survival, wrote about the importance of expressing behavioral patterns conform to standards, rules and beliefs of the reference context, in addition to more established factors such as organizational efficiency. In fact from Meyer and Rowan onwards, all scholars belonging to the neo-institutional school argue that organizations that shape their behavior to moral rules and regulations of their reference context can be defined as *legitimate*.

This condition, within the constant search for contextual conformity and survival, may shield the company from any behavioral change (eg introduction of technological innovations) that could induce sanctionary reactions (eg strikes, etc.) in context members (Brown, 1998). The proper meaning of legitimacy, for the purpose of our study, is expressed by two scholars, namely Scott and Suchman.

Scott (1995, p. 45) argues that 'legitimacy is not a commodity to be possessed or exchanged but a condition reflecting cultural alignment, normative support, or consonance with relevant rules or laws'. Suchman (1995), moreover, defines legitimacy as 'a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs and definitions'.

This last definition marks our goal: legitimacy, as an expression of conformity to rules, norms and social beliefs is an essential factor both to the social acceptance of the company and to the implementation of reputation strategies towards the achievement of survival. These considerations highlight the existence of a gap in the line of studies regarding

corporate/brand reputation. According to this line of study, which includes Van Riel and Fombrun among its main authors, the corporate image that stakeholders develop as a result of communication activities carried out by the company, refers to the four domains (product, social, financial and employment) and it is aimed at facilitating the identification of the company among its many competitors (Van Riel and Fombrun, 2007, p. 41).

These assumptions consider therefore conformity of the company to rules, norms and cultural values of the reference context, as a behavior merely aimed at standing out in the competitive scenario. Such approach overlooks the fact that a behavior consistent with context requirements also allows the company to simply reach a perceptive positioning in constituences' minds (cognitive legitimacy) and not necessarily results in the elaboration of distinctive evaluations compared with other competitors, with a consequent effect on financial results (Suchman, 1995). There are in fact many place marketing studies saying that an organization, whether it complies or not to social expectations, plays a strong role within its territory up to the point of reinforcing or

reducing its attractiveness (for example, companies that do not meet environmental standards make the area in which they operate perceived as highly polluted and therefore not economically, socially and/or touristically attractive) (Chiu, 2011).

This means that the company holds a dual (economic and institutional) behavioral approach towards its reference context.

Our work shows that in the first case, when the corporate behaviour is merely geared towards profit, reputation is only seen as the capacity to produce and/or cause results related to competitiveness.

The institutional approach, however, takes into account the role, either positive or negative, the company plays within its reference context, and therefore is also about how the company itself is seen by the community it either directly or indirectly interacts with (Rindova, et al., 2005).

Differences between legitimacy and reputation

Some researchers described the firm as either a *social* (Kogut and Zander, 1996) or a *discursive* (Tsoukas, 1996) community, or as a *community of practice* (Constant, 1987; Kreiner and Lee, 1999). In addition, scholars like Anderson et al. (2008), Araujo et al. (2008), and Kjellberg and Helgesson (2006) have developed suggestions that markets are co-created (performed) as actors engage in market and/or social practices (Storbacka and Nenonen, 2008).

Recurring actions, defined as social practices, undertaken by individuals and social organizations within a social system, make possible the establishment of relations between social players. Such relations will evolve towards the adaptation of social actors' respective activities, that will contribute to change within the reference contexts involved and will be in turn affected by them. (Giddens, 1984). This phenomenon marks a process of *reflexive self-regulation*, typical of social integration phenomena, expression of relational reciprocity among actors in a position of co-presence (Staber and Sydow, 2002).

Berger and Luckmann (1967) argued in fact that organizations eventually mirror their environment as they reflect socially assembled realities.

Constant search by the company for the state of consonance in the creation and/or maintenance of its relationship with the individual/consumer, and mutual adjustment/change of practices and behavior employed by social players, therefore express the existence of a continuous adaptation process in which the company, in order to survive under uncertain conditions, looks for opportunities to establish relations and interactions with the individual/consumer. In such a dynamic business scenario, the corporate system constantly looks for players with which to create and maintain lasting relations, through the development of a state first of consonance, and then of resonance, based on compliance with rules, regulations and social beliefs (classic examples are on

the one hand the banking, tax and labor systems, and on the other hand the legal system in general). Consonance, as previously mentioned, is a condition that is achieved when the relevant players (corporate system and context members) identify a common language, while resonance marks a relational evolution in which the players create opportunities to reach common goals (Barile, 2006; Golinelli, 2010).

As to the relations between business and individual, the latter can hold the status of social recipient (constituence/audience) and/or of economic recipient (target/consumer) of corporate behavior. The individual expresses relational consensus following an assessment of corporate conduct. That is shaped in turn by corporate skills and abilities, which are expression of both conformity to social norms, values, rules and meanings operating within the reference social systems, and of

firm-specific features, aimed at making the individual/target discriminate between different companies, due to the perception of either tangible or intangible specific assets (Hirsch and Andrews, 1984; Parsons, 1960; Hawley, 1968; Tolbert and Zucker, 1996; Thornton, 2002).

The company that meets standards, rules and values can either present itself as a value tile within its context (industry, place, etc.) together with the other players (constituence/audience), or as a system whose survival goals are the result of differentiation towards its competitors (Golinelli, 2010).

At evaluation stage (awareness, evaluation, judgement), not necessarily aimed at purchasing, the individual/social actor can on the other hand consider the organization in question as acceptable, when the latter is compliant with legal and cultural norms and usages, that are typical of the social context shared by both (Rao, 1994).

Acceptance is achieved by a rational organization that complies with laws, rules and social practices so as to fit in the reference context, this way expressing its values, within an evaluation process carried out by the stakeholders involved. First institutionalist and then neo-institutionalist theories have defined such mimetic approach as *isomorphism* (Di Maggio and Powell, 1991; Di Maggio and Powell, 1983).

Legitimacy and isomorphism

As to isomorphism, neo-institutionalist scholars define institutions as 'historical accretions of past practices and understandings acquire the moral and ontological status of taken-for-granted facts which, in turn, shape future interactions and negotiation' (Barley and Tolbert, 1997; DiMaggio and Powell, 1991; Jepperson, 1991; Leblebici et al., 1991; Meyer and Rowan, 1977; Zucker, 1977).

These scholars also maintain that the notion of isomorphism is the key to understand why companies that operate within the same institutional/social context take decisions and follow behavioral patterns that are usually very similar.

According to Meyer and Rowan (1977), the notion of isomorphism implies that:

- organizations should meet rationality criteria set by the institutional context in order to be considered efficient, to maximize legitimacy and resources, and their ability to survive;
- isomorphism processes are determined not only by the tendency to conform to the external environment, but also by the action of the environment itself that leads to the creation of new organizations consistent with the rational myths (institutionalized rules, norms, procedural ceremonies) it has produced;

- to every new myth that consolidates correspond new organizations, created to meet the needs the myth itself has produced (an example is that of followers, that is of companies that adopt imitative behaviour with relation to pioneer companies and/or market leaders);

- the best way to manage the conflict between internal rationality criteria and environmental pressure is to develop two parallel structures, one formal, consistent with myths and ceremonies, the other informal, aimed at gaining competitive advantage (Meyer and Rowan, 1977).

Rational behavior, that is aligned to normative and cultural expectations of social context members, especially individuals, gives the company social legitimacy, which could also support the creation and/or maintenance of a favorable reputation for the company itself and its members (employees, managers, consultants, owners, etc.) (see Fig. 1).

Fig 1: Isomorphism and differentiation

Isomorphism, therefore, tends to have different connotations depending on if it evolves according to cognitive (social beliefs), normative (existence of scarce resources whose acquisition is essential to survival) and/or coercive conditions (existence of rules essential to social and economic activity) (Leydesdorff, 2000; Di Maggio and Powell, 1983).

Cognitive or mimetic isomorphism (by adaptation or selection) is characterized by a spontaneous process of imitation and/or interpretation in which the interaction between actors and relevant messages is processed and turned into cultural meaning (Rao, 1994; Bridwell, and Mezas 2012).

In addition, the prevailing existence of rules and resources leads to the identification of other forms of isomorphism based on:

1. awareness of the importance of acquiring new know-how and practices in order to survive: Normative Isomorphism

2. pressure factors such as laws, regulations etc, that lead to compliance: Coercive Isomorphism (Golinelli, 2010)

Normative Isomorphism is found in company-context interactions in which is often present a greater ability, knowledge and/or possession of intangible assets (facility = ability/capacity), so as to define a condition of preeminence of one towards the other.

An example of this is the financial, economic and legal behavior that the company is forced to adopt in order to comply with European standards (Basel III, for instance, regarding conformity to evaluation standards set by the banking system).

Coercive Isomorphism is also found in interactions between actors, every time it becomes necessary to identify rules and/or standards useful to determine how a social actor should behave in order to gain legitimation.

An example of this is the effort to adapt corporate behavior to environmental and social ethics or to accountability procedures, in order to get to a condition of congruence with the social actors involved and to achieve social survival.

The relationship between players and context can therefore be seen as a continuous and mutual adaptation that depends on environmental determinism and the ability of the company to influence its reference context. While the former affects and constrains corporate activities, the latter is intended to influence context entities and to establish the autonomy of the corporate system towards the surrounding reality (Golinelli, 2010).

Isomorphism therefore takes place when- or wherever a player conforms to the expectations of another player (partial expression of the suprasystem), this way developing a mutual cultural similarity.

Legitimacy and isomorphism, as described, display something quite useful to the development of this study: legitimacy is based on the notion of contextual homogenizing aimed at establishing conformity and congruence, and therefore non-rivalry, against the entire reference context and/or members of it.

Reputation, being known and being known for something

If homogenizing/harmony are the predominant social conditions in the case of legitimacy, a different assumption can be made with relation to reputation (Baccarani and Golinelli, 1992). According to the most popular definition, reputation is the expression of corporate conduct aimed at differentiating the company against competitors in the perception of the individual/consumer, supporting competitive rivalry.

Reputation is therefore that set of aggregate perceptions and evaluations, developed by stakeholders and induced by the process of *corporate branding*, that favor the company against its competitors (Fombrun, 1996).

Roberts and Dowling (2002) define corporate reputation as '... a perceptual representation of a company's past actions and future prospects that describes the firm's overall appeal to all its key constituents when compared to other leading rivals ...'.

For the purpose of our study we can therefore take into account the approaches, seemingly different, proposed by Fombrun and Rindova. Indeed, while the first holds that compliance with rules and social practices may be what actually favors the establishment of competitive differences between the compliant company and its competitors, Rindova, et al. (2005) argue that a perceived high quality of products means a greater business prominence in the minds of the stakeholders involved.

It is therefore clear that the reputational state, also due to contextual conformism, tends to add value to the corporate brand, so to become the pivot of competitive evolution, allowing the company to offer products with higher (reputational) quality at higher prices.

Corporate branding planning aims therefore at:

- reducing information asymmetry with relation to target evaluation;
- reducing the degree of purchase risk faced by the individual/consumer;
- reducing unawareness, by the target, of corporate features that are beyond the products/services on offer (firm specific).

For the purpose of this work, it is important to consider the adoption of a symbolic approach which considers reputation as a conformity aimed at competitiveness, representing on the one hand its resources and dynamic, and on the other hand current results and future ambitions (Love and Kraatz, 2009; van den Bosch, de Jong, and Elving, 2005).

As part of the symbolic approach, the notion of conformity does not express only the semantic adaptability that the company displays towards the relational partner (individual/consumer/target) through communication activities in which the company itself shares the same language with the reference target, but also a cognitive, emotional and cultural adjustment in terms of structures and practices (Love and Kraatz, p.316).

Symbolic representation, aimed at conformity, can be therefore seen as the process of creation/maintenance of corporate reputation, which covers both spontaneous and planned communication activities.

Spontaneous communication results from corporate behavior seen as expression of values, culture and corporate personality.

Planned communication (corporate identity) is on the other hand the symbolic representation (visual identity) of what the company is (corporate brand) and of what it offers in terms of values and culture (product brand) (Fombrun and van Riel, 2003).

Van Riel and Balmer (1997) define corporate identity as 'the way in which an organization's identity is revealed through behavior [and] communications, as well as through symbolism to internal and external audiences' (van Riel, and Balmer, 1997).

The *process of corporate identity* is that set of marketing and communication activities undertaken by the company in order to build favorable associations and positive reputation towards all stakeholders (Hatch, and Schultz, 2008).

The creation of a corporate identity, either of brand or of product, is aimed at achieving a high level of recognition by relevant stakeholders and at developing the ability to transfer value to them. Corporate identity has therefore the purpose of helping the individual/evaluator to develop his perceptions by reducing the risk linked to the purchase of company products.

We can say that corporate brand is a 'script' that simplifies the decision-making process while associations, developed on the basis of expectations, are about cognition, affection, evaluations. Such evaluations (corporate image) represent the result of perception that stakeholders, as recipients of corporate behavior, develop either towards the distinctive/competitive capabilities of the company (with relation to finance, organization, production, sales, etc.) or towards the corporate essence compared to that of other companies (van Riel and Fombrun, 2007; Rindova et al, 2005; Barnett and Salomon, 2006).

Fombrun (1996) defines reputation as an asset that, according to the resource-based view (Barney, and Arikan, 2001), is expression of inimitable distinctive capabilities the company holds compared to its competitors, although it must be stressed that reputation is, unlike other assets, a resource stored in the mind (image) of the targets of corporate behavior/signals.

According to such principles the firm, both through planned and spontaneous marketing and communication activities, tends to create, maintain and develop its reputation on the basis of two main goals: being known and being known for something (Lange, Peggy and Dai, 2011). The *being known* goal is about stimulating and developing stakeholders' awareness in order to make the company/organization/brand prominent compared to its competitors, with relation to both social behavior and corporate essence, the latter considered in a holistic perspective.

Being known for something, on the other hand, is about the intention of the company to be perceived by stakeholders as different from its competitors, as a result of specific features of the product/service offered (see Fig. 2).

In order to achieve survival in increasingly competitive markets, the company needs to deliver features that allow observers/stakeholders to assess qualities and essence compared to its peers. Such assessment develops over time and with relation to skills and qualities expressed/communicated by the organization towards a target audience, and set out to differentiate the company from other competitors.

The evocative/communicative process, therefore, brings clearly out the importance of a symbolic approach aimed at creating cultural consonance with the reference target/audience (Rao, 1994; Staw and Epstein, 2000; Love and Kraatz, 2009).

It is important to emphasize how the socially compliant behavior of the company has implications not only in terms of social legitimacy, but also in terms of reputation, and therefore of competitive differentiation.

Fig 2: Reputation and Legitimation Process

The support that legitimacy provides to reputation takes place either when the company adopts a behavior aimed at purely economic ends, or when the stakeholder's behavior has evaluative purposes aimed at differentiating the company according to cultural and/or qualitative criteria. In this regard it is useful to refer to a study by Staw and Epstein (2000) that provides a compelling example of this proposed 'symbolic conformity mechanism'.

They found that firms enhanced their reputations by adopting various popular management practices (e.g. total quality management, employee empowerment, and teams). They argued that this effect occurred because these practices embodied the normative values and cultural beliefs of the audiences who *ascribed* the reputations.

In conclusion, conventional thinking holds that legitimacy is a requirement of all organizations whereas reputation is a desirable, but not essential property.

Conclusions and future research directions

In a historical moment like the current one, where internationalization strategies seem to be paramount to corporate survival, developing and maintaining a state of legitimacy in new markets/

territories is a crucial step both to build idiosyncratic elements that enable competitiveness and to contribute to the enhancement of the contexts/territories in which the company becomes a value element.

This work aims to provide scholars with new insights for further research about the identification of corporate behavior affecting either legitimacy or reputation of the company, and its potential development.

As to practitioners, the main goal of the work is to stimulate a reflection on planning awareness, both strategic and operational, and on marketing and communication behavior, aimed at competitive challenge and at displaying the social role the company plays towards a territory/context/community. In the strategic phases of segmentation and positioning, it becomes therefore important to take into account both social and economic stakeholders, in order to better plan corporate behavior. We may conclude this work by emphasizing the mutual relationship existing between reputation and legitimacy.

Such relationship gives the company greater visibility and credibility, also against its competitors, when it behaves according to social expectations.

On the other hand, reputation tends to affect legitimacy when competitive behavior is carried out according to contextual standards, values and beliefs.

Finally, it is important to consider that the condition of legitimacy may represent an added value to the context, either spatial or industrial, where the company operates. In order to stimulate future research, it may therefore be interesting to evaluate how perception within the reference contexts is affected by corporate legitimacy, in terms of either territorial or industrial development.

DO FIRMS MANAGE THEIR SOCIAL NETWORK REPUTATION? AN INTERNATIONAL FACEBOOK AND TWITTER STUDY

Becker, Kip¹; Nobre, Helena²

¹ Boston University, USA (kbecker@bu.edu)

² Boston University, USA (hnobre@bu.edu)

Abstract

Social networks are increasingly becoming a dynamic force in firm or brand reputation management. There are numerous examples of how single voices using viral systems have, in a matter of days, reached out to millions about poor service or flawed products. Managing social networks is, however, not without cost (financial or time) and thus it is reasonable to assume that larger companies would have better defined strategies for social network reputation management than smaller ones. These strategies would result in their responding more rapidly and in a more meaningful manner than medium or small companies. The research explores this assumption and offers an integrity management model to replace prior more company focused ones. The social network activities of 189 different size companies taken from the three major world stock markets representing North America (NYSE) and Asia (Hong Kong/HKSE and Japan/TSE) Results supported that larger companies are slightly more responsive but smaller firms seem to respond more quickly. Of interest was (1) the number of firms (of all sizes) without social media site, (2) The high number of firms that failed to respond to site postings and (3) the length of time it took firms to respond. Given the potential negative impacts to brand and company image there appears to be a pervasive lack of strategic framework as most firms in the study were not monitoring, integrating or leveraging social media adequately.

Key words: social networks, reputation management, business continuity, company image management, brand image, Facebook, twitter

Introduction

The fears of companies, resulting from numerous actual incidences over the past few years, and the often disorganized responses to them, have resulted in an increased awareness of the need for corporate social network business continuity programs designed to mitigate threats to the brand and company image. Previously the major responsibility of business continuity programs was to assure that a firm could operate after facing supply chains disruptions, damaged manufacturing facilities or critical human resources disturbances. It is clear now that in order to mitigate threats monitoring and responding to the highly interactive social network environment must be added to the list of a firm's business continuity activities.

Recognition of the importance of brand and company image, how that image is established as well as factors that might influence the bond (to include word of mouth campaigns, catastrophic events and product recalls) is of increasing importance. This is highlighted by such recent events as: Nestlé's

(2010) forced adoption of a new policy to identify companies linked to deforestation after a social network expose by Green Peace, the negative social network postings when hackers obtained personal information about millions of Sony's (2011) game station users, McDonald's (2012)Twitter ad campaign which backfired causing consumers to express anger through the social media site and Verizon wireless (2012) having to drop plans to charge a fee for customers paying their bill online after an online social network petition, which massed 100,000 signatures, called on individuals to drop Verizon. Each of these occurrences resulted in significant negative image effects and serves as a reminder that the nature of a consumer relationship, and how it is developed or maintained, can directly affect whether it will withstand short term disruptions. With the increasingly popularity of social online communities it is clear that companies need to take cautionary measures in protecting reputations and brands.

Prior to social networking (SN) consumer's word of mouth (WOM) complaints were normally isolated leaving the dissatisfied individual a single and ineffectual voice. With the aid of viral networks these single voices now have the ability to quickly garner the attention of millions. It is clear that in less than a decade advanced technologies have developed a global communications network that has redefined social interaction. As in society in general not all individuals are of equal influence. According to Brown and Duguid (2002) the ability to develop a social network reputation is essential if one is to exert influence or power. They believe that feedback from members of a social network is essential in the formation of a digital reputation and acts collectively in allowing others to assess if a person possess the knowledge, experience and expertise he/she claims to have and whether the creation of a strong tie with that individual would be advantageous.

The idea that social interaction can be a powerful marketing force is not new. Kozines (March, 2010 p.71) calls attention to Ryan and Gross's 1946 statement six decades ago that, "conversations among buyers were more important than marketing communications in adoption" as one of the first articles addressing consumer interaction. While firms have been striving to understand how to best use influencers of social networks to their marketing advantage it is important to additionally appreciate that these same powerful systems can turn against a firm and possess the ability to damage productivity and reputation. These instant communications of social networks have made it possible, due to widespread and low cost information, for rapid disruptions to a firm's image to occur for legitimate, or less than legitimate, reasons. Such disruptions can put long term pressures on the company-consumer relationship by altering consumer perceptions of the brand and/or the company. Firms that appreciate this new force can often avoid, or lessen, the impact of potential social network damage.

The importance of including social networks in an overall business strategy plan as well as in a firm's business continuity programs cannot be overstated. Consider that in 2008 sixty six percent of business stated that the emergence of blogs and social media had changed the way their organizations communicated. Only a year later this figure had risen to 73 percent (Wright, D. & Hinson, M. 2009).

Many firms have social network programs (such as Facebook and/or Twitter) in place. Simply having a social network is, however, not sufficient as firms must be engaged with those sites through active monitoring, timely responses and constantly seeking ways to develop consumer trust and loyalty. One of the critical aspects in developing a social network relationship relates to trust. Invoke Solutions (2010), a social media research company, “found that the most trusted information was posted by people respondents knew, “people like them” – their friends, family and other online peers. Blog posts were more likely to be trusted “completely” than posts on Facebook and trust dropped off sharply when it came to Twitter. Twitter streams were trusted less than other media, even amongst friends” (MacAlpine, 2011). The result of a broad research project by Invoke Solutions also yielded several insights into the features that are important in developing trust. It is interesting to note that the most significant factor in developing trust was not the size of the reader base, or the how long a person had been engaged with the company’s social media, but whether the site was open to dialog (meaning both positive and negative postings) and if there was high level quality of the content. This observation clearly highlights the importance of not just having a SN site but maintaining an active free environment for users while professionally monitoring and being responsive to site postings.

In the era of social media, marketing managers’ control over the content, timing, and frequency of information is being severely eroded. In the new paradigm, information about products and services also originates in the marketplace. This information is based on the experiences of individual consumers and is channeled through the traditional promotion mix. However, various social media platforms, many of which are completely independent of the producing/sponsoring organization or its agents, magnify consumers’ ability to communicate with one another. This “groundswell” (Li & Bernhoff, 2008) has profoundly affected all aspects of consumer behavior, and has bestowed consumers with power they have not previously experienced in the marketplace (p 360).

Consumers’ ability to communicate with one another limits the amount of control companies have over the content and dissemination of information. Christopher Vollmer and Geoffrey Precourt (2008) underscore this in their book, *Always On*. As they note, in the era of social media “consumers are in control; they have greater access to information and greater command over media consumption than ever before” (p. 5).

In the new communications paradigm marketing managers need to recognize the power and critical nature of the discussions being carried on by consumers through social media. Of particular importance to corporations is that social media is perceived by consumers as a more trustworthy source of information regarding products and services than corporate-sponsored communications transmitted via the traditional elements of the promotion mix (Foux, 2006 p. 360)

Robert Kozines (March, 2010 p.71) in a historical perspective of word of mouth (WOM) research offers a series of models to explain how WOM, and the company reactions to it, have changed over time. In one the earlier WOM stages, The Organic Interconsumer Influence Model, Kozines notes that what is involved is action by one consumer to another without direct prompting, influence, or

measurement by marketers. According to Kozines this stage was followed by the Linear Marketer Influence Model where marketers attempted to influence consumer WOM. It was during this stage that companies began to recognize the concept of the opinion leader and how these individuals could be used to sway consumer preferences.

The importance of including social networks in an overall business strategy plan as well as in a firm's business continuity programs cannot be overstated. Consider that in 2008 sixty six percent of business stated that the emergence of blogs and social media had changed the way their organizations communicated. Only a year later that figure had risen to 73 percent (Wright, D. and Hinson, M., 2009).

Network social groups obtain their power in the same manner that Inter-networks do. Robert Metcalf's law, designed to illustrate how connected computer networks on the LANS and WANS derived their value, is equally valuable in helping to appreciate how social network derive theirs. Metcalf's law states that the "value" or "power" of a network increases in proportion to the square of the number of nodes on the network (Hendler, J. and Golbeck, J., 2007). This means that as the number of people in a network grows the value of the content they share grows exponentially. For example, if there are 10 people in a social net the power of the structure is 10^2 or 100. If the number is, however, increased by simply one member the power now becomes 11^2 or 121. This explains why viral networks can be so dangerous by quickly engaging thousands of members/viewers. With this in mind it becomes clear that a firm must be proactive with social network communities establishing and maintaining strong communication ties. Jolly (2001) refers to company's choice of communication styles as either "dialogue" or "monologue" noting that companies traditionally have had a one way communication channel to their consumers. Companies now must establish interactive communications with the many social platforms consumers use to exchange ideas, cooperate and even to seek advice from consumers in what is considered as "social casting" (Jones, B., Temperley, J. and Lima, J., 2009). Companies must have well-conceived online social network strategies that call for implicit collaboration between a company and the social network environment in order to shape and protect their image. In response to the recognition that social network members can significantly influence the value (positively or negatively) of a company brand or image it is essential that firms actively, and passively, monitor social sites in search of potential threats.

Mangold and Faulds (2009) have noted that the social media communication paradigm now requires many important changes in company attitudes and assumptions about how to manage communications strategy as consumers are responding to social network information in ways that directly influence all aspects of consumer behavior, from information acquisition to post-purchase expressions of satisfaction and dissatisfaction. This consumer to consumer interaction means that managers who have been accustomed to exerting a high level of control over company-to-consumer messages must move away from the old models toward understanding relationship building to influence the discussions taking place in the social media space.

The need to influence social networks, to the degree possible, is highlighted within The Rising CCO III Shandwick (Jamison, G. & Gaines-Ross, L. 2010) an annual survey conducted by global executive search firm Spencer Stuart and global public relations firm Weber. The survey found that 34 percent of global chief corporate communications officers (CCOs) report that their companies experienced a social-media based reputation threat during the previous year. That firms have yet to incorporate social networks into their monitoring or business continuity plans is clear as the same report noted that approximately thirty-three percent of the companies stated that they were not prepared for managing social network reputational threats. This low figure raises questions as without a defined strategy firms remain vulnerable to attacks and can only operate in a defensive manner. The ease with which social networks seem to be dismissed as significant business threats, in spite of the clear examples, is troublesome.

While social networks pose threats to all size firms one would assume that large companies, by virtue of their resources, would be more prepared and active than smaller ones. A recent study (McCann, 2010) conducted by communications firm Burson-Marsteller noted "65% of the largest global companies have Twitter accounts, 54% had Facebook fan pages, and 50% have YouTube video channels" The study also noted that while financially significant for large firms a social media campaign can be "less than 1% of their overall marketing budget. The study while, discovering that a number of firms had accounts, did not investigate if the firms use these tools or if they were part of a organized communications strategy. It also left unanswered the fundamental questions of:

- Who monitors and controls the company social media sites?
- Who is responsible for observing what people are saying on the internet (chats, ratings and SNs)?
- How are posts noted and what are the guidelines for response?
- What is in place to monitor and act to influence reputation externally?
- What kind of information is collected and how/to whom is it forwarded for consideration?

The authors have developed a new model which expands the concepts of Kozines' Linear Marketer Influence Model to reflect the new reality that consumers (prosumers) have assumed a power base which operates external to company influence. While Kozines recognizes the importance of monitoring the social environment his model continues to focus power to the firm. The authors believe that a model of company/brand reputation management needs to reflect the continual interplay and accumulation of the many consumer networks as a dynamic ongoing and interconnected process. In the Consumer Initiated Integrity Model the marketer recognizes the geometric growth and power of Web Word of Mouth (WWOM) and continually monitors Internet postings while providing a meaningful and engaged relationship with the consumer (Figure 1)

Figure 1 . Consumer Initiated Integrity Model

The research addressed the Consumer Initiated Integrity Model's aspect of social media monitoring by directly monitoring the responses to the postings to company sponsored social networks sites (Facebook and Twitter). The purpose of the research was to explore the tenets that: (1) large firms would have more active presence in social media activities than small firms, (2) that these large firms would recognize the importance of an ongoing vigilance of their sites and (3) large firms would be in a better position to respond in a more value added manner. Facebook and Twitter postings were made to company social media sites to determine:

- The if large, medium and small size firms have social network platforms in place
- If these SN platforms are monitored and responded to
- The length of time to took a firm to respond related to the firm's size

To this end the following three hypotheses were formulated:

Hypothesis 1: Large firms will respond to social network (Facebook and Twitter) posts at a greater frequency than small firms.

Hypothesis 2: Large firms will respond more quickly to social network posts (Facebook and Twitter) than small firms.

Hypothesis 3: Large firms will post more positive category posts than small firms.

Research Methodology

Firms studied

One hundred and eighty-nine companies were selected in a random manner. 99 companies (33 each size) were from the Fortune 500, NSE midsize capitalization and the NSE small capitalization listings (2010 listings) and 45 companies (15 each size each stock market) were from listings (2010 listings) of

the large capitalization, midsize capitalization, and small capitalization on the Hong Kong (HKEX) and Japanese (TSE) exchanges. A post was made to the Facebook page of each firm and to the firm’s twitter site. Responses were classified into three categories: active, neutral and no response. Companies were considered to have responded to researchers actively if they not only replied to the post but also offered further help are considered “active response.” If a firm responded with a value added contribution (e.g. “interesting research”, “can I help more”) the response was considered active. A firm that responded with simply doing what was requested (note the posting) was considered neutral and firms that failed to respond were classified, no response.

The time of the posting was noted as was the time of a response (if there was one). The Facebook site and the Twitter site of each firm was monitored every five minutes for the first hour and then on a systematic basis for a total period of seventy-five hours. The posting on each company site was standard. The posting on Facebook was “Boston University Research Project in Reputation Management. Could the company Facebook site manager respond to let us know this post was seen. Thank you.” and the posting to the Twitter site was “Boston University Research Project in Reputation Management. Could you respond to let us know this post was seen. Thank you.’ The Twitter posting was slightly different than the Facebook posting due to the limit of 140 characters.

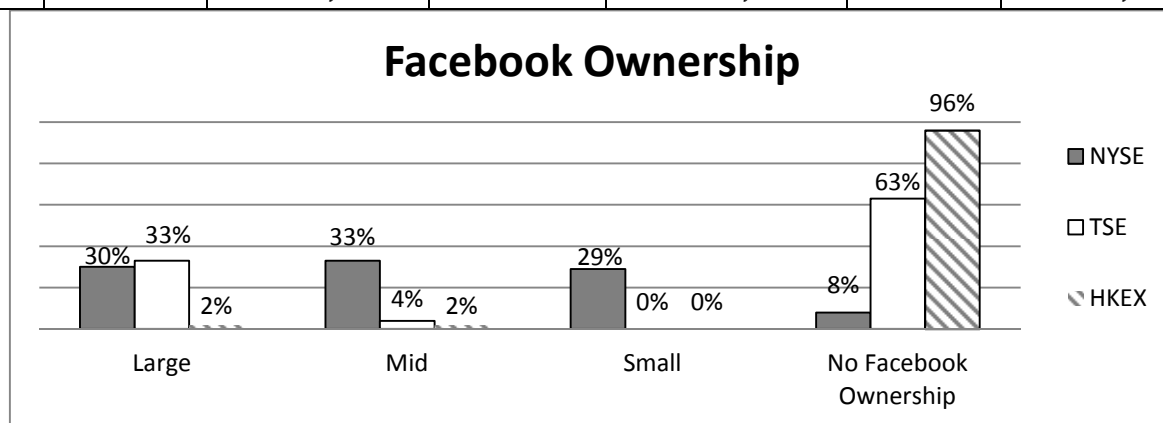

Figure 2. Facebook Ownership by Exchange

Results (By Country Index)

Figure 2 is a demonstration of 99 firms listed on the NYSE, 45 firms listed on the TSE and 45 firms listed on the HKEX. The percentage of total Facebook ownership is as follows: 92% (92 out of 99) of firms listed on the NYSE, 37% (19 out of 45) of firms listed on the TSE and 4% (2 out of 45) of firms listed on the HKEX. As for large sized firms listed on the three different stock markets with Facebook ownership, 30% (30 out of 99) of large sized firms listed on the NYSE, 33% (15 out of 45) of large sized firms listed on the TSE and 2% (1 out of 45) of large sized firms listed on the HKEX have Facebook ownership. As for medium sized firms listed on the three different stock markets, 33% (33 out of 99) of medium sized firms listed on the NYSE, 4% (2 out of 45) of medium sized firms listed on the TSE and 2% (1 out of 45) of medium sized firms listed on the HKEX have Facebook ownership. As for small sized firms listed on the three different stock markets, 29% (29 out of 99) of small sized firms listed on the NYSE, 0% (0 out of 45) of small sized firms listed on the TSE and 0% (0 out of 45) of small sized firms listed on the HKEX have Facebook ownership. Firms listed on the three stock markets with no Facebook ownership are as follows: 8% (7 out of 99) of firms listed on the NYSE, 63% (28 out of 45) of firms listed on the TSE and 96% (43 out of 45) of firms listed on the HKEX don't have Facebook ownership.

Figure 3. Twitter ownership by Exchange: NYSE, TSE, HKEX (Large: L, Medium: M, Small: S, No Twitter: N.T)

Figure 3 provides information relating to the Twitter ownership of 99 firms listed on the NYSE, 45 firms listed on the TSE and 45 firms listed on the HKEX. The percentage of Twitter ownership is as follows: 90% (90 out of 99) of firms listed on the NYSE, 35% (16 out of 45) of firms listed on the TSE and 0% (0 out of 45) of firms listed on the HKEX have Twitter ownership. As for large sized firms listed on the three different stock markets with Twitter ownership, 32% (32 out of 99) of large firms listed on the NYSE, 31% (14 out of 45) of large firms listed on the TSE and 0% (0 out of 45) of large firms listed on the HKEX have Twitter ownership. As for medium sized firms, 30% (30 out of 99) of medium sized firms listed on the NYSE, 2% (1 out of 45) of medium sized firms listed on the TSE and 0% (0 out of 45) of medium sized firms listed on the HKEX have Twitter ownership. As for small sized firms, 28% (28 out of 99) of small sized firms listed on the NYSE, 2% (1 out of 45) of small sized firms listed on the TSE and 0% (0 out of 45) of small sized firms listed on the HKEX have Twitter ownership. Firms listed on the three stock market with no Twitter ownership are as follows: 10% (9 out of 99) of firms listed on the NYSE, 65% (29 out of 45) of firms listed on the TSE and 100% (45 out of 45) of firms listed on the HKEX.

Figure 4. Total Facebook Response: NYSE, TSE, HKEX (Large: L, Medium: M, Small: S, No Response: N.R.)

Figure 4 depicts the Facebook responses of firms listed on the NYSE, TSE and HKEX. Out of the 92 firms listed on the NYSE with Facebook ownership, 29% (26 out of 92) responded while 71% (66 out of 92) did not respond. Out of the 17 firms listed on the TSE with Facebook ownership, 18% (3 out of 17) responded while 82% (14 out of 17) did not respond. Out of the 2 firms listed on the HKEX with

Facebook ownership, 50% (1 out of 2) responded. As for large sized firms listed on the three different stock markets, responses to Facebook were as follows: 33% (10 out of 30) of large sized firms listed on the NYSE, 20% (3 out of 15) of large sized firms listed on the TSE and 0% (0 out of 1) of large sized firms listed on the HKEX responded. As for medium sized firms listed on the three different stock markets, responses to Facebook were as follows: 30% (10 out of 33) of medium sized firms listed on the NYSE, 0% (0 out of 2) of medium sized firms listed on the TSE and 100% (1 out of 1) of medium sized firms listed on the HKEX responded. As for small sized firms listed on the three different stock market, responses were as follows: 21% (6 out of 29) of small sized firms listed on the NYSE, 0% (0 out of 0) of small sized firms listed on the TSE and 0% (0 out of 0) of small sized firms listed on the HKEX responded.

Figure . Facebook Responses

	NYSE Twitter Response		TSE Twitter Response

		51 out of 90		12 out of 16

Figure 5. Twitter response: NYSE, TSE, HKEX (Large: L, Medium: M, Small: S, No Response: N.R.) (HKEX has no Data / No Twitter ownership)

Figure 5 demonstrates the total Twitter responses of the firms listed on the three different stock markets. Out of the 90 firms listed on the NYSE with Twitter ownership, 44% (39 out of 90) responded while 56% (51 out of 90) did not respond. Out of the 16 firms listed on the TSE with Twitter ownership, 25% (4 out of 16) responded while 75% (12 out of 16) did not. Firms listed on the HKEX had no Twitter response because they had no Twitter pages. As for large sized firms listed on the three different stock markets, responses to Twitter were as follows: 47% (15 out of 32) of large sized firms listed on the NYSE responded while 29% (4 out of 14) of large sized firms listed on the TSE did. As for medium sized firms, responses to Twitter were as follows: 50% (15 out of 30) of medium sized firms listed on the NYSE responded while 0% (0 out of 1) of medium sized firms listed on the TSE. As for small firms, responses to Twitter were as follows: 32% (9 out of 28) of small firms listed on the NYSE responded while 0% (0 out of 1) of small firms listed on the TSE did.

	NYSE Attitudes of Tonality			TSE Attitudes of Tonality			HKEX Attitudes of Tonality

	0 out of 22	15 out of 43	42 out of 117	0 out of 1	0 out of 6	1 out of 26	–	0 out of 1	0 out of 1

Figure 6 presents the Attitudes of Tonality for the firms listed on the 3 different stock markets. . As for Large sized Firms, attitudes of tonality were as follows: NYSE large sized firms were, 45% (10 out of 22) active, 35% (15 out of 43) neutral and 32% (37 out of 117) had no response. TSE large sized firms were, 100% (1 out of 1) active, 100% (6 out of 6) neutral and 85% (22 out of 26) had no response. HKEX large sized firms were, 0% (0 out of 1) active, 0% (0 out of 1) neutral and 100% (1 out of 1) had no response. As for medium sized firms, attitudes of tonality were as follows: NYSE medium sized firms were 55% (12 out of 22) active, 30% (13 out of 43) neutral and 32% (38 out of 117) did not respond. TSE medium sized firms were, 0% (0 out of 1) active, 0% (0 out of 6) neutral and 12% (3 out of 26) had no response. HKEX medium sized firms were, 0% (0 out of 1) active, 100% (1 out of 1) neutral and 0% (0 out of 1) had no response. As for small sized firms, attitudes of tonality were as follows: NYSE small sized firms were 0% (0 out of 22) active, 35% (15 out of 43) neutral and 36% (42 out of 117) had no response. TSE small sized firms were, 0% (0 out of 1) active, 0% (0 out of 6) neutral and 4% (1 out of 26) did not respond. HKEX small sized firms were, 100% (1 out of 1) active, 0% (0 out of 1) neutral and 0% (0 out of 1) had no response.

Figure 6. Attitudes of Tonality: NYSE, TSE, HKEX (Large: L, Medium: M, Small: S)

Figure 7 demonstrates the average time of reply for firms listed on the three different stock markets. As for firms listed on the NYSE and TSE, the average time to reply was as follows: 10 large firms listed on the NYSE replied in 7.66 hrs while 3 large firms listed on the TSE replied in 3.56 hrs. As for medium firms listed on the NYSE and the HKEX, 10 medium sized firms listed on the NYSE replied in 3.53 hrs while 1 medium sized firms listed on the HKEX replied in 2.0 hrs. 6 small sized firms listed on the NYSE replied in 2.80 hrs. As for Twitter responses for firms listed on the NYSE and TSE, responses were as follows: 15 large sized firms listed on the NYSE replied in 8.71 hrs while 4 large sized firms listed on the TSE replied in 0.50 hrs. As for Twitter responses for medium sized firms listed on the NYSE, 15 medium sized firms replied in 5.53 hrs. 9 small sized firms listed on the NYSE replied in 1.27 hrs.

	NYSE Average Time of Reply		TSE Average Time of Reply		HKEX Average Time of Reply

Figure 7. Average Time to Reply: NYSE, TSE, HKEX (Large: L, Medium: M, Small: S)

Conclusions

The purpose of the research was to investigate the social media sites of three different size firms and how the management of the sites could relate to maintaining a company’s online reputation. It is interesting that in some of the areas investigated companies behaved in a similar manner regardless of size and in some areas there was a difference. In contrast to Twitter which remained open (when available) to posts by consumers, almost all companies imposed controls on their Facebook pages. For an individual to post a comment on most the company sites surveyed one first had to “like” or become a “fan” of the company. A significant number of companies would not allow individuals to comment directly on their home Facebook pages and when they did the

comments normally went to a second level page. Most of the small and medium cap companies acted the same as Fortune 500 companies by not allowing individuals' comments to be posted on their Facebook pages. In our investigation, regardless of capitalization size, companies listed on NYSE were dominant in number of Facebook and Twitter page ownership. The majority of NYSE firms had Facebook (92% F) and Twitter (90%T) sites. This number, however, fell significantly when reviewing Japanese ownership (36%F /35%T) FSE) and became essentially nonexistent with firms on the HKEX (only 4%F /0%T). This indicates that while a true international phenomenon and the majority of Facebook members outside the United State worldwide companies, unlike their consumers, have not embraced social networks.

The first hypothesis that large firms would respond to social networks at a greater frequency than small firms was supported. The relative size of the firm was related to the frequency of response as large firms had the most responses, followed by medium with small firms having the fewest. United States firms had the greatest number of responses in each of the three categories and only large firms on the TSE responded (HKEX is discounted as only two firms of the 45 questioned responded).

The second hypothesis that large firms will respond more quickly to social network posts (Facebook and Twitter) than small firms was not confirmed and the opposite was observed. It is interesting that when small firms responded they did so quicker than large firms and tended to use Twitter. This finding is limited to NYSE firms as only large firms responded on the TSE and only medium ones on the HKEX. Companies respond faster on their twitter pages than they did on their Facebook pages. The reason could be that the twitter instant-message environment encourages more immediate communication. The use of Twitter might account for the lack of value added responses as fewer characters (140) are available to respond. It might also point to the use of mobile devices for small firm monitoring which makes longer messages more cumbersome and thus less likely.

The third hypothesis, that large firms will post more positive category posts than small firms was supported as the large size firms of the NYSE and TSE both had more positive responses than the small firms (the HKEX discounted due to only one response). While small companies tended to respond quicker than large companies, the quality of their response (judged by tonality) was less. Given that no small firm provided anything other than a neutral response (or no response) might further indicate that small size firms may not be devoting resources to maintain a professionally trained staff so as to quickly and personally reply to social network posts. In the United States (NYSE) there was a higher percent of active mid-size company responses. One might wonder if medium firms are better positioned for social network activities (responses) having more funds to devote to social network activities than small firms but are, at the same time, not as encumbered with massive slow moving bureaucratic processes as the larger ones.

The results indicate that while the business world is aware of the power that social networks can yield, companies of all sizes remain naïve as to how to establish truly interactive consumer

relationships. While this may appear surprising, the general lack of appreciation for the increasing importance of social networks is not new. Murphy (2006) found an overall lack of either presence or response to sites pointing out that some traditional marketers believe that they have nothing to gain from customer empowerment. Sing (2008) provided some insight into why many firms have taken a rather passive approach to social networks stating that, "Marketers have been accustomed to telling the customer the message they want the customer to hear, rather than the message the customer truly cares about" (Singh, et. al, 2008 pp. 282). Without providing for consumer interaction one could question if most company social network sites are not merely extensions of the firm's static webpages. It seems that while many firms in Japan and the United States have recognized the need to establish social network sites most, however, do not know what to do with them.

Generally there appears to be a lack of a strategic framework as most firms were not monitoring, engaged, integrating and leveraging social media adequately. Mangold and Faulds (2009) have noted that the social media communication paradigm now requires many important changes in company attitudes and assumptions about how to manage communications strategy as consumers are responding to social network information in ways that directly influence all aspects of consumer behavior, from information acquisition to post-purchase expressions of satisfaction and dissatisfaction. Unfortunately it appears that few firms have seriously responded to Jones (2009) observation that firms need to have well-conceived online social network strategies that call for implicit collaboration between a company and the social network environment in order to shape and protect their image.

The study clearly points out that while growing globally each year companies have yet to incorporate social networks into their monitoring or business continuity plans. An unexpected finding was the number of non-monitored social networks and that, regardless of category; few firms were actively involved with their own social media to the extent one would expect. An overall observation was that firms appear unclear how to properly use social networks as a significant number did not respond to postings on the firm's Facebook or Twitter sites. The high non response rate for both small and large firms indicates that all size firms have yet to seriously focus on the use of social networks as a part of an overall integrated communications strategy. This is a worrisome finding given importance of social networks to the development and maintenance of a brand or company image.

Abstract

The purpose of this paper is to explore children awareness of currency notes and coins, source of money knowledge among children and to investigate the knowledge of money among children.

Based on structured interview of 53 children from IIUM Educare, descriptive analysis was conducted on items designed to measure children's awareness towards money including source of money knowledge for children.

Results indicate that children recognize currency notes more accurately as compare to coins. As well as for many children mothers are main source of money knowledge. Through this paper it is also revealed that children actively participate in grocery shopping.

These results are important for parents and marketers. As parents are key players in the life of children and they can be considered as an effective source of knowledge. The role of children is also evident from this research in grocery shopping.

Keywords: Education, money, knowledge, children, parents, Malaysia

Introduction

The sixth internationally agreed Education Goals adopted in Dakar Framework for Action 2000-2015 aim to meet the learning needs of all children, youth and adults by 2015:

Goal 1: Expand early childhood care

Goal 2: Provide free and compulsory primary education for all

Goal 3: Promote learning, life skills for young people and adult

Goal 4: Increase adult literacy by 50 %

Goal 5: Achieve gender parity by 50 %

Goal 6: Improve the quality of education

(World Education Forum Dakar, Senegal, 2000)

It can be inferred from above mentioned goals that during 2000-2015 main emphasis will be on improving literacy rate. But this increase in literacy rate will not be at the cost of quality as it is mentioned in Goal 6. Under the light of Goal 1 and Goal 2 educating kids at a very early stage is of primary objective.

Islam also elaborates importance of education through Quran and *Sunnah*. And this is also evident from the life of Prophet Muhammad (Peace be upon him) and *Sahabah* that education is integral for every society. The very first revealed word of Holy Quran was "Iqra" which means READ! Seek knowledge! Educate yourselves! Be educated. (Holy Quran, Surau 96)

This importance of education is very well understood by western world and according to Melinda Gates (2009) in an interview "A great education sets a kid on a really fantastic. But the public school system serves only about one-third of kids really well. We know how much we both benefited from an incredible education. That's something every kid ought to have."

Quality Education

If one limits education only to get children into school then it is only half of the battle. The rest is getting quality education and one that fits in his/her life and interests and aspirations as well as those of his/her families (Jensen et. al. 2008).

But as this is era of globalization so the role of information technology and media is enormous nowadays so at elementary level, educating children about money is integral and most critical than ever before. Parents should start establishing awareness of money among children at early age whereas teachers at school should teach children about money so the importance, value and its use can be recognized. These early lessons will help them about spending and saving of money.

Why children?

The total population of United States of America in July 2010 was 310 million out of which almost 20% are up to the age 14 years where as the population of European Union is 491 million. From this 491 million 15% fall within the age of 14 years. Australian population is 21 million and almost 17% are under the age of 14 years. The Malaysian population is 26 million and 31 % population is under the age of 14 years (CIA World Factbook, 2010). So this important group should be targeted in such a dynamic way that after ten to fifteen years they can be fruitful for Malaysia. After reading this we, the authors, decided to study about money awareness of children who are in the age bracket of 5 and 6 years in Malaysia.

Research Objectives

Following are the main objectives of research:

- To explore whether children are aware of denomination of currency notes and coins.
- To identify the source of money knowledge among children and their shopping behaviour.
- To investigate if health claim can shift their food preference towards healthier food.

Money Education for Children in Malaysia

After going through the literature it is revealed that in Malaysia so far no study has been conducted through which the money awareness among children can be judged. So authors started research paper to fill the mentioned gap. The authors intend to explore the money knowledge among Muslim children in Malaysia. Under the light of above mentioned objectives authors intend to study the money knowledge it into four dimensions. In the very first phase denominations of coins and currency notes were asked followed by asking that who is the main source of money knowledge for them. In the third step children were asked about their participation in grocery shopping with parents. In the last step their preference with stimuli and without stimuli is surveyed.

Literature Review

Definition of Children

Definition of child is prominently defined in Laws of Malaysia Act 611 under Child Act 2001 and it is clearly mentioned in the following words "Child means a person under the age of eighteen years". In the later part of the same act it has been written that Child is not only a crucial component of Malaysian Society but also key to its survival, development and prosperity. Under the light of mentioned act so much stress is given on families and guardians to give proper attention to children in order to secure the future of Malaysia.

Money

Definition of "Money" given by www.businessdictionary.com is anything of value that serve as

- Generally accepted medium of financial exchange
- Legal tender for repayment of debt

- Standard of value
- Unit of accounting measure
- Means to save or to store purchasing power.

The one aspect and which is of great importance for parents is Understanding of Money by Children. To create sensible awareness of money worth is the top most concern among parents. (Mitchell et al., 2003). Living standard and spending pattern of family has an enormous impact on children's perception about money. Teachings about managing money effectively starts well before school age so that a foundation can be laid for wise usage of money by children. (Mitchell et al., 2003)

Knowledge

There is no exact definition of knowledge. However many experts are unanimously agreed that knowledge is an organized combination of ideas, rules, procedures and information (Bhatt, 2000). The word of knowledge can be defined as range of one's information or understanding. (<http://www.merriam-webster.com/dictionary/knowledge>)

So from above mentioned definitions it can be inferred that knowledge is exploring and knowing something. It can be by experience, practice or by some practitioner or expert.

Awareness of Money among Children

Many books appeared to help parents regarding establishing awareness of money, about jobs and about the economic world (Godfrey, 1994; Rendon & Krantz, 1992). The importance of education is also evident from Quran and Sunnah. According to National Child Education Conference and Exhibition 2009 "Preschool education is an economic investment not to be underestimated. It is the cornerstone for higher education, it promotes a child's self esteem and gives your child the edge needed for lifelong success".

A report of UNICEF in 2009 instructed that in times of crisis or periods of peace, in cities or remote villages, we are committed to realizing a fundamental, non-negotiable goal: quality education for all.

Money Awareness by Education

Infact the education of a child starts by parents. When start discussing things, or buy toys for them or take them to supermarkets for grocery shopping or even while driving or at any park the child as an observer ask questions and register all the activities of his/her parents. During playing games adults may have opinion that children are playing but genuine, significant work is happening. (Rivera, 2009).

According to Toye (2007) in an article written by him in NH Business Review in 2007 title "Teach Your Children Well About Money" said that that financial matters of family should be discussed with children although they are not earning but they are affected by financial decisions by parents.

Allowances and Children

Early researchers like Marshall (1964) and Marshall et. al. (1960) mentioned that allowances given by parents to the children has nothing to do with the money knowledge of children. But it is mentioned by Stipp (1988) that children's main source of money are allowances given by parents and gifts. In 2001 Furnham investigated and found that 91% of parents believe that children should get allowance and it should be in "S" shape means it should be increased gradually. This allowance should be started from the age of 6 Years. Periodic allowances should be given to children so that sense of spending, sharing and habit of saving can be institutionalized in kids (Kimberly Vanderbeek, 2000). Amount of allowance varies with age. As the child grew older the amount of allowance should be increased accordingly which gives sense of responsibility to children (Mitchell et. al., 2003). Guidance of parents regarding spending of allowance is of great importance. At times siblings or relatives or gift money can also be source of allowances.

Simultaneously during grocery shopping parents should involve children so they can realize the worth of money while purchasing goods. As shopping also educates them about the financial position of their parents so while purchasing they can make wise decisions.

Money Education and Schools

Education becomes more sophisticated and structured at the age of 3 or 4 or 5 when children are admitted to school so that they can be able to interact with other classmates, teachers and learn how to be successful. According to an article title *The Truth About Kids* by Peg Tyre written in 2009 that pre kindergarten lesson should be regarding value of money which can be done by sorting change into coins. But the teachers expectation to children at this very lesson should be very low. But during early elementary school, children should be told about currency name, denomination of currency notes or coins. So these lessons by teacher and parents should be continuous. The idea of money box really served good. Through these money boxes children can keep putting money in that box which can be opened by them at any time. By doing this they can be able to understand the worth of small denomination notes or even coins that when they keep on putting small currency notes or even coins it become big after certain period of time.

If parents dole out money to children then their exposure towards currency will remain limited and can hamper in establishing their understanding about money (Mitchell et al., 2003). And they can be more dependent on this doll system.

Sources of Money for Children

Sources of children's money are allowances, earnings, gifts and money given by parents. This money is either given for required family spending or as incentives or for extracurricular activities (Caplow 1982; Dunsing 1956; McNeal 1979). This pocket money, allowances and even earnings can educate the children more about money.

The role of parents is evident from above discussion and it can be inferred that they are major source of money. But regarding money knowledge teachers can also play their role in establishing awareness of money among children.

But there are certain other sources of money education or even sources of money for children for example relatives which include siblings, uncles and aunts. On birthdays, Eids, Christmas or at any other special occasion children receive money from their beloved ones. At times when students get good grades in exams they receive gifts in shape of money so they can be encouraged.

Sources of Money Awareness for Children

Teachers and parents are contributing towards money education to children. Economic lessons are becoming more vital now than ever before. (Peg Tyre, 2009). Wise mentors and teachers know the importance of "play" which can also be treated as international language of learning. So by introducing different games in kindergarten or school students and children can be educated regarding value of money. Children can also be allowed to make payment at grocery store, put the money in parking meter or they can be involved in similar kind of experience. (Vanderbeek, 2000).

This education of money to children can be termed as **EduKioMoney** (Asif et. al. 2009). In fact teachers at school and parents during shopping and at home can play their role in establishing understanding of money for children.

The research was done by structured Interviews to school going children. The age group will be from 5 years to 7 years. They will also be offered certain things and their priority will be assessed that whether they go for expensive goods or cheaper ones. Then on the basis of this analysis authors will infer about **EduKioMoney** that how well the kids have understanding about money.

They were also shown coins and currency notes and it has been observed that whether they are familiar with the denominations or not.

Population and Sample Size

The sample included the children who are in the age of five and six years. For experimentation and observation purpose authors contacted to IIUM Educare where children from different

countries are studying. Total fifty three students participated in the experiment and were observed as well. Twenty two boys and thirty one girls were participated in the data collection procedure. Whereas the age of twenty eight student was five years and twenty five students were in the age of six years.

Conceptual Framework

Design

First of all a letter was send to the parents of students to get permission to include their child in experimentation and observation. Through that letter the education level and the income of parents was asked. Almost fifty one percents parents did not mention the their income. As far as education is concerned more or less fifty percent did not mention their education level.

In the experiment students were shown 5 cent, 10 cent, 20 cent and 50 cent coins. They were also shown currency notes of Rm1, Rm 5 and Rm 10. In this phase their understanding about the currency was judged.

In the second phase they were asked about the source of money education and were asked that whether they go with their parents for grocery shopping or not. And tried to inquire about their response during shopping like whether they participate in shopping or not and what kind of item they purchase if they were allowed to purchase something.

In the last phase the students were asked about their response with and without stimuli.

Instrument

As sample size was too young so authors keep on asking from the students about the denominations, source of money information, their response during grocery shopping and whether they themselves purchase anything or not. Later on two same pencils with different prices were shown and it was observed that whether they go for cheap one or expensive one. In the last they were shown two pencils of same price and there response was judged.

Procedure of Data Collection

After getting permission from the Management of IIUM Educare it had been decided that on one day students who were five years of age will be interviewed whereas on the very next day students of six years of age will be interviewed.

The teacher was asked to help the authors and send the students one by one so that all phases of experimentation can be completed for all students.

So the students came turn by turn and they were asked about the denominations of coins (5, 10, 20 & 50) and currency notes (1, 5 & 10). Later on they were asked that who told them about money followed by the question that whether they participate in grocery shopping with their parents or not. They were also asked that whether they buy something from supermarket or not.

In the last phase there response with and without stimuli was observed and noted.

Data Analysis Method

Descriptive Statistics was run through SPSS to analyze the data. The frequencies and responses all were calculated through descriptive analysis.

Logistic regression also be done to study the pattern of money knowledge among children.

Results and Discussions

For this particular research study title “ Money Knowledge Among Muslim Children: An Exploratory Study” authors have selected IIUM Educare. Total 53 students were participated in survey. Out of 53 students 28 were 5 years old whereas 25 were in the age of 6 years. Total 22 boys and 31 girls were participated in this study.

Objective 1: Children awareness about coin and currency note denomination:

The responses which authors got after showing coins and currency notes are shown in the table below. It can be inferred that as compare to coins, students are very well aware of the currency notes. The trend or the correct responses in case of currency notes observed more as compare to

coins. 85% students correctly recognized 1 Ringett, 77% of the students correctly identified notes of Rm 5 and Rm 10. So this trend shows that may be students/children recognize the notes on the basis of colour or any other feature.

<i>Coins/Currency Denominations</i>	<i>Response Type</i>	<i>Frequency</i>	<i>Percent</i>
5 Cent	Correct	28	53%
	Incorrect	25	47%
10 Cent	Correct	36	68%
	Incorrect	17	32%
20 Cent	Correct	34	64%
	Incorrect	19	36%
50 Cent	Correct	22	42%
	Incorrect	31	58%
1 Ringett	Correct	45	85%
	Incorrect	8	15%
5 Ringett	Correct	41	77%
	Incorrect	12	23%
10 Ringett	Correct	41	77%
	Incorrect	12	23%

Gender Based Comparison

When gender based comparison was done then it is revealed that except in case of Ringgit 1 the correct currency recognition in case of girls was higher as compare to boys. In case of Ringgit 1 the percentage of boys who correctly recognized is higher than girls. It shows that girls are not only showing more correct response towards coins but as well as currency notes.

The above mentioned response by girls shows the careful attitude and a high sense of responsibility. The correct recognition of currency shows that they are more responsible in spending the money.

Objective 2: Identification of Money Knowledge Source

The second objective of this Study was to explore the source of money knowledge among children. It was revealed that the students who were in the age of 5 years, response of 9 students was that their father is source of money knowledge whereas 12 students responded that their mother teach them about money. Only one student replied that her uncle teach her about money. 6 students were unaware of the fact that who teach them about money.

	<i>Gender</i>	<i>Correct</i>	<i>Incorrect</i>	<i>Correct Response Percentage</i>
<i>5 Cent</i>	<i>Boy</i>	9	13	41%
	<i>Girl</i>	19	12	61%
<i>10 Cent</i>	<i>Boy</i>	14	8	64%
	<i>Girl</i>	22	9	71%
<i>20 Cent</i>	<i>Boy</i>	13	9	59%
	<i>Girl</i>	21	10	68%
<i>50 Cent</i>	<i>Boy</i>	8	14	36%
	<i>Girl</i>	14	17	45%
<i>1 Ringett</i>	<i>Boy</i>	19	3	86%
	<i>Girl</i>	26	5	84%
<i>5 Ringett</i>	<i>Boy</i>	16	6	73%
	<i>Girl</i>	25	6	81%
<i>10 Ringett</i>	<i>Boy</i>	16	6	73%
	<i>Girl</i>	25	6	81%

The students who were under the age of 6 years, 10 of them identified their father as source of money knowledge, 13 responded that their mothers tell them about money where as 2 were not confirmed that who teach them about money.

Money Knowledge Source

	<i>Father</i>	<i>Mother</i>	<i>Others</i>	<i>Do not Know</i>	<i>Total</i>
<i>5 years</i>	9	12	1	6	28
<i>6 Years</i>	10	13	0	2	25
<i>Total</i>	19	25	1	8	53

	<i>Father</i>	<i>Mother</i>	<i>Others</i>	<i>Do not Know</i>	<i>Total</i>
<i>Boy</i>	10	10	0	2	22
<i>Girl</i>	9	15	1	6	31
<i>Total</i>	19	25	1	8	53

When this trend was studied on the basis of gender, researchers came to know that 10 boys responded that their father is main source of money knowledge for them. 10 said that their mother teach them about money where as 2 boys were do not know that who tell them about money.

Above calculations showed that a greater number of students learned about money from their mother. As far as some are concerned, their fathers teach them about money. But only few (8 students) do not know that who teach them about money. Only one student mentioned that his uncle is the source of money knowledge. .

Objective 3: Children attitude towards grocery shopping

In order to study the third objective of this research when students were asked that whether they participate in grocery shopping or not. 22 students who were 5 years old mentioned that they participated in grocery shopping whereas 6 mentioned that they do not participate in grocery shopping. All students who were in the age of 6 years mentioned that they participate in grocery shopping.

Participate in Grocery Shopping

	Yes	No	Total
5 years	22	6	28
6 Years	25	0	25
Total	47	6	53

20 boys and 27 girls acknowledge that they participate in grocery shopping whereas 2 boys and 4 girls said that they do not take part in grocery shopping.

Participate in Grocery Shopping

	Yes	No	Total
Boy	20	2	22
Girl	27	4	31
Total	47	6	53

Buy anything from Supermarket

	Yes	No	Total
5 years	22	6	28
6 Years	25	0	25
Total	47	6	53

It has been observed that many students no matter they are in the age of 5 year or 6 year they participate in grocery shopping and participate in the decision making made during shopping. This participation gives a great exposure to money as well the products purchased by family. This attitude and liberty by parents to children give children understanding about products

denominations of coins and currency notes as well as establish sense of responsibility in spending money.

22 students of 5 years old and all 25 students who were in the age of 6 years mentioned that they buy something from the supermarket.

When this trend is studied on the basis of gender it is revealed that 20 boys and 27 girls replied yes they do purchase something from supermarket whereas 2 boys and 4 girls replied negatively.

Buy anything from Supermarket

	Yes	No	Total
Boy	20	2	22
Girl	27	4	31
Total	47	6	53

22 students of 5 years old and 14 students of 6 years of age identified that they used to purchase food item whereas 3 students who were in the age of 5 years and 11 students who were in the age of 6 years mentioned that they purchase non-food items during shopping. Only 3 students were said that they do not know that what kind of items they purchase from supermarket.

Items purchased from supermarket

	Food Item	Non-Food Item	Do Not Know	Total
5 years	22	3	3	28
6 Years	14	11	0	25
Total	36	14	3	53

16 boys and 20 girls have identified that they purchase food items whereas 5 boys and 9 girls said that they shop non food items. Only 1 boy and 2 girls said they do not know that whether they buy food items or non food items.

Items purchased from supermarket

	Food Item	Non-Food Item	Do Not Know	Total
Boy	16	5	1	22
Girl	20	9	2	31
Total	36	14	3	53

In order to analyze the independence in shopping by the students they were asked that whether children themselves do shopping or not. It has been observed that it is identified majority of the students purchase food items but some buy non-food items as well. This food items shows that

the awareness by students to purchase something which consumer instantaneously but some also go for non food item. One students categorically mentioned that she purchase shoes. So this activity shows that participation of children in shopping activity give learning and pleasure simultaneously.

In the later part of study students were shown two identical pencils of same value. The response was as under:

Preference without stimuli

	<i>First Option worth 20 cent</i>	<i>Second Option worth 20 cent</i>	<i>Total</i>
<i>5 years</i>	14	14	28
<i>6 Years</i>	7	18	25
<i>Total</i>	21	32	53

Preference without stimuli

	<i>First Option worth 20 cent</i>	<i>Second Option worth 20 cent</i>	<i>Total</i>
<i>Boy</i>	10	12	22
<i>Girl</i>	11	20	31
<i>Total</i>	21	32	53

In the same study students were shown two identical pencils of different values and they were asked to choose one. 15 out of 28 students who were 5 years of age selected pencil worth 20 cent where as 13 had chosen second option worth 50 cent.

Preference with Stimuli

	<i>First Option worth 20 cent</i>	<i>Second option worth 50 cent</i>	<i>Total</i>
<i>5 years</i>	15	13	28
<i>6 Years</i>	10	15	25
<i>Total</i>	25	28	53

	<i>First Option worth 20 cent</i>	<i>Second option worth 50 cent</i>	<i>Total</i>
<i>Boy</i>	9	13	22
<i>Girl</i>	16	15	31
<i>Total</i>	25	28	53

Conclusions and Implications:

Following are some major conclusions which are revealed after completion of this research:

- Students recognize currency notes more accurately as compare to coins. This may be because of colour of currency notes or may be children use currency notes more as compare to coins.
- For many students mother is the main source of money knowledge but some students mention that their father teach them about money. Only one female student mentioned that her uncle teach her about money.
- Children not only participate in grocery shopping with their parents but they also did some purchase from the supermarket of their own choice.

The above study reveal the fact that it is requirement of the time that money knowledge should be shared with the children. Because as soon as they become aware of the denomination they will show the sense of responsibility in spending the money. Their close interaction with parents enable them to participate in spending decisions which can teach them about the quality of products as well as wisdom of using money.

This wisdom bring lot of convenience in their life as well as it is also the requirement of time. The early lessons about money establish sense of responsibility, institutionalized saving money and even it can also help them in their future how, when and where to use the money.

The good spending sense of money can bring prosperity not only to one family but also to a nation.

Future studies can be conducted to compare the children of dual family career versus children whose father/mother are only source of income.

When the above data was summarized following result can be deduced.

	<i>Response</i>	<i>Number of Students</i>
<i>5 Cent</i>	<i>Correct</i>	28
	<i>Incorrect</i>	25
<i>10 Cent</i>	<i>Correct</i>	36
	<i>Incorrect</i>	17
<i>20 Cent</i>	<i>Correct</i>	34
	<i>Incorrect</i>	19
<i>50 Cent</i>	<i>Correct</i>	22
	<i>Incorrect</i>	31
<i>1 Ringett</i>	<i>Correct</i>	45
	<i>Incorrect</i>	8
<i>5 Ringett</i>	<i>Correct</i>	41
	<i>Incorrect</i>	12
<i>10 Ringett</i>	<i>Correct</i>	41
	<i>Incorrect</i>	12

Abstract

We examine the foreign ownership patterns in local stocks in an emerging capital market, i.e. the Istanbul Stock Exchange (ISE), to derive insights into the linkage between foreign investors' equity-level preferences and the information provided by the corresponding firm's financial statements. Our data consists of foreign ownership share in non-financial stocks over the period 2004 – 2008, during which foreign investors held on average 61% of the free-float equity in the ISE. Our analyses suggest that foreign investors are more likely to hold shares in firms with larger market capitalization and those with low leverage and book-to-market ratios. Overall, the results provide suggestive evidence on the asymmetric information hypothesis between local and non-local investors and, accordingly, useful insights into the equity home bias puzzle.

Keywords: foreign investors; foreign ownership; emerging markets; Istanbul Stock Exchange

Introduction

The country irrelevance proposition set forth by standard models of international portfolio choice typically lack of empirical support as investors continue to systematically hold a large part of their wealth in locally traded assets. Hence, the so-called *home bias puzzle* runs counter to both the mainstream theoretical prediction as to the efficiency of the global market portfolio of risky assets² and the well-established case supporting the relative advantages of

holding internationally diversified portfolios over domestically diversified ones.³

² See, among others, Solnik (1974) and Adler and Dumas (1983).

³ The literature on the gains from international portfolio diversification is huge. A number of recent studies include, among others, Baele and Inghelbrecht (2009), Chiou (2009), and Driessen and Laeven (2007).

Beside the interest in examining investors' aggregate foreign portfolio allocations at the country-level, a parallel and still growing literature deals with investors' firm-level foreign portfolio allocations. Mostly depending upon the availability of relevant data, studies falling in this strand of literature investigate the factors motivating agents in financial markets to hold a particular firm's shares traded abroad instead of holding the market portfolio of the foreign country of interest.⁴ In line with this body of research, the present study also tackles this issue by providing new evidence on the firm-level determinants of foreign ownership of local stocks in an emerging stock market, namely, the Istanbul Stock Exchange (ISE).

Our objective is to examine whether firm-specific financial information derived from the firm's financial statements affects the foreign ownership in the corresponding firm's shares in the stock market. We focus on the patterns of stock-level foreign ownership instead of country-level portfolio allocations by means of a unique and, therefore, not exploited dataset to date. We also believe that the research context (i.e. the ISE) provides a suitable environment to investigate the potential factors driving the foreign ownership to the extent that there are any binding constraints on transactions issued by foreign investors within the ISE. Therefore, the ownership patterns should directly reflect foreign investors' preferences. Indeed, since the issuance of the Decree No. 32 in August 11, 1989, foreign investors (both institutional and individual) are allowed to purchase and sell all kinds of listed shares in the ISE and repatriate the proceeds. Although the Turkish economy experienced severe economic and financial downturns during the last two decades, the ISE had not exerted any restrictions

on capital flows issued by foreigners. There is also no tax discrimination between local and non-local investors. Furthermore, the ISE constitutes an interesting context for the purposes of this research given the high foreign participation to the stock market in Turkey: Over the period 2004 to 2008, foreign investors held, on average, about 61% of the free-float equity in the ISE.

Based upon an empirical model specification relating foreign ownership to an array of firm-specific financial ratios, we find that foreign investors mostly prefer larger firms, with low degrees of leverage and low book-to-market ratios. The effect of the firm size on foreign ownership is substantial. A simple, random-effects specification using the full set of explanatory variables suggests that one unit increase in the firm's size, gauged by the natural logarithm of the total assets, induces almost 10% in foreign ownership in the corresponding firm's stocks. This result is robust to alternative econometric specifications including non-linear regressions, and to different years of the data used for the estimations. This finding is consistent with prior studies like Kang and Stulz

⁴ See, among others, Diyarbakirlioglu (2011), Rhee and Wang (2009), Aggarwal et al. (2005), Lin and Shiu (2003), Dahlquist and Robertsson (2001), Kang and Stulz (1997).

(1997), Dahlquist and Robertsson (2001) or Lin and Shiu (2003), who also provide similar evidence about the relation between size and foreign ownership. Thus, our results support the conventional view that the firm size is a good proxy of the degree of familiarity by foreign investors vis-à-vis the stocks, which they consider to hold. Moreover, the signs of the coefficient estimates of leverage and market value variables suggest that foreign investors prefer to hold more shares in firms with less financial risk and higher growth potential.

The paper proceeds as follows. Section two provides a review of related studies. Section three describes the Istanbul Stock Exchange in brief, by focusing especially on the development of foreigners' investments. The data and methodology are described in section four. Section five then presents the empirical results, and section six concludes the paper.

Related Studies

The basic normative portfolio result stemming from pioneering studies such as Solnik (1974) and Adler and Dumas (1983) states that in a perfectly integrated global capital market populated with rational investors, one should hold the global portfolio of risky securities where each country's weight is proportional to its relative world-market capitalization weight.⁵ Therefore, according to the standard theories of international portfolio choice, there should be no reason to expect any causal relation running from either country- or firm- specific factors to the observed patterns of investors' cross-border asset holdings. However, this is rarely the case since many studies have so far documented a strong preference towards domestically traded assets despite the well-documented benefits of global portfolio diversification, coined all together by the *home bias puzzle*.⁶ Parallel to this literature, the issue of how investors allocate their existing foreign assets among different foreign markets or stocks traded in these markets has generated a joint and growing literature.

In a frequently cited study, Kang and Stulz (1997) examine the ownership of Japanese stocks by non-Japanese investors for the period 1975-1991. Their results are twofold. First, they report that foreign investors in Japan do not hold the market portfolio of local stocks, and that they prefer to hold disproportionately larger shares in Japanese firms with large market capitalization. Second, they show that the firm size explains much of the variance in the data even after controlling for various firm characteristics including leverage, current ratio, return on assets, beta, residual variance, excess return, market value and book-to-market. They interpret this size bias by non-Japanese investors vis-à-vis large domestic firms as being consistent with Merton's hypothesis⁷

⁵ See Brealey et al. (1999) for a review.

⁶ Lewis (1999) and Karolyi and Stulz (2003) are the two most cited literature reviews on the home bias puzzle.

⁷ See Merton (1987).

stating that investors tend to hold more shares in firms which they know more about. This result is also robust to liquidity and export ratio in that small firms with higher export to sales ratio have greater foreign ownership.

Dahlquist and Robertsson (2001) provide further evidence for the size bias. They analyze the determinants of foreign ownership in Swedish firms, for the period from 1993 to 1997. First, they reject the hypothesis that non-residents invest according to the market portfolio of Swedish stocks. Then, they investigate the link between foreign investors' preference and an array of firm characteristics mainly used by Kang and Stulz (1997). They also use four additional proxies for firm recognition and investor influence, namely, the export rate, turnover rate, ownership concentration and a dummy for foreign listing. The authors find that foreigners prefer large firms paying low dividends and having large cash positions on their balance sheets, and that they overweight firms with widespread ownership, a feature common to large firms in general.

Lin and Shiu (2003) investigate foreign ownership in the Taiwan stock market from 1996 to 2000 and empirically provide evidence that foreign investors seem to favor large firms and

low book-to-market stocks. Their results show also that foreign investors have a preference for firms with high export ratios and hold more shares of high beta stocks than of low beta stocks for small firms. Regarding the impact of the export-to-sales ratio on foreign ownership, the authors note that these firms are likely to be well known internationally, and that foreign investors hold more shares in such firms.

Jiang and Kim (2004) conjecture that (i) greater transparency increases the level of information asymmetry in the market, which, in turn, reduces liquidity and increases cost of capital, and that (ii) foreign investors prefer equity shares of firms with lower information asymmetry between the firm (inside managers) and the market (outside investors). Using firm-specific data on foreign equity ownership of Japanese firms for the period 1976-1994, they show that foreign investors tend to hold more shares in large firms with better accounting performance and low leverage as in Kang and Stulz (1997). Overall, their results suggest that foreign (institutional) investors are likely to be efficient processors of public information and are attracted to Japanese firms with low information asymmetry.

Aggarwal *et al.* (2005) take the perspective of US mutual funds investing in 30 emerging market equities after the market crises of the 1990s. Unlike the studies cited above, Aggarwal *et al.* (2005) investigate the effect of both country- and firm-level disclosure and institutional policies on US mutual funds' portfolio preferences. Controlling for various firm-level attributes including the market capitalization, quality of financial reporting, return on equity, dividend yield etc., they note that US mutual fund investment is positively associated with the firm-level policies fostering

transparency and better disclosure standards. In turn, disclosure is likely to alleviate a country's other institutional deficiencies, which would potentially affect foreign institutional investment in the country of interest. More recently, Rhee and Wang (2009) put forward the liquidity impact of foreign ownership in emerging stock markets, considering the case of Indonesia for the period from January 2002 to August 2007. They control for stock characteristics, trading activities, persistence in liquidity and foreign ownership and find that foreign ownership has a negative impact on liquidity.

The Istanbul Stock Exchange and Foreign Ownership

The securities exchange market in Turkey (ISE), began to operate as an autonomous and professional institution in January 1986. Table 1 contains the major annual data such as the traded value, the traded number of stocks and the number of companies traded for the ISE since its inauguration. As shown in the table, while only 80 companies' stocks were traded in 1986, this figure increased to 321 by the end of 2009.

Year	Traded Value (US\$ million)	Annual Change in Traded Value (%)	Traded Number of Stocks (nominal '000 TL)	Annual Change in Traded Number of Stocks (%)	Number of Companies Traded on the ISE Markets
1986	13	-	3	-	80
1987	118	807,69	15	400,00	82
1988	115	-2,54	32	113,33	79
1989	773	572,17	238	643,75	76
1990	5.854	657,31	1.537	545,80	110
1991	8.502	45,23	4.531	194,80	134
1992	8.567	0,76	10.285	126,99	145
1993	21.770	154,11	35.249	242,72	160
1994	23.203	6,58	100.062	183,87	176
1995	52.357	125,65	306.254	206,06	205
1996	37.737	-27,92	390.924	27,65	228
1997	58.104	53,97	919.784	135,28	258
1998	70.396	21,16	2.242.531	143,81	277
1999	84.034	19,37	5.823.858	159,70	285
2000	181.934	116,50	11.075.685	90,18	315
2001	80.400	-55,81	23.938.149	116,13	310
2002	70.756	-12,00	33.933.251	41,75	288
2003	100.165	41,56	59.099.780	74,16	285
2004	147.755	47,51	69.614.651	17,79	297
2005	201.763	36,55	81.099.503	16,50	304
2006	229.642	13,82	91.634.552	12,99	316

Notes: Prepared using data from the ISE web site. www.imkb.gov.tr

Table 1. Main indicators about the ISE since its inauguration

The liberalization movement, started in the mid-1980, has dramatically modified the structure and the regulation of financial markets in Turkey. In the ISE, foreign institutional and individual investors are allowed to purchase and sell all kinds of listed shares and repatriate the proceeds since the issuance of the Decree No. 32 in August 11, 1989. There is also no tax discrimination between local and non-local investors. In 1992, the World Federation of Exchanges (WFE) granted to ISE the full membership. Just one year later, in

1993, the U.S. Securities and Exchange Commission (SEC) recognized the ISE as a "Designated Offshore Securities Market". Afterwards, in 1995, the Japan Securities Dealers Association (JSDA) recognized the ISE as an appropriate foreign investment market for private and institutional Japanese investors. Not only foreign legal entities, but also non-resident individuals may purchase or sell all sorts of securities and other capital market instruments in the ISE, without restraint. Nonetheless, orders and transactions must all go through a local intermediary institution. The

share of total equity held by foreign investors, at the end of each year for the period 2005-2009, is displayed in table 2.

Year	Domestic investors' shareholdings (%)	Foreign investors' shareholdings (%)
2004	48.15	51.85
2005	48.24	51.76
2006	27.72	72.28
2007	32.58	67.42
2008	32.66	67.34

Notes: Data for 2006 is calculated based on the number of stocks. For other years, the ownership percentages are calculated using the market value of stocks.

Source: Authors' compilations using data from the Central Registry Agency's annual reports.

Table 2. Descriptive statistics, raw dataset

Data and Methodology

Data description

In order to investigate the relation between firm-level financial ratios and foreign investors' holdings in the corresponding firm's stock traded in the ISE, we make use of a unique, hand-collected panel dataset. The sample consists of yearly observations for 165 firms over the period 2004-2008. Because the data availability for each firm differs across years and the number of firms is quite high compared to the number of periods, the dataset is an unbalanced short (micro) panel. For comparability purposes across entities and to ensure the adequacy of the interpretation of different firms' financial ratios, we only include manufacturing firms into the sample and exclude all financial stocks. Besides the percentages of foreign ownership for each firm, we collect firm-level indicators for each firm from the ISE's website (www.ise.org). The firm-level indicators consisting of financial ratios can be classified as follows:

1. *Size*: There is extensive evidence in the literature demonstrating that foreign investors prefer large firms. Therefore, we include the asset size (SIZE), defined as the natural log of the firm's total assets.
2. *Liquidity*: The current ratio (CUR), defined as the ratio of current assets to current liabilities, is used as a measure of the ability to meet short-term creditors' demands.
3. *Asset turnover*: (i) the receivables turnover ratio (ART), defined as the ratio of net sales to accounts receivable, measures the firm's efficiency in collecting its sales on credit; (ii) the inventory

turnover ratio (INT), defined as the ratio of cost of goods sold to inventory, is used to gauge for the efficiency of the firm in managing its inventory.

4. *Leverage*: The financial leverage is estimated by the debt ratio (FINLEV), which is defined as the ratio of total liabilities to total assets. This ratio allows one to measure the firm's ability to meet its financial obligations.

5. *Profitability*: We employ three different measures to control for the firm's profitability. First, the return on equity (ROE), defined as the ratio of net income after tax to shareholders' equity, is used to measure the level of profit the firm is able to generate given the resources provided by its shareholders. Second, the return on sales (ROS), defined as the ratio of operating income to net sales, is used to measure the firm's operational efficiency. Third, the rate of growth of net income (GNI), defined as the annual percentage change in net income, helps one to determine if the firm is growing at a sustainable rate.

6. *Market value*: The following proxies are used as the firm's market value indicators: (i) the earnings per share (EPS), defined as the ratio of net profit to outstanding shares; (ii) the earnings to price (EPR), defined as the ratio of earnings per share to market value per share; and, (iii) the book to market ratio (BM), defined as the ratio of the book value to the market value.

Tables 3 and 4 provide short descriptions of these explanatory variables and some descriptive statistics, respectively.

Methodology and econometric issues

Our methodology simply consists of the regression analyses of the foreign ownership of Turkish stocks on an array of firm-specific financial characteristics. Specifically, we estimate the following equation:

$$Y_{it} = c + \alpha(\text{Size})_{it} + \beta(\text{Liquidity})_{it} + \gamma(\text{Asset Turnover})_{it} + \delta(\text{Leverage})_{it} + \theta(\text{Profitability})_{it} + \lambda(\text{Market Value})_{it} + e_{it} \quad (1)$$

where, the dependent Y_{it} is the foreign ownership in stock i (in percentage values) observed at the end of year t , e_{it} is the composite error term, and α , β , γ , δ , θ and λ are unknown parameters. Thus, we conjecture that the foreign ownership in a given stock can be explained by firm characteristics including proxies for size, liquidity, asset turnover, leverage, profitability and market value. When it comes to choose the econometric specification, we opt for both panel and cross-sectional regressions. Panel regressions use both the cross-sectional and the time-series information in the data, while cross-sectional regressions estimate the model for each year of the

dataset. Although panel regressions are likely to be more appropriate than those run separately for each time unit in the dataset, it will be shown that the estimation results neglecting the time-series dimension are qualitatively convergent to panel regression results given the short time span of the data relative to the number of cross-sectional units (large N vs. small T).

Category	Indicator	Symbol	Definition
Size	$\ln(\text{total assets})$	SIZE	natural log of total assets
Liquidity	Current ratio	CUR	ratio of current assets to current liabilities
Asset turnover	Receivables turnover ratio	ART	ratio of net sales to accounts receivable
	Inventory turnover ratio	INT	ratio of cost of goods sold to inventory
Leverage	Debt ratio	FINLEV	ratio of total liabilities to total assets
Profitability	Return on equity	ROE	ratio of net income after tax to shareholders' equity
	Return on sales	ROS	ratio of operating income to net sales
	Rate of growth of net income	GNI	annual change in net income
Market value	Earnings per share	EPS	ratio of net profit to outstanding shares
	Earnings to price ratio	EPR	ratio of earnings per share to market value per share
	Book to market ratio	BM	ratio of book value to market value

Table 3. Description of explanatory variables

Regarding the choice of estimator in panel regression models, a first option is to run the model by pooling the observations across time and subjects. This approach, however, is subject to severe criticisms since it typically leads to omitted-variable bias problem in most cases. A second option is to implement a fixed-effects estimator by adding year dummies to the traditional OLS procedure and estimating a least-squares dummy variable (LSDV) model instead. The objective in including dummies for years into the traditional OLS estimator is to control for the effects of unobservable year-specific shocks to the data. In regressions not reported here, the significance of these year dummies is controlled via incremental F -test and the null hypothesis could not be rejected, suggesting that adding year-specific fixed-effects is not appropriate in our case. We have also controlled for the accuracy of the fixed-effects estimator by adding dummies to each stock. Beside the non-rejection of the incremental F -test for stock-level dummies, this procedure is also hard to

advocate since it consumes too much degrees of freedom due to the micro-panel structure of the dataset.

	Mean	Standard deviation	Minimum	Maximum
<i>Dependent</i>				
Foreign ownership	0.222	0.278	0.000	0.980
<i>Size</i>				
(ln) Total assets	19.034	1.423	15.650	23.200
<i>Liquidity</i>				
Current ratio	2.329	2.057	0.320	24.980
<i>Asset turnover</i>				
Receivables turnover ratio	33.222	167.795	0.420	2103.830
Inventory turnover ratio	8.138	14.980	0.540	168.390
<i>Leverage</i>				
Debt ratio	0.454	0.281	0.020	3.780
<i>Profitability</i>				
Return on equity	-0.035	0.480	-5.140	1.170
Return on sales	0.040	0.196	-3.090	0.590
Growth of net income	-0.384	6.391	-76.290	26.620
<i>Market value</i>				
Earnings per share	0.742	3.034	-6.050	32.860
Earnings to price	-0.015	0.356	-3.330	1.450
Book-to-market	1.054	1.065	-8.620	6.750

Table 4. Summary statistics

We implement two linear estimation techniques. First, we use a random-effects estimator. In contrast to the frequently used fixed-effects estimator, this procedure attributes a random intercept drawn from a common distribution to each unit in the data. Indeed, in case of large- N vs. small- T panels, the random-effects estimator is likely to be more efficient than the within estimator. Second, we use the between-effects estimator to fit the regressions. This is equivalent to taking the mean of each variable for each case across time and running a regression on the collapsed dataset of means. As such, the between-effects estimator essentially uses the information content found in the cross-section dimension of the data.

Empirical Results

Panel regressions

Tables 5 and 6 show the results obtained from the random-effects and between-effects specifications, respectively.

Explanatory variables	(1) All	(2) Size	(3) Liquidity	(4) Asset turnover	(5) Financial Leverage	(6) Profitability	(7) Market

Notes: The table reports panel regressions results of foreign ownership on predictor variables using the random-effects specification. The numbers in parentheses below the coefficient estimates are *t*-statistics obtained using heteroskedasticity-consistent standard errors. Statistical significance at 5% (respectively 1% and 0.1%) is denoted by * (respectively ** and ***).

Table 5. Panel regression of foreign ownership, random-effects model

In tables 5 and 6, we run the regressions using different sets of the explanatory variables to separate out the likely effects of each predictor category on the dependent variable. Hence, the first column shows the estimates using the full set of predictors. Besides, columns (2) to (7) report the estimation results involving other groups of the firm-level financial characteristics as outlined in the previous section. The *t*-statistics displayed below the parameter estimates assess the statistical significance of the coefficient estimates. Looking at columns (1), it can be stated that regressions using the full set of predictors capture a good deal of the variance in the data. Yet, most of this explanatory power is due to the size variable: A random-effects specification using only the natural logarithm of the firm's total assets explains about 35% of the total variance.

Generally speaking, the estimation results suggest that foreign ownership is negatively related to debt ratio and the ratio of book value to market value, and positively related to firm size. Across tables 5 and 6, estimated coefficients on inventory turnover, current ratio and return on sales are also significant in some cases. Specifically, foreign ownership of local stocks is negatively related to

inventory turnover as shown by the random-effects model, and to current ratio in between-effects model. The return on sales variable is significant in the first column of table 5 and 6, bearing the expected positive sign.

Explanatory variables	(1) All	(2) Size	(3) Liquidity	(4) Asset turnover	(5) Financial leverage	(6) Profitability	(7) Market
$\ln(\text{total assets})$	0.111*** (9.433)	0.114*** (10.291)

F statistic	13.200	105.907	3.287	0.205	0.916	4.084	2.854

Notes: The table reports panel regression results of foreign ownership on predictor variables using the between-effects model specification. The numbers in parentheses below the coefficient estimates are t-statistics obtained using heteroskedasticity-consistent standard errors. Statistical significance at 5% (respectively 1% and 0.1%) is denoted by * (respectively ** and ***).

Table 6. Panel regression of foreign ownership, between-effects model

Taking into account the full set of results, the most salient one is the positive linkage between size and foreign ownership. Regardless of the set of predictors and the estimator choice, the variable $\ln(\text{total assets})$ is always statistically significant and correctly signed: The coefficient estimate is around 0.1. Moreover, this result is only slightly affected when we exclude other predictors from the model. This finding is in line with previous studies (Kang and Stulz, 1997; Dahlquist and Robertsson, 2001; Lin and Shiu, 2003), as well as consistent with the theoretical argument provided by Merton (1987), who state that investors prefer to hold securities which they are more familiar with. In particular, the relationship between the firm's size and investor's degree of familiarity with the firm of interest mainly goes through its value as an information variable.

On the other hand, the debt ratio is significantly and negatively related to foreign ownership, as expected. This result indicates that foreign investors in the ISE do not prefer firms with high leverage, like the foreign investors in Japan as reported by Kang and Stulz (1997) and in Sweden as reported by Dahlquist and Robertsson (2001). Finally, we also note that foreign ownership is negatively related to the book-to-market ratio, suggesting that foreign investors prefer growth firms having lower book-to-market scores as it has been previously highlighted by Dahlquist and Robertsson (2001) and Kang and Stulz (1997).

Cross-sectional regressions

In addition to the previous results, we also report in the next tables the estimation results obtained from cross-sectional regressions run for each year of the data.

Year	(1) 2004	(2) 2005	(3) 2006	(4) 2007	(5) 2008
$\ln(\text{total assets})$	0.110*** (8.307)	0.115*** (8.993)	0.119*** (8.782)	0.112*** (8.546)	0.128*** (9.000)
Current ratio	-0.028*** (-3.964)	-0.016 (-1.745)	-0.039* (-2.402)	-0.037** (-2.780)	-0.012 (-0.929)

Notes: The table reports the results of OLS regressions of foreign ownership on predictor variables. *t*-statistics obtained using heteroskedasticity-consistent standard errors are shown in parentheses below the coefficient estimates. Statistical significance at 5% (respectively 1% and 0.1%) is denoted by * (respectively ** and ***).

Table 7. Cross-sectional regression estimates of foreign ownership, OLS estimations

To check for the robustness of our results we implement two additional estimation procedures. Table 7 shows the results of the traditional OLS procedure, while the table 8 reports the results obtained from the robust regressions. We regress the dependent variable on the full set of predictors, whence the parameter estimates are comparable to those reported in columns (1) of the previous tables.

We notice that the coefficient estimates obtained from year-by-year regressions broadly support the previous results of panel regressions. Estimated coefficients suggest similar patterns with respect to the firm-specific factors affecting the foreign ownership of local stocks in the ISE. Both the statistical and economic significance of the predictor variables remain qualitatively the same even though we neglect the time-series information in the data. The book-to-market is negatively signed each year, with statistically significant coefficients. The return on equity ratio is significant too, particularly in columns (4). However, its coefficient changes of sign depending on the year of the data as well as on the estimation method, rising doubts about the explanatory power of the return on equity on the dependent variable. The current ratio is likely to have some explanatory power. Yet, the positive effect of size on foreign ownership is well captured by the corresponding firm's total assets. The size proxy is statistically highly significant in all cases, regardless of the choice of estimator and year of the data.

Concluding Remarks

Although the opening of equity markets in Turkey is relatively recent compared to those in more developed and mature exchanges, the Istanbul Stock Exchange provides the market participants with a highly liberalized and technologically advanced trading environment. Thus, the foreign participation in equity ownership reflects the growing interest of non-residents to the ISE, especially during the last decade. Besides, the absence of any discrimination between local and non-local investors implies that either the market-wide or the firm-level foreign ownership percentages should directly capture foreign investors' portfolio preferences in Turkish stocks. This is an important feature, among others, making our research context an interesting one because examining the patterns of foreign ownership of local stocks would directly contribute to our understanding on the determinants of cross-border portfolio holdings, in general, and the reasons of the persistent home bias worldwide, in particular.

Bearing these motivating facts in mind, this paper explores a unique, hand-collected dataset on firm-level share ownership by foreign investors in Turkish stocks. The data has a micro-panel structure and have been collected for 165 firms on annual frequencies over the period 2004-2008. The analysis consists of examining the link between the patterns of foreign ownership and various firm characteristics including size, liquidity, asset turnover, leverage, profitability, and market value.

Among the full set of explanatory variables used to proxy these firm-level characteristics, estimations point out to firm size as the major covariate of foreign ownership. A between-effects model using the (natural log of the) firm's size as the explanatory variable captures almost 40% of the variance in the data. Regardless of the econometric specification used, the effect of the firm's size is well captured by economically and statistically significant coefficient estimates. The book-to-market ratio has also some explanatory power, suggesting that foreign investors are likely to hold more shares in growth stocks with lower book-to-market ratios. For the remaining variables, the results remain generally inconclusive, albeit statistically significant in some cases. As such, our results can be considered as complementary to those obtained in Kang and Stulz (1997) and Dahlquist and Robertsson (2001), who also find a significant relation between foreign ownership and the firm size and the book-to-market ratio in Japanese and Swedish markets, respectively. Obtaining such findings close to those reported for more developed and mature economies like the Japan and Sweden, is likely to be interesting (or surprising) on one hand, and reasonable on the other hand. In fact, it seems that, whatever is the width or depth of the stock market, foreign investors prefer being safe to being sorry later on, by holding more shares in companies taking less financial risk and relatively more familiar to them.

One important avenue for future research would be to examine the respective performances of domestic and foreign investors in the ISE. As long as one admits that foreign investors' preference toward large firms undergoes an asymmetric-information story, one should also expect domestic investors to outperform their foreign counterparts by materializing their informational advantage. Empirically, evidence on the respective performances of local and non-local investors is relatively mixed (Kalev *et al.*, 2008; Dvorak, 2005; Malloy, 2005). Theoretically, mainstream models of cross-border portfolio flows and holdings, which assume asymmetric information between domestic and foreign investors, predict a positive relationship between foreign purchases of local stocks and the firm's size or the returns on the market (Brennan *et al.*, 2005; Brennan and Cao, 1997). Therefore, the comparison of relative performances of local investors and foreign investors, who are supposed to be less well informed about Turkish stocks, remains an open and uninvestigated issue.

Abstract

In the actual scenario of high technological competitiveness and environmental complexity, MNEs focus the attention on the R&D activities. The context is more and more dominated by a strong and growing competition between companies among their global forcing organisations to move the focus of competitive advantage from the classical sources to new strategies. More specifically, the choice of locating in a specific place may have important consequences on the general performance of the group.

This paper focus on foreign MNEs that have decided to start their own R&D activity in Piedmont, one of the 20 regions of Italy. These companies choose on the strength of several drivers. This paper goes beyond the existing literature analyzing the level of satisfaction that MNEs give after the settlement. 51 MNE in Piedmont were analyzed and most of them revealed to be generally satisfied. This result has been confirmed by the high level of presence after 3 years from the settlement. At the end improvement areas were found, such as utilities available and bureaucracy level.

Introduction

Multinational Enterprises (MNE) are increasingly adopting a global strategy for their activities of research and development (R&D); therefore, academics have shown growing interest in reference to this phenomenon since the '90s.

The most debated topics about this domain appear to be about some principal areas of interest, such as the classification of the activities made abroad (Kuemmerle, 1999; Sun, 2003), the choice of the place where to locate R&D centers (Belderbos et.al., 2008; Dougherty et al., 2003), the organization of R&D's network all around the world (Alfaro and Chen, 2009) and the strategies carried out by MNE in order to run global R&D process (Arora et al., 2001; Chesbrough, 2003; Ernst, 2005).

This paper has a dual purpose: first, to investigate why multinational enterprises chose to localize themselves in Piedmont, one of the 20 regions of Italy with an area of 25,402 square kilometres and

a population of about 4.4 million, and the drivers of this choice; second, to investigate the satisfaction of the firm which chose to locate their R&D activities in Piedmont.

Literature review

The hypercompetition made the R&D function more and more important as a driver of success; hence, in the last years it has been noted that MNE are spreading these activities beyond national borders. As a first consequence, the literature about the globalization of R&D increased, analyzing some time the evolution of the R&D internationalization process, other time the localization choice of R&D centers, still other time the organization of R&D activities and the presence of networks.

However, the focus of this paper is on the MNE R&D localization choices. There are two main models proposed by academics to explain these choices: (a) the rational choice model and (b) the behavioural imitation model. According the first model, places chosen for the activities of R&D came out from a deliberate decisional process pushed by the analysis of the external environmental and the internal organization. The second model, instead, is based upon the theory that R&D's localization process is cumulative and path-dependent.

Rational model studies

During last years, many studies supporting the rational model were proposed. Siedschlag et al. (2009), for instance, through the analysis of 446 location decisions of foreign affiliates in the R&D sector incorporated in the European Union over 1999-2006, suggest that on average, the location probability increases with the size of demand, agglomeration economies, low production cost, R&D intensity, flexibility of labour markets, access to skilled labour and information technology infrastructure.

Cantwell and Piscitello (2005) through their studies stated that the location of foreign R&D centers were most influenced by spillover and externalities.

Serapio and Dalton (1999) analysed 701 R&D foreign centres in the U.S.A, finding out that the 75.2 % of those structures were located in the 11 principal States of the country. Those data support the theory that there is a strong trend towards concentration of these activities in certain areas characterized by particular features; this thesis has been endorsed by other academics such as Cappellin (2010).

Dunning (1998) identified some variables influencing the location of value added activities by MNEs in the 1970s and 1990s depending on four different type of FDI (resource seeking, market seeking, efficiency seeking and strategic asset seeking). Tellis et al. (2008) showed that the grade of attractiveness of a geographical area is closely linked to the number of PhD in Science and Engineering available in that country.

So, according to these authors, firms choose their location not to gain from a transfer of knowledge (a direct or indirect transfer), but simply to grant themselves an access to asset they can only find in a specific location (such as qualified human resources, specific know-how and facilities,...)

Moreover, another important localization driver is the capacity to maintain the R&D results. The studies on this specific topic, generally state that the probability rises where the use of intellectual property protections is high (Branstetter et al., 2006).

Finally, MNEs often chose to locate R&D centers close to their other functions such as production, marketing and sales, in order to easily control communication, resources sharing, coordination (Malecki, 1980).

Behavioural model studies

According to the behavioural imitation model the MNEs location process is cumulative and path-dependent. This approach asserts that there are controversial results in traditional research, and that often the degree of concentration cannot be convincingly explained by the conventional rational choice model that relies mostly upon factors such as market size, labour costs and infrastructure, among others. On the contrary, site location decisions are also the product of imitative behaviours among decision makers faced with uncertainties and multiple risks. (Sun et al., 2006; Sun and Wen, 2007).

Information uncertainties lead people to follow signals from others, sometimes even without questioning the rationales. When companies look for R&D locations, they look at other companies to see where similar R&D facilities have been set up. In other words, prior decisions by other firms in the same industry to locate R&D in the same state/country actually cause an otherwise identical firm to locate its own R&D in the same place.

Other studies

There are several studies which study R&D location choice not only from the drivers point of view, but also from the organization point of view. They try to investigate how a MNE organizes its R&D activity in order to better find a compromise between the necessity to be global and the need to be very close to the local market with its subsidiaries.

Bartlett and Ghoshal (1990) identified four modes of R&D organization in MNEs: central-for-global (centralized development of technology at home for the global markets), local-for-local (decentralized development of technology for the local markets), locally-linked (development of specified technology at each location for the global markets), and globally-linked (development of technology through R&D cooperation in different countries for the global markets).

Then, the recent literature (Alfaro and Chen, 2009), instead, put increasing attention to the establishment of internal and external network by MNE. The studies of Narula and Zanfei (2005) are very interesting in this analytical perspective, by analysing the processes of globalization. Other authors, such as Arora et al. (2001), Chesbrough (2003), Ernst (2005) and Tardivo (2008), emphasized the importance of open system of innovation and the knowledge sharing network importance.

Finally, other authors put in evidence the importance of the presence of R&D facilities in foreign seats. The pioneering studies of Ronstadt (1977) about technologic activities inside American MNE identified four structures: Technological Transfer Unit (TTU), Indigenous Technology Unit (ITU), Global Technology Unit (GTU) and Corporate Technology Unit (CTU).

However, most researchers divide the motives to undertake R&D in foreign countries into two categories: knowledge exploiting and knowledge augmenting (Ambos 2005; Belitz 2006; Kuemmerle 1997, 1999).

Finally, Sun (2003) indicates an alternative approach based on two different categories: strategic or tactical – according to their relevance. Strategic R&D gives more importance and relevance to the MNE global markets and it has a long-term aim. Tactical R&D, on the contrary, has a short-term relevance and focuses on local markets.

Methodology

This research has a double purpose. On one hand, the aim of investigate the reasons why MNEs choose a specific localization for its R&D activities; on the other hand, it looks for the return of this choice in terms of satisfaction. In order to achieve these purposes, an empirical enquiry has been made on Piedmont-based foreign MNEs. Piedmont is a very interesting case due to its geographical position and its vocation to R&D – there are more than 200 R&D public and private centres, 380 laboratories, 4 universities, 6 scientific and technological parks, 12 innovation clusters and 6 incubators). Yet, Piedmont alone represents 8% of the Italian GDP. 412 Piedmont-based foreign companies were selected analyzing the database “R&P-Politecnico di Milano” combining with data from “Centro Estero per l’Internazionalizzazione del Piemonte (CEIP)” and other databases (Cerved-Lince, AIDA-Bureau Van Dijk, Hoover’s-D&B). From the list are excluded companies linked to the hotel industry, to personal services and all those companies without a local executive manager. Finally, a structured questionnaire was sent during the second half of 2011 to the 181 companies of the sample. 51 companies responded with acceptably completed questionnaires (a successful response rate of 28 per cent).

The research analyzed the drivers which make Piedmont a suitable place for basing R&D activities and at the same time the level of satisfaction of the investigated MNEs concerning their choice. Moreover, it investigates the relations between MNEs and the local environment (potential spillovers) underlining possible critical situation and improvement areas.

The empirical analysis

Home countries of the analyzed MNEs are reported below (Figure 1)

<i>Home country</i>	<i>%</i>
<i>USA</i>	<i>25.88%</i>
<i>Germany</i>	<i>18.42%</i>
<i>France</i>	<i>14.29%</i>
<i>UK</i>	<i>9.43%</i>
<i>Spain</i>	<i>5.39%</i>
<i>Japan</i>	<i>5.12%</i>
<i>Sweden</i>	<i>4.58%</i>
<i>Switzerland</i>	<i>4.00%</i>
<i>Netherlands</i>	<i>3.50%</i>
<i>Other eu countries</i>	<i>4.00%</i>
<i>Other extra-eu countries</i>	<i>5.39%</i>
<i>Total</i>	<i>100.00%</i>

Figure 1 - MNEs of the sample by home countries (%)

Source: personal elaboration

The subsidiaries interviewed run several activities/function: 56.90% of them is present with an entire BU, 66.7% of them with a production unit, while 64.7% has a commercial office; 45.1% based in Piedmont an independent unit fully focused on R&D.

<i>Function</i>	<i>MNE</i>	<i>%</i>
<i>Business Unit (BU)</i>	<i>29</i>	<i>56.90 %</i>
<i>Production units</i>	<i>34</i>	<i>66.70 %</i>
<i>R&D center</i>	<i>23</i>	<i>45.10 %</i>
<i>Representative office</i>	<i>12</i>	<i>23.50 %</i>
<i>Technical center (technical assistance)</i>	<i>21</i>	<i>41.20 %</i>
<i>Commercial office</i>	<i>33</i>	<i>64.70 %</i>
<i>Warehouse</i>	<i>21</i>	<i>41.20 %</i>
<i>Other</i>	<i>3</i>	<i>5.90 %</i>

Figure 3 - functions of the local branches

Findings

The research revealed four decisive drivers leading companies to base in Piedmont their R&D activities. More specifically those are: a) quality and flexibility of the human resources b) facilities c) integration with the local environment d) infrastructures (i.e. streets, railways, ...)

For each of these drivers the MNEs expressed a qualitative opinion about the difference between what they expected - before the settlement – and what they really found – after the settlement.

More specifically:

Quality and flexibility of the human resources

Human resources preparation are considered by the companies below expectations in 14% of the cases, while 78% of the MNEs consider them according to expectations (or partially even better than expected). More specifically companies gave a positive opinion on the professional training, university and post graduate education (over 2/3 consider themselves more than satisfied).

Facilities

In this case the analysis puts in evidence two main results.

On one hand, there is huge satisfaction for the “Piano Pluriennale Competitività”. This is a project financed by Piedmont Region allocating 500 million Euros with the aim of starting a new era of reforms in supporting innovation, business and development. On the other hand, there is a bad feeling as far as utilities and bureaucracy are concerned. Half of the interviewed companies expressed a negative opinion on the quality -considered low – and the availability – considered restricted and inadequate – of the utilities; a slighter percentage underlines dissatisfaction for the price/quality ratio of the services.

Finally, the analysis shows that 40% of the interviewed MNEs is not satisfied at all with the bureaucracy; more than one half highlights problems in getting urban concessions and authorization. These procedures would need to be simplified, defined and a very strict timing, and more contacts between MNEs and local authorities.

Integration with the local environment

The most positive result emerges with reference to this driver. The process of embeddedness in the area is lead by the incidence and the quality of the relations among local entities. Data (Figure 4) attest that 74% of the MNEs develop R&D activities in cooperation with some partners (Universities and the Politecnico of Turin - 75%; innovation clusters - 21% and other companies outside the group - 63%). The most relevant data is provided by utility/service companies, 61% of which develops R&D activities joint exclusively to enterprises from Piedmont.

<i>Sector</i>	<i>No cooperation</i>	<i>Piedmont</i>	<i>No Piedmont</i>	<i>Both</i>
<i>Manufacturing</i>	41,00 %	9,00 %	0,00 %	50,00 %
<i>Service</i>	14,00 %	61,00 %	8,00 %	17,00 %
<i>Total</i>	26,00 %	40,00 %	4,00 %	30,00 %

Figure 4 – collaboration in R&D

Source: personal elaboration

The embeddedness in the territory is also confirmed by the fact that 32 foreign MNEs are joining the innovation clusters through the contributions in projects and activities together with other companies from Piedmont and that 7 other MNEs have decided to fully join a cluster alone.

Moreover, regarding the type of research activity (Figure 5), the results show that more than 60% of the MNEs develop both industrial and experimental kind of research. This percentage grows when analyzing only the data of the service companies.

<i>Sector</i>	<i>Industrial research</i>	<i>Experimental research</i>	<i>Both</i>
<i>Manufacturing</i>	9.00 %	39.00 %	52.00 %
<i>Services</i>	7.00 %	22.00 %	69.00 %
<i>Total</i>	8.25 %	31.50 %	60.25 %

Figure 5 – type of R&D done by local unit

Source: personal elaboration

Finally, concerning the grade of dependence from the parent company on the R&D issue, the survey reveals that only 28% of the local subsidiaries in Piedmont does R&D activities exclusively for its parent company -i.e a good level of autonomy is guaranteed - while 25% does them for other companies and the other 47% for itself.

Infrastructures

MNEs look pretty satisfied of the infrastructures. In particular, they give a sufficient evaluation of logistics in general, as well as the highway system. On the contrary, they give a negative opinion on the the rail system and the public transport.

The main local commercial airport (Torino Caselle) has been positively valued concerning the accessibility and negative valued regarding the lack of international links.

Conclusions

The research has perfectly put in evidence that MNEs include structures that tend to be more flat and flexible. The increase of mobility, not just in terms of capital, but also of human resources, has widened the geographical spaces setting the companies on a comprehensive plan, also facilitated by

the information revolution that overturned all the physical constraints of the various processes in different divisions/countries.

For this reason, the MNEs analyzed are trying to avoid the risk of inactivity, or simply the lack of response to changing external environment. In fact, in order to survive in the economic environment described above, organisations must be able to use tools of various types and levels to become more profitable and competitive.

In the last decades many factors stimulate the internationalization of business R&D and the beginning of the globalization of innovation. In this scenario, MNEs are driven to an extreme internationalization of their R&D activities. Many researchers investigated the main drivers leading the decision of a MNE to choose a specific location for its R&D centres. Thanks to the sample analyzed, this paper, according with the literature, found confirm about these four drivers, but at the same time goes beyond providing an evidence of the satisfaction of MNE referring the drivers.

So, data reveals in general a positive evaluation confirmed by a 76% rate of still presence on the territory after the first 3 years from the initial settlement. Nevertheless, the research shows some critical points which should be taken into consideration by whom is in charge of regional policy of attracting FDI. Even if efforts made by the Piedmont (i.e. Institutions) for putting into action the "Piano Pluriennale Competitività", there are still areas of enhancement. Utilities, bureaucracy and some infrastructures should all be developed through regional support. In this way the territory should be more attractive, expanding the number of companies staying in the area and attract more and more foreign MNEs.

Abstract

In the recent years, the importance of services has steadily grown while the importance of goods has somewhat declined. In this contest, tourism services are immensely important and also of growing importance in several countries.

As there is a diversity of services in the tourism sector, the paper concentrated on the hotel industry one, that includes a set of companies that is homogenous in production and in competitive setting. In this contest, the aim of this paper is to investigate the relationship between performance and his determinants in the Italian hotel industry. The findings aim to verify whether variables as the size, the category and the variety of the service provided positively influence the performance of the hotels.

In the first part, the paper includes a literature review on the subject, with special focus on the concept of performance in the hotel industry. In the second part, the paper describes the empirical research; finally, the results put in evidence a clear relation between the category and the performance, while it does not seem to be present a link between the size and the variety of the services provided and the performance.

Keywords: Hospitality Industry, Hotels, Performance, Italy.

Introduction

During recent decades, the importance of services to the global economy has steadily grown while the importance of goods has somewhat declined. In fact, the service industries comprise approximately more than 70% of aggregate production and employment in the Organisation for Economic Cooperation and Development (OECD) nations (OECD, 2012).

Hotel industry and tourism services are immensely important and also of growing importance in many countries. The latest World Economic Impact Report by World Travel and Tourism Council

(WTTC, 2012) shows that world travel and tourism continues to grow in spite of continuing economic challenges.

The hotel industry is a key sector within the tourism industry since it is fundamental to the provision of all other tourism services, being the most basic requirement of the tourist after they reach their destination (Orfila-Sintesa, Crespi-Cladera, & Martinez-Ros, 2005). Consequently, this study chooses the hotel industry as a suitable setting for the service economy.

As there is a diversity of services in the tourism sector (Tremblay, 1998), we concentrated on the hotel industry one that includes a set of companies that is homogenous in production and in competitive setting.

This study focuses on the determinants of performance in the hotel industry, and presents an empirical evidence of the contribution of determinants on performance. That is, the goal of this study is to investigate the relationship between the determinants of performance and hotel performance.

Terminological Definition and Contextual Framework

A distinctive feature of hotel management concerns the complexity arising from the range of diverse activities undertaken (e.g., rooms, food and beverage, laundry, etc.) in a building where service provision coincides with customer service consumption.

Although there has been attention directed to hotel outsourcing management issues in professional-oriented periodicals (e.g., *Hotel and Motel Management*, *Lodging Hospitality*), and recently greater interest shown by hospitality researchers (Goldman and Eyster, 1992; Hallam and Baum, 1996; Hemmington and King, 2000; Paraskevas and Buhalis, 2002; Espino-Rodriguez and Padron-Robaina, 2004, 2005; Lam and Han, 2005; Lamminmaki, 2005, 2006, 2007), to date, there has been limited accounting research interest shown in hotel management issues. The few exceptions to this observation include Brignall et al. (1991), Collier and Gregory (1995a,b), and Guilding (2003). Chenhall (2003, 2007) notes a growth in the importance of service industries and specifically cites the hospitality and tourism sectors as providing opportunities for future research.

Determinants of performance in the hotel industry

Firm's performance is due both to external and internal factors: external, because firms compete in sectors and markets which influence strategy and results; internal, because firms have to decide every day the correct way to operate, to allocate resources, etc in order to manage business functions and reach goals.

In the service firms, “performance” is not just related to balance sheet, financial data (Ghalayini and Noble, 1996), but also to human resources, quality, image, brand awareness. Studies of performance indicators are discussed in the literature and measured largely by the firm’s financial outcomes; however, in the last 25 years, there has been a revolution in performance measurement (Neely and Bourne, 2000).

Measurement approaches that relied just on financial results are now being replaced by more integrated systems that combine financial and non-financial indicators (Bergin-Seers and Jago, 2007). The most important consequence is that performance can not just be quantified in money terms, most of all if it relates to customer satisfaction and quality (Ghalayini and Noble, 1996).

By this new approach, performance in the hotel industry has been studied linking the performance to both external and internal factors. By the first point of view, some authors tried to find a correlation between performance and external factors (Tang and Jang, 2009; Arslanturk et al., 2010; Brida and Monterubbiansi, 2010; Brida et al., 2011). By the second point of view, other authors looked for a correlation between performance and internal factors (Gursoy and Swanger, 2007; Sainaghi, 2010a), while other authors analyze internal variables related to several firm functions, processes and operations, with a strong focus on strategy (Ingram, 1996; Ingram and Baum, 1997; Bresciani et al., 2012), marketing (Kim and Kim, 2005), production (Sigala 2004; Barros 2004), organization (Øgaard et al., 2008).

So, it appears very clear in the literature that indicators used to measure these variables can be clustered in two main groups: balance sheet indicators and competitive/strategic indicators. Within all these studies, our work focuses on the determinants of the revenue per available room (RevPar), a performance metric in the hotel industry, which is calculated by dividing a hotel’s total guestroom revenue by the room count and the number of days in the period being measured.

The Italian case

Hotel performance in Italy shows a generally favourable view, as measured by year-on-year percentage change for the year-to-date 2011 for the key performance indicators of occupancy, average daily rate and revenue per available room, according to data.

The “Sesto rapporto sul sistema alberghiero in Italia” (Federalberghi, 2010) revealed that 20% of Italy’s hotels are more the 100 years old, 80% more than 30 and that the majority of the hotels are small. On the other hand the quality has risen; in 1990, 1500 were 4 or 5 star, in 2010 there were 5445.

The latest Travel & Tourism Economic Impact 2012 - Italy (WTTC, 2012), puts in evidence that the direct contribution of Travel & Tourism to GDP in 2011 was EUR 51.4bn (3.3% of GDP). Moreover, in 2011, Italy generated EUR 30.5bn in visitor exports.

According to World Tourism Organization Network (WTON, 2011), with more than 43.2 million tourists a year, Italy is the fourth highest tourist earner, and fifth most visited country in the world. People mainly come to Italy for its rich art, cuisine, history, fashion and culture, its beautiful coastline and beaches, its mountains, and priceless ancient monuments, completely spread throughout the territory.

Developing the Hypotheses

Which products and kind of service to provide is a critical decision that each hotel has to take. To measure the choices made, the literature suggests the importance of monitoring the category (i.e. number of stars), the size (i.e. number of rooms), to be part of a chain, the services provided (i.e. meeting/congress spaces), the location/destination.

Several authors looked for a relation between dimension, economies of scale and performance (Israeli, 2002; Barros, 2004; Pine and Philips, 2005; Claver-Cortés *et al.*, 2007; Assaf and Cvelbar, 2010; Claver-Cortés *et al.*, 2010). For these reasons, it is possible to formulate the following hypothesis:

Hp1: it exists a positive correlation between hotel dimension and performance.

Star rating has used as a determinant of performance by several researchers, who have often found positive correlation between the number of stars and performance (Ingram and Roberts, 2000; Israeli, 2002; Danziger *et al.*, 2006; Tarì *et al.*, 2010). As a consequence, it is possible to formulate the following hypothesis:

Hp2: it exists a positive correlation between the stars number, and so quality, and performance.

Some authors use the presence of meeting rooms, congress spaces and other conference facilities as a measure of performance (Claver-Cortés *et al.*, 2006; Urtasun and Gutiérrez, 2006). Following these authors, it is possible to formulate the following hypothesis:

Hp3: it exists a positive correlation between the service provided and performance.

Figure 1: correlation matrix

Source: personal elaboration

Finally, many authors (Baum and Mezias, 1992; Baum and Haveman, 1997; Urtasun and Gurierrez, 2006; Shoal et al., 2011) uses variables as “location” or “destination” to look for a relation with performance. The hotel industry generally recognizes the advantages of a central district location, resulting in higher demand, pricing ability, and profitability, but in other cases put in evidence the negative effects of agglomeration and competition among centrally located hotels (Seul Ki and SooCheong, 2012). The case of Italy, however, is special because all the attractions are completely spread throughout the territory. For this reason it has no sense to look for a correlation between location and performance.

In the same way, as the Correlation Matrix (Figure 1) does not show a correlation between “Chain” and RevPar, we do not look for a correlation between these two variables. In fact, in general the empirical evidence shows at time a positive relationship between to be affiliated and the

results (Ingram and Roberts 2000; Yeung and Law 2005), sometimes any link (Damonte et al., 1997; Israeli 2002).

Research Methodology

The data used are taken from “World Economic Impact Report” by World Travel and Tourism Council (WTTC, 2012) and “Sesto rapporto sul sistema alberghiero in Italia” (Federalberghi, 2010). The research was conducted in two separate phases. In the first phase a sample of 450 hotels was selected, including only those which are representative of the region and which have a star rating of 3 or more (on a rising scale of one to five). In the second phase a structured questionnaire was sent during 2011 to the 500 hotels of the sample. 208 hotels responded with acceptably completed questionnaires (a successful response rate of 41.60 per cent).

This research applies a revisited version of the model of analysis used by Sainaghi (2010b). The author identified revenue per available room (RevPAR) determinants of individual firms located in a destination analysing a sample of 72 hotels operating in the 3-5 star range

The model is consequently synthesized using size (Size), star rating (Stars) and services provided (Congr) as Dependent Variables and revenue per available room (RevPAR) as Independent Variable. So:

$$RevPAR = \beta_0 + \beta_1 Size + \beta_2 Stars + \beta_3 Congr$$

where:

- *RevPAR* (revenue per available room) = a performance metric in the hotel industry;
- *Size* = number of available rooms;
- *Stars* = number of stars of the hotel – category;
- *Congr* = binary variable which detects the presence of meeting rooms and congress spaces (1 = yes; 2 = no);

Several studies use RevPar as indicator of the hotel performance (Kim and Kim, 2005; Cho and Erdem, 2006; Namasivayam *et al.*, 2007; Campos Blanco *et al.*, 2011) due to the fact that it is not an economic variable and it catches the importance of competitive/strategic indicators.

Research Results

Thanks to the questionnaire, it has been possible to collect data on dimension, category, and services provided. Figure 2 shows the characteristics of the 208 hotels answered the questionnaire.

<i>Independent variables</i>		
<i>Size (Size)</i>	<i>Hotels number</i>	<i>%</i>
<i>Less than 50 rooms</i>	126	60.6%
<i>From 50 to 79 rooms</i>	56	26.9%
<i>More than 79 rooms</i>	26	12.5%
<i>Total</i>	208	100.0%
<i>Category (Stars)</i>		
<i>5 stars</i>	6	2.9%
<i>4 stars</i>	48	23.1%
<i>3 stars</i>	154	74.0%
<i>Total</i>	208	100.0%
<i>Services provided (Congr)</i>		
<i>Congressual hotels</i>	114	54.8%
<i>No Congressual hotels</i>	94	45.2%
<i>Total</i>	208	100.0%

Figure 2: hotels

Source: personal elaboration

The data (Figure 1) show some significant correlations between independent variables. However, it has been decided to maintain these variables in the model because these kind of correlations are typical of the hotel industry. To confirm this choice a multicollinearity test was conducted. In particular, it was found: a Variance Inflation Index (VIF) of 1.65, which is under the level (3.0) suggested by literature (Hair *et al.*, 2005); a Condition Index of a maximum of 20.43, which is, also in this case, under the level (25.0) suggested by literature (Belsley *et al.*, 2004).

Model Summary^b

<i>Model</i>	<i>R</i>	<i>R Square</i>	<i>Adjusted R Square</i>	<i>Std. Error of the Estimate</i>

	Total	43693,739	103			

a. Predictors: (Constant), Congr, Dim, Stars

b. Dependent Variable: RevPAR

Figure 3: tests of significance

Source: personal elaboration

Applying the model, it was possible to find significant statistical results ($P = .000$) which explains 86.8% of the RevPar variability ($R^2 = 0.868$). This means that the three independent variables (Size, Category and Services provided) together explain 86.8% of the variability of the performance (RevPar) of the hotels. Moreover, the ANOVA test shows an acceptable result ($P < 0.0001$) (Figure 3).

Figure 4 puts in evidence the results of the regression.

The columns B and Beta put in evidence the sign of the correlation between the independent variables and RevPar. Category (Stars) and Services provided (Congr) are positive correlated to performance, which means that the higher the category and services provided, the better the performance. On the contrary, there is a negative sign for the dimension (Dim).

However, looking at the Sig. column it is possible to note that just stars is a useful variable to explain the variability of RevPar. So, it is possible to assume that the results positively answer Hp2 i.e. that there is a positive correlation between the stars number, and so quality, and performance; on the contrary, it does not find a significant correlation between size and performance and between services provided and performance, so Hp1 and Hp3 have to be rejected.

Conclusions

The results put in evidence category (Stars) as the only determinant of hotels performance. The category has a positive correlation with performance, this means that the hotels of greater quality level exhibits a higher capacity to handle the employment and prices, yielding a value higher in RevPAR.

Pointing out the strong correlation between the stars and the size (0.593) it can be stated that the hotels of a higher category also tend to be larger and show greater efficiency. The stars have also a high correlation with the conference services (0.398), allowing a more efficient management of employment and prices.

It is now interesting to pass rapidly through the assumptions that have not been verified by the analysis and in particular the absence of a significant correlation between size and performance (Hp1), and between services provided and performance (Hp3).

The dimension does not show a significant correlation with performance. One possible explanation is due to localization. The larger structures tend to be located in areas not central or, often, very remote.

Finally, services provided has a positive correlation but not significant with the performance. This evidence is rather unique. Indeed, it is reasonable to expect that this type of aid appeal to seasonally adjust employment and revenue growth, generating an improvement in RevPAR and therefore not only the sign is positive, but that the correlation is significant. One possible explanation may be related to difficulties that hotels are using these facilities during the low season.

Generally speaking, from data collected in the study, it was evident that quality is a key cultural factor pervading a hotel's management philosophy and approach to operations. This factor is underscored by the importance of the hotel star rating system. The star rating system signifies that hotels are independently branded with respect to their quality. A priori, it is to be expected that higher quality hotels will have more sophisticated management systems to support their higher quality service delivery. As maintenance of a high quality of service is expected to be more important to higher star rating hotels, it follows that high star rating hotels will implement relatively sophisticated systems to assist in the decision-making process and to control the quality of service provided by subcontractors.

Abstract

A majority of the western population seems to be very much concerned about ethics and sustainability. Hence one should assume that the ethical correct and on sustainability focussed human being of today would keep an eye on ethics and sustainability in regard to his investments. Surveys show that this is not the case. Only a very small portion of the investment market goes to ethically sustainable investments. The purpose of this paper is to find out what might be reasons for the low acceptance of ethically sustainable investments and what needs to be done to attract further investors. Thereby, the focus of the investigation lies on private investors in German speaking countries. Through an extensive literature review and the conduction of expert interviews it is concluded that main reasons for the low acceptance of ethically sustainable investments are a lack of transparency and standardization, deficiencies in regard to certification, shortcomings in terms of financial advice and reservation about the performance. The complexity of ethically sustainable investments leads to the fact that there is no simple solution to the problem of acceptance, because the different expectations which are put on these investments cannot be met by a unified solution. Nevertheless different approaches to the solution are presented in this paper, like a clear and transparent communication of the selection criteria used in the creation of the investment products, professionalization of marketing and sales, and fortification of a public debate combined with the transfer of investment basics and the communication of results of performance studies.

Keywords: investment, sustainability, ethics

Introduction

Ethics and sustainability are very important topics nowadays. Accounting scandals, the subprime crisis and the use of green energy are among the issues often discussed. Climate change, environment protection and social responsibility are also hot topics. The oil disaster in the Gulf of Mexico and the Fukushima catastrophe refocused our attention on the issue of sustainability. The former German President Christian Wulff resigned because of an investigation by the German prosecution authorities into allegations of corruptions. A majority of the western population seems

to be very concerned with ethics and sustainability. People want accountability in the economic, ecological and social spheres for people in positions of power and also for businesses.

Just as consumers want to influence the behaviour of large corporations through the purchase of sustainable products, there are more and more investors who want to assume responsibility and take a closer look at what happens with their money once they invest it in a bank or investment company (Werner, 2009, p. 37; Fricke, 2010, p. 8). Furthermore, the financial system has major economic importance and therefore has a large influence on businesses and the sustainability debate (Hübner, 2010, p. 169). In this context, ethically sustainable investments play an increasingly important role.

The interest of private investors in sustainable investments is growing steadily. A survey by Imug (Institute for Market-Environment-Society) on 1,000 German households in 2004 revealed that nearly 30 percent of the respondents found sustainable investments attractive or very attractive (Imug, 2004, p. 13). However, only 2.6 percent of the respondents had already made such investments (Imug, 2004, p. 16). According to a survey by DZ Bank in the autumn of 2009, every second investor is interested in ecological investments, and one out of three in ethical ones (DZ Bank, 2009). However, in 2009, the share of sustainable investments in the total volume of managed assets in Germany was only 0.8 percent (Tober and Vögele, 2010, p. 19). Consequently, there is a gap between the expressed interest and the actual acceptance of the market. This gap could be caused by supply and demand, but surveys have already shown an increasing number of sustainable investment funds with a growing amount of money being invested (SBI 2011). Hence, this paper focuses on the demand side of such investments.

The purpose of this study is to identify factors that explain this gap and with it the low dissemination of ethically sustainable investments in the German investment market. This will involve investigation of the reasons for the low acceptance of ethically sustainable investments as described in the literature and of the causes of this as described by experts given their practical experience. In addition, this paper aims to present possible measures to attract further investors.

In answering the questions, there is no claim for completeness. Hereinafter, the focus is placed on ethically sustainable investments in Germany or German-speaking countries in particular. Developments in other European countries and the United States are not part of this study. Moreover, the emphasis is placed on private investors and not on institutional investors. Despite the comprehensive literature review, the results cannot be seen as representative. Only a few experts have been interviewed. Further research could involve an empirical standardized survey based on a certain number of participating investors, which could result in more representative results.

Ethically Sustainable Investments

To align investments fulfil not only financial but also moral criteria has a long tradition going back to the beginning of the 20th century (Werner, 2009, p. 27, and Ristau and Gewalt, 2010b). In the U.S., Christian-influenced investors, especially Methodists and Quakers, maybe were the first to focus their investments on the basis of ethical and social motives. They refrained from investing in so-called “sin stocks”, including companies in the arms, drugs and gambling industries. This form of investment was adopted by a large number of people during the 1960s and ‘70s as part of the protest movements against the Vietnam War and the apartheid regime in South Africa (Wissenschaftliche Arbeitsgruppe für weltkirchliche Aufgaben der Deutschen Bischofskonferenz, 2010, p. 9). In addition to private investors, more and more churches, universities and foundations also considered ethical criteria in their investments (Werner, 2009, p. 28).

Since the 1990s in particular, ecological (e.g. no nuclear power) and social (e.g. no child labour) aspects have increasingly been taken into account in ethically sustainable investment, which is often called sustainable investment, ethical and ecological investment or socially responsible investment (Rudolph, 2010, p. 445 and Wissenschaftliche Arbeitsgruppe für weltkirchliche Aufgaben der Deutschen Bischofskonferenz, 2010, pp. 9 and 10). In English-speaking countries, the term SRI (Socially Responsible Investment or Sustainable and Responsible Investment) has been widely adopted. However, no consensus on the definition of this term has been reached.

Meanwhile, almost all financial institutions also offer ethically sustainable investment products. There are also alternative banks (ethical-ecological banks), which have an ethical, ecological and/or social criteria for their businesses (Fricke, 2010, pp. 13-49). Loans may be granted only under strict criteria and their own investment in the capital market also has to meet high standards, which exclude involvement in certain activities such as arms or genetic engineering. In addition, alternative banks try to work more transparently than traditional banks by reporting the projects to which they grant loans. However, the degree of transparency differs even among these alternative banks.

The ethically sustainable investor can rely on a wide range of investment products similar to that of the conventional investor (Fricke, 2010, p. 10). Choices range from call money accounts, stocks and various funds to types of insurance. Particularly in the area of funds, a very large variety of different ethically sustainable funds exist (Gerth, 2008, p. 98). A distinction can be made not only between equity, bond and balanced funds, but also in terms of investment focus. Thus, there are several themed funds, which are tailor-made to specific target groups, but the boundaries between the differently themed funds are often not clearly defined (Werner, 2009, pp. 124 and 125).

The vendors of ethically sustainable investments define sets of criteria that can be used to identify promising companies that could fit into a portfolio (Gerth, 2008, p. 74). There are no rules and no consensus on what is to be regarded as ethical or sustainable. In addition to traditional metrics such as sales and profit, management, production and the products are also tested according to environmental, ethical and social criteria. The providers use this additional information to select from the range of eligible companies those that best meet their needs.

The concepts for categorizing ethically sustainable investments can be divided into active and passive approaches (Schäfer, 2009, p. 68 and Flotow, Häßler and Schmidt, 2002, p. 77). In the active approach, the investor intentionally influences the management by utilizing his or her shareholder rights (so-called engagement approaches). In the passive approach, the investor limits him or herself to expressing values by making specific investments (supporting) or by not making specific investments (avoiding). The following figure gives an overview of the different concepts used to categorize ethically sustainable investments.

Source: Own diagram based on Werner, 2009, p. 47, and von Flotow, Häßler and Schmidt, 2002, p. 78.

Various studies on ethically responsible investments have been conducted (Pinner 2008); for example, these include Mill 2006, Sparkes 1995, Camejo 2002, Mackenzie 1998, Havemann & Webster 1999, Cooper & Schlegelmilch 1993, Gregory 1997, Kempf & Osthoff 2006, diBartolomeo & Kurtz 1999, Klassen & McLaughlin 1996, Gunthorpe 1997, Cowton 2004, McWilliams 2000, Derwall et al. 2005, Webley & More 2003, Barnea et al. 2004, Heinkel et al. 2001, Sparkes & Cowton 2004, Orlitzky et al. 2003, Schröder 2005, Schröder 2003, Guerard 1997, Diltz 1995, Goldreyer et al. 1999, and Benson et al. 2006. However, we could only find one study – Mächtel 1996 – asking questions

similar to those dealt with in this paper. Mächtel analysed the key success-related factors in ecological-orientated investment funds in German-speaking countries. A number of studies on ethically responsible investments can be found online (<http://www.sristudies.org>).

Empirical Study – Design, Methodology, Approach

In order to identify the causes behind the low acceptance of ethically sustainable investments and what measures are proposed to increase the spread of these investments, both a literature review and expert interviews are carried out. To identify the opinions and experiences of experts, qualitative interviews are conducted and subsequently analysed. As such, it must first be determined who is an expert and shall be questioned. In some way, the status of being an expert, which is limited to a specific domain, is subjectively determined awarded by the researcher (Meuser and Nagel, 1991, p. 73). An expert is someone who is in some way responsible for designing, implementing or controlling a method of problem solving, or who has privileged access to information about groups or decision-making processes (Meuser and Nagel, 1991, p. 73). Hence, in this study, the following people are considered experts: those who work in the financial sector, including but not limited to those who specialize in the field of ethically sustainable investments. By interviewing experts who are not focused on ethically sustainable investments, the range of views on possible reasons for the low acceptance of ethically responsible investments and possibilities to overcome them can be expanded. In this study, only experts of the supply side are interviewed. Potential investors are not questioned.

Through the interviews, a variety of individual experiences of experts shall be analysed, but there is no claim for this selection to be representative. Simply, the opinions of actors of different activities in the financial sector are included in the investigation. Typical sample sizes for a hermeneutic interpretation range from $n=6$ to $n=120$ (Helfferrich, 2009, p. 175). In this study, six experts are interviewed. Five of the six interviews involve personal conversations. One involves a telephone interview.

The interviews are problem-centred interviews, which include only open, semi-structured questioning (Mayring, 2002, p. 67). The interview allows the respondent to speak as freely as possible, but it is centred on a specific issue, which the interviewer introduces, and to which he returns consistently. The specific issue has been analysed previously by the interviewer; he has developed certain concepts related to it, which are compiled in an interview guide and addressed by him in the course of the conversation (Mayring, 2002, p. 67). Therefore, within the scope of the interview, the theoretical assumptions are compared with the real world, reviewed and changed (Lamnek, 2010, p. 349). The interview guide is created using the following steps (Helfferrich, 2009, pp. 182-185):

- Collect questions in terms of a brainstorming session
- Check the questions in order to reduce the list to a few important and useful questions
- Sort the questions according to content
- Subsume individual aspects to the superior questions

The result is an interview guide with core questions that all the experts are asked, as well as additional questions that can be used flexibly depending on the course of the conversation.

There is no standard instrument for the analysis of qualitative interviews. Rather, the content analysis has to be adapted to the material and designed to the specific research question (Mayring, 2010, p. 49). In this study, the following analysis steps are conducted in order to filter interesting aspects out of the totality of the material. (The analysis steps are based on the analysis option described in Lamnek, 2010, pp. 369-370.)

- **Transcription** The interviews are taped and transcribed. Then, the transcriptions are sent to the interviewees for review, so that they can express any requests for changes and approve the use of the text for the analysis in this paper.
- **Development of thematic progressions** Generic terms for the topics mentioned in the conversation are written next to the corresponding paragraphs in the transcription. This creates a chronological overview of the various aspects raised.
- **Create a matrix of topics** The matrix is produced by adding all relevant topics and personal opinions mentioned (e.g. endorsing a measure) to a list. By checking the mentioned themes and statements of each interviewee, it is ensured that personal opinions can still be assigned to the right person. In a second step, the statements are sorted by superior subject areas, whereby the subsequent analysis is facilitated.
- **Identification of new themes and divergent opinions** The matrix of topics helps to compare the causes and solutions covered in the literature with the causes and solutions mentioned in the expert interviews. In this way, new and as yet unmentioned topics can be identified, as can areas where the experts disagree.
- **Summary** A summary of the experts' opinions, experiences and assessments is made.

Findings

Both, the literature review and the expert interviews lead to the conclusion that a major reason for the low acceptance of ethically sustainable investments is a lack of transparency. Owing to the growing range of ethically sustainable products and the use of a variety of different and not clearly

defined terms, it is increasingly difficult for investors to orientate themselves in this area (Hagedorn, 2011, Schäfer, 2009, p. 64 and Fricke, 2010, p. 8).

The concept of ethically sustainable investments is complex and requires more and specifically tailored information than that of classic investment because the investment analysis has to be extended to non-financial aspects such as ethical, ecological and social factors (von Rosen, 2009, p. 89). In the literature, the sustainability assessment, which is usually carried out by specialized research and rating agencies, is seen as another reason for the low acceptance of ethically sustainable investments because there is no standardized method for assessing sustainability (von Flotow, Häßler and Schmidt, 2002, p. 52); as such, the research and rating agencies depend to a high degree on the willingness to provide information of the companies to be evaluated (von Flotow, Häßler and Schmidt, 2002, p. 95). In addition, this is because the assessment methods and associated weightings of individual criteria are not transparent enough to be retraced from the outside (Fricke, 2010, p. 59). The interviewed experts, however, do not see the assessment of sustainability performance as a major problem for the acceptance of such investments and are against standardization in this area.

With regard to the communication of the product providers, improvement is also needed. Investors need a lot of information on ethically sustainable investments in order to ensure that they can maintain their orientation because of the great variety of products and different concepts of categorization that exist in the market. Often negative criteria are used for the categorization so as to exclude certain activities such as arms or nuclear power (Tober and Vögele, 2010, p. 38, and Werner, 2009, p. 46). Positive criteria are based on the fact that certain selection criteria must be fulfilled by the investment (Fricke, 2010, p. 56). The concept of positive criteria includes the controversial best-in-class approach, where the most sustainable industry representatives are selected, without excluding specific sectors like the oil and automotive industries (Fricke, 2010, p. 57, and Weber, 2010, p. 52). In addition, more recent concepts of categorization such as the integration approach, in which ethical, social and environmental risks are taken into account in traditional financial analysis, make it increasingly difficult for investors to distinguish ethically sustainable products from conventional investments (Tober and Vögele, 2010, p. 37, and Eurosif, 2010, p. 60).

Another reason for the low acceptance of ethically sustainable investments seen in the literature and by the experts is the investors' lack of knowledge about ethically sustainable investments and the basics of sustainability. Psychological factors such as convenience, inertia and habit often cause investors, even those with special knowledge, not to make the last step to actual investment. The experts and the literature also agree that there is some reservation about the performance of ethically sustainable investments among investors and consultants (Pinner, 2008, p. 91). However, there have been many studies generally concluding that the selection of investment options using ethically sustainable criteria does not lead to a level of performance significantly above or below the benchmark level (Detlefs, 2010, p. 58, and Schröder, 2005, p. 19).

According to the experts, another weak point is the distribution channel because most financial service providers are not interested in an active sale of ethically sustainable investments and, for the consultants, there is no incentive to deal with this complex issue and to explain and sell it to customers.

Practical Implications

Approaches for improving the acceptance of ethically sustainable investments in particular should try to improve transparency, information and communication in this area. This includes the elaboration of terms and definitions such as 'sustainability' and the creation of uniform typologies of ethically sustainable investments (von Flotow, Häßler and Schmidt, 2002, pp. 78-80) in order to achieve a common understanding of this investment type (Eurosif, 2010, p. 21). Furthermore, especially in the literature, standardization of reporting formats and indicators for social and ecological performance of companies is requested to ensure better comparability (von Flotow, Häßler and Schmidt, 2002, pp. 52, 53).

There is agreement to the effect that financial institutions should communicate clearly what they mean by ethically sustainable investments and which criteria they use when creating their ethically sustainable investment products (Ristau and Gewalt, 2010a). In this context, transparency guidelines already exist for mutual funds with an associated transparency logo, which were designed by Eurosif and are voluntary in nature (Pinner, 2008, p. 117, and SBI, 2011). In some countries, labels or certificates are used for ethically sustainable investments, which facilitate the orientation for investors (Pinner, 2008, p. 117, and Oekom Research AG, 2010, p. 11). The interviewed experts see great difficulties in this regard because the definitions of eligibility criteria and tolerance limits endanger the diversity of products, which is needed to fulfil the various personally and culturally conditioned desires and needs of investors.

Regarding the lack of knowledge of investors, there should be a greater public debate about ethically sustainable investments, in which in addition to the generally required basic knowledge of these investments, results of performance studies should also be communicated in order to eliminate the widespread reservations about their performance (Karch, 2009, pp. 190, 1991).

In addition to good products with a competitive performance, it is important to improve the acceptance of ethically sustainable investments by ensuring the continued professionalization of marketing and sales in this area (Rat für Nachhaltige Entwicklung, 2010). This includes consultants having to obtain knowledge of ethically sustainable investments during their initial training formation or in subsequent courses (Eurosif, 2009, p. 16). The introduction of a question on the attitude of customers regarding sustainability as a compulsory part of their consultation is proposed in the literature and supported by almost all experts interviewed in this study (Rat für

Nachhaltige Entwicklung, 2010). Furthermore, conventional financial institutions should also actively sell ethically sustainable investments, and specific marketing and sales campaigns by the major vendors, such as DWS Investments and Union Investment, could strongly promote the distribution of ethically sustainable investments.

Outlook

Both the literature and the interviewed experts predict further growth for ethically sustainable investments (Eurosif, 2010, pp. 18, 19). However, how quickly their acceptance will increase and whether ethically sustainable investments will become mainstream is still uncertain.

Since their origins in the early 20th century (Werner, 2009, p. 27), ethically sustainable investments have gone through a strong period of development and are no longer just for idealists who are willing to give up returns for moral considerations. Ethically sustainable investments are of interest to more and more private and institutional investors. They are enjoying ever-increasing volume and achieve remarkable returns, including over a longer period (CRIC, 2009, p. 62).

Nevertheless, this investigation has shown that there is still great need for improvement in order to increase the proportion of ethically sustainable investments among the total invested capital in Germany. In particular, the transparency, communication and information need to be improved so that more investors and advisors obtain sufficient knowledge and make conscious choices to undertake such investments. Whether one of the measures identified in this study to improve the acceptance will ultimately become binding or if the increase of transparency and knowledge in this area will be due to voluntary initiatives remains an open issue. It is important, however, that a change in values takes place in society, that the awareness of sustainability continues to increase and that people are clear about their personal influence and take responsibility for their own actions. Only if customers of conventional banks demand more sustainability and responsible action will successful integration of the concept of sustainability into the financial industry occur. This is particularly relevant in the context of the economic and financial crisis, which showed how much of a focus there has been on short-term profit maximization and how little comprehension and reflection there is regarding this selfish behaviour.

Ethically sustainable investments are on the right track towards greater acceptance among institutional and private investors, but the actors in this area must proceed vigilantly and carefully so that dubious suppliers and products, who are drawn in by the increasing attractiveness of this market, do not destroy the credibility of this sector as a whole. In addition, the boom in this area must not lead to basic characteristics of ethically sustainable investments being given up by, for example, making the content of the products arbitrary, simply in order to generate volume or by seeking only top yields in the sustainability area.

Abstract

In consideration of the characteristics of small and medium-sized enterprises (SMEs), this paper deals with the application of value-based management (VBM) in SMEs and the theoretical background to the cost of capital within VBM concepts. Furthermore, this paper presents different approaches to determine the cost of capital and in particular the cost of equity in SMEs by comparing the pros and cons of these methods. The applicability of these approaches is schematically illustrated by a concluding case study.

Keywords: value-based management, SMEs, cost of capital, WACC, case study

Introduction

Although previously neglected, small and medium-sized enterprises (SMEs) have become an increasingly important research subject. The concept of value-based management (VBM) in particular, as a key management philosophy (Britzelmaier, 2009, p. 11), has been dealt with in several reports (e.g. Krol, 2009a; Tappe, 2009; Khadjavi, 2005). However, various obstacles can be identified that limit the application of VBM in SMEs. These can be explained with the lack of specific knowledge and limited financial and personnel resources (e.g. Krol, 2009b, pp. 18-19). In addition, the determination of the cost of capital, in particular the cost of equity, leads to a central barrier in practice. Mainly developed for large publicly traded companies, common approaches of determining the cost of equity, such as the Capital Asset Pricing Model (CAPM) and the Arbitrage Pricing Theory (APT), assume a capital market orientation, which is mainly not given in SMEs. Therefore, several approaches have been developed to try to overcome this problem by comparing privately held SMEs with comparable traded companies or using qualitative risk estimations for the determination of the cost of equity.

The following paper deals with the above-described problem and presents alternative approaches for the determination of the cost of equity. The discussion is followed by a brief case study.

Characteristics of Small and Medium-sized Enterprises

The economic importance of small and medium-sized enterprises in Germany and Europe as a whole is now undisputed (e.g. Schauf, 2009, p. 15; Tappe, 2009, p. 22; Mac an Bhaird, 2010, p. 8). This can be illustrated by considering different economic dimensions, for example, the public finances, the labour market, innovation and competition (Hamer, 2006, pp. 33-39; Tappe, 2009, pp. 22-23). Mac an Bhaird showed that, in 2008, 99.8% of all enterprises in the European Union could be categorized into the SME sector (Mac an Bhaird, 2010, p. 3).

SMEs were long seen as a marginal scientific subject (Julien, 1993, p. 157). Through various initiatives, such as the foundation of SME-related institutes and the implementation of specialized courses of study, the research gap to large companies has been reduced, albeit not eliminated (Behringer, 2004, p. 5; Mac an Bhaird, 2010, p. 1).

Although the relevance of SMEs in public and science is accepted, the definition of SMEs is still controversial and not standardized. Already in 1962, Gantzel identified 190 different approaches to define SMEs (Gantzel, 1962, pp. 293-310). This complexity is increased by the fact that there are a wide range of definitions in different countries (Krol, 2007, p. 3). The aim is not to find a single definition but to distinguish SMEs from other groups by using an appropriate definition for a particular research target (Behringer, 2004, p. 7).

SMEs can be typically defined by using qualitative and quantitative criteria (e.g. Tappe, 2009, p. 12; Krol, 2009a, p. 12). Commonly used quantitative criteria are the average number of employees, gross revenue and total assets. Therefore, the European Commission designates companies as SMEs when they have less than 250 employees, an annual turnover of less than EUR 50 million and a balance sheet that does not exceed EUR 43 million (European Commission, 2003). Although a definition set by quantitative measures is clearly quite simple to understand and apply, diverse criticisms of this approach can be found in the literature, such as the overlapping of different measures (Kayser, 2006, p. 38) and the determination of thresholds (Krol, 2009a, p. 15). Quantitative criteria cannot describe the plurality of SMEs (Britzelmaier et al., 2011, p. 334); therefore, the integration of qualitative criteria is advantageous (Khadjavi, 2005, p. 55).

In the literature, different qualitative criteria to describe SMEs have been reported (Krol, 2009a, p. 15). These include the unity of ownership and management (Britzelmaier et al., 2011, p. 334; Krol, 2009a, p. 15; Tappe, 2009, pp. 15-16), the absence of capital market orientation (Khadjavi, 2005, p. 56; Pfohl, 2006, p. 20), the central position and importance of the entrepreneur (Khadjavi, 2005, p. 57) as

well as the specific finance and organization structures (Tappe, 2009, pp. 17-18). While differentiation of SMEs from large companies is possible using qualitative criteria, the operationalizability is the common point of criticism (Krol, 2009a, p. 15).

Recent publications about value-based management in SMEs define the research subject by using a combination of quantitative criteria to demarcate small SMEs and qualitative criteria to distinguish them from large companies (Khadjavi, 2005, pp. 54-58; Tappe, 2009, pp. 20-21). The consideration of VBM requires on the one hand a minimum of personnel resources and the implementation of an adequate controlling system, which is often absent in SMEs (Britzelmaier et al., 2009, p. 346). On the other hand, companies exceeding the thresholds can show the characteristics of SME; therefore, a qualitative demarcation is needed (Schauf, 2009, p. 9).

The Application of Value-based Management in SMEs

The creation, the continuous improvement and the measurement of the value of a company form the centre of value-based management (Dillerup and Stoi, 2011, p. 147). On the basis of the concept of Shareholder Value as reported by Rappaport in 1986 (Rappaport, 1986), other approaches like the Economic Value Added® and the Cash Flow Return on Investment were developed (Britzelmaier, 2009, p. 12). Besides the globalization of capital markets and increasing M&A activities in the 1980s, the main reasons for this development were the weaknesses of profit-oriented performance measures and the principal agent problem (e.g. Britzelmaier, 2010, p. 40; Dillerup and Stoi, 2011, p. 148; Tappe, 2009, pp. 75-78). Today, VBM is seen as a key management philosophy (Britzelmaier, 2009, p. 11) that is broadly accepted in practice (Weber et al., 2004, p. 5). Although long-term development is a target of SMEs (Piontkowski, 2009, p. 357) and VBM is principally valid for SMEs (Arbeitskreis (AK) Wertorientierte Führung in mittelständischen Unternehmen, 2003, p. 526), the applicability of VBM to SMEs is low compared with that for large companies (Britzelmaier et al., 2011, pp. 343-344).

Various factors that support the application of VBM to SMEs can be identified. These include:

- VBM helps to ensure the going concern and competitiveness of a company in a constantly changing environment by the consideration of risk-adjusted profitability and increasing awareness of strategic issues (Krol, 2009a, pp. 110-111; Tappe, 2009, p. 50; Beck and Britzelmaier, 2010, p. 20).
- VBM supports the fulfilment of the stricter rating requirements of Basel II through reconciliation of rating criteria and the aims of VBM (Beck and Britzelmaier, 2010, pp. 20-21).

- Owing to the special significance of meta-economical, non-financial goals in SMEs (Krol, 2009b, pp. 5-6), the orientation on VBM ensures the rationality of the management (Krol, 2009a, p. 122). Independently from that, value orientation explicitly implies ecological, ethical and social goals and prevents these issues being neglected (Britzelmaier et al., 2011, p. 334; Krol, 2009a, p. 58).

Reasons for the lack of application are manifold. Hirsch et al. states that the lack of application of VBM (in family businesses) is supported by the scientific practice. The majority of publications on VBM implicitly refer to large traded companies (Hirsch et al., 2007, pp. 635-636; Schomaker and Günther, 2006, p. 217). A more practical and empirically proven barrier for the avoidance of VBM is that SMEs are confronted with limited financial and personnel resources as well as a lack of knowledge about VBM. SMEs link the implementation of VBM to the extension of their IT systems and the hiring of additional staff, both of which may result in higher costs (Krol, 2009b, pp. 18-19; Britzelmaier et al., 2011, p. 347).

Another more practical barrier to the applicability of VBM in SMEs, which is focused on in this paper, is the determination of the cost of capital (Khadjavi, 2005, p. 193). The fundamentals and the resulting obstacles in the determination of the cost of capital are described below. Subsequently, possible alternative approaches for SMEs are discussed.

Fundamentals of the Cost of Capital

As explained above, the concepts of value-based management were originally developed for large publicly traded companies against the background of increasing globalization of the capital markets (e.g. Britzelmaier, 2009, p. 12). All concepts have in common that they compare the return of the company with its cost of capital. Modifications are mainly associated with the different usage of cash flow or profit-oriented figures (Britzelmaier, 2010, p. 41). Investors expect a specific hurdle rate of return, which can be defined as the cost of capital (Pfister, 2003, p. 9). The underlying concept for the definition of cost of capital is based on the concept of opportunity costs. An investor forgoes providing the capital to the next best alternative investment that has a comparable risk structure and duration (Pratt and Grabowski, 2010, p. 3; Hostettler, 2002, p. 157; Khadjavi, 2005, p. 194; Stewart, 1999, p. 431).

The determination of the cost of capital is essential because it involves assessment of the relevance of the value-based management concept (Männel, 2006, p. 81) and is the most difficult part in the calculation (Roztock and Needy, 1999, pp. 2-3). In the above-mentioned main concepts of VBM, the cost of capital is in the centre of the calculation (e.g. Rappaport, 1986, p. 55). Weber et al. showed that, in all considered approaches, the Weighted-Average-Cost-of-Capital (WACC) is used for the determination of the cost of capital rate (Weber et al., 2004, pp. 50, 72 and 84). The WACC

summarizes the cost of debt and the cost of equity to the cost of capital of the business (Pratt and Grabowski, 2010, pp. 4-5). The WACC is calculated using the following formula (e.g. Dillerup and Stoi, 2011, p. 161):

$$WACC = r_{(equity)} \frac{equity}{equity+debt} + r_{(debt)} \times (1 - t) * \frac{debt}{equity+debt}$$

WACC = Weighted-Average-Cost-of-Capital

$r_{(equity)}$ = cost of equity rate

$r_{(debt)}$ = cost of debt rate

t = company tax rate

The WACC is calculated on the basis of the financing side of the balance by using market values instead of book values. Market values represent the actual financing conditions and therefore should be the basis for the evaluation of future projects and the whole company. This argumentation corresponds to the described opportunity principle (Hostettler, 2002, pp. 169-170). In addition, a target capital structure is frequently used (Anderson et al., 2000, p. 385). A company is anxious to reach the respective financing condition in the long run on the one hand, and on the other hand, through the usage of a target capital structure, the circularity problem can be avoided (Hostettler, 2002, p. 170; Copeland et al., 2002, pp. 252-253; Pfister, 2003, p. 282).

The cost of debt can be determined by using the contractually agreed interest rate or, for bonds, the rate of return observed in the market (Töpfer and Duchmann, 2006, p. 33) and is therefore basically easy to verify (Pfister, 2003, p. 263; Stewart, 1999, p. 434). In the absence of a quote for their bonds, rates for companies with a similar credit rating can be used as an indicator (Stewart, 1999, p. 434). The formula of the WACC indicates that the tax effect of the cost of debt has to be deducted. This is caused by the fact that interest rates reduce the tax payments (Ward, 1999, p. 289). Although, in the cost of debt, various specifics have to be considered, especially for alternative financing products (e.g. Copeland et al., 2002, pp. 259-264), this topic will not be considered in the following discussion.

The cost of equity represents the expected return of an investor in comparison to that from alternative investments with a similar risk and payment structure (e.g. Hostettler, 2002, p. 157; Khadjavi, 2005, p. 194). Different models add a risk premium to a so-called risk-free yield. These models include the following (Britzelmaier, 2009, p. 73):

- Capital Asset Pricing Model (CAPM)
- Arbitrage Pricing Theory (APT)
- Market-derived Capital Pricing Model

- Dividend Discount Model

Although the APT has several advantages over the CAPM (see Pfister, 2003, p. 32), the CAPM is the most frequently used model for estimating the cost of equity in practice (Dillerup and Stoi, 2011, p. 158; Pratt and Grabowski, 2010, pp. 103-104). It is also recommended in the literature (e.g. Copeland et al., 2002, p. 264). The bases for the CAPM are the portfolio theory of Markowitz and the separation theorem of Tobin, and it was developed by Sharpe, Lintner and Mossin (Britzelmaier, 2009, p. 74). The basic idea is that, in an equilibrium, the cost of equity is equal to the yield of a risk-free investment plus a risk premium, whereby the risk premium is equal to the market risk premium multiplied by the company-individual risk, the so-called beta (Vélez-Pareja, 2005, p. 2). The equation is expressed as follows (e.g. Britzelmaier, 2009, p. 76):

$$r_{(equity)} = \underbrace{r_{(risk-free)}}_{\text{risk-free yield}} + \underbrace{(r_m - r_{risk-free})}_{\text{market risk premium}} \times \underbrace{\beta}_{\text{company-specific risk}}$$

As with many other models, the CAPM is based on different assumptions (e.g. Britzelmaier, 2009, p. 74), which result in some limitations (Pratt and Grabowski, 2010, pp. 103). In practice, $r_{(risk-free)}$ and $r_{(m)}$ can be relatively easily derived from long-term government bonds or market indices, respectively; hence, the evaluation of the company-specific β is the crucial factor in the calculation (Steinle et al., 2007, p. 205). For companies that are not publicly traded, relevant capital market figures cannot be derived (Günther, 1997, p. 180) and such approaches are therefore not valid for these types of companies without adjustments (Vélez-Pareja, 2005, p. 3). Similar problems arise by the determination of company divisions that are typically not publicly traded independently (Pfister, 2003, p. 67). Therefore, the following section will discuss alternative ways to determine the cost of equity and, in particular, the beta for SMEs.

Approaches for the Determination of the Beta in SMEs

In the literature, there are several reported methods that can be used to determine the β and therefore the cost of equity for SMEs without access to the capital market. These include analogy approaches as well as analysis or qualitative approaches.

Figure 1: Alternative approaches to determine the beta for SMEs
(own illustration based on Peemöller, 2005; Pfister, 2003)

Analogy Approaches

The main characteristic of analogy approaches is that traded reference companies are used as a benchmark (Pfister, 2003, p. 85). In Germany, research activities on analogy approaches are mainly carried out on the specific problem of determination of β for business units. These approaches are also valid for the determination of the β of non-traded SMEs (Pfister, 2003, p. 85). Within the analogy approach, which is widely used in the Anglo-American region, there are various methods that basically differ in terms of the considered number of reference companies (Steinle et al., 2007, p. 206).

The pure play technique compares the underlying company with a single reference company whose beta factor can be derived from market data (Pfister, 2003, p. 88; Bufka et al., 1999, p. 117). The underlying assumptions are that the systematic risk of the reference company has to be equal to the risk of the considered company and that both companies have similar financing structures (Pfister, 2003, p. 88). If these requirements are not fulfilled, adjustments have to be made (AK Finanzierung, 1996, p. 552). Alternatively, Günther recommends calculating an unlevered β before adjusting it with the actual financing structure of the company, called relevered β (Günther, 1997, p. 181; Copeland et al., 2002, pp. 372-373). The main challenge in the pure play technique is to find an appropriate company that is comparable in terms of the characteristics of risk, size and capital structure (Palliam, 2005, p. 339). Nevertheless, the calculated beta of the pure play technique can serve as a good first indicator (AK Finanzierung, 1996, p. 552).

In contrast to the described technique, the difference to the peer group approach and the industry beta is that the beta is determined by means of a group of reference companies or a specific industry, respectively (AK Finanzierung, 1996, pp. 552-554). The industry beta approach is based on the assumption that the business risk is mainly determined by the business field in which the companies are active (Pfister, 2003, p. 98). These industry betas can be observed from published data or calculated on their own (AK Finanzierung, 1996, p. 553). If different companies are allocated to groups that do not inevitably belong to the same business field, but that show similar characteristics, they can be defined together as a peer group (Pfister, 2003, p. 95).

The main advantage over the pure play technique is the reduction of statistical estimation errors (AK Finanzierung, 1996, p. 553). Nevertheless, all approaches have weaknesses in the identification of appropriate companies (Pfister, 1997, p. 97) or the existence of reliable information (Steinle et al., 2007, p. 207). Through the insufficient quotation on the stock exchange of middle-sized companies, especially in Germany, larger companies have to be considered to find an appropriate reference group, which impairs the comparability (Schütte-Biastoch, 2011, p. 186).

Analysis Approaches

In the absence of capital market information, different analysis approaches exist. In Germany in particular, it is often difficult to find adequate reference companies (Peemöller, 2005, p. 33). The underlying approaches are the earning beta, the accounting beta and the fundamental beta. They try to connect accounting data, mainly on the basis of financial statements, with the market beta (e.g. Steinle et al., 2007, p. 207), a stock beta coefficient derived from market information (Palliam, 2005, p. 339). The concept is based on the assumption that accounting data are influenced by information and events, which would also be the basis for the market prices (AK Finanzierung, 1996, p. 556). The various methods differ in terms of the number of considered measures. While in the earnings beta, only the profit is taken into account to describe the systematic risk and therefore a connection is doubtful, in the accounting beta concept, the determination is based on a broader data sample through integration of additional, accounting-related risk measures (Peemöller, 2005, p. 34; Steinle et al., 2007, p. 207). In contrast, additional economic factors are integrated in the fundamental beta (Peemöller, 2005, p. 34; Steinle et al., 2007, p. 207).

The main advantages of the analysis approach are related to the avoidance of the use of empirical stock returns (Schütte-Biastoch, 2011, p. 187) and the ease of use of the earnings and accounting beta (Pfister, 2003, p. 166). However, this approach is characterized by several disadvantages. Empirical studies on the earnings beta and accounting beta show different results, thus a consistent statement cannot be made (Pfister, 2003, pp. 166-167 and 196). In addition, accounting-based figures are exposed by the accounting policy and are therefore designable (Peemöller, 2005, p. 34). Financial

data do not reflect the overall risk situation of SMEs and therefore have to be expanded using other non-financial factors (St-Pierre and Bahri, 2006, p. 556). Sophisticated models like the concept of *Barra* for estimating fundamental betas are complex and conflict with the typical lack of resources already mentioned for SMEs (Peemöller, 2005, p. 34).

Qualitative Approaches

The described approaches presuppose the availability of adequate data. Qualitative approaches consider subjective appraisals for the risk estimation instead of objective generated reference data (Pfister, 2003, p. 221).

Scoring models like the model of the *Boston Consulting Group (BCG)* and the model of *Fuqua Industries Inc.* (see Pfister, 2003, pp. 226-233; Bufka et al., 1999, pp. 118-120) are now popular for practical applications (Steinle et al., 2007, p. 207). The *BCG* model was primarily developed for the *VBM* concept to determine the cost of capital for different business units (Bufka et al., 1999, p. 118). The considered criteria (control, market, competitors, products, market entry barriers and cost structure) have to be evaluated by the management (Pfister, 2003, pp. 226-227). Although scoring models convince through the simple application (Peemöller, 2005, p. 34), barriers can be found in the subjectivity of the selection and evaluation of criteria (Pfister, 2003, p. 244).

Another method that is frequently used in practice is the build up method (Pfister, 2003, pp. 226; Hostettler, 2002, p. 173). On the basis of the yield of a risk-free investment, subjective quantified charges for the risk premium are added (Pfister, 2003, pp. 223-225). The components for the risk premium could be a general equity risk premium, a small-company risk premium or a company-specific risk premium (Pratt and Grabowski, 2010, pp. 87-88). For SMEs, a premium for the company size should be taken into account, especially if the company has a size that is not recognized on the market (Pratt and Grabowski, 2010, p. 95). Although this method offers advantages in terms of practicability and therefore in terms of acceptance (Pfister, 2003, p. 225), it has been subjected to substantial criticism given the subjectivity and the arbitrariness of the quantified risk components (Pfister, 2003, pp. 225-226).

Copeland et al. stated that "a crude but often effective way of estimating betas is to elicit the help of management" (Copeland et al., 1996, p. 342). In SMEs in particular, the involvement of the management in the determination of the cost of capital is essential (Pfister, 2003, p. 222). A possible procedure recommended by Copeland et al. is that the management team provides a list of business areas for which betas are known. They select a business field that corresponds to their own business. If a consensus is reached, this corresponding beta can be used for their own company (Copeland et al., 1996, p. 342; Pfister, 2003, p. 222).

In the described approaches, it is assumed that the determination of the risk-free yield and the market yield is known or can be derived from the market accordingly. Taking into account that the market risk premium significantly differs for large and small publicly traded companies, there are doubts about whether the market risk premium of a small privately held company is comparable to these figures (Roztocki and Needy, 1999, p. 3). Peemöller pointed out that unsystematic risks that result, for example, from competitive disadvantages for SMEs are not recognized in the CAPM standard model and therefore have to be considered in the market risk premium (Peemöller, 2005, p. 34). Müller argues that owners of a private company have invested a significant amount of their net worth in the company, which exposes them to an idiosyncratic risk due to a lack of diversification; therefore, they require higher returns (Müller, 2010, pp. 30-31).

Another possible approach could result from a direct survey of the investors (Damodaran, 2010, p. 15). The cost of equity represents the expected return of an investor (e.g. Hostettler, 2002). In contrast to large traded companies with a diversified owner structure, SMEs are characterized by a small number of owners with generally homogeneous expectations and high commitment to the particular company (Tappe, 2009, pp. 15-17). Against this background, it seems reasonable to determine the yield expectation by interviewing the shareholders. Moro et al. argued against the effectiveness of this procedure owing to the fact that investing in a company occurs as a result of various factors, including benefits from the social recognition obtained from having done so (Moro et al., 2010, pp. 2 and 11).

After discussing the different approaches for determining the cost of equity and in particular the β , the following section provides a practical example.

Case Study for the Determination of the Cost of Equity in SMEs

The above-described approaches are used for the determination of the cost of equity for SMEs. The following case study schematically illustrates how some of these approaches can be used in practice. The basis for this case study is a project in cooperation with a privately held enterprise that exceeds the quantitative thresholds indeed but shows the typical qualitative characteristics, namely, the absence of capital market orientation and therefore limited financing possibilities. The case study is based on exemplary measures in order to assure confidentiality.

The calculation of the cost of capital was based on the CAPM. For reasons of simplicity, taxes are only considered on the company level in this case study. The different components for the CAPM were determined as follows:

- The basis for the risk-free yield is the 10-year federal securities with annual coupon payments. To eliminate errors resulting from a specific reporting date, the arithmetic

mean of the last five years (on a monthly basis for 2007-2011) was used as risk-free rate. The result was 3.49% (Deutsche Bundesbank, 2012).

- The market risk premium, the difference of the market return and the risk-free yield, was defined as 4.5%. This assumption is based on the recommendation of the German Institute of Public Auditors (Peemöller, 2005, p. 34).

For the determination of the company-specific beta factor, a combination of analogy and qualitative approaches was used. In the first step, traded companies, as well as industry fields, that are comparable in terms of the product range were selected. The beta factor was calculated on the basis of MSCI World Index (MSCI, 2012) and adjusted according to the capital structure of the company. For the industry beta, MSCI industries were evaluated. As a result, the pure play method, the peer group method as well as the industry beta showed similar figures; therefore, the decision was made to use a beta of 0.95. In the second step, the cost of equity was adapted to the specific risk situation of the owner due to the unlimited liability with respect to the build up method. This risk extension was considered with an additional 3.0%. This represents the individual risk situation of a privately held company, which is not given in a traded company with a heterogeneous owner structure and limited liabilities.

$$r_{(equity)} = 3.49\% + 4.5\% \times 0.95 + 3.0\% \cong 10.8\%$$

The basis for the cost of debt (4.0%) was the contractual agreements or historical data. The WACC based on the target capital structure of 70% equity and 30% debts was thus calculated as follows.

$$WACC = 10.8\% \times 70\% + 4.0\% \times (1 - 30\%) \times 30\% \cong 8.4\%$$

The calculated WACC of 8.4% is the basis for the calculation on the group level. For associated companies or different business units within the company, adaptations are made.

Conclusion

After illustrating the fundamentals of SMEs, VBM and the importance of the cost of capital, this paper showed several approaches to determine the cost of equity in the particular case of SMEs and provided detailed discussions of them.

The discussion revealed that the determination of the cost of equity is still an obstacle that SMEs are confronted with when applying VBM. The disadvantages of the described methods are multifarious and refer mainly to the subjectivity or the limited empirical evidence. Nevertheless, these concepts can be beneficial with regard to the determination and can therefore be considered as a starting point. The described opportunities for VBM of SMEs are essential and shall not be outweighed by the difficulties with regard to the determination of the cost of equity. It is crucial that the used approach is transparent for the management, in order to gain acceptance. As

illustrated in this case study, the authors recommend using a combination of different approaches to avoid a biased and subjective estimation. It is desirable to expand the research activities in this field and to introduce the available approaches in practice to support the applicability of VBM in SMEs.

CULTURAL TOURISM IN WORLD HERITAGE SITES: AN EMPIRICAL STUDY ON AN ITALIAN MARGINAL AREA

Buonincontri, Piera¹; Simeon, Maria I.²

¹ Institute for Service Industry Research (IRAT) – Italian National Research Council (CNR), Naples, Italy. Email: p.buonincontri@irat.cnr.it

² Institute for Service Industry Research (IRAT) – Italian National Research Council (CNR), Naples, Italy. Email: m.simeon@irat.cnr.it

Abstract

Marginal areas are characterized by a poorly developed economy often focused on the primary sector, a strong depopulation, poor infrastructure, environmental and structural problems. These areas, however, are also characterized, due to their features, by a strong relationship with their heritage and local identity. These are key factors on which territories can base their competitive advantage; tourism based on these assets may activate processes of local development.

The purpose of this paper is to individuate strategies and marketing tools able to strengthen the tourist attractiveness of a UNESCO World Heritage Site located in an Italian marginal area. The focus is on the UNESCO site Sassi di Matera - in Southern Italy - a marginal area in geographic and economic terms, with a high cultural and tourist potential not adequately developed.

A questionnaire-based survey has been conducted on 780 tourist of Matera to study their behaviour of visit and individuate the strengths and weaknesses of Matera. The data collected provides policy tools useful for decision makers to reduce the negative effects of marginality and obtain competitive advantages based on local heritage and identity.

Keywords: Cultural tourism; Marginal area; World Heritage Sites; Empirical survey

Introduction

Marginal areas are characterized by unfavourable social and economic conditions, which generate a situation of delay and backwardness in the development, compared to the external environment (Antolini and Billi, 2007): they have an unfavourable geographical location, problems of accessibility and particular geo-morphological features (Landini, 2005); in addition, these areas are characterized by a poorly developed economy often focused only on the primary sector, a strong depopulation, poor infrastructure, environmental and structural problems (Hohl and Tisdell, 1995).

It should however be considered that these areas are also characterized by an identity heritage still strong and authentic. This is a key factor on which they can base their competitive advantage.

In this context, tourism is the most effective strategic instrument to make known the identity, history, culture and local traditions, and to avoid that these resources may be lost because not economically significant (Gualerzi, 2006). Tourism in marginal areas may be an opportunity to activate the processes of development and to revitalize these uncompetitive areas.

In Italy, the main strength of the tourism sector is related to the natural, historical, artistic, and cultural heritage of the Country. The value of Italian heritage is recognized worldwide and it attracts each year more than 40 millions of tourists at international level (Tourismonitor, 2011). In Italy there are 24 National Parks inscribed in the Official List of Protected Areas; more than 3.400 Museums and 2.000 Archaeological Sites. Italy has also the largest number of sites in the world under the protection of UNESCO (47 sites are inscribed in the UNESCO World Heritage List).

Comparing the Regions of Italy, however, there are strong imbalances in the tourism market; in particular, the South of Italy is still poorly developed - with the exception of few destinations. Many areas of Southern Italy, in fact, although their significant tangible and intangible cultural heritage, present a strong economic marginality and lack of infrastructure. Cultural heritage should be used as strategic tool to strengthen the tourist competitiveness and attractiveness, and to activate the local development. The restoration of cultural and identity heritage of a territory, in fact, is now recognized as a fundamental process for the development of weak areas (Nicolosi et al., 2009); ever more territories focus on the enhancement of their heritage to attract tourists, preserve the local culture, and activate the socio-economic development.

Starting from these considerations, the purpose of the paper is to individuate strategies and marketing tools able to empower the tourist attractiveness of a marginal area in Southern Italy.

The focus is on Sassi di Matera in Basilicata Region, a marginal area in geographic and economics terms, but inscribed in the UNESCO World Heritage Sites List and with a high cultural and tourist potential not adequately developed. A survey has been conducted on 780 tourists of Matera to study their behaviour of visit. Results allowed to individuate marketing tools, policies and guidelines useful for decision-makers and private economic actors interested in strengthening the tourist competitiveness of the area.

The paper is structured as follows: section 2 is a brief reflection on marginal areas and tourism development; section 3 profiles the Research context; section 4 describes the Research design. Section 5 presents field research results, and section 6 details the Conclusions.

Tourist Development in Marginal Areas

Tourism as factor of development of marginal areas allows to (Antikainen et al., 2006; Belletti, 2001, 2010; Manente, 2005): create new employment opportunities, stimulating and ensuring high

involvement of local people; start new businesses even with limited private investment, through new sources of income, the diversification of typical local activities, and the participation of new investors; create and improve products and services not only for tourists (accommodation, transport, attractions and other activities); enhance, restore and protect identity resources that might be lost; attract high quality tourists able to generate positive effects on local activities.

An advantage of marginal areas compared to the more developed destinations is the strong bond with their heritage and identity. Tourism can be the right tool for the enhancement of tangible and intangible heritage of these territories, generating advantages both for locals and tourists: local heritage can be considered a strategic factor able to differentiate and give a competitive advantage to the destination (Urry, 2001). This is true especially considering that tourist demand is increasingly oriented toward non-traditional destinations, more sensitive to cultural and social values related to the local identity (Richards, 2007; Staniscia, 2006). Tourists want to learn new cultures, develop authentic relationships with the residents (Fusco Girard, 2008), and discover the identity of places (Thimothy and Boyd, 2006; Sistu, 2007). Tourism based on local identity draws a development strategy that influences the growth also in related sectors, highlighting the distinctive features of local communities (Palmer, 1999; Pritchard and Morgan, 2001) and strengthening the local identity of the inhabitants (Ashworth and Larkham, 1994). Cultural heritage, therefore, is one of the main strengths of marginal areas and their delay in development can be an opportunity to avoid the risks and damages related to the commodification of culture and the invasive use of resources.

Institutional bodies and local communities should be the key actors to enable and promote the processes of development in marginal areas (Bimonte and Punzo, 2003). The creation of a system of relations between public institutions, with the involvement of local community, is fundamental to define integrated supplies able to attract tourists throughout the year. The cooperation between local actors can define a shared project of development, which takes into account all the local resources and considers the territory an integrated supply system (Amin, 1998). The enhancement and promotion of cultural heritage and local identity can be transformed into a powerful engine of development difficult to transfer or imitate.

Research Context

Matera is a heritage town in Basilicata Region - Southern Italy. The town is famous worldwide thanks to its historical centre and its neighbourhoods – I Sassi - recognized World Heritage Site by UNESCO since 1993. Sassi di Matera - divided into Sasso Barisano and Sasso Caveoso - are an outstanding example of a rock-cut settlement, perfectly adapted to its geomorphologic setting and its ecosystem and exhibiting continuity over more than two millennia. They represent a traditional

human settlement and land use showing the evolution of a culture that has maintained over time a harmonious relationship with the natural environment (ICOMOS, 2006). Matera presents a very high density of monuments, churches and cultural resources: the town is full of signs related to its historical condition, considering that the majority of houses and churches in Sassi di Matera are caves excavated in the tufa rock.

Despite Matera has a rich cultural heritage, characteristics of geographic, demographic, economic, and infrastructural marginality are evident:

Geographical marginality.

Matera is predominantly rural in accordance with the Organisation for Economic Co-operation and Development - OECD classification (Regione Basilicata, 2008); most of the Basilicata Region is considered rural area with comprehensive development problems according to the National Strategy Plan for Rural Development - NSP (Regione Basilicata, 2008) (Figure 1).

Figure 1: Typology of rural areas - Basilicata Region

Source: Regione Basilicata, 2008

Demographic marginality

Between 2001 and 2010 the population of Matera has grown less than 10% (+5.2%): the inhabitants rose from about 58,000 to 60,800. Moreover, the percentage of elderly is higher than that of the young: in 2010 the residents with + 65 years are 17.6%, while the young -15 years are 14.6% of the population (ISTAT, 2010).

Economic marginality

The local economy is mainly based on agriculture, small business and the production of living room furniture, mainly sofa. This sector, however, is in crisis since 2006 (Formez, 2006).

Infrastructural marginality

Matera is not connected by rail; road network is still very weak, and buses are not frequent. The nearest airport is located in the Puglia Region, 60 km away. The town may be reached only by car or bus.

The marginality of Matera is a critical situation, but also leads to an important advantage, which is connected to the authenticity and uniqueness of the area. The inscription into the UNESCO World Heritage List, in fact, is also due to the fact that ICOMOS (1993) has recognized Sassi di Matera as “the best surviving and most complete example of continuity in the Mediterranean region of this type of settlement, which developed in close harmony with the ecosystem”. Matera has a still very strong link with its culture and traditions, an uncontaminated environment, cultural and artistic heritage expression of local identity, typical products (food and wine, handicrafts, etc.) not affected by globalization. The marginality of Matera can therefore be considered an opportunity for the local development: its uniqueness and its heritage are factors on which Matera may base a distinctive competitive advantage. In this context, lasting and sustainable tourism policies based on a right enhancement of the local heritage and of the local identity can, for example, facilitate the recovery of ancient works that would otherwise be lost, spread the ancient traditions, and stimulate the production of typical products (Urry, 2001, Richards and Wilson, 2006).

ICOMOS has recognized also the crucial role that cultural tourism can play in the development of Sassi di Matera , and has given recommendations related to a proper tourism able to enhance the area without damaging the local heritage. In the Periodic Reporting of 2006, ICOMOS underlined that a problem that needs careful attention was tourism, which should be controlled in accordance with a visitor management plan so as to avoid a type of development which can ruin the ambience.

An analysis of tourism in Matera through statistical data (ISTAT, 2011; APT Basilicata, 2011) revealed that tourism in the town is effectively increasing in recent years; for this reason, considerations by ICOMOS and the need to define policies of cultural tourism in accordance with to the historical features of Matera acquire a weight increasingly important.

From the demand side, Matera received more than 115.800 national and international arrivals and 182.000 overnight stays in 2011. An increase in arrivals and overnight stays of both domestic and international tourists in the period 2008-2011 is registered. In particular, the arrivals of Italians

increased by 48% and the arrivals of foreigners increased by 58,2%; the overnight stays have increased by 43% for Italians and +45% for foreigners. The analysis of tourist flows per month of the year highlights four periods of maximum intensity in 2010 (April, August, September, and December) for the Italian tourists, and two different peaks for the foreigners (May and September). The leaner periods are in January, February and November for Italian tourists; January, February, November and December for foreigners. Most of tourists of Matera come from Italy (72,6% in 2011), especially from the nearest regions: Puglia (17%), Lazio (13%), and Campania (12%). In the last years, however, also has increased the number of tourists from Northern Italy: tourists from Lombardia, for example, were 11% in 2008 and 12% in 2011. Also the number of foreigner tourists increased from 2008 to 2011 (+0,3%); the most visitors come from USA (15,2%), France (12,8%), and Germany (12,7%).

Research Design

A survey on tourists of Matera has been conducted to assess whether the local cultural and identity heritage is properly enhanced and to individuate the right tools to strengthen the tourism in the area. Visitors-based marketing interventions, in fact, allow to increase the awareness of the distinctive features and promote all the distinctive assets of the area.

Methodologically, interviews to a sample of 9 official tour guides of Matera have been conducted in June, 2010. The interviews were realized through a structured form to investigate the targets, the timing of the visit and the proposed itinerary. Furthermore, the tour guides have expressed their opinions about the problems and opportunities of the territory. The information gathered from interviews were used to structure a questionnaire with closed questions, which was administered in different locations in the centre of Matera to 780 visitors (647 Italians and 133 foreigners) between June 23 and July 9, 2010.

The questionnaire has analyzed the behaviour of visit of tourists and revealed the strengths and weaknesses of Matera. The results of the survey allow to define specific strategies and marketing policies able to improve the tourist competitiveness of the area.

Findings

The respondents have a high education level: 43% have some college education, and 31% obtained a degree. 28% of interviewers are employees; 15% are professionals or entrepreneurs. The most representative age classes are 46 - 60 years (38%) and 31 - 45 years (35%). Italian tourists come from the nearest regions: Puglia (18%), Lazio (14%), and Campania (12%); 55% of Italians are from the other regions. Foreigners principally come from France (15%), USA (12%), Germany (11%), Japan (11%), and UK (6,3%).

In most cases, the visit of Matera is organized with partner (28%), family (28%) or friends (18%). 8,6% of respondents used the services of tour operators or travel agencies. The tours organized by tour operators and travel agencies usually consider Matera as a short destination within tour packages that include the main attractions of Puglia and Basilicata; these tours generally propose the overnight stay in Puglia Region.

The main strength is the uniqueness and attractiveness of *Sassi di Matera*. The historical importance of *Sassi* is recognized at international level and the area is the first site of Southern Italy to be inscribed in the UNESCO World Heritage List. This recognition is known by 95% of the sample (97% of Italians and 94% of foreigners): questionnaire results highlight the success of a proper institutional communication of the UNESCO brand. The *uniqueness of Sassi di Matera* is also the main reason to visit the city (38%), followed by *curiosity for a famous city* (19%) and *suggestions by friends* (12%) (Figure 2).

Figure 2: Why have you chosen to visit Matera? (Max 3 answers)

Source: our elaboration

The attractions that respondents considered most interesting during their visit were, in the order: Sassi, Churches and historic buildings, History and traditions of the town. Also these results show the importance and the attractiveness of Sassi (Figure 3). Most of the sample, however, did not visit museums, attended shows and events, or visited the neighbourhood of the town.

Figure 3: During the visit of Matera, how do you think are interesting the following factors?
 Source: our elaboration

Furthermore, respondents expressed a general satisfaction about the visit of Matera. In particular, 49% of Italians and 47% of foreigners is satisfied with the experience of visit; 30% of Italians and 40% of foreigners is extremely satisfied (Figure 4).

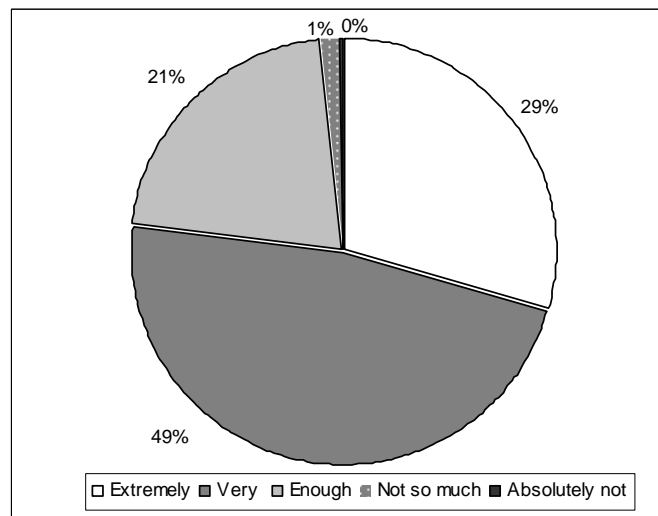

Italians**Foreigners**

Figure 4: Are you satisfied of your travel experience in Matera?

Source: our elaboration

The attractiveness of the city is also confirmed by the fact that 30% of respondents had already visited Matera in a previous trip; in addition, 89% of the sample said they would return to visit the town and 99% would recommend a visit in Matera to relatives and friends.

The analysis has also revealed weaknesses of tourism in Matera.

The first weak point is related to ineffective communication of the real potential of the destination. The empirical survey, in fact, showed that the visit of resources was above the

expectations of tourists for 60% of foreigners and 42% of Italians. These results show that tourists are not perfectly informed about the quantity and quality of the resources in Matera until they reach the town (Figure 5).

Italians

Foreigners

Figure 5: How do you rate your visit in Matera?

Source: our elaboration

This weakness in the communication of the tourist supply of Matera induces tourists to spend a little time in the town, often visiting Matera in half-day, without booking hotels for the night. 38% of the total sample, in fact - 39% of Italians and 28% of foreigners - not spend the night in the city; 25% spend one night, and only 28% of respondents stay for 2-3 days (Figure 6). The favourite accommodations are three-star hotels (22.8%), four-star hotels (21.4%), and bed & breakfast (23.6%). A large number of cave-dwellings in the Sassi, in fact, have been restored and converted into bed &

breakfasts, offering visitors unique experiences, which are preferred to the traditional services offered by hotels.

Figure 6: How much time will you spend in Matera during this trip?

Source: our elaboration

The analysis shows that tourism in Matera is mainly related to day-trippers; this is a great critical point, because the city is instead equipped with a large number of accommodations able to serve the tourist demand. Matera has the 17% of the Regional accommodation and the number of hotels and other establishments is constantly arising over the years. In particular, there are 24 hotels in Matera in 2011 - most of them four stars hotels - and 100 other establishments; between them, 76 are bed & breakfasts (APT Basilicata, 2011). Public funding and incentives in recent years have, in fact, allowed to increase the number of guesthouses and bed & breakfasts: between 2008 and 2011 these structures increased by 32 additional units.

The limited time devoted to the visit of Matera is linked to a further weakness of the tourism: the potential, the number and attractiveness of cultural resources of Matera, in fact, are not known until the visitor reaches the city.

Only when the tourist reaches the destination, he/she realizes how many resources worthy of attention are in the town.

The idea of spending more than a day in Matera, however, is generally not considered during the planning of the journey: for 40% of the total sample, Matera is considered a destination to visit within a wider circuit, which includes stops in other areas of the Basilicata Region, Puglia Region, or the entire South of Italy. This is true for Italian tourists (59%), but even more for foreign tourists: 85% have visited or will visit other places in Italy during their trip (Figure 7).

Italians

Foreigners

Figure 7: The journey in Matera is part of a tour:

Source: our elaboration

The inefficient transport infrastructure to reach the town is another limit for the tourist development of Matera: as shown in the previous paragraph, in fact, the geographical and infrastructural marginality are two important weaknesses. The railway network, in fact, is currently not adequate to the needs of tourists, and most visitors use their car (68% of Italians and 51% of foreigners), or the service bus to reach Matera (20% for both Italians and foreigners).

Some strategic actions can be implemented to reduce the weaknesses of the tourist system of Matera, and to make resources and cultural identity of the town the main factors to develop tourism and overcome the current situation of marginality.

In particular, respondents are interested in staying longer in the town if there was a wider range of cultural and gastronomic events (20%), adequate transport infrastructures to reach Matera (14%), and if they had the opportunity to visit the surroundings (13%) (Figure 8).

Figure 8: Would you be interested in staying longer in Matera if there was: (Max 3 answers)

Source: our elaboration

Visitors could be encouraged stay longer in Matera through the improvement of road and rail network, and the planning of tourist routes able to link the visit of Matera with the visit of its surroundings.

Other strategic actions to enhance and promote tourism in Matera are related to the definition of well-structured tourist routes along the Sassi; the organization of real and virtual circuits that stimulate also the visit of minor and peripheral sites; the promotion of intangible heritage of Matera, such as its myths, legends and traditions; the introduction of cumulative tickets to visit more resources. The survey, in fact, showed the strong interest of tourists for the history and traditions of the city, and cumulative tickets could encourage also the visit of museums in the town, that are important but not known and visited by tourists, such as the Museum of Contemporary Sculpture in Matera – Musma - and the Domenico Ridola National Museum.

Matera should be promoted as an integrated tourist product that combines food and wine, local traditions, historical, cultural, and landscape resources. In this context, a central role can be played by the brand UNESCO, which is still not widely used and shows to have strong potential.

Conclusions

Tourism in Matera has some structural competitive limitations due to problems to reach the area; furthermore, it presents a high prevalence of day-trippers - although foreign tourists who stay more days in the town are increasing in recent years. Day-trippers cause problems to the competitive growth of the destination: a half-day tourism produces an increase in the number of visitors which, with the same total expenditure, causes a greater consumption of resources; furthermore, the effect of crowding has a negative influence on satisfaction of tourists who spend more time in Matera.

To define territorial marketing policies and to reduce the negative effects of marginality, Matera and its surroundings must be managed in an integrated perspective, taking into account also museums, cultural events, and the most important resources that are in the area near Matera (rock-hewn churches, cave-dwellings, Byzantine paintings as the famous Crypt of Original Sin). The local cultural heritage and the identity resources of Matera have a great potential to allow the development of tourism in the town, but tourist policies are necessary to enhance them and strengthen their competitive value.

This study is at an early stage of research and the analysis needs to be extended to Sassi di Matera also in the future. Moreover, it should be replicated in other marginal areas in order to strengthen the findings. Several marginal areas are attempting to determine the most appropriate ways to activate a positive tourism development, enhancing their heritage and, at the same time, preserving their culture and identity. This paper could result in a deeper understanding of those strategic actions that lead to competitive advantages in tourism of marginal areas.

TECHNIP'S INTERNATIONALIZATION TOWARDS MECs AND SMCs. THE KEY ROLE OF CULTURAL COMPETENCE

Calza, Francesco¹; Cannavale, Chiara²

¹ Full professor of Business Management, Università degli studi di Napoli "Parthenope", E-mail: francesco.calza@uniparthenope.it

² Assistant professor of Business Management, Università degli Studi di Napoli "Parthenope", E-mail: chiara.cannavale@uniparthenope.it

Abstract

The increasing environmental turbulence and the high competition push firms to enlarge their markets and to research new opportunities to implement and successfully develop their products. Internationalisation becomes more and more a learning strategy, aimed at exploring opportunities and to consolidate existing advantages. According to this perspective, managers' capability to understand diversity is fundamental to guarantee leaning efficacy. Above all in emerging markets, such as Middle East Countries (MECs) and Southern Mediterranean Countries (SMCs) and Middle East, cultural distance can limit firms' success, by precluding learning and reducing firms' capability to interact with local stakeholder. This paper aims at exploring the concept of cultural competence and to highlight its value for European firms entering SMCs and Middle East. The empirical analysis is focused on the case study of Technip Italy, a world leader in engineering, technologies and project management for the oil and gas industry, successfully operating in the area.

Keywords: Internationalization, cultural competence, SMCs, MECs

Introduction

Because of the increasing global competition, firms need continuously to look for new markets both to reach higher market shares, and higher level of efficiency. On the first side, Western firms have to reduce the threats coming from the entropy of their markets and look abroad not only to sell, but to revitalize their businesses and products. On the other side, Western firms face competitors coming from emerging markets and advantaged by cheaper coasts. They have consequently the need to become more efficient, by delocalising their activity in more convenient contexts.

While attractive and necessary, internationalization poses big challenges for firms. Entering a new market implies the necessity to face with a different and sometimes distant cultural context, where different rules exist (Weber et al., 1996; Altman and Baruch, 1998; Melin, 1992; Adler, 1986). Peoples

are influenced by different values and social dynamics. In order to succeed, firms have to take into account diversity, they should adapt their behaviours and, much more important, they should be aware of cultural differences (House et al., 2004; Morosini et al., 1998). If manager understand the reasons of diversities, they can actually transform cultural differences from barriers into factors of success. The firms, which better adapt to distant markets, which organise their activities in order to reduce the perception of the distance are actually those, which get the highest success (Barkema et al., 1996; Barkema and Vermeulen, 1998).

International strategies are successfully if based on learning (Barkema, Vermeulen, F., 1998). Firms have to learn about the host market because they have to understand its rules, to highlight the key stakeholders, to attract local customers. Learning goes even beyond: If firms are learning oriented, internationalisation helps in finding new opportunities, it promotes innovation and it improves firms' adaptation capability (Torbiörn, 1994; Tung, 1998; Jun, et al., 2001). However learning from diversity is possible only if people are able to recognise and evaluate diversity. That is internationalisation results are strongly dependent on cultural knowledge (Boisot, 1998) and on cultural competence, too (Mendenhall et al., 2002; McCall & Hollenbeck, 2002; Stroh & Caligiuri, 1998; Caligiuri, 1997).

Meant as the capability to combine the home and the host culture in the most suitable way, cultural competence is fundamental to catch the best opportunities to combine cultural knowledge. It influences people's openness towards diversity, and consequently their inclination to accept others' idea, information, and technology (Stier 2009, 2003).

This paper aims at investigating the role of cultural competence, meant as the capability to use cultural knowledge in the best way. Cultural knowledge and cultural competence are key factors of firms' success: cultural knowledge is an intangible resource, it refers to managers' consciousness about cultural differences, which is the base for adaptation. Our hypothesis is that cultural competence can create bridges between different cultures, reducing the perception and effects of cultural distance. We have explored the value of these concepts through the case study of the multinational Technip Italy successfully internationalised in SMCs and MECs.

The value of cultural competence

The increasing environmental turbulence and the high competition push firms to enlarge their markets and to research new opportunities to implement and successfully develop their products. Particularly Western firms, which have to face competitors coming from emerging markets and advantaged by cheaper coasts, look at emerging markets in order to reach higher level of efficiency and to revitalize their businesses.

Internationalisation is more and more meant as a learning process aimed at highlighting the best combination of existing resources and the best way to acquire new resources and to combine them. According to the resource-based view (Mitchell et al., 2000; Peng, 2001), firms decide to internationalise when they feel to have exceeding resources or when new opportunities emerge in different geographical markets. As far as market and resource seeking are the main reasons why firms invest abroad, more and more firms follow different perspective: operating abroad is no more a consequence of the opportunities emerged in the new market, but a way to acquire new knowledge, to increase their resources in order to get new competitive advantages or to consolidate the existing ones.

As far as internationalization is a must, firms have to be aware about the risks they can meet in foreign markets. While entering new markets, firms meet with different cultures. Peoples are influenced by different values and social dynamics and, in order to succeed, firms have to evaluate and adopt behaviours, which can fit with the rules existing in the host cultural context (Morosini et al., 1998; Shenkar, 2001). The more the distance between the home and host culture, the higher is the necessity to develop cultural competencies. Firms can learn about the new market only if they are able to establish effective communication, to highlight the potential barriers to knowledge transfer and sharing.

Boyacigiller But what is culture? According to Hofstede (1980), individual culture is the result of collective culture, national cultural, and individual experiences. In his opinion, individual behaviours depend on the education individuals receive and on the social inputs they get. Culture is not something stable or fixed across time, but something that change, according to the individual experiences and to the social and historical changes that a society experience during its life.

Looking specifically at international firms, Tadmore (2006) underlines the importance of acculturation strategy and recognises culture as a key aspects of global competitiveness. In his opinion, globally competent employees are a key resource for international firms: they can successfully span the boundaries of their host and home organizations by guaranteeing the integration between the firm and the host market (Caligiuri, 1997).

Mendenhall et al. (2002) recognise the importance of international assignments for the development of cultural skills. However the cultural knowledge deriving from international experience is itself a result of expatriates' cultural competence. International assignments produce results in terms of learning, only if expatriates are able to recognise, understand, and evaluate diversity (Stroh & Caligiuri, 1998). Expatriates' contribution to organisational learning is strongly dependent on their capability to understand and respect cultural differences (McCall & Hollenbeck, 2002), i.e. on their cultural competence.

Cultural competence is probably one of the main competencies of international firms: it impacts on individuals' inclination to knowledge transfer and sharing, on the way individuals decide to share knowledge, on their capability to recognise and evaluate key information (Magala, 2005). Above all if we look at emerging and developing countries, which become more and more attractive for firms, the increasing degree of dynamism and unpredictability requires firms to be ready to accept and promote changes (Hitt et al., 1998).

To succeed internationally, firms need flexible structures, which can facilitate coordination and collaboration across countries. A culture that values innovation will reinforce organizational learning which is strongly dependent on individuals' capability to accept changes and to value them as something positive for the organisation. Learning is change (Masalin, 2003). It occurs when exploration and exploitation are combined in an optimal way (Weick and Westley, 1996) and in an uncertain and unstable environment it is possible only if a cultural competence exists, that is if individuals are inclined to accept risks and to explore diversity.

The linkage between culture and knowledge is not new in the economic-business literature. Boisot (1998) talks about cultural knowledge and considers it as a main intangible resource of modern firms. According to the author, even if cultural knowledge is difficult to evaluate, because embedded in social processes and tacit knowledge of how to conduct them, it is a key aspect of internationalisation. Culture operates at many level of aggregation through institutional structures, which influence people's capability to recognise and use knowledge assets. It refers to individuals such as to organisation, regions or countries, and at each level it substantially contributes to the way information and knowledge is transmitted. In this way, it is possible to distinguish between cultural knowledge (Boisot, 1998), and cultural competence, namely the capability to combine the existing knowledge in the best way to fit with receivers' culture.

National culture influences individual culture and together with individuals' practical experiences, it contributes to build the prevailing culture of an organisation (Weber et al., 1996). Firms' capability to manage diversity is consequently the result of both the organisational culture prevailing in it, and of the national culture, which manifest its effects through the individuals who work within the organisation.

This perspective is useful to explain why within a multinational, different subsidiaries achieve different results. Organisational culture is not sufficient to explain organisation's attitudes toward culturally distant context. It has to be completed by national culture (Weber et al., 1996). Individuals manage relationships and share information, and their culture should be coherent with the need of flexibility and adaptation, which are the key for success, above all in culturally distant markets.

Together with risks, cultural distance creates some advantages, too. In the long term, the coexistence of cultural differences increases firms' capability to face uncertainty and to evaluate new systems of analysis and problem solving (Boyacigiller and Adler, 1991). However these advantages are possible only if the organisation is able to be opened towards diversity and if no forms of ethnocentrism affect firm's inclination to face with diversity. According to this need, culture is fundamental to reach a competitive advantage: relationships are positive only if based on respect and reciprocal trust, that is if people are ready to compare with other and they are inclined to manage comparison through a profitable dialogue more than through contrasts, diversities can enrich the organisation and the capability to learn from the other can create the basis for a long term competitive advantage.

Given that national culture influences people's inclination to face diversity and to learn from the outside, it is an important competence of international firms. If firms are able to combine diversity and to adapt their behaviour, they are able to create a fruitful relationship and consequently to build a competitive advantage, which is more and more based on the capability to acquire and transfer knowledge. If we look at partnership between firms coming from advanced markets, such as Europe, and firms coming from emerging markets, the success of inter-firms relationships depend more and more on the capability to explicit the reciprocal advantages deriving from a two-way learning process: European firms need local partners in order to acquire market knowledge, that is to understand and catch local customers, and to overcome the low transparency of laws and social rules. At the same time, local firms need European partners in order to acquire the technological knowledge necessary for their development.

The key-role of learning inclination and consequently of cultural adaptation which is its sine qua non condition, is well depicted by the experience of the MNC Technip in Southern Mediterranean Countries (SMCs) and Middle East.

European investment in SMCs and Middle East: a cross-cultural perspective

As far as firms' interest towards South Mediterranean Countries (SMCs) is increasing, little is known about local culture and on its impact on firms and consumers. The most important contributions focus on the great influence of Islam, as a religion that rules many aspects of the social and economic life in this area.

Al-Khatib et al. (2002) underlines the importance of interpersonal relationships and the strong feeling of loyalty towards the group and the colleagues, which according to the author depend on Islamic values and which can represent a strong barrier for the outsider. As noted by Cone (2003) Islam is much more than a religion, it is a conduct of life. The greatest part of Koran is dedicated to the economic and social conduct, and each human action is evaluated according to the Koran

teachings. A first basic concept is the *din*, that is the total submission to Allah. Another basic concept is the *Unmah*, which refers to the extremely importance Muslims recognize to the participation to the Community life. The importance of the community (*Unmah*) enforces the feeling of belonging and can create prejudice towards people coming from different cultural contexts and following other religions.

The importance of religion is testified by the respect of *Shar'ia*. Even if not imposed by the law, *Shar'ia* is still very important in the most of countries, and some cultural traits find their roots in the *Shar'ia*'s main economic and social precepts are (Cone, 2003). The first precept is Unity, that is Allah is the element that unifies the Universe and everybody finds his place in the Universe by respecting the Koran principles. The second one is Responsibility, which means that everybody must care about the world they live in. The third one is Equilibrium, according to which people have to preserve a balance between their own necessities (and desires) and those of the Community. Last but not least, the Free Will, meant as people rule to do their best in every kind of situation (Gaardner et al., 1999 and Filoramo et al., 1998).

SMCs have not been studied in the main cross-cultural researches. However both House et al (2004), and Hofstede (2001) look at some Arabic countries, highlighting some characteristics which look to be coherent with what discussed above. Particularly in the GLOBE project (House et al., 2004) ⁸ the cluster Middle East embraces the most of Islamic Countries studied by the Authors and is characterized by the following values (Should be scores):

- a high level of power distance, that is the acceptance of an unequal distribution of power, and a high respect of power positions;
- a high level of uncertainty avoidance, that is a low inclination to changes and to face risks;
- a high level of institutional collectivism, that is the degree to which organizational and societal practices encourage and collective distribution of resources, and collective action;

⁸ House et al (2004) conceptualized 9 dimensions to study the different perception and acceptance of leadership within each context. The nine dimensions are: power distance, uncertainty avoidance, institutional collectivism, in-group collectivism, gender egalitarianism, performance orientation, future orientation, human orientation, assertiveness. They collected their data by what is known as The Global Leadership and Organizational Behaviour Effectiveness Research Project (GLOBE). The Globe Project is a multi-phase, multi-method project in which researchers investigate 62 countries, grouped into ten cultural clusters, in order to analyse in depth their different cultures. Each dimension is studied at two levels in order to understand the practices and the values prevailing in each context, in order to highlight the main cultural tendencies emerging within them.

- a high level of future orientation, that is individuals' inclination to engage with long-term oriented behaviours, such as planning, investing in the future, delaying gratification;
- middle level of in-group collectivism, that is the degree to which individuals express pride, loyalty towards their organizations or families;
- a middle level of humane orientation, which refers to individuals' inclination to encourage and reward fairness, altruism, friendship, charity and generosity;
- a low level of assertiveness, that is the degree to which individuals in organizations or societies are assertive, confrontational, and aggressive in social relationships;
- a low level of performance orientation, which refers to the extent to which an organization or society encourages and rewards group members for performance improvement and excellence.
- a low level of gender egalitarianism, that is the tendency to minimize gender role differences.

All the mentioned dimensions look to be coherent with Islam precepts. The importance of the group is coherent with the value of the Unmah, while uncertainty avoidance and power distance can be connected to the total submission to Allah. The low level of performance orientation, and assertiveness are coherent, too: People tend to respect others, and moral obligation as much more important than legal obligation or richness.

The linkage between religion and culture becomes even clearer if we consider the values on which the construct of Islamic family relies (Patai, 1979), that is: a) courage, which refers to the ability of self-control in stressing and emotional situations; b) bravery, which is meant as the individual readiness to take risks in order to save his fellowmen; c) hospitality, which is strongly related to others' respect; d) generosity, which is meant as the inclination to give to others through personal and family sacrifices; e) honour and dignity, both related to defence of social image, respect of honour and traditions, and unlimited loyalty to the family; f) Islamic identity, that is God is everywhere. The former values explain well Islamic countries inclination to collectivism, their low level of assertiveness and future orientation. While the last one seem to fit well with the strong uncertainty avoidance, and the low performance orientation.

Overcoming cultural distance

Looking at the Globe findings, the Middle East cluster presents a high cultural distance with regards to Europe, just a little bit lower with respect to the European countries involved in the Latin cluster. In addition, the importance of culture is testified by the great value local people recognise

to tradition, and by their strong feeling of belonging. However, cultural distance is not a problem itself. What represents a barrier is managers' avoidance to face with diversity, to value what they perceive as too different from their own cultures. If managers perceive the host culture as too distant, they can assume inertial behaviours. In the same way, if people in the host market perceive firms' culture as too distant, they can distrust foreigners and avoid relationships.

The importance of perception is very well explained by the sociological theory of identity (Haller, 2003), according to which pride and shame impact on people emotions, with strong effects on relationships between people coming from different cultural contexts. During a cross-cultural relationship, when one's identity is perceived as relevant pride emerges. On the contrary, if one's own identity is rejected or denigrated, shame emerges. Pride and recognition have positive effects: they enable effective relationships by holding partners together. Degradation and shame have a total different effect: they take to distrust and create the basis for social conflicts. Pride and shame are related to five important factors: the evaluation people have of themselves and the perception of their evaluation by others; the necessity to keep consistent images of themselves and the others; the social experiences people live with others and the significance they give to cultural dissimilarities, such as languages, religions and so on.

If we look at SMCs and Middle East, with respect to Europe, they are characterized by different economic systems, different social structures and divergent degrees of socio-economic development. These socio-economic differences, together with the heritage of the colonialist dominations and of the more recent wars explain locals' perception of Europeans as people coming from very different cultural contexts, even if closer than US. In addition, colonialist domination doesn't help in developing equal relationships and increases locals' tendency to feel oppressed and to perceive European managers' behaviours as dominant and opportunistic. Previous research showed actually SMCs people's preference to interact with Italian businessmen, more than with French or US ones (Calza et al., 2010). At the same time the exigencies for French multinational (MNC) to involve local managers or expatriates from less distant culture has emerged, too (Calza et al., 2009).

When cultures are perceived as distant, firms need to find the way to change people's perception. Cultural distance cannot be eliminated, but choosing the right social leverage, firms can reduce it perception as a problem. In order to overcome the distance, European firms should aim at building cultural bridges, that is social mechanism able to improve local peoples' trust towards the organisation. In the case of foreign direct investments, cultural bridges have to be built up within the organisation, for example by choosing the right persons to act as interface between the home and the host market (Calza et al, 2009). The choice of the right people enable firms to build up cross-cultural bridges, that is strong linkages between the home and the host cultures, which enable a

more effective and fast knowledge transfer between the partners. Expatriates' competence, namely cultural competence, is fundamental to build cultural bridges (Fig. 1). Expatriates have to be inclined to accept and respect diversity because this is crucial to establish profitable and long term relationships. The capability to understand the context is crucial to read and satisfy clients' need, but even to overcome the socio-political instability, which can stop any phase the advancements of the projects.

Figure 1: Cultural competence as cultural bridges

Source: Adapted by Calza, Aliane, Cannavale, 2010

Cultural bridges are important in contractual relationships, too. They help to reduce the distance between the partners and can be represented by a key sponsor, familiar to the host market stakeholders, or by an organisational unit, which has high cultural competencies, and is able to use the cultural knowledge it has got on the context to build profitable relationships. Market knowledge is easier to acquire and expatriates find lower difficulties in understanding diversity. At the main time, expatriates can establish better communication mechanisms and choose the most suitable communication styles, in order to make technological knowledge transfer easier. The reciprocal learning process is helped by culture: people are more inclined to listen at each other, and understanding is easier when "languages" are less distant. The good interpersonal relationships create trust, thus enabling once more a profitable cooperation among partners.

This is the case of the French Multinational Technip (Fig. 2), which has charged its sister Technip Italy of the main businesses the group has in the SMCs and Middle East. Technip is specialised in realising energy infrastructures, a step-by-step project, which requires a high degree of flexibility, and a deep knowledge of the context. Knowledge transfer is critical for success, local managers and technicians have to learn how to use the infrastructures, and the way they are built strongly depends on authorities' desires. Cultural distance plays a big role: it can cause misunderstanding with clients and workers, thus limiting performances in each phase of the project. According to Technip's experience, the choice of Italian managers is successful: Italian managers are able to establish fruitful relationships; they show higher degree of technical flexibility, which is very appreciated by local customers. Local workers show a more friendly approach with Italian managers, whom they perceive as less domination-oriented than their French colleagues.

Technip Italy success in SMCs and Middle East: a case study analysis

Technip Italy is a sister company of the French MNC Technip, a world leader in engineering, technologies and project management for the oil and gas industry. The group has more than 50 years of experience and thanks to the expertise and know-how of its teams, Technip is a key contributor to the development of energy technologies and sustainable solutions all over the world.

Technip has 23,000 employees and operates in 48 countries. Each area of the world contributes substantially to its revenue: the main market is represented by Europe, and Central Asia (27%), followed by Americas (24%), Middle East (23%), Africa (14%), and Asia (12%). Given the wide spread of its activities, Technip faces strong cultural challenges. It has to manage international relationships with clients dispersed all over the world, and cultural differences can strongly impact on the starting of new relationships, and on the knowledge transfer which represent the core factors of these relationships. Technip core business is actually represented by the oil and gas market, and particularly in three segments: Subsea (44%), Onshore (47%), and Offshore (9%).

As sister company of the group Technip, Technip Italy has gained a worldwide reputation as a highly reliable and creative partner, sustaining its clients with maximum flexibility, providing innovative technological solutions, customizing contractual arrangements and guaranteeing full achievement of all project targets, while observing the highest human and environmental safety standards. It employs 2500 people and has realized more than 500 projects in 60 countries. Its activities concern the best known industrial areas, such as Europe, Middle East, North Africa, Latin America, as far as more unusual or inaccessible sites Vietnam, Malaysia, Southern Africa, Central America, P.R. China, Canada. Some of its key realizations include actually a fertilizer complex in Vietnam, the Isla Refinery at Curaçao, and the Horizon Oil Sands Project in Canada.

Technip Italy is a construction-oriented international engineering company. It boasts consolidated experience in assisting customers along the whole "life" of a plant: feasibility studies, conceptual design and licensors evaluation, basic design and detail designs, start up and plant optimization, debottle-necking. The company applies a "learning from analysis" process, based on its success is due to continuous feedback from successful projects and critical review techniques. It pursues a rigorous control of health, safety and environment parameters, all over the world. The implementation of innovative techniques and materials enables good international relationships, based on reciprocal advantages and trust even in more distant and unstable countries.

Technip Italy has been executing operation & maintenance (O&M) contracts for over 20 years. At the same time, Technip Italy has set up a dedicated department to carry out commissioning activities in a timely and orderly manner. It involves three divisions: commissioning, maintaining, and training, all strongly related to learning and knowledge transfer.

As far as the high level of technological techniques and engineering is part of the knowledge heritage of Technip group as a whole, Technip Italy seems to have a strong advantage in culturally distant markets. Technip's main clients are indeed: BP, Saudi Aramco, Sasol, Sabic and ENI, ENI Gas, ENI Gas BV Libyan Branch, Western Libya Gas. The high percentage of Arabic clients is due to the global organization of the group, which took to a specific geographical orientation of each company. Technip Italy has been charged with Southern Mediterranean Countries, Middle East, and Eastern Asia clients.

Technip Italy is competitive advantage finds its root more in soft aspects, than hard technical factors. Local customers prefer cooperating with Italian team, more than with the French one, for the strong flexibility and the high inclination to knowledge transfer of the Italian company. Italian project managers are inclined to accept uncertainty, they show a low level of assertiveness, which makes local workers and customers feel comfortable. They are ready to change their projects according to local clients' demand. On the other side, Italian managers appreciate local customers: they pay always on time and relationships are long-term oriented.

The importance of cultural similarities is highlighted by another cultural dimension, too. Italian technicians show a low degree of performance orientation, lower than their French colleagues. Paradoxically, the low performance orientation represents another cultural advantage in Islamic countries, where the value of relationships and interpersonal loyalty are far more important than objective results and rapidity.

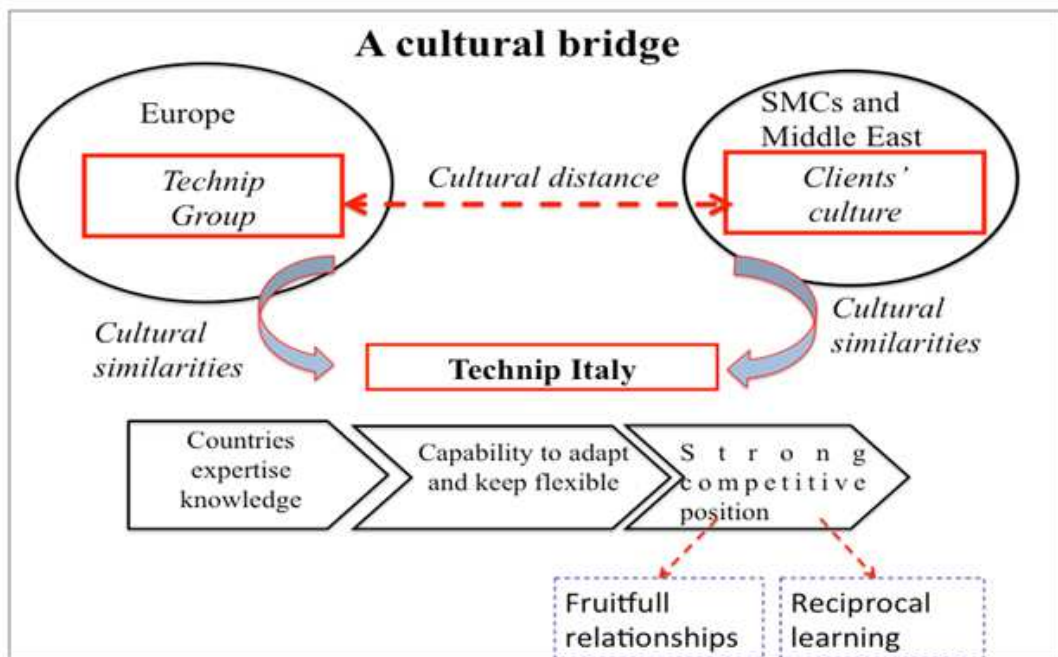

Fig. n. 2. The role of Technip Italy's cultural competence

Source: our elaboration

All these aspects have clearly emerged during the interview of an Italian project manager frequently engaged with projects in SMCs and Middle East. The project manager has underlined the learning orientation of Technip Italy and its strong attention towards clients and their contexts. The Italian team takes all the decisions concerning the implementation of the project together with local customers. Arabic clients are used to change their orders, and Italian technicians' flexibility is perceived and evaluated as a core competence of the Italian firms. Italian managers know that local clients are ready to pay for the changes they ask and are not afraid to change their plans and to adapt their design and projects if this can better fit with clients' needs and desires.

According to his experience, the key aspects are the long-term relationship with the local sponsor, who is very important to enable trust from local stakeholder, and to overcome social instability, and the low transparency of the context. The relationship is first of all an inter-personal relationship based on trust and reciprocal respect. Reciprocal advantages have to be clarified both with the sponsor, who takes important economic advantages, and with clients who look for new technologies and infrastructure, but above all for a relationship based on intent to satisfy their needs.

At a corporate level, the choice to charge Technip Italy with Islamic clients is due to a specific strategic aim: the optimization of customer relationship. This decision poses on cultural issues: the Italian team looks to be more flexible and customer oriented and this fits better with Islamic clients,

who are used to vary their projects and to ask for technical improvement once that works have started. Italian managers look to be more culturally competent in SMCs and MECs, and this can be connected to several reasons.

First of all, a lower cultural distance, with respect to their colleagues, could facilitate Italian managers, while operating in SMCs and MECs. According to the GLOBE, Italy belongs to the Latin Cluster, which is less distant from Middle East than other clusters. That is, Italian people's facilities to interact with locals are coherent with Globe's dimensions. Second, the reciprocal perception of a low cultural distance can be reconnected to an important social construct that is to religion, with some important social constructs as the family values and the tendency towards paternalism and authoritarianism, which is typical both of Catholicism and Islam (Gaardner et al., 1999 and Filoramo et al., 1998).

Together with cultural similarities, perceptions play an important role. Italy had a minor role in the colonialist imperialism in the area, and consequently Italians do not face prejudices and feeling of shames, which can be connected to this kind of historical heritage. Italian firms are not perceived as threats to their identity, thus reducing the risk of shame feeling and contrast. In addition, Italy has a long historical heritage in common with many Arabic countries and strong commercial relationships, such as FDI have already during the 60, made in Italy had a strong success in the countries, above all in the building sector.

Technip Italy entered Islamic countries for market reasons. They represent a huge market for their products, and they give the possibility to come in contact with foreign firms of the building sector, which can open the door towards Asian countries. Moreover, the Qatar subsidiary enables to exploit important tax advantages, too.

Conclusion

National culture has a big impact on international business. On behalf of a company, it influences managers' capability to face diversity and more properly the way through which they evaluate and interact with diversity. On behalf of the host market, it influences stakeholders' inclination to interact with foreigners, to accept their products and knowledge.

Internationalisation represents more and more a learning strategy. Above all towards emerging countries, internationalisation is often due to a reciprocal need of learning: international firms look for the best way to use their resources and to find new ones. Firms and clients of host markets usually look for new products and services, in order to reach higher degree of social and technological development.

Learning is strongly influenced by culture. In order to learn, people have to be inclined to doubt of their knowledge and to transfer to others what they know. A participative and cooperative style is necessary to establish a profitable knowledge sharing, and transfer is quite more effective if people are able to understand each other. International learning relies on a key competence – namely cultural competence, which is recognised by many authors as the main advantages deriving from international assignments.

As far as cultural competence is often mentioned by literature (Magala, 2005; Stier, 2006, 2003; Selznick, 1957; Kilmann et al., 1986; Smircich, 1983), only a few contributions focus on cultural competence as a key aspect of internationalization (Mendenhall et al., 2002; Stroh & Caligiuri, 1998; Caligiuri, 1997). This paper aims at filling this gap, by giving a contribution on the difference between culture as a resource and cultural competence. In addition, it applies the concepts of cultural competence to international strategies with the aim to better understand the linkage between cultural competence and firms' international success. Cultural competence is explored and recognised as the foundation of cultural bridges (Calza et al., 2009) that is of those social mechanisms able to reduce the perception of cultural distance and to positively influence international relationships.

If we look at relationships between European firms and SMCs or Middle East, cultural distance can become a huge barrier to knowledge transfer and international investments. On one side, foreign firms have to be aware of different social and economic rules. On the others, local should be opened towards different managerial cultures and ready to accept the knowledge they receive from foreigner. In such a situation, the capability to understand others and to respect diversity is fundamental to establish and preserve relationships. An additional competence is required, together with technological and market ones: that is cultural competence. If foreign firms want to find profitable markets in Islamic countries, they have to be able to successfully interact with local stakeholders. Knowing local cultures is the first step to understand locals' behaviours. But more deeply, foreigners have to understand those social rules, which can deeply impact on reciprocal perception, and acceptance.

When investors, either entrepreneurs or managers, are able to embed in the context, relationships are fruitful and loyal, with huge revenues for European firms. This is the case of Technip, a French multinational very successful all over the world and particularly in SMCs and Middle East. In order to overcome cultural distance, Technip has relied on the cultural knowledge and cultural competence of Technip Italy. Technip Italy's strong orientation towards learning and knowledge transfer, together with the capability to adapt and to stay flexible seem to be the main roots of the competitive advantages the company is gaining in the area. This sister company represents for

Technip the cultural bridge necessary to perception of cultural distance and to optimize in the host markets.

The paper has some important limitation, too. The concept of cultural competence relies mainly on the wider concept of competence explained by the resource-based view, but it should be further explored and better defined. In addition, to be generalized as a factor of competitive advantage, cultural competence should be studied and tested through a wider analysis. A single case study is not sufficient to explore the practical implication of cultural competencies and cultural bridges. Nevertheless it is an interesting starting point to go deeper in this field of research.

TOWARDS A CONCEPTUAL DEFINITION OF ACADEMIC ENTREPRENEURSHIP

Cantaragiu, Ramona¹

¹ PhD student at Academy of Economic Studies, 6 Romană Square, 1st district, Bucharest, Romania. E-mail: ramona_cantaragiu@yahoo.com

Abstract

Without a unanimously accepted definition, the subject of academic entrepreneurship looks chaotic and the studies are hardly linked in order to provide a powerful theoretical framework which would foster new researches. This paper intends to bring some light to the current debates relating to the ways in which academics can act entrepreneurially by surveying the literature and suggesting a definition which allows it to be distinguished from other forms of entrepreneurship. The proposed definition is meant to cover all the angles by looking at value producing activities for external actors as the main basis for entrepreneurial academic initiatives. The definition is then used as the main pillar on which to build a distinct characterization of academic entrepreneurship and to disentangle this notion from the knot in which many entrepreneurship threads have been entangled: academic, commercial, social, scientific entrepreneurship and intrapreneurship. The main point of separation is the existence of a distinct impact on the knowledge production and diffusion in the case of academic entrepreneurship which sets it apart from any other entrepreneurial forms. This dialogical knowledge brings forth issues of authorship, scientific autonomy and measuring the value of knowledge created and imparted between the academic and the external environment. However, the suggestion that academic entrepreneurship represents a new way of working with knowledge implies a paradigm shift which can be initiated only by providing a definition of this practice in the light of the proposed change which is what this paper sets out to do.

Keywords: academic entrepreneurship, commercial entrepreneurship, social entrepreneurship

Existent Definitions of Academic Entrepreneurship

When the term academic entrepreneurship was first conceived, it referred simply to an extension of business entrepreneurship to academia, a mere differentiation between companies founded based on academic knowledge and the others. As its popularity grew and more and more disciplines and institutions got involved in entrepreneurial activities, it started to borrow the discourse of the social entrepreneurship which is also a rising thread of inquiry in social sciences today. Based on the different views of entrepreneurship, the scholars involved in the study of academic entrepreneurship can be integrated into three main categories expressing the

extensiveness of the definitions they use: commercial definitions, knowledge transfer definitions and value creation definitions.

The prevailing definitions of academic entrepreneurship start from the idea of for-profit business creation and talk about university spin-offs, the companies started by academia (Shane, 2004; Wright et al., 2009). Some authors have created a more detailed taxonomy and separated the businesses created by academics on the basis of their own research from those created by other means, talking about general academic entrepreneurship and research-based entrepreneurship (Goel and Grimpe, 2011). Others have looked only at academic businesses set up using venture capital (Zhang, 2007), while others took into consideration any business created on the basis of intellectual property generated inside universities, irrespective if the entrepreneur was part of the academia or not (Hayter, 2011). These definitions refer only to pure entrepreneurial intentions, but leave out other means of obtaining money through knowledge transfer that the academia has at its disposal and also the fact that monetary value is just one type of value that can be created through entrepreneurial means. The next two categories of definitions broaden their scope and take the issues mentioned above into consideration.

The authors who choose to regard academic entrepreneurship as a means of transferring knowledge from the university environment to the market extend the definition so that it includes all the contacts that the academics have with business entities which are the basis of monetary value creation. Under this paradigm we can talk about soft and hard academic entrepreneurial activities (Philpott et al., 2011). Those activities which have the more tangible results are introduced in the category of hard activities: patenting, licensing and spin-off formation and they can be viewed as more entrepreneurial in nature and introducing compatibility issues with the traditionally accepted academic role (Louis et al. 1989 cited in Phillipott et al., 2011). At the other end of the spectrum we encounter the softer activities such as academic publishing, grant seeking and contract research, which are far more acceptable for the academic culture.

The third stream of definition embraces the view of entrepreneurship as creation of societal value, without necessarily putting emphasis on monetary value in particular and it will prove particularly worthy of attention as it was developed by social sciences scholars. This view is mostly encountered in social sciences and humanities discussions of the entrepreneurial dimension of the academic activities and it broadens the scope in order to fit with the realities of these fields of study. For Botes (2005), a scholar concerned with community development in Africa, entrepreneurship is related to risk taking, the ability to see opportunities where others see chaos, and the creation, renewal and enhancement of value not merely for owner, but for all stakeholders. Thus, academic entrepreneurship is proven by choosing the right methods of research. The talk revolves around the concept of community-based learning which is achieved when the academic perspective is merged

with real-life community-based experiences resulting in something more than simple volunteer activity. As Winfield (2004) says, "the work in the community makes the academic study relevant and the academic study directly informs the work in the community" (p. 9). The application of this teaching method leads to what Kingma (2011) terms community engagement: "Faculty, as entrepreneurial thinkers, seek new ways to engage with the community to create value, and this value creation within a local community establishes the university as an anchor institution" (p. ix).

Based on the aforementioned definitions and taking into consideration their blind spots, the following definition has been conceived: academic entrepreneurship is a practice performed with the intention to transfer knowledge between the university and the external environment in order to produce economic and social value both for external actors and for members of the academia, and in which at least a member of academia maintains a primary role.

This definition includes a part of the category of the commercial definitions because it stresses the importance of the academic entrepreneur to be the one who initiates the transfer of knowledge as business creation and excludes those companies created on the basis of university knowledge but not by academia. Thus, the academic entrepreneur is the initiator of the entrepreneurial practice and it has to remain the main shaper of the practice in order for the activity to fit into what is called academic entrepreneurship. As this is one of the main features which distinguishes academic from corporate entrepreneurship, this is crucial to be present at all times. Consequently, the definition allows for academic entrepreneurial practices to transform naturally into either business or social activities when the academic involvement reduces its intensity as the scientist(s) redraws from the activity.

Moreover, by putting an emphasis on value creation and not solely monetary results, the proposed definition fits nicely with the discourse of the authors from the value creation stream of thought and is large enough to comprise social entrepreneurial activities. Social entrepreneurship is taken to mean an "innovative, social value creating activity that can occur within or across the nonprofit, business, or government sectors" (Austin et al., 2006:2). However, in contrast with social entrepreneurship which is motivated by the existence of a certain problem in the environment, academic entrepreneurship can be a lot more proactive and anticipate problems as well as working in fields in which there are no apparent social problems.

The definition also stresses the need for the activity to produce value for external actors and not only for academia, thus distinguishing academic from scientific entrepreneurship as a means to achieve a higher rank inside one's profession. Scientific entrepreneurship refers to the activities performed by academics with the view of gaining professional capital such as a promotion in the

university hierarchies (e.g. publishing articles and books, participating in conferences, participating in administrative activities, becoming members of professional communities).

The fact that the definition mentions the creation of value as the intended result of the academic entrepreneurial practices places the assessment of the success or failure of the academic initiative outside the economic realm driven by profits and into the subjective one in which value is obtained in a transactional mode. Even if the action does not have the intended consequences, it still produces something and that result merits its own investigation. Every action has a result, even though it may not be the one intended and in the case of academic entrepreneurship the intention matters as much as the result. This is true because academic entrepreneurship is an emerging field in which there are no certain recipes for success. The field is in continuous formation, and any entrepreneurial attempt brings value to the whole entrepreneurial ideology whether it succeeds or not.

Academic, commercial and social entrepreneurship

As presented so far, it is clear that academic entrepreneurship combines different elements from commercial, social, scientific and intrapreneurship and thus it needs to be disentangled from these knots and presented as a distinct thread. The change which occurs in the domain of research and knowledge creation as entrepreneurship becomes part of the academic environment is the main pillar on which we can build the distinction among academic, commercial and social entrepreneurship that will be detailed in the next section. This analysis will be based specifically on what sets academic entrepreneurship apart from other types of entrepreneurial activities, focusing on these characteristics and not on those of social or commercial entrepreneurship which have been described in other articles (Austin et al, 2006; Archer, 2008; Santos, 2009).

Opportunity identification and creation

According to Austin et al. (2006) the difference which makes the most importance lies in the opportunity dimension which enacts the fundamental differences in missions and responses to market failures of the two ends of the entrepreneurial continuum, commercial and social entrepreneurship. Even if academic entrepreneurship can fall inside both categories, it does provide a particular layer in its mission as it involves the creation and dissemination of knowledge between the university and the external environment. What academic entrepreneurship brings is a new layer in the communication patterns between the knowledge creation institutions of education and the market/society, a pattern which is based on a continuous dialog.

The central drive of academic entrepreneurship is linked to the transfer of knowledge in a more direct way between the academic world and the external environment in which it is activating. Although the university is not profoundly separated from its environment, academics have in the

past been accused of having retreated inside an ivory tower, of being distant and not interested in what happens outside the walls of their institutions. The nascent practice of entrepreneurialism amongst academics is said to be the cure to this said aloofness which was professed by major scholars as Merton (1973) or Humboldt (Albitron, 2006).

Thus, what the most important opportunity needed to be taken by academic entrepreneurs is that of the dialogue which increases the dialogic literacy (Bereiter and Scardamalia, 2005) of the academia and the external actors which get involved. This literacy is defined as “the ability to engage productively in discourse whose purpose is to generate new knowledge and understanding” (p. 11) and it is considered to be the fundamental literacy for a knowledge environment. Thus, while in the case of commercial entrepreneurship the emphasis is placed on the economic returns provided by a certain activity and in the case of social entrepreneurship on social innovation, in the case of academic entrepreneurship the accent is on producing knowledge for the external partners and the academia through a meaningful dialogue. While social entrepreneurship identifies opportunities by focusing on neglected positive externalities which result from market and state failures (Santos, 2009), entrepreneurs from academia seek opportunities by looking for partners for dialogue that have something to give and something to receive from the academic environment. The knowledge producing dialogue can lead to commercial or social opportunities, or a combination of both, but as long as it remains a mutual exchange of knowledge between the academia and the external partners, it will fit under the definition of academic entrepreneurship.

Context

The context refers to the general social, economic, legal and political environment which has a bearing on entrepreneurial activities. In the case of universities, the shift to a knowledge-based economy in which the higher education institutions are invited to become part of the triple helix alongside the government and the industry (Etzkowitz, 2003) and to become a mode 2 knowledge producer (Gibbons et al., 1994), all these representing external pressures towards increased academic entrepreneurship.

The emphasis falls on the nature of the action, on its directedness and lack of mediation: the academic scientist in person goes out of the university and establishes fruitful interactions with his/her environment, as compared to the situation in which only the products of his/her labor (students, research, knowledge) get to the environment and have to be activated by others in order to produce value. As such, academic entrepreneurship is full of potentialities.

Among these potentialities we can also encounter tensions inside the academia and between the academia and the external actors which are derived first of all on the different claims on the knowledge which is produced. The dialogic knowledge creation brings forth issues of intellectual

property rights and authorship. The two worlds have different ways of handling knowledge, the academic one is based on knowledge dissemination and use by others as a way to prosper, whereas the business world is based on tight protection of the knowledge through copyrights and trademarks. These issues are most prominent in the case of academic entrepreneurship than in others. But, as Murray (2006) has shown, academics have proven that tensions can be handled at the institutional level by boundary work and by rewriting the rules so as to accommodate the two distinct logics of academic science and commerce.

Academic entrepreneurship also comes with its own ideological and ethical problems. Its detractors sustain the view that it is a perverse intrusion of the market inside the 'ivory tower' of the academia where knowledge teaching and producing was done autonomously and for truth's sake in the past. And these are also voices from inside the academia which hold that this shift has meant giving over the reins of the research to business and communities. Thus neither academic, nor commercial entrepreneurship have escaped the scrutiny of the public without them being discovered to have some dark spots.

Regarding the external context which is outside of the decision of academic entrepreneur, an important dimension is represented by the legal environment which limits or enlarges their entrepreneurial possibilities. As an example, in France, the academic scientist who starts a business can be involved in it just for a limited period of time and there are other constraints as well stemming from the fact that a large number of academics especially in Europe are employed in state universities and have to obey the laws concerning civil servants (Manifet, 2008).

The development of academic entrepreneurial activities is mostly dependent either on state or commercial money, making it highly sensible to the economic conditions and to how the commercial entrepreneurial activities are doing. However, by having many different sources of financing, academic entrepreneurship is perhaps able to be more flexible and adaptive than other types of entrepreneurship. The fact that the main goal is to produce and use knowledge allows entrepreneurial academics to shift between commercial and social practices according to the characteristics of the external environment.

But in the case of academic entrepreneurship there is another context which has great bearing on the successful implementation of the entrepreneurial intention and that is the organizational context of the higher education institution in which the potential entrepreneur works. Although there are cases of commercial entrepreneurship which is born inside already established firms, there is also the distinct possibility of beginning the entrepreneurial practice outside the framework of an already existing organization. The same is true for social entrepreneurship. But, if in these cases it is just a possibility, in the case of academic entrepreneurship the existence of an already

formed set of ideas and practices is axiomatic. The academic entrepreneur is already part of an organizational culture and she has already been socialized in respect to certain practices which may make the entrepreneurial shift harder or easier depending on the entrepreneurial orientation of the university. For example, the university could have an in-house transfer office, a business incubator and could provide entrepreneurship courses to the academia outside business studies in order to promote the linkage between society/market and them.

People and Resources

Academics who want to become involved in entrepreneurial activities seem to be disadvantaged by their lack of business and community connections and by their lack of access to funds. Whereas commercial entrepreneurs have at their disposal well known avenues for obtaining financing for their ideas and social entrepreneurs work closely with the philanthropic sector, the average academic only has direct access to his/her peers and the students enrolled in the institution he/she is affiliated to.

However, the academics also have access to the resources of their institutions and to the connections established by it and can transform that capital into financial capital or people capital, such as in employees or partners for their initiatives. The access to these institutional resources comes with certain constraints and demands, in the form of financial rewards or image promotion required by the university. Also, the academic has to maintain the close connection with the institution he/she was affiliated at the start of the initiative to remain inside the academic entrepreneurship paradigm and to continue to have access to resources. The need to remain involved in academic activities puts time constraints on the entrepreneurial ones, as the academic can't put aside his/her teaching and university research aside.

Deals

The kind of value promoting the link between the entrepreneur and the people with which he/she works can be based on the exchange of financial rewards or intellectual rewards such as those obtained by being involved in activities which create values which can then be used in order to be entrepreneurial in a scientific way and further the academic career. The motivations of the academic entrepreneur are born out of the difference between the academic and the external environment which provides them with new problems and different perspectives related to their research work.

Most of the time, entrepreneurial activities can involve students as well and they create a dynamic learning environment. The value exchanged with students is the validation of their studies by practical assessment and also the establishment of future job opportunities through the academic networks which are set up by entrepreneurial activities. The university is interested in promoting

entrepreneurship among its faculty members because this implies an increase in image capital and also economic capital, but at the same time, too many entrepreneurial activities can become a threat to the quality of educational activities and also a threat of losing valuable academic scientist to commercial and social enterprises.

The efficiency of the dialogue intended to produce and diffuse knowledge is not easily done and the focus is not necessarily on the results, but on the existence of the intention toward entrepreneurial behavior on behalf of academics. Although the universities themselves are the directly interested in promoting this type of behavior, the requirements for society/market linkages are not widely used as promotion criteria inside university ranks which could indicate the elusiveness of the results and the current experimental stage of the field.

Where Does This Leave Academic Entrepreneurs?

The answer to this question starts from Carayannis and Formica (2006) who believe that the entrepreneurial scientist has two character profiles: (1) that of homo scientificus, breaking away from convention to search for ground-breaking discoveries, and (2) that of homo economicus, with a special acumen for marketing and sales. Applied to academic entrepreneurs, this framework requires the addition of a third character profile: (3) that of homo empathicus (Rifkin, 2009). Understood in the academic context, homo empathicus refers to the attitude of producing knowledge by participating, not by being objective and detached and also of sharing the knowledge producing activities with others by engagement, interactivity and interdisciplinary. This empathic dimension is entangled with all the activities that a faculty member performs (teaching, research and entrepreneurship), and it is the development of all these characteristics that sets academic entrepreneurs apart from their peers. However, this empathic dimension is crucial in orienting the attention of the academic scientist towards environments governed by different logics such as the commercial, governmental or philanthropic and it is also the ability which guarantees that once an interaction was initiated it will have large chances of success. The greater the ability of academics to empathize with people belonging to other islands of meaning (Zerubavel, 1991), the better their chances to become successful academic entrepreneurs.

The support for this framework comes from the literature concerned with the motivations and determinants of academic entrepreneurship. The study conducted by Morales-Gualdron et al. (2008:21) in Spanish universities revealed that academic entrepreneurs who set up university spin-offs are primarily motivated by the search for scientific knowledge which the creation of a company facilitates: "The higher accumulation of knowledge coupled with the desire to apply that knowledge and continue advancing in their development are the elements that 'pull' the actions of these entrepreneurs, and possibly determine most of the decisions they make through their

academic careers." This implies that academic entrepreneurship can be seen as a means to achieve scientific entrepreneurship, being another way to finance research and develop ideas. This view is sustained by the results presented by Shane (2004) in his book regarding the academic entrepreneurs' decision to sell equity or finance through debt their university spin-offs. This need to be in control can be linked to the way in which we defined academic entrepreneurship as a practice performed primarily by a member of the academia, which supposes that the outside influence is not the primary decision factor. Also, the link between academic entrepreneur and his/her homo scientificus side also hints at the need to maintain the university connections because the university is the primary environment in which new research results are disseminated.

On the other hand, Landry et al. (2007) discovered that focusing on user needs leads to greater implication in knowledge transfer activities in the case of natural sciences and engineering university researchers. Moreover, Olmos-Penuela et al. (2011) have extended this conclusion to humanities and social sciences academia concluding that the common variable positively related with the engagement in the different knowledge transfer activities analyzed was the focus on the social utility of the research. Also, those activities which increase social capital such as professional mobility, prior business experience, consulting activities have been shown to contribute to the promotion of academic entrepreneurship (Krabel et al., 2009; Mosey and Wright, 2007; Goel and Grimpe, 2011).

Based on which dimension manifests more prominently, we can analyze which type of entrepreneurship the member of academia is involved in: if the homo economicus is the primary decision making actor than the activity will fit into the commercial entrepreneurial practices, whereas if the homo empathicus is the one providing the drive behind the intent, then it is a socially entrepreneurial practice. Nonetheless, what this framework reinforces is the idea that all three character profiles coexist in the same person and that they can choose to manifest in one situation in a certain degree and in another situation in a totally different combination. These idiosyncratic manifestations are influenced by personal characteristics and existing cultural features (Tuunainen and Knuuttila, 2009).

Conclusions and Future Research

The same as Austin et al. (2006), we can conclude that there is no totally commercial entrepreneurship and no totally social entrepreneurship even in the academia, and that all entrepreneurial practices have to combine elements of both. What needs to be investigated further is the change in cultural features which allows contemporary academic entrepreneurs to become more socially aware and engaged, meaning more homo empathicus and if these are the same features which allowed them in the past to become more homo economicus.

Academic entrepreneurship is an unruly subject which defies the boundaries between concepts and requires a treatment not based on any previous knowledge. It is an uncanny practice which is best viewed in its own merits and not as a part of either commercial or social entrepreneurship. It is meant to create an uncomfortable sensation in the researcher that seeks to explore the nature of these activities as they span across different fields of knowledge and produce their specific results. Stretching the conceptual limits, we could say that academic entrepreneurship resembles the uncanny as described by Freud “a feeling of something not simply weird or mysterious but, more specifically, as something strangely familiar.” (Royle, 2003: vii) The familiarity is provided by the societal context which seems to be fraught with discussions regarding academic entrepreneurship and the entrepreneurial universities and by the fact that we have already been acquainted with commercial and social entrepreneurship. However, this does not represent a clear case of either and it can be thus called uncanny.

IS CELLAR DOOR AN OPPORTUNITY FOR BAG-IN-BOX? A CONSUMER PREFERENCES ANALYSIS IN THE ITALIAN WINE MARKET

Capitello, Roberta¹; Begalli, Diego²; Agnoli, Lara³

Abstract

In Italy, the cellar door activities are being transformed. The local, daily and low involved consumer, purchasing bulk wine, is slowly being replaced by the consumer-tourist. This research focuses on the role of packaging for the consumers who purchases wine from the cellar door, in order to understand the benefits they expects to obtain. It also analyzes how consumption behavior influences the packaging choice. Most marketing studies on wine packaging focus on the glass bottle, on design strategies and on consumer perception. Few studies analyze the consumer perception towards new packaging options.

A direct survey through questionnaire was carried out by the consumers-tourists at the cellar door of an Italian winery.

Three Logit regression models have been applied, in order to estimate the probability that consumers will buy wine in the three different packaging options: bottle, demijohn and bag-in-box. The results of the regression function for the demijohn confirm that the choice for this packaging is linked to a traditional consumption model and to the local production; for the bottle the role of "Age and Information", "Wine, Food and Environment", "Image" emerges. The probability to choose bag-in-box is given by "Image", "Wine and Outside Meal Effect" and "Intrinsic Attributes of Wine".

This study highlights that there are some development opportunities for the bag-in-box in Italy, given by the increasing consumers attention toward new packaging benefits, and linked to the wineries, that should fill up the consumer information gap and include bag-in-box in an integrated vision of marketing mix.

Keywords: Bag-in-box, cellar door, consumer behavior, wine, Italy

Introduction

In Italy, the cellar door activities are being transformed. Bulk wine is no longer widely sold to the local, daily and low involved consumers. This consumer segment is slowly being replaced by the consumer-tourist. Research highlights that the consumers-tourists are different from the traditional consumers: they are wine involved, prefer typical wines of medium-high quality, and are also interested in the cultural and social aspects of wine. They want to improve their knowledge of wine production process and the terroir, by establishing direct contact with the winemaker and living an unforgettable experience (Bruwer and Alant, 2009; Charters and Ali-Knight, 2002).

Also the Italian wineries are gradually developing to offer new experiential contents; in particular, they should implement new product strategies, involving packaging, to provide functional and hedonistic benefits. Starting from this consideration, this research focuses on the role of packaging for the consumers who purchase wine from the cellar door, in order to understand the benefits they expect to obtain. It also analyzes how consumption behavior influences the packaging choice.

The reduction in bulk wine purchases is caused not only by the decrease of per capita consumption, but also the need of service benefits. From this point of view, consumers, producers, and researchers have focused on the glass bottle as the only way to create added value. However, the heterogeneity of wine productions on the one hand, and the market segmentation on the other hand, may stimulate the interest toward alternative packaging options, considering the wine characteristics, the distribution channel, the consumption situations and the expected benefits.

From the technological point of view, researchers highlighted that the glass bottle did not always outperform the other packaging. The choice of the packaging should be carried out according to the characteristics of the wine, and its use functions, commercialization forms and usability, which may make different packaging options more convenient than the glass bottle, both in technological and economic terms. Furthermore, the impact of the packaging disposal on the environment, global warming and greenhouse gases increase has aroused the attention of consumers and wineries toward new "green" packaging, as lighter weight glass bottles, PET bottles, TetraBrik and bag-in-box (Buiatti *et al.*, 1997).

Besides being environmental friendly, these packaging have specific technical and technological characteristics. Some bag-in-box advantages are the following: materials and closure perform better than TetraBrik, its high tech functions maintain the sensory qualities of the wine longer than the glass bottle when opened, it is easily stored, recycled, and biodegradable.

The interest of wineries towards bag-in-box is growing in the Italian market. This phenomena involves the wineries focused on direct sales, especially the cooperatives. They are suffering from the reduction of bulk wine sales, sold for example in demijohn, and react by proposing bag-in-box as an alternative with new service benefits. However, many wineries are still hesitant to adopt this packaging in the domestic market, because its acceptability by the consumers is poorly known. The consumers are reluctant to use this packaging because they are not familiar with its potentialities, confuse it with the TetraBrik, widely distributed by retail chains, and consider wines in bag-in-box as low quality wines. Also the legislation limited its uses: only from 2008, the Italian producers can package denomination of origin wines in bag-in-box.

The situation in other markets is quite different. The Italian wineries make extensive use of bag-in-box wines for foreign markets, especially in Northern Europe. For example, in recent years it has overtaken the bottle in Norway and in Sweden, partly because of the lower taxation than glass bottle. In France, it is one of the few growing areas in the declining domestic market. In Australia, the role of bag-in-box is evolving in a completely different way. For many years it has been one of the most important packaging options in the domestic market, qualifying the wine as a commodity. Nowadays, the consumer's attention towards premium wines is causing its decline (Mueller and Umberger, 2009).

Literature Review

Packaging is one of the wine quality cues for the consumer, and not only for those less expert. Previous studies stated that the intrinsic attributes are more important than extrinsic attributes for utilitarian products and, extrinsic cues as brand name and packaging prevail on intrinsic cues for products of image (De Chernatony and Knox, 1990). Instead, for wine quality is determined by a very wide and diverse set of attributes, and the role of extrinsic and intrinsic ones is still being studied.

Starting from this multidimensional concept of quality, Charters and Pettigrew (2007) have investigated how the marketing elements, including packaging, enter the evaluating process of the quality, and are themselves quality. They act in different ways, depending on the consumer segment. The packaging transmits an image that is directly linked to price to the low involved consumer. The authors suggest a "triadic relationship" between packaging (label particularly), price and reputation, very relevant in situations of personal achievement and sociality. The medium or high involved consumers perceive the marketing package "as integral to the concept of quality".

According to Orth and Malkewitz (2008), packaging is a communication vehicle for brand managers. The packaging, the bottle shape and color, and its label, determine the look of a wine, create a distinction from the competitors and offer more “shelf appeal” (Jennings and Wood, 1994).

Therefore, the impact of packaging and consumer involvement are strongly connected, and since the involvement is powered by the purpose, also the assessment of the product and the packaging is closely related to the reason to buy. Starting from the purpose, the consumer chooses not only the wine, but also the packaging, the design, the value for money, as well as its usability and functionality. These expected benefits should be taken into account by firms in setting product strategies.

Therefore, it is obvious that the new packaging options affect the quality of the product, not only through the technological performance, but also through the impact on the consumer in terms of image, consumption situation to satisfy, and expected services. The literature analysis reveals that the studies about the impact of bottle and label on product assessment by the consumer are numerous and arouse increasing attention (Mueller and Lockshin, 2008; Rocchi and Stefani, 2006). But the studies about the relations between new packaging options, the consumer characteristics and the purchase and consumption behavior are almost absent (Mueller and Umberger, 2009).

Also studies about the role of packaging from the producer point of view are lacking. The effort to broaden the product portfolio with bag-in-box wines is underestimated. The article of Santini *et al.* (2007) studies the market opportunities of the bag-in-box in the United States.

Objective and Methodology

This study aims at contributing to fill gap in knowledge in the analysis of the relations between packaging choices, consumer characteristics and consumption patterns.

The focus is on consumer-tourist at the cellar door, because this segment may be potentially interested in alternative packaging options, able to replace the purchase of bulk wine in demijohn, in the sharp decline by the modern consumer. In particular, this research will explore the opportunities that the wine SMEs can obtain from bag-in-box in the cellar door. Another innovative aspect of this research comes from the comparative assessment by the consumer of the three types of packaging suitable for direct sales, namely the bottle, the demijohn and the bag-in-box.

A direct survey through questionnaire was carried out by the consumers-tourists at the cellar door of a winery that lies in the province of Fermo, in Marche region. The questionnaire was developed to gather five types of information: i) socio-demographic characteristics of respondents; ii) beverages consumed in the different consumption occasions; iii) choice and consumption

behavior for wine; iv) purchase behavior and preferred packaging options for wine (bottle, demijohn, bag-in-box); v) advantages and disadvantages of the three packaging options.

The questionnaire was submitted to 150 consumers-tourists. Table 1 shows the socio-demographic characteristics of the sample.

The sample is not representative for the population, but it is significant if compared to the cellar door custom of a wine SME that is interested in enhancing its direct sales and the visitor experience.

After describing the consumers-tourists characteristics and the benefits that they expect from the three packaging options, the analysis aims at verifying the relationship between packaging and consumption behavior. Therefore, three Logit regression models have been applied, in order to estimate the probability that consumers will buy wine in the three different packaging options. The dependent variables are dichotomous, with value 1 if the respondent buys wine in bottle, demijohn or bag-in-box respectively, and 0 otherwise. The independent variables consist of the socio-demographic characteristics of the consumer, the consumption and purchasing behavior, the consumption situations and the importance associated to wine attributes. These variables have been identified through the principal components factor analysis, to avoid dependence among variables and to reduce the number of variables at the same time. This analysis highlights latent dimensions that are the independent variables for the Logit regression analysis. The factor analysis has also played an explanatory role, selecting the latent variables able to discriminate the respondents behavior. The dimensions with eigenvalues greater than one have been selected and rotated by varimax method.

Discussion of Results

Consumption behavior

The wine plays an important role by respondents in the different consumption occasions, reflecting the Italian traditional consumption pattern. The wine is drunk during meals at home and outside, with family or friends, often with water (Tab. 2). The other beverages are not able to replace it in these situations, but they are preferred in the occasions outside meal. At home and at friends soft drinks (juice and soda) are favored, while at the bar the alcoholic beverages (beer) prevail.

Among regular consumer, the traditional wine consumption pattern keeps: i) the high consumption frequency (daily for almost two thirds of respondents); ii) the choice of wine based on generic characteristics (color, still/sparkling); iii) the frequent purchase by the winery for regular consumers. Occasional consumers, usually young, differ: they put wine in competition with other

beverages, especially outside meal, buy wine at the supermarkets and the wine shops, and search information by participating at wine festivals, courses and reviews.

<i>festivities</i>	<i>wine 100.0%</i>

Tab. 2 – Preferred beverages in the different consumption occasions (n=150)

Pros and cons of the three packaging options

Table 3 shows that the higher the consumption frequency is, the greater is the interest in different packaging options than bottle, and the bag-in-box in particular.

	<i>Occasional consumers (n=14)</i>	<i>Frequent consumers (n=39)</i>	<i>Daily consumers (n=97)</i>	<i>Total (n=150)</i>
<i>bottle</i>	100.0	100.0	32.0	56.0
<i>demijohn</i>	0.0	2.6	36.1	36.0
<i>bag-in-box</i>	21.4	38.5	64.9	54.0

Note: chi-squared test between the variables consumption frequency and packaging options is significant with $\alpha < 0.000$

Tab. 3 –Packaging option in relation to consumption frequency (% of respondents)

Table 4 shows the benefits of the three packaging options perceived by consumers. The bottle is associated with quality wine, recyclability of the glass, and its property to preserve the product.

The demijohn is chosen for its price and the possibility of re-use. The wine is interpreted as a commodity, whose price is assumed to be low. The consumers are not interested in the packaging differentiation elements and therefore they are indifferent about its characteristics.

As for the demijohn, respondents associate bag-in-box to daily consumption, but they are able to discern some of its properties: the ease of transport, the reduction in waste and purchase time, the affordability and its ability to preserve the product. However, they are still reluctant about its recyclability, showing a lack in knowledge. They also incorrectly associate bag-in-box with TetraBrik widely sold by retail chains, doubting of its suitability for quality wine. In fact these consumers buy bag-in-box wine directly from the wineries and prefer local wines, mainly autochthonous. In this case, the bag-in-box is more practical than the demijohn.

	<i>bottle</i>	<i>demijohn</i>	<i>bag-in-box</i>
<i>reduction of the purchase time</i>	41,3	9,3	44,6
<i>reduction in waste</i>	34,6	7,3	48,0
<i>reservation capacity</i>	42,6	10,6	39,3
<i>convenience</i>	47,3	10,0	52,6
<i>ease of transport</i>	36,0	4,0	51,3
<i>affordability</i>	6,6	22,6	44,0
<i>recyclability</i>	72,6	22,6	7,3
<i>suitable for quality wine</i>	55,3	11,3	28,6

Tab. 4 – Benefits associated with the three packaging options (% of respondents, n=150)

Packaging preferences

Starting from a set of 43 variables that comprehend the characteristics and the consumption behavior of respondents, the factor analysis extracted 13 dimensions, explaining 71.4% of the variance. Table 5 shows the extracted dimensions, which names come from their associated variables with a factor loading greater than 0.500.

The dimension “Age and Information” (D1) opposes the modern consumption behavior to the traditional one. The former is associated with younger respondents, who want to be informed about wine, are always curious, interested in the novelty and willingness to enrich their cultural background, show awareness in choosing wine through specific characteristics and mostly buy wine at supermarkets. The latter concerns the older respondents, who drink wine at home during meals and buy wine directly from the cellar door.

The dimension “Image” (D2) characterizes respondents who pay attention to the intangible aspects of the product. Factors such as brand reputation, experts’ advice, packaging design, label information, denomination of origin, awards and medals are particularly taken into account to assess a wine. The extrinsic sphere of the product plays an important role for these consumers, because it consists in objective factors that can help, or confirm, their ability to assess the tangible characteristics of the product.

The dimension “Wine, Food and Environment” (D3) comprehends the consumers who consider environment respect and organic production important for a wine. It refers to a new philosophy that is gaining ground in recent years, linked to the culture of good and healthy eating, and environmentally friendly.

<i>Dimensions</i>	<i>Variables with the highest positive factor loadings</i>	<i>Variables with the highest negative factor loadings</i>	<i>Explained variance (%)</i>
<i>D1 – Age and Information</i>	- wine purchased in supermarkets (0.737) - search information about wine (0.722)	- wine consumption at home during meals (-0.904) - importance of wine color at home (-0.859) - consumption frequency (-0.882) - wine purchased from the cellar door (-0.851) - age (-0.798)	15.2
<i>D2 – Image</i>	- importance of brand reputation (0.703) - importance of denomination of origin (0.694) - importance of awards and medals (0.684) - importance of experts' advice (0.660) - importance of packaging design (0.650) - importance of label information (0.581)	-	8.4
<i>D3 – Wine, Food and Environment</i>	- importance of environmental friendly production (0.775) - importance of organic production (0.772)	-	6.2
<i>D4 – Water and Meal Effect</i>	- water consumption at friends' home during meals (0.914) - water consumption in the restaurant (0.855) - water consumption at home during meals (0.521)	-	5.3
<i>D5 – Intrinsic Attributes of Wine</i>	- importance of taste (0.767) - importance of alcohol by volume (0.715)	-	5.3
<i>D6 – Beer and Price Effect</i>	- importance of price (0.642) - beer consumption in the bar (0.502)	- water consumption in the bar (-0.671)	4.3
<i>D7 – Beer and Friends Effect</i>	- beer consumption at friends' home outside meals (0.782)	- wine consumption at friends' home during meals (-0.630)	4.1
<i>D8 – Water and Outside Meal Effect</i>	- water consumption at home outside meals (0.777)	-	4.0
<i>D9 – Beer and Meal Effect</i>	- beer consumption in the restaurant (0.767) - beer consumption at friends' home during meals (0.589)	-	4.0
<i>D10 – Friends' Advice</i>	- importance of friends' advice (0.604)	- importance of wine color outside home (-0.691)	3.8
<i>D11 – Wine and Outside Meal Effect</i>	- wine consumption at friends' home outside meals (0.725) - wine consumption at home outside meals (0.559)	-	3.6
<i>D12 – Point of Sale</i>	- wine purchased in cooperatives (0.807)	-	3.6
<i>D13 – Value for Money</i>	- importance of value for money (0.736)	-	3.5

Tab. 5 –Dimensions extracted by the factor analysis and variables with the highest factor loadings

A group of six dimensions (D4, D6, D7, D8, D9, D11) explains one quarter of the variance, concerns the substitution factors between wine and the other beverages. The dimensions “Beer and Price Effect” (D6), “Beer and Friends Effect” (D7) and “Beer and Meal Effect” (D9) show that the preference for beer is linked to the price, and to moments of sociality and conviviality with friends and outside the home. The dimensions “Water and Meal Effect” (D4) and “Water and Outside Meal

Effect" (D8) distinguish consumers that pay attention to alcohol content and prefer water to wine both during and outside meal. The dimension "Wine and Outside Meal Effect" (D11) considers consumers who choose wine outside meal, whether at home or at friends.

The dimension "Intrinsic Attributes of Wine" (D5) characterizes the consumers who perceived the quality through the intrinsic characteristics of a wine (taste, alcohol by volume, color and grape variety).

The dimension "Friends' Advice" (D10) differentiates the consumers that follow the suggestions of friends in choosing a wine, because they are considered expert, or as a sign of belonging to a group.

Finally, the dimensions "Point of Sale" (D12) and "Value for Money" (D13) concern the consumer buying process: the first is focused on the purchase of wine from the cellar door, the second on the price affordability.

The thirteen dimensions explained above are the independent variables used to estimate three Logit regression functions for the bottle, the demijohn and the bag-in-box (Tab. 6). The highest goodness of fit is registered for the first function, correctly classifying 89.3% of the cases and explaining 81.7% of the observed variance. This percentage is lower for the function "demijohn" and "bag-in-box"; however they correctly classify respectively 86% and 70% of the cases.

The regression function for the bottle shows three significant independent variables with a positive sign. The dimension "Age and Information" highlights that youth, and wine involvement, linked to the modern consumption pattern, increase the probability to choose wine in a bottle. The dimension "Wine, Food and Environment" is positively associated with the choice of the bottle because it emphasizes the attention to the quality of the product and the production process. The dimension "Image" is connected to the intangible nature of the bottle and to the information content of the label.

Conversely, the attention to the value for money decreases the probability of choosing a wine.

The results of the regression function for the demijohn confirm that the probability to choose the demijohn is linked to a traditional consumption model and to the local production. The choice is led by the attention to the value for money and the daily consumption during mealtime. Therefore, the wine is not preferred in the occasions outside meal, and substituted with other beverages, like beer. The negative coefficients for the two dimensions "Age and Information" and "Image" highlight that the demijohn choice is associated with a low involved consumption behavior: higher age, direct purchases from the cellar door, high consumption frequency, lower interest in information and cultural aspects of wine.

The regression function for the bag-in-box shows that the probability to choose this packaging is given by the three dimensions “Image”, “Wine and Outside Meal Effect” and “Intrinsic Attributes of Wine”, that can also be interpreted as development drivers for the bag-in-box.

The dimension “Image”, which characterizes consumers focused on the extrinsic attributes of wine, could increase the acceptability of bag-in-box if the wineries improve the design and information of this packaging option.

Tab. 6 – Logit regression functions for bottle, demijohn and bag-in-box

The dimension “Wine and Outside Meal Effect” associates the interest in the bag-in-box with outside meal consumption of wine. This could be an opportunity because it can ensure the storage life and product usability also in these situations.

The dimension “Intrinsic Attributes of Wine” is specific to this model. It can reveal the “concreteness” of the consumers who choose bag-in-box for both the product and the packaging properties. They are characterized by high consumption frequency, purchase from the cellar door, and attention to the tangible characteristics of the product (taste, alcohol by volume, color and grape variety). Therefore, bag-in-box performances in maintaining the sensory properties of the wine become an important lever.

The dimension "Age and Information" lowers the probability of purchasing the bag-in-box wine. It highlights that youth and the interest in the wine may stem the choice of this packaging. This depends from the actual market positioning of the bag-in-box, that leads to associate it with low quality wines, undifferentiated, suitable in domestic consumption situations, packaged in demijohn or TetraBrik.

Managerial Implications

The results of this research confirm that the demijohn is a packaging option in the final stage of its life cycle, with scarce revitalization possibilities (Tab. 7). Furthermore, the analysis shows the specificity of Italian consumer compared to the New World one, meaning that bag-in-box is still in the launch phase in the domestic market.

The comparison between bottle and bag-in-box allows the drawing of interesting opportunities for the latter packaging option. It is certain that the bottle will remain the packaging with the greatest capability to express the quality of a wine, and its identity. Nevertheless bag-in-box could benefit from the current trends in wine consumption, despite it responds to a segmented market in terms of product typology and consumer occasions.

The research highlights that the consumer of bag-in-box is quite different from that of demijohn. The dimension "Age and Information" has a negative impact on both the packaging options, because most purchasers of bag-in-box are daily wine drinkers and not so young. Considering the bottle and the bag-in-box, only the dimension "Image" has a positive impact on both. However, the analysis highlights that there are some development opportunities for the bag-in-box, linked to the consumer attention toward certain packaging characteristics and the information gap, and linked to the wineries, that should include it in an integrated vision of marketing mix.

The strategic development of the bag-in-box can be synthesized in some main guidelines.

The research highlights that the information is a pivotal point. It should be strengthened in two areas: the technological and economic performances, and the information content on the label. Today, the label is absolutely minimal and neglected, designed for a traditional consumer, like the one interested in demijohn. Consequently, today the Italian wineries relegate this form of packaging for basic wines.

Another problem is that bag-in-box is included as a simple extension of the product range for the Italian wineries, without a specific market target. Therefore, the wine portfolio strategy should be revised, considering the bag-in-box in an integrated way, in terms of brand image, target market, communication strategy and distribution channels.

	<i>Bottle</i>	<i>Demijohn</i>	<i>Bag-in-box</i>

* = $<15\%$, the percentage indicates the consumer quota that consider the packaging characteristic important

Tab. 7 – Packaging options and importance of consumer and packaging characteristics

In this context, the cellar door sales can become a strategic option to reposition this package.

Another weakness to overcome that generates prejudices about the quality of wines in bag-in-box relates to the legislation, that has allowed to sell denomination of origin wines in bag-in-box only since 2008. However, this implies to modify the production rules that regulate each denomination of origin, and this procedure is long and complex in Italy.

Another important aspect jointly concerns the communication to the consumers and the strategic orientation of the wineries. The existing prejudices lead the wineries to do not pack bag-in-box wine because the consumers experience is negative, and the consumers to do not buy bag-in-box wine because they consider it a poor quality product and its value for money is unfavorable, because they confuse it with TetraBrik.

Solving these problems means to help the bag-in-box to be also appreciated by the postmodern consumer and to find in the cellar door a valorization leverage.

Abstract

Knowledge agent (KA) is defined as the simplest unitary entity that activates a knowledge process which aims to deal with collective problems or issues within organisations. The Knowledge Agent Theory (KAT) conceptualises the ontology of KAs as a living system with autopoietic characteristics of self producing its components to maintain an identity for learning. In this paper, we examine the boundary functions of KAs with a multiple-case study in a stochastic demand industry. Three types of learning groups are identified. They are: pseudo-, quasi- and unblocked KAs. Only the unblocked KA has complete boundary functions. The findings explain why organisations do not learn. The analysis also shows that neighbourhood relations at the individual and organisational levels between members within a KA set critically bond members together to form a learning entity.

Keywords: Knowledge agent, autopoietic living system, neighbourhoods, boundaries

Introduction

Organisational learning is a relatively new academic discipline to management scholars and practitioners, where the dominant topics are mainly concerned with the process of learning for incremental changes and radical adjustments (Easterby-Smith et al. 2004). In recent years, organisational researchers have started to address the role of team learning as agents to search for solutions to collective problems in organisations (Edmondson 2002). Some of the literature in knowledge management also confirms that engagement of individual members in acquiring and transferring knowledge is the key enabler in activating the knowledge process (Ichijo et al. 1998). Chan et al. (2009) conceptualised that learning groups which execute a knowledge process to deal with collective problems in organisations have autopoietic characteristics that comprise knowledge agents (KAs). KAs are defined as the simplest unitary entity that activates the knowledge process for learning. In this paper, we start with the premise that an organisation learns through actions

and interactions that take place between members who are bonded together as a KA entity. Through this entity, organisations maintain their existence by internally and externally coping with new environments. Although there is emerging literature on team learning (Edmondson 2002, Wilson et al. 2007), we know little about why organisations change, or fail to change, through knowledge processes carried out by learning groups. To better understand the features of learning groups that act as KAs, an intensive field study has been conducted in a stochastic demand industry.

Knowledge Agent Theory

Knowledge in an organisation is defined as a mix of facts, organised or justified skills, experience, value judgments and beliefs. By acquiring knowledge, an organisation can generate the capacity to act on transforming problems to solutions, transmission of solutions to other parties, predicting the outcomes of processes, making better decisions, and making sense of the signals from the environment (Argyris 1977, Blosch 2001, Ching & Yang 2000, Manjula & Mustapha 2006, Styhre 2003, Sveiby 1997, von Krogh et al. 2000). Knowledge in nature is not a living thing (Birkinshaw & Sheehan 2002, Bukowitz & Williams 2000, McElroy 2003, Wiig 1993). In order to activate organisational knowledge, organisations need KAs to execute knowledge processes. When a group of members gather together to form an entity and take collective actions in learning and contribute created or learned knowledge to achieve a business goal or produce solutions to problems in organisations, they are known as a KA entity. The main feature of a KA entity, however, is to maintain its identity and existence by producing self-components that constitute boundaries. This is an autopoietic system with structural autonomy from its environment for future continuation. In other words, the entity is a living system that self-produces its components in order to maintain an existence. The living system concept was first proposed by Maturana and Varela (1980). It was further elaborated by Luhmann's social systems theory (1995).

In the observations made by Maturana and Varela (1980), one essential feature of a living system is its individual autonomy. The living system has its boundaries and is self-defined by its components. The components give an identity to an entity, which automatically creates its own necessary characteristics and boundaries. Maturana and Varela (1980) labelled this structure-determined single entity as an autopoietic system. The system consists of particular components as inputs and generates necessary components to maintain the identity. The living system is closed and self-produces its components to construct its own boundaries.

Luhmann (2006) asserted that social systems deal with interactions between actors who are in different entities, make decisions with the consideration of premises to absorb uncertainties of external environment in order to stabilise organisational processes and operations. Autopoietic

systems constitute as self-referential systems such that their existence is enabled through their ability to continue operations within systems. The constitution of boundaries by an entity in order to distinguish itself within its environment is the key element to containing structural autonomy. At the same time, interaction between internal components and the external environment, via structural coupling, occurs. We conceptualised KAT as a living system with self-producing characteristics which have undergone a self-observing and self-referential process to distinguish itself from other operation sectors, such as sub-business units within organisations or one's self-region, to carry out knowledge processes.

Self-producing system

The KA entity is a circular unit. Its operations are continuously generating its own components to maintain a living system identity for carrying out knowledge processes. The outputs produced by the entity comprise two types: (I) knowledge which would be implemented to solve collective problems or change organisations for the better, and (II) memories of experiences in relation to learning processes and applications of new knowledge. The type I outputs eventually become the inputs to operate the organisational business activities. They have positive impacts on organisations. Type II outputs are the inputs of self-referential processes and circularly act in self-producing activities within the KA operating system. Type I outputs are the cognitive resources that make sense to the organisation environment in order to deal with the collective issues in organisations. Type II outputs become the cognitive abilities to support the continuation of the KA entity identity and cognitive evidence to examine the membership with which the entity uses to make sense of its environment. In the event that the existing structure of components may not be sufficient to hold an identity for learning, the entity will structurally couple with outside components that integrate them into KA systems. Otherwise, the original components need to gain cognitive resources to enhance their roles as components of the KA entity. This circular process allows the KA to self-produce its components and constitute boundaries.

Self-referencing

Self-referencing is a reflective activity to examine the likelihood that current components will maintain an autopoietic system for learning. Through this continuous process, it distinguishes itself from its environment to avoid instability and at the same time, examine the existing components to keep its identity with the triggers of its environment. The source of instability is from the different goals of the original location and those that the KA entity expects to be achieved. The self-referencing process is to avoid disintegration of the entity. The need to change the components is purposively determined by the KA entity to retain its identity as learning activists, not an adaptation of its environment. The KA entity is realised through a particular arrangement of

components in order to be bounded within the boundaries to operate knowledge processes. Any changes that can be undertaken in the structure of components are determined by the particular arrangement that maintains their self-producing nature. All interactions in the system are determined on its own, through self-referencing. This self-referential ability has the means to retain previous interactions and justify the producing of components. So, the outputs of self-referencing are the inputs for self-observing (Bakken &, Hernes 2003).

Self-observing

The purposes of an autopoietic system are to simplify a living system so that an entity could avoid a complex situation which would interfere with its operation systems, and stabilize a living system to self-produce its components. To ensure that entity distinction is not lost from the environment and maintain self-production, a KA entity is a self-observing unit. The distinction as an entity in an autopoietic system guides the observations of the observed observer. That is, the entity observes itself within the boundaries with its self-referential cognitive resources in a recursive manner to develop self-consciousness of its identity. Self-observing is therefore, a nervous system to detect any deficiency of the self-producing inputs which barricade the holding of the characteristics of being a self-living system to produce the self components of an entity. The cognitive resources for self-observing are bounded but unlimited. Through recursive interactions, the things held in an entity may generate new meanings to it to examine its identity is whether the entity holds all the properties of a KA. When the entity observes itself to lack sufficient conditions to maintain its identity with current components, neighbourhood searching within a convex region will allow the commencement of integrating new members, either inside the organisation or from an external source, through structural coupling to interplay the new components. To allow interaction between the existing components of a KA entity and members outside its boundaries, new components may be formed through neighbourhood confirmation (Maturana & Varela 1980). This process is called structural coupling. The change of the structure of components is to maintain identity. At the same time, it gives signals to self-producing mechanisms to produce the necessary components to maintain boundaries. It is the only process in autopoietic systems that allow interaction between the members inside and outside the entity. The new meaning of the experience and outcomes of knowledge processes are recursively applied to its own outputs become the memory which are reused as inputs in self-referential activities.

Boundaries

Boundaries represent a distinction or demarcation between an entity and the environment in which an entity can be identified and explained (Luhmann 2002, Mingers 2006, Checkland 2006). They comprise a region that defines the particular characteristics of an entity. The purposes of

boundaries are to separate, contain or include different elements or spaces, and regulate the functions and operations that are carried out inside their parameters. The distinction between an entity and the environment is exclusively mediated by meaning, which constitutes boundaries. The outcomes of ongoing processes of including and excluding membership with explicit identities or differences ensure that actions taken by an entity are predictable.

Boundary functions

The boundaries of a KA entity establish three basic properties within its components: (i) cognition to conduct knowledge processes, (ii) willingness to put forth effort on knowledge processes, and (iii) taking of action to plan and implement.

The first property is cognition, which refers to the process of acquiring and using knowledge to solve problems and make decisions (Mingers 2006; Reed 2010). Cognitive activities include information processing, knowledge application, and preference changes. Cognition is a sensory input which corresponds with the external world to make decisions.

The second property is the willingness of individuals to put forth effort towards knowledge processes in organisations; thus they are not forced to become learners. Willingness is an inner drive; it is the taking of actions based on attitudes towards or apart from their beliefs to take part in a knowledge process is the impact of selective exposure and attention processes towards new information which are separate steps in information processing (Fabrigar et al. 1999).

The third property is the commitment of those who have these two properties to create an action plan for knowledge process implementation that deal with organisational issues. KAT has a self-referential nature; if the components see the organisational issues as self-issues, then the knowledge process will take place. However, social individuals hold many characteristics, and even if they have all the said properties, may not be the appropriate components to construct the boundaries as a KA entity. Consequently, double neighbourhood relations could provide the means to overcome this issue.

Double Neighbourhoods

Boundaries separate the external and the internal. In a boundary zone, friction could be reduced if there is a neighbourhood relation between the interior and exterior. Neighbourhoods contain a path that allows the internal and external to connect, when they have commonalities and differences are tolerated. Commonalities are anything in which more than one element from different entities share the same attributes of something (Dietz 2002, Sampson et al. 2002). It is to link elements together to establish a neighbourhood relation to perform a KA role. A KA entity is

formed in organisations when double neighbourhood relations form between the KA set and two internal parties: (i) potential components who are members of the organisation, (ii) the organisation.

Members of a learning group who have the properties that are determined by KA boundaries potentially become components of the KA entity. The likelihood that an entity becomes a KA to carry out the knowledge process depends on double neighbourhood relationships. The primary neighbourhood is the relation between the KA set and individuals. The KA set is a group of members who hold the three aforementioned basic properties. It becomes a social system because all of the learning activities involve different units within an organisation. So commonalities are needed to link the set and individuals together. If individuals perceive that the outputs of a KA entity conflict with their formal or informal groups in an organisation, the linkage may break. On the other hand, when local interests are tolerated, a neighbourhood relation exists. This is known as a primary neighbourhood relation which links the KA set to individuals. However, a primary neighbourhood is insufficient to allow for the existence of KAs. The secondary neighbourhood at an organisational level is needed. A secondary neighbourhood is an agreement between the KA set and an organisation in which group learning is needed to be performed for changes to happen. Generally, organisations conduct different tasks to achieve different business goals in the short or long term. When an organisation is treated like a single unit, it commits to providing resources for changes and bears short term negative effects during the change process. Then, the organisation holds a secondary neighbourhood relation with the KA set. When both individual and organisational neighbourhood relations occur, a KA entity could exist and its functions would be legitimate. Without a commitment to learning, the secondary neighbourhood at the organisational level cannot be sustained.

Research Methodology

In this study, cross-case participatory observation research has been employed. The soft goods industry with its stochastic demand is selected for the field study. The replication logic (Yin 2009) is used along with the participation of four firms in the textiles and clothing industry. After the collective goals of each participating firm were set at a focus group meeting, a single day operation management training workshop was separately arranged with each firm to collect the observation data on learning behaviour. As well, to collect and validate the primary data, multiple sources of evidence were collected from natural settings which included interviews, meetings, and surveys. More than eighty participants who are at managerial or supervisory levels were observed in the workshops and over one hundred informants shared their learning experiences in interviews and meetings. In this paper, we will limit our discussion on the findings to examine the boundary functions of KA entities which hold autopoietic characteristics.

Sampling Frame

Four firms were selected to participate in the study. All of the participants are anonymous. The firms are named as Alpha Fashion Manufacturing Ltd., Beta Knitwear Ltd., Gamma Fabric Mill Ltd. and Delta Intimate Apparel Ltd. All of them had conducted knowledge processes for changes in the last twelve months at the time of the field study with the purpose of improving their overall activities related to performance.

Alpha is an original equipment manufacturer (OEM) that makes light weight clothing for fast fashion and youth casual wear retailers in Europe and the US. The productivity had been dropping. In order to improve productivity, Alpha re-engineered its operation systems in production, merchandising and product development.

Beta is a knitwear exporter that serves the high end knitwear fashion market in Japan and Europe. After the global financial crisis in 2008, its order numbers reduced more than one third and the unit price was lowered by 15%. The firm decided to explore new markets in Europe to replace its major customers in the Japanese market. To enhance business competency, Beta plans to integrate its trading unit with a production unit in Shenzhen.

Gamma is a fabric mill with production facilities in Hong Kong. It is a market leader in manufacturing bi-stretch, technical denim and advanced cotton fabrics. Gamma faces the challenge of high labour costs in the production of goods in Hong Kong and has been trying to eliminate total costs in core operations, supportive operations and quality improvement.

Delta is a typical OEM that produces intimate garments for both large and small lingerie retailers in the US. It has been changing its production operations and skills to respond to the changes in the market: short delivery time, smaller quantities per order, and a wide variety of each product collection. The new market environment has caused the company to bear higher production and raw material costs. Their business performance has been below expectations. So the firm works on cutting overall costs in order to maintain competency.

Data collection

The informants at the managerial level from the four firms were first asked to self-weight the yield of desirable knowledge that enabled problem processes to be addressed in their firms in the last twelve months. Focus group meetings were held to observe the ways that the participants addressed and discussed problems that they are facing. The four parts of speech classification in the action inquiry model are adopted (Torbert et al. 2004) to analyse the likelihood that participants will play a KA role. The contents of interview transcripts were classified into four different areas that pertained to experience and affected behaviour: framing, advocating, illustrating and inquiring

to determine if the primary and secondary neighbourhood relationships occur in the firms. Multi-sources of evidence to validate the observed data in the group learning experiences were collected. The data were stratified according to their intentions, plans, actions and outcomes in the solving of collective problems. The multi-sources of learning experiences triangulated the data to validate the analytic results of the impacts obtained from the knowledge process into three types: no, local and extensive.

Findings

Solution values

When an organisation is assessed as receiving no positive benefits after a knowledge process was conducted, the solution values are defined as having no impact. If the outcomes of the knowledge process bring about a potential positive value at the local level (Edmondson 2002) that cannot be extended to a wider scope within the company to solve problems inherent companywide, it is called local impact. An extensive impact is obtained when the knowledge process generates knowledge which comprehensively benefits in a broader manner. Latent systematic problems, errors that randomly occur in different locations within an organisation without specific causes, will be eliminated or the negative impact caused by external changes will be minimised.

After integrating the self-weighted solution values with observations and survey findings, three types of solution values were identified in the firms in the sample frame. Alpha is the only firm in the sample frame in which the proposed solutions generated from its previous knowledge process failed to bring about any positive benefits or achievement of its collective goals. There are local impacts in Beta and Delta. Gamma is the only firm in the sample frame that has experienced extensive impacts.

Types of knowledge agent

It is assumed that if organisations experience positive impacts, they learn; if organisations learn, then the KA entity exists. The analysis shows that all but Alpha experienced positive impacts on their goals. However, only Gamma has experienced extensive impacts companywide. The solution values for Beta and Delta are at the local level in which issues are settled at the departmental or group level.

We assert that KAs exist if there are positive impacts in the organisations that result from knowledge processes. When learning groups do not have boundary functions and/or the double neighbourhood relations are not completely established, improper KAs form. In the field study, three types of KAs are observed: unblocked, quasi- and pseudo-KAs. Unblocked KAs have boundary functions and double neighbourhood relations. Members in quasi-KAs have boundary

functions, but the primary neighbourhood relation is not established between the members of the learning group and their local units. So organisations only experience local impacts. Pseudo-KAs, however, are not real learning groups. Most of the time, the members are appointed by organisations without at least one of the three properties that comprise boundary functions. Among these three types of KAs, only unblocked KAs are the proper KAs to carry out learning functions that help organisations achieve collective goals via knowledge processes.

The activity patterns of collective knowledge processes that were observed provide evidence that infer on the type of KA. In Alpha, its experience with the collective knowledge process and outcomes illustrate that the firm has not learned. Its learning group members were appointed by the managing director. The senior staff members who were unwilling to take part in the knowledge process are illustrative of members in a learning group who do not have the boundary functions of KAs. There are some conflicts of interest between the production and merchandising departments which negatively affected the knowledge process during knowledge exchange. With an incomplete neighbourhood relation and insufficient conditions for boundary functions, the learning group at Alpha behaved like a pseudo-KA.

In contrast, the continuous extensive impacts were found in Gamma. The learning group had both boundary functions and double neighbourhood relations. This infers that unblocked KAs exist in the firm to conduct knowledge processes. Delta and Beta were observed to have the learning behaviours of quasi-KAs that only local impacts were found.

Discussion

Regardless whether individuals detected that the outcome of the knowledge process matched or did not match the expectations derived from their collective need, the organisation will have learned (Argyris & Schön 1978). Proper KAs exist. Otherwise, the learning groups in organisations become improper KAs. The cross-case study gives evidence to support this proposition. The learning groups in Gamma have autopoietic characteristics that continuously form different learning groups who are also stakeholders of the collective goals. The outcomes of the knowledge process generate new knowledge to deal with the changes in the business environment. With informants' input, the problem solving process in Gamma is summarised into four steps, in which double neighbourhood relations are found. First, when there is a collective issue that has arisen in the firm, the management team would internally and externally identify the stakeholders and form a working group. Second, the working group lists out the expectations of the benefits attained after the fulfilment of the objectives as well as the conflicts between different stakeholders. Third, the members review the affected operation processes and predict the trade off before any action plans are implemented. In this process, the members compile commonalities among members. At the

same time, they discuss the likelihood of eliminating or accepting the occurrence of local conflicts of interests. When the conflicts of interest are acceptable or eliminated, a primary neighbourhood at the individual level is formed. Fourth, the core members of the working group seek management support to deal with the issue. After management supports the actions, a secondary neighbourhood at the organisational level is established. The group starts to work on the issue.

In contrast, the learning group at Alpha was appointed by the managing director. The analysis indicated that some members of the learning group are incapable of learning new knowledge. It also revealed the lack of cognitive ability which may be one of the reasons that members showed unwillingness to participate in the knowledge process. As a whole, the learning group does not have boundary functions. It acts like a pseudo-KA. The firm does not learn.

The learning group in Beta basically has quasi-KA learning behaviours. The trading unit places the business risks onto the production unit, but refuses to share the benefits which caused both units to be unable to compromise in reaching a common goal. The conflict of interest between these two units has not been resolved. No secondary neighbourhood relation is established. The observation from Delta also provides evidence that the learning behaviours in the firm are close to those of a quasi-KA: change occurs in local but cannot be extended to other departments. This results in no breakthroughs in overall productivity. Although members have properties of boundary functions, no neighbourhood relations are established.

Conclusions

KAs are theorized as entities that have autopoietic properties and self-produce components for continuation. The members within KA entities have cognitive capacities and circularity of reflecting their experiences to continuously learn. The outcomes of a self-producing system are: (1) positive impact and usefulness for the organisation to make better decisions, (2) experience gained in the knowledge processes which help the KA entity to review needs in learning and justify structurally coupling new members within the KA set. To form an unblocked KA, members of the learning group need to have boundary functions and establish double neighbourhood relations at the individual and organisational levels. An analysis of a study based on multiple cases provides evidence that learning groups can become proper KAs to allow organisations to learn when both boundary functions and double neighbourhood relations hold. The organisational learning practitioners can adopt the KAT to form proper KAs by finding commonalities between the members in the learning group and eliminating their conflicts at least to a bearable level in order to establish double neighbourhood relations to implement knowledge processes.

FDI IN INDIAN RETAIL-AND ITS IMPLICATIONS

Chandrasekhar, N.¹

¹ Faculty Marketing & Retail, University of Applied Sciences, Esplanade 10, 85049, Ingolstadt, Germany.
Email: natarajan.chandrasekhar@haw-ingolstadt.de

Abstract

The health of a nation is gauged not only by the quantum of FDI it attracts but also the trend it follows. In turn this is dependent on the economic policies formulated and practiced and the willingness of all concerned to engage with global economic practices. Since the early 1990's when the government embarked on a policy of liberalization it has been observed that FDI inflows showed a steady increase until the last couple of years when in fact there has been a de-growth particularly 2010 over 2009 by almost 30%. On the other hand China has attracted FDI more than 4 times the quantum of India during the same period.

Investors will look to invest in 'opportunities' as they see bearing the most attractive returns within a given frame work considering both the 'home' as well as 'host' country. Facts and figures very clearly indicate the positive impact even in India for certain sectors when FDI has been embraced. On the other hand, India most urgently requires gathering as much as investment as is possible to keep the momentum of growth going and one such opportunity is the organizing of our retail segment which would support development endeavor in a big way. The issue of embracing partial FDI in retail has seen some level of procrastination which requires more urgent and serious attention. Can India afford to lose this opportunity?

This paper attempts to study the implications for this investment as also providing some suggestions.

Keywords: Foreign Direct Investment, Organized retail, Traditional retail, Economic policies, Employment, Infrastructure development.

FDI -A GLOBAL SCENARIO

For the first ever time since this concept of 'FDI' came into existence this world saw the flow of money channelized in the direction it originally was intended to and that is towards economies which are in transition and development. The year 2010-2011 in which about US\$ 1222 billion flowed has been eventful for the world in every sense in terms of development, both with the financial markets and the political scenario. The two most important factors for any country in its overall development. The data sourced from UNCTAD and encapsulated below (Fig 1) amply illustrates the current position.

Fig 1 Global and Regional FDI Trends in 2010

Source: UNCTAD

There are three important observations to be made with the overall global picture of FDI and they are in a way synergizing the very objective/s of this type of investment.

- The flow of FDI into developed and matured economies is declining due to home market saturation.
- Transition economies indicate a halt to their FDI slide with their propensity to adopt more liberal trade attitude and a win-win outcome.
- Developing economies have started receiving better inflows due to huge untapped markets and consumerism besides serving as a profit making opportunity for developed economies

To add to above factors another aspect of great importance, namely ‘The Global Commitment Index `which reflects the mood of leading rich countries is encouraging. A graphical representation is depicted below (Fig 2) which should be read together with the UNCTAD report to understand the great opportunity this type of investment presents to the investor and investee.

Fig 2-Commitment to development Index 2011

Source: Center for Global Development

at 18 of these 22 countries were above average in their disposition. For the purpose of this paper we stay focused on the first three policy areas, namely, aid, trade and investment (FDI) though the other four policy areas Migration policies, Security policies, Environmental policies and Support for new technology cannot be ignored when actual investment is made. So each of this investing country gets scored on seven policy areas which are averaged for an overall score. While a score of 7 is considered good, the average was 5.

The Indian FDI Scenario

Foreign direct investment (FDI) capital flows into India have increased dramatically since 1991, when India opened it economy to FDI, and inflows have accelerated since 2000. FDI inflows to India reached \$11.1 billion in calendar year 2006, almost double the 2005 figure, and continued to increase in the second half of the decade. The Indian government had announced a target of \$25 billion in new FDI inflows for the 2007–08 fiscal year .Globally FDI has experienced a corresponding resurgence since 2004, recording year-on-year increase of 29 percent in 2005 and 27

percent in 2004, after declining for several years in the early 2000s. Consistent with the global pattern, FDI inflows into India declined between 2001 and 2003, before experiencing a resurgence that surpassed average global growth, with year-on-year increases of 45 and 72 percent, respectively, in fiscal years 2004–05 and 2005–06.

Preliminary data for inward FDI for the 2006–07 fiscal year show FDI inflows of \$15.7 billion, representing an increase of 184 %, in rupee terms, over the preceding fiscal year. While there is a large percentage increase compared to the global average, the value of inward FDI flows to India relative to developing countries remains small. However, FDI inflows to India surpassed inflows to South Korea in 2006, making India the fourth largest destination for FDI in Asia, behind China, Hong Kong, and Singapore. The only bad period being 2010 when there was an actual dip in the inflow the quantum being US\$ billion 24.2 ,a clear downward spiral over 2008 and 2009 and as a percentage a drop of more than 30 percent. However this could be attributed essentially to the upheaval in the global financial scenario besides the domestic political scenario.

India's investment policy does not permit FDI in the following sectors: housing & real estate except development of integrated townships and settlements, retail trading, lottery business, gambling and betting, agriculture (including plantations other than tea plantation). What must be noted here is that FDI up to 100% is permitted in some sectors under automatic route and this includes medical equipments and drugs and pharmaceuticals and pesticides except those requiring industrial licensing. More recently FDI has been permitted up to 51% in single brand retail. This sector is presently in focus and a subject of national debate with three key players involved in the process. The organized retail association, the traditional retail association and the government.

An Overview of India's Economic and Fiscal position:

Slides marked 'a' to 'm': Snapshot Slides .Source- www.dipp.gov.in

a)

Economic Performance a picture of reasonable consistency:

Sustained economic growth

Average last 10 years 6.5%

2004-05 6.9%

Forecast up to 2006-07 >7.0%

Forecast till 2050 – Goldman Sachs 5 % p.a.

2010 Real growth GDP of 10.1%

Services share in GDP over 50% (52.4% share in GDP in 2004-05)

At mid decade manufacturing sector growth stood at 8.8% in 2004-05 (17.4% share in GDP in 2004-05)

Fig 3-GDP GROWTH RATE (%) AND TRADE AS A % of GDP
 SOURCE: COMPILED FROM WORLD DEVELOPMENT INDICATORS DATABASE

Foreign Trade:

Merchandise exports grew by 25% in 2004-05, (US\$80 billion) and the 2009-2010 figure stands at US\$ 180 billion

Imports grew by 36%, (US\$106 billion) during the same period and for 2009-2010 stands at US\$280. The figure below clearly depicts these facts.

Investment:

Foreign Investment – over US\$14 billion in 2004-05 (FDI US\$5.5 billion, FII US\$8.9 billion) and for the year 2010 stood at US\$ 24.4 billion.

Mature Capital Markets

NSE third largest, BSE fifth largest in terms of number of trades.

A well developed banking system

Fig-4 INDIA'S GROWTH, EXPORTS AND IMPORTS (FY 2005-2006 till 2009-2010)

SOURCE: www.ibef.org

b)

Rationalization of tax structure – both direct and indirect

Progressive reduction in peak rates

Peak Customs duty reduced to 15%

Corporate Tax reduced to 30%

Customs duties to be aligned with ASEAN levels

Value Added Tax introduced from 1st April 2005

Fiscal Responsibility & Budget Management Act, 2003

Revenue deficit to be brought to zero by 2008

c)

Industrial Licensing

Progressive movement towards de licensing and deregulation

Licensing limited to only 5 sectors (security, public health & safety considerations)

Foreign Investment

Progressive opening of economy to FDI

Portfolio investment regime liberalised

Liberal policy on technology collaboration

Trade Policy

Most items on Open General License, Quantitative Restrictions lifted

Foreign Trade Policy seeks to double India's share in global merchandise trade in 5 years

d)

Exchange Control

All investments are on repatriation basis

Original investment, profits and dividend can be freely repatriated

Foreign investor can acquire immovable property incidental to or required for their activity

Rupee made fully convertible on current account

Taxation

Companies incorporated in India treated as Indian companies for taxation

Convention on Avoidance of Double Taxation with 65 countries

E&f

Evolution of FDI Policy

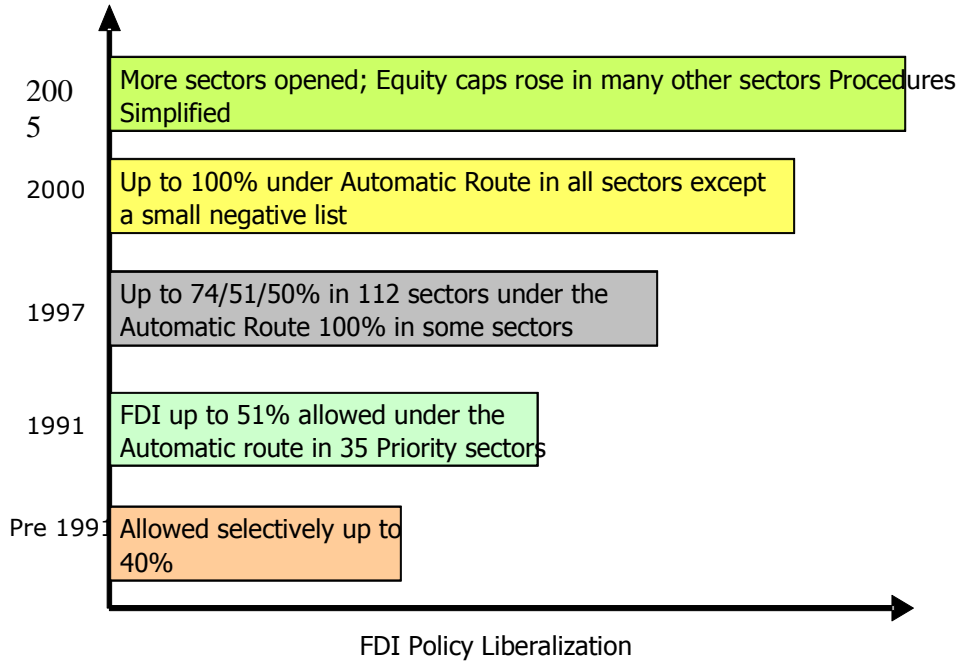

Fig 5 Evolution of FDI Policy

As can be observed from the above diagram(Fig 5) it must be said that India has progressively but cautiously liberalized its attitude towards FDI though we are tempted to ask whether the pace of this liberalization is adequate considering the domestic growth rate projected, the propensity of other developing economies to attract this investment and last but not the least the predisposition of developed economies to invest considering the fact that they see very little growth in their home market at present.

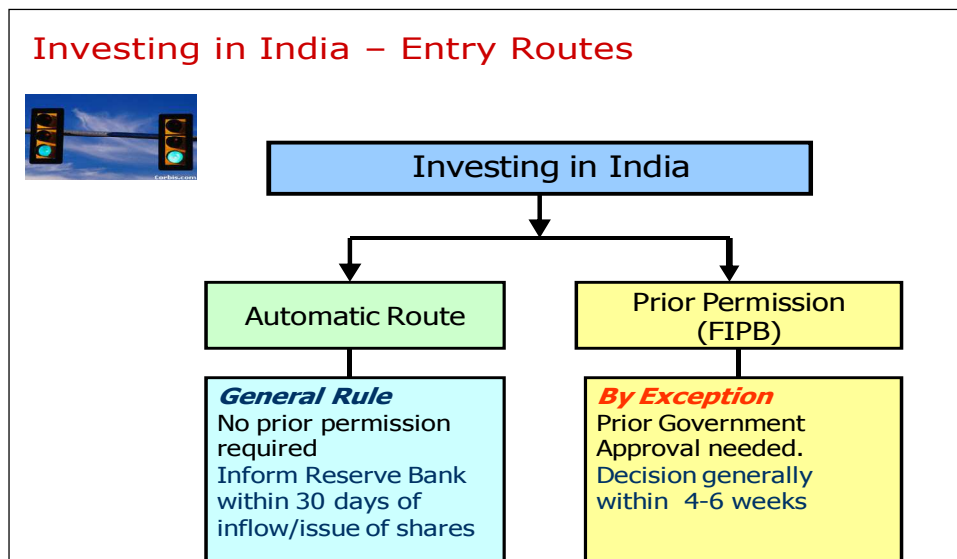

Fig 6 –FDI Entry Routes

G)

New sectors opened to FDI

Defense production, Insurance, print media - up to 26%

Development of integrated townships up to 100%

E-commerce, ISP without gateway, voice mail, electronic mail, tea plantation -100% subject to 26% divestment in 5 years

FDI equity limits rose

Private sector banks rose from 49% to 74%

Drugs and pharmaceuticals from 74% to 100%

Advertising from 74% to 100%

Private sector refineries, Petroleum product marketing, exploration, petroleum product pipelines – 74% to 100%

Procedural simplification

Issue of shares against royalty payable allowed

h)

FDI in domestic airlines increased from 40% to 49%. Automatic route allowed

FDI up to 100% allowed under the automatic route in development of townships, housing, built up infrastructure and construction development projects

Foreign investment limit in Telecom services increased to 74

FDI and portfolio investment up to 20% allowed in FM Broadcasting. Hitherto only Portfolio investment was allowed.

Transfer of shares allowed on automatic route in most cases

Fresh guidelines for investment with previous joint ventures

A WTO (TRIPs) IPR regime compliant in position since 2005 – Patents Act amended to provide for product patent in pharmaceutical and agro-chemicals also.

I)

FDI up to 100% allowed under the 'Automatic Route' in all activities except for

Sectors attracting compulsory licensing

Transfer of shares to non-residents (foreign investors)

In Financial Services, or

Where the SEBI Takeovers Regulation is attracted

Investor having existing venture in same field

Sector specific equity/route limit prescribed under sectoral policy

Investments made by foreign investors are given treatment similar to domestic investors

J)

FDI equity limit-Automatic route

Insurance – 26%

Domestic airlines – 49%

Telecom services- Foreign equity 74%

Private sector banks- 74%

Mining of diamonds and precious stones- 74%

Exploration and mining of coal and lignite for captive consumption- 74%

K)

FDI requiring prior approval

Defense production – 26%

FM Broadcasting - foreign equity 20%

News and current affairs- 26%

Broadcasting- cable, DTH, up-linking – foreign equity 49%

Trading- wholesale cash and carry, export trading, etc., 100%

Tea plantation – 100%

Development of airports- 100%

Courier services- 100%

L)

Foreign technology agreements also allowed under Automatic route:

Lump-sum fees not exceeding US\$2 Million

Royalty @ 5% on domestic sales and 8% on exports, net of taxes

Royalty up to 2% on exports and 1% also permitted for use of Trade Marks and Brand name, without any technology transfer

Wholly owned subsidiaries can also pay royalty to their parent company

Payment of royalty without any restriction on the duration allowed.

M)

2nd most attractive investment destination among the Transnational Corporations (TNCs) - UNCTAD's World Investment Report, 2005

3rd most attractive investment destination – AT Kearney Business Confidence Index, 2004

Up from 6th most attractive destination in 2003 and 15th in 2002

2nd Most attractive destination for manufacturing

Among the top 3 investment 'hot spots' for the next 4 years

UNCTAD & Corporate Location – April 2004

Most preferred destination for services - AT Kearney's 2005 Global Services Location Index (previously Offshore Location Attractiveness Index)

The above scenario is clearly indicative of the potentially optimistic outcome for the investee and investor.

Retail Scenario- India.

Retail in India still does not enjoy the status of 'Industry' and is essentially dominated by traditional stores and the latest estimate is that this could be to the extent of 95%. There are a few large Indian corporate houses who have ventured into the domestic retail space with organized format and some of them are well entrenched to capitalize this early entry advantage. This being the broad domestic retail picture the government is under constant political pressure when discussing the issue of permitting FDI in the retail sector. It is estimated that there are more than 12 million traditional stores across all categories of products which together contribute about 8% of the total national GDP besides being the second largest 'employer' only next to the agricultural sector.

The graphical representation (Figure 7) depicted below furnishes a visual picture for different categories together with the expected or forecasted spending well into the year 2015. Again this serves to confirm the potential the country offers. It must be mentioned here that it is interesting to observe the anticipated growth in dollar value terms.

Fig 7-CONSUMER SPENDING SOURCE: Planet Retail

The Indian retail sector is one of the least concentrated in the world. Together the top five domestic corporate retailers have a combined market share that is a single digit. The Indian retail scenario is one of contrasts, fragmentation and heterogeneous with the predominant role still

played by the traditional set of family run stores and hawkers who through their trade associations are vigorously opposed to the entry of foreign retailers or their investment in this sector.

Despite this resistance there has been rapid growth with some domestic regional players setting up different retail formats leading to a future possibility of retail market getting concentrated and more organized.

Currently the Indian government has allowed 51% FDI in single brand retail and 100% in Cash & Carry that is B2B operation. It must be pointed out that a number of domestic organized players have also entered into collaborative arrangements with international retailers to take advantage of the huge retail market opportunity which the Indian market is projected to throw up. So to say just waiting on the sidelines.

The opportunities arising by virtue of getting organized by inviting international retailers and the consequent implications that this could have on the Indian economy is just one of the compelling factors for this paper.

As per the 'Mumbai Mirror' report dated 24th of February 2009 FDI inflow in 2008-2009 is likely to exceed US \$25 billion despite the financial meltdown impacting the global economy. In fact it is expected that this quantum is likely to exceed US \$25 billion that came in during 2007 – 2008. To quote N N Prasad Joint Secretary in the Ministry of Commerce, Government of India 'our FDI will be more than US \$ 25 billion. It is a very good sign'. To make another interesting connection the program of 'Vision 2020' prepared by the Chemical and Fertilizers ministry to make India one of the top 5 global innovation hubs requires huge investment including substantial participation from the private sector under the public –private partnership model. This is what the Chemicals and Fertilizers minister, Government of India Ram Vilas Paswan had to say: 'the present state of infrastructure and R & D of the pharmaceutical industry in the country is rather weak. We need to bolster it immediately. Once this proposal comes through, India will become a global pharmaceutical hub. Five out of ten drugs being discovered in the world will be in India. We will also ensure patenting of our own drugs'. Hence there is a huge potential for FDI in the healthcare sector including its retail element and the policy body should not have any hesitation in permitting the same. When we consider the pharmacy retail there is a temptation to argue that it is a very specialized retail and directly impacts the welfare of mankind but on the other hand a closer look will reveal that all retail is concerned with the end consumer and does impact him one way or the other. Ultimately it is best quality at the most affordable price whether it is a prescription drug or a branded consumer product.

Even for a moment if one does consider organized retail just on healthcare retail front alone a myriad of associated activities are revealed. There is no going back on the fact that there is a dearth

of educated and trained retailers who will by necessity have to be multi skilled. This in turn will call for competent human resource personal that are not only experts in their domain but in associated skills. A complete new breed of human resource professionals we require to generate.

Getting organized implies addressing the training issues of the existing unorganized employees as well as making provision for future requirements. Issues such as supply chain management very much a part of organized system will throw up huge opportunities both in terms of infrastructure and transportation development, not to underscore the role of information technology which is the very back bone of organized retail. The fact that we get access to modern and latest technology cannot be overlooked which once again would result spawning linked industrial sectors like barcode manufacture, RFID, electronic instruments and gadgets etc. One should not overlook the advantage of 'a learning experience on a golden plate' as these investors have been through the maze. That is a huge experience in different formats and markets is shared which would otherwise take decades and consume valuable time.

With good inflow of FDI in retail sector and the employment opportunities directly and indirectly interlinked it is very likely that the impact of FDI in retail will not be restricted only to the direct retail level but is more likely to be strongly felt by interlinked sectors. As mentioned in the earlier paragraph there will be a large requirement of Information technology professionals, experts in supply chain management and logistics system, transportation and communication besides the core implementation personal from the regulatory side. For example 'Vision 2020' for the pharmaceutical industry mentioned earlier on in this paper talks of Rs 5000-10000 crore being the investment amount and restricts itself with only 'drug development' and mentions about 5 lakh jobs being created in 4 years time. India ranks the lowest in terms of per capita total health expenditure as well as per capita government health expenditure. We have a very long distance to go which in itself is an opportunity and will have economic ramifications if this issue is not addressed with urgency(reference to Working paper number 198 ' Impact Of Preventive Healthcare on the Indian Industry and Economy'- Alka Chadha et al). Take the health insurance industry it reveals that there are 800,000,000 individuals not covered by any insurance scheme. Some well know management authors and gurus have referred to this segment as 'the bottom of the pyramid' or simply BOP. If we have a healthcare system which is possible only if the retail is organized where the pharmacy forms part of the system a substantial number of these can be brought into the insurance umbrella with suitable models. A huge opportunity for employment generation due to infusion of funds into retail. In fact employment generation could be exponential as it will not be restricted only to the retail alone.

In a very recent article in 'Hindustan Times' dated 27th of December 2011 by Pankaj Mullick under the title 'Ready, get set and give retail a go' the potential of this sector if it receives FDI and the treasure trove it is, is revealed. He sums up with the following figures:

- Around \$8 billion to \$10 billion of fresh investments could come into the country in the next 5 to 10 years
- About 35 million people are hired by the Indian retail industry. Allowance of FDI could add at least another 10 million jobs in the next 5 to 7 years
- Employees at the managerial level in the retail sector can expect their salaries to rise 25% to 40%

Clearly the sectors which have been allowed FDI in the process of liberalization have done well. There is no indication to the contrary in any case. The probable hurdle here would be the future and role of existing retail workers in general. For example there is scope for attracting FDI in the healthcare retail segment alone in excess of US \$2 billion taking care of its deployment over a period of time and canalizing the same into specific activities associated with retail (funding JV's with traditional stores, funding training of employees of unorganized segment, funding formal and informal education centers). A time window of 2 to 3 years should be observed to usher in this change. This time frame is essential taking into consideration the social fabric of India. Extending this logically to the balance of retail market would indicate huge opportunities both in terms of lifting the economy and generating employment exponentially.

The government should step forward and take active part in creating awareness for organizing retail at the bottom of the pyramid thus gradually improving the standard of living, leading to encouraging demand and thereby fueling supply.

The time to act is now with India exhibiting a very high global services location index which could enable us to get substantial FDI, useful in upgrading our current living standards while generating employment opportunities exponentially.

Implications for India

As would any investor expect it is only fair that he would take for granted a decent rate of return on investments made with a reasonable assurance of safety coupled with the fact that this return would be for a period which would substantiate the efforts. Embracing this investment would entail embracing the system in totality save the peculiarities related to and impacting the host culture and in turn the return on investments. This implies technology, infrastructure, manpower, and other related or interlinked aspects.

It is widely believed in the retail sector that for every one person employed directly in retail there are nine others who are indirectly employed like supply chain, cold storage warehouse, transportation, back office support and other activities which actually aid in selling the product to the end consumer. This actually sums up the huge employment potential in this sector though it is beyond this paper to arrive at a specific figure in these related employment opportunities. All these activities would require huge investments which could be attracted as FDI.

In the case of India the problem is neither its lack of attractiveness as a destination for FDI nor the real need for the same. Both these aspects are apparent. But what really are the crunch issues then?

The primary issue is with the introduction of FDI in retail the investor will demand a level of organization of the retail leading to disturbing the existing traditional retail employees and due to the system of operations demanding better productivity which means better or improved margins for the retailer thereby cutting away margin eating activities of the existing system. This implies direct sourcing where the so called middle men (estimated to cost 10 to 15 %) of the total cost will be saved. This can translate into better prices for the consumer. A direct but distinct advantage of the organized chain concept.

Hence being a serious socio-economic issue these implications will need to be addressed if we intend going ahead and taking the reforms in our stride.

Issue 1: Retail sector being the second largest employer in India, close to 35 million people will be impacted directly if we 'do away' with traditional stores. So how do we gainfully engage them and in the process assure them their livelihood?

Issue 2: Will the government be truly supportive of other developmental issues which go to support issue 1?

Issue 3: The impact the above mentioned decisions 1 & 2 will have on different stake holders not excluding different political parties.

It must be realized that international retail corporate entering India will have to work in tandem with governmental authorities and other associations for a predetermined timeframe in rehabilitating those individual businesses which are likely to be impacted within a given physical area depending on the location in the host country of the International retailer.

A super store is typically 'a put together' of a number of different stores offering different categories of consumer products under one large format. Whatever the extent of automation there will be a dire requirement of skilled personal and this human resource could be drawn from these existing traditional stores. This implies that such personal while having adequate experience may not have the required professional skills. Here comes the involvement of international and other

governmental agencies to fully take part in 'retraining' such individuals. One method is to (as part of the permission to permit FDI) set aside a budget for this purpose which could be used in the upgrading of such individuals and the other could be supporting organizations which do so. Modern retailing also requires learning skills not directly involved with retailing, like warehousing, cold storage operations, bulk breaking and logistics. Investments are required here for training and upgrading which could be carried out in a continuous manner. By adopting this strategy a sizeable number of existing traditional stores would get adsorbed and later absorbed into the modern system where their past 'local neighborhood' experiences can be exploited by international retailers. For instance, local choice of brands, sentiments, culture etc...which have often been a huge deterrent to international retailers success in different countries? Examples of failures, Carrefour in South Korea and Wal-mart in Germany. The abundance of traditional store retail employees could very well be a boon to these international operators. This issue requires addressing the interests of different stakeholders involved in the process and work out a suitable and detailed plan. It is an issue of building a 'win-win' situation. For one, the existing employees of the traditional retail outlets could look at opportunities of getting employed formally and acquiring new skills.

On the second issue it is a question of how swiftly the government can and is willing to act. This could be in terms of further freeing up FDI norms in infrastructure development and modernization efforts, technology implementation, swift and committed clearances where required and perhaps looking at special terms for a fixed time period to motivate the investor. The other important issue but hidden from sight is the aversion of the 'next' generation in line to take over and run family owned stores. This is becoming increasingly obvious with rapid growth in technology and the younger generation not following the footsteps of the earlier members of the family. There is an increasing trend for them to educate themselves formally and get better recognized rather than just being 'shopkeepers'. This is in fact a huge social pressure not obviously seen but felt. With more than 60% of its population in the 'young age group' segment it is imperative for the government to address this aspect with the next 5 years in mind. Also it should be noted that the government is indeed having to put up with 'revenue leakage' of substantial proportion as a bulk of such traditional stores do not generate any income for the government on one hand but avail all social services and other benefits expected by any citizen. Hence by formalizing retail such aspects would also get addressed.

This two pronged approach would not only protect the 'interests' of the impacted population but also speed up the development of the nation in many ways. Scientists have long ago formulated laws in Physics (Newton's first law of motion) as well as human resource experts have supporting studies to show and demonstrate the 'reluctance to change'. We have time and again been hearing that 'only change is constant'. The need of the hour is to usher in the introduction of FDI in a

phased manner taking into concern the issues of direct stake holders in this case the existing traditional retailers without political parties practicing 'vote bank ' politics. The nation's development cannot and should not be held back but in conclusion take care of the 'consumers' offering them the best of choice, price and service which would only be possible with inclusive organization.

CAUSE-RELATED MARKETING AND STRATEGIC AGILITY: AN INTEGRATED FRAMEWORK FOR THRIVING IN A DYNAMIC ENVIRONMENT.

Christofi, M.¹; Leonidou, E.²

¹ University of Gloucestershire. E-mail: michael_chr@live.com

² University of Gloucestershire. Email: erasmialeo@hotmail.com.cy

Abstract

This article posits a framework that illustrates how the concepts of strategic agility and cause-related marketing are synthesized in order to generate a sustainable competitive advantage through superior brand awareness and positive corporate reputation. This paper reflects how CRM and strategic agility in the context of creating and sustaining a competitive advantage in a hyper-dynamic environment, can complement and magnify each other's traditional context of analysis. Moreover, this article appears to be the first of its kind to theoretically examine the dynamics implied by synthesizing these, so far, distinct concepts. In conclusion, the paper posits a set of research directions designed to enable scholars to further advance the integration of strategic agility and CRM from both problem-driven theory development as well as theory-driven practice management perspectives.

Keywords: strategic agility, cause-related marketing, competitive advantage, brand awareness, corporate reputation.

INTRODUCTION

Both marketing theorists and strategy scholars directly address the currently existing paramount challenge of organizational survival by posing the research question: what generates competitive advantage in a dynamic environment and how can it be sustained (Barney, 1991; Teece, et. al., 1997; Hunt, 2000; Srivastava et al., 2001; Dietl et al., 2009). However, in achieving this objective, strategy scholars have debated the value of formal planning and management research arguing that it has offered inconsistent support for strategic planning to enhance competitive advantage (Slotegraaf and Dickson, 2004). At the core of this debate lies the significance of agility. While strategic planning is valuable to firm performance, there is an underlying concern regarding consequential rigidity. The contribution of agility is that it offers the means of managing uncertainty and micro-macro environmental changes more effectually.

Comprehending the role of flexibility within the perspective of strategic planning, the Agile Manifesto was put forward in 2001, and several principles were created since then (Vidgen, and Xiaofeng, 2009; Gwanhoo and Weidong, 2010). However, the existing literature on agile development is regarded largely naive and prescriptive, lacking empirical research and theoretical foundation to

support the principles and practices of agile development, especially outside the field of information technology (Conboy, 2009). In parallel to this, marketing faced a serious challenge as to its strategic and organizational roles (e.g., Hayes and Abernathy, 1980) resulting in the perception of uneasiness and uncertainty of the discipline in strategic planning (Anderson, 1982; Mahajan et al., 1987; Achrol, 1991).

The aforementioned two perceptions might have been the cause for the two disciplines to never conjoin until now for the development of a competitive advantage. Interestingly in this respect, the field of CRM as a Corporate Social Responsibility (CSR) related strategy, followed its own path and experienced an unprecedented growth during the last two decades within the marketing paradigm to be used as a feasible business contrivance and a presumable source of sustainable competitive advantage (Porter & Kramer, 2002; Larson et al., 2008). The framework proposed by this paper is designed to increase the firm's competitive advantage and enhance the benefits of synthesizing agility and Cause-Related marketing. When designing the framework the authors were guided by Yadav's (2010) directions of framework development .

In the following section, we initially analyze the role of brand awareness and corporate reputation in the context of gaining a sustainable competitive advantage. Thereafter, we discuss CSR, in particular focusing on Cause-Related marketing. Next, we analyze the field of strategic agility and continue by developing an integrated framework that synthesizes CRM through brand awareness and corporate reputation, and strategic agility for the development of a competitive advantage. Finally, this paper discusses a set of implications for both theory and practice and sheds light on avenues for future research.

THE CONCEPT OF SUSTAINABLE COMPETITIVE ADVANTAGE

Starting with a systematic review of the literature on competitive advantage, two schools of thought emerge: On the one hand, neoclassical economics primarily deal with the industrial organization literature, and they view competitive advantage as a position of superior performance that a company attains through offering differentiated products for which customers are paying premium prices eagerly, or through offering no-frill products at low prices. The Resource-Based View (RBV) orientated theorists contend that organizations can enjoy a sustainable competitive advantage due to resource heterogeneity and the imperfect mobility of such resources and capabilities (Peteraf, 1993; Christensen and Bower, 1996; Cockburn, et al. 2000). The majority of the RBV related scholars define competitive advantage as being conceptualized as the firm's implementation of a value creating strategy, not currently being implemented by any other organization-competitor, that cultivates and exploits a variety of benefits such as cost reduction, neutralization of competitive threats, and/or utilization of market opportunities (Day and Wensley,

1988; Newbert, 2008). Sustainability is accomplished when the advantage successfully resists competitive erosion by competitors' behavior. In other words, the skills and resources underpinning a business competitive advantage cannot be duplicated by its competitors being very often path dependent (Bharadwaj et al., 1993) and a newly created factor of competitive advantage (Porter & Kramer, 2002). The authors of this paper follow the view of Coyne (1986), as cited in Hall (1993), as it combines the neoclassical economists' and RBV theorists' perspectives suggesting that, in order to have a competitive advantage, the product and/or delivery system attributes need to be important to customers, and to be sustainable, they also need to be the outcome of a capacity differential which will endure.

Sources of Competitive Advantage

In general, researchers distinguish between two broad sources of competitive advantage: assets, also known as unique resources, and distinctive skills (Day & Wensley, 1988; Grant, 1991; Bharadwaj et al., 1993; Adegbesan, 2009; Greve, 2009). Coyne (1986), classifies the sources of sustainable competitive advantage into four categories of capability differential: 'cultural differential', 'functional differential', 'regulatory differential' and 'positional differential'. Implicitly, competitive advantage can derive from any of the four differentials only; therefore, in that purport they are exhaustive. The nature of the four capabilities is examined infra.

Capabilities based on assets

Regulatory capability accrues from the acquisition of legal entities such as contracts, intellectual property rights, trade secrets, etc. Some of these might be accorded a balance sheet valuation all being legitimate.

Positional capability happens in the aftermath of actions which, for instance, have generated a certain configuration of the value chain or a certain reputation with customers, etc. In other words, positional differential is an outcome of previous actions and decisions.

Capabilities based on competencies

Functional capability pertains to the ability of performing specific things; it derives from the skill, experience, and knowledge of employees and others in the value chain such as distributors, stockbrokers, suppliers, advertising agents, lawyers, etc.

Cultural capability applies to the enterprise as a whole. It integrates the beliefs, values, habits and attitudes of the individuals and groups which constitute the organization. Then the organization's culture results in, for instance, an ability to change, to learn, to react to challenges or achieving a perception of high quality standards.

The first two capabilities are concerned with what a company has, whilst the other two capabilities are concerned with what a company does (Hall, 1993). This article adopts Coyne's model of capability differentials and extends it, as it is shown in figure 1, by integrating brand awareness and positive corporate reputation deriving from CRM practices, as intangibles resources that are associated with the positional differential and strategic agility for the cultural differential. In the following part, we analyze brand awareness and positive corporate reputation, as two intangible sources of competitive advantage

Competitive Advantage and Brand Awareness

Hoyer and Brown (1990) define brand awareness as a rudimentary level of brand knowledge involving, at the very least, identification of the brand name. Awareness reflects the lowest level of a continuum of brand knowledge that fluctuates from simple recognition of the brand name to a highly developed cognitive structure based on circumstantial information. Recognition is interpreted as the process of perceiving a brand as already encountered (ibid.). In this paper, brand awareness is defined as the cognitive process of consumers to recall a brand name at any given point in time.

Furthermore, brand awareness is associated with a variety of potential benefits. Acker (2012) argues that the most unexceptional goal of competition is to win the brand preference fight with a "my brand is better than your brand" strategy, and the majority of marketing budgets are allocated towards this direction. However, the firm that wins the global brand battle must be able to protect and sustain its position in the marketplace from competitors. Therefore, if a company has a high level of brand awareness it creates barriers to the other competing firms, and thus it makes the entry into the market difficult, dear, and highly risky. Moreover, Homburg et al. (2010) state that a serious investment is necessary to build a high level of brand awareness to significantly drive market performance. Most importantly, according to Hoyer and Brown (1990), brand awareness exerts an influence on consumer choice. Specifically, brand awareness is a prevalent choice tactic amidst inexperienced consumers encountering a new decision task, whilst consumers who are aware of one brand in a choice set tend to sample fewer brands when they purchase. In addition, consumers who are also aware of one brand in a choice set tend to choose the most known brand even when it is of lower quality than other brands (Hoyer and Brown 1990; Edelman, 2010; Esch et al., 2010). Accordingly, Day and Pratt (1971) and Strizhakova et al. (2011) argue that brand awareness, specifically when coupled with favorable tendencies or attitudes, represents a competitive advantage that can later be converted into increased sales performance. However, it may be emphasized that, the present awareness formation models in marketing strategy have given little attention to the role of competition (see Mahajan et al. 1984, Naik et al. 1998, Bass et al. 2007, as cited

in Naik, et. al., 2008). Besides, the existing literature also lacks normative guidelines for the optimal strategies to pursue for invigorating brand awareness (Sasi, and Subhash, 1971; Naik, et. al., 2008).

Competitive Advantage and Corporate Reputation

In the strategy literature, corporate reputation is considered an intangible asset leading to a competitive advantage in the marketplace of products and services (Weigeilt and Camerer, 1988; Hall, 1992; Mahoney and Pandian, 1992; Kor and Mahoney, 2004). In this context, Fombrun (1996), as cited in Roberts and Dowling (2002), describes this intangible asset as reputational capital. Consonant with the Resource-Based View of the firm, reputation may be considered as a valuable resource that should be managed by the organization (Barney 1991; Dowling and Moran, 2012). Roberts and Dowling (2002) define reputation as a perceptual representation of a firm's past actions and future prospects that characterize the company's overall appeal to all its key stakeholders when compared with competitors. As such, they view reputation as a universal perception of the extent to which an enterprise is held in high esteem or regard' (Weiss, et. al., 1999; Roberts and Dowling, 2002).

In order to provide a common language for the following discussion, the authors define the term positive corporate reputation as the consumer's favorable perceptions of a firm's past and current actions, in terms of ethics, esteem and social contributions, that result in a sustainable competitive advantage.

The Benefits of a Good Corporate Reputation

A thorough review of the literature reveals that positive corporate reputation has a variety of potential benefits as to several business functions, such as market-entry-barriers, financial performance, quality management, transaction cost and consumer research (Roberts and Dowling, 2002; Walsh and Beatty, 2007). In that respect, we expect that a firm's good corporate reputation created by its Cause-Related Marketing practices generates and sustains a competitive advantage. In addition, corporate reputation, as experienced by various stakeholders, is an important strategy for reducing transaction costs, and positively influences financial and customer related outcome variables, such as consumer trust and loyalty (Walsh and Beatty, 2007).

Furthermore, a positive corporate reputation may be viewed as a market entry barrier for competitors because a good reputation is hard to replicate (Roberts and Dowling 2002), and if so, it incurs huge financial costs (Barney, 1991). In basic terms, a dominant firm creates a good reputation through several types of investments made in the industry and market it operates in. A rival company who wants to enter the market, would therefore have to assume the costs of building up a comparable or even better reputation in order to reduce its relative competitive disadvantage. As

such, a powerful corporate reputation offers the leading enterprise with a valuable resource in order to continue to sustain its dominant position in the market (Hall, 1993).

In addition, a variety of potential benefits of good reputation provide the rationale for the relationship between reputation and financial performance (Shamsie, 2003). Against this background, various scholars suggest that firms with a positive reputation have an advantage against their competitors and are likely to attract more customers (Fombrun and Shanley, 1990). As reputation also serves as a sign of the underlying quality of a company's products and services, consumers may pay a premium price for the offerings of such companies (ibid.). Moreover, a company with a good reputation might also possess a cost advantage because employees opt to work for high-reputation organizations, and should therefore work harder and long hours or for lower emolument. Along similar lines, marketing research suggests that a positive reputation enhances sales force performance, new product introductions and recovery strategies in the event of crises (Shamsie, 2003).

Conceptualized as a holistic evaluation, corporate reputation is usually measured as the organization being good, marveled, and held in high regard. In that respect, a good reputation is a source of competitive advantage, as it raises the level of trustworthiness of the seller and the trust of the buyer, thereby reducing risk and the associated transaction costs (Goldberg and Hartwick, 1990; Dowling and Moran, 2012). In addition, according to Hall (2002) and Roberts and Dowling (2002), a firm's reputation is valuable, rare, difficult to duplicate and irreplaceable. The position taken in this paper converges with the aforementioned arguments and states that a good corporate reputation is a valuable intangible asset that allows an organization to achieve a sustainable competitive advantage, as long as it remains positive.

CSR AND CAUSE RELATED MARKETING

Corporate social responsibility is a rapidly expanding theme in today's business society and is being recognized as a core long term business strategy (Hess, et. al., 2002; Lichtenstein, et. al., 2004; Barone, et. al., 2007; Lev, et. al., 2010; Winterich, and Barone, 2011).

A very extensive and systematic CSR literature review revealed that research has focused on two prevalent perspectives: the normative one which is characterized by the notion of doing good for the sake of doing good and the enlightened self-interest perspective which is the business case in which firms are doing good as a tool for advancing their level of profitability. According to Krishna and Rajan (2009), Cause-Related Marketing concentrates on a specific cause that is linked with a firm as a whole or with a specific product or service of the enterprise, known as transactional Cause-Related Marketing.

Simply stated, Cause Related Marketing is a marketing practice that conflates organizational charity, fundraising for a non-profit organization and social responsibility, for the purpose of furthering the profitability of a business (Ross, et al. 1992; Walsh, 1999; Gourville and Rangan, 2004; Folse, et. al., 2010; Zdravkovic, et. al., 2010). However, unlike traditional corporate philanthropy, cause related marketing practices do not accrue from philanthropic budgets. On the contrary, marketing managers choose to participate in cause marketing campaigns rather than in other promotional strategies (Vlachos, et. al., 2009).

The Benefits of CRM

Varadarajan and Menon (1988) argued that CRM helps to achieve many substantial benefits, such as improving sales performance, strengthening corporate reputation and brand image and expanding the target market of a company. Similarly, Cone et al. (2003) and Wang and Qian (2011) state that corporate CRM may act as a promotional tool for products and enhance brand image, as well as to extenuate the risks of reputational losses and thus, secure crucial resources from stakeholders. In addition, some scholars have argued that corporate philanthropy positively affects a company's financial performance because decisions associated with charitable contributions can be made strategically not only to enhance the firm's image and reputation, but also to raise the value of its moral capital (Godfrey, 2005). Towards this end, moral capital can purvey shareholders with insurance-like protection for a company's relationship-based intangible assets, and therefore, to enhance shareholder wealth (Godfrey, 2005). Furthermore, Barone et al. (2000) state that the results of several studies indicate that corporate philanthropy can positively affect consumer choice. Accordingly, Bloom et al. (2006) stated that exposure to any type of a well-conceived CRM initiative for a brand would lead to more positive feelings and judgments of the brand in a consumer's mind. Concordantly, Hoeffler and Keller (2002) and Keller (2003) have argued that CRM enhances an organization's image and can lead to brand awareness. However, according to Hoeffler and Keller (2002), this area needs further examination by scholars, in that many brands labor to create such effects among their consumers. In conclusion, the end result of doing good is being measured by many enterprises in terms of how much it contributes to a firm's competitive prime (Cone, et al., 2003). In conclusion, based on the previous literature review, the authors expect that Cause Related Marketing practices are positively related to positive corporate reputation and brand awareness.

THE CONCEPT OF AGILITY

According to Sambamurthy et. al. (2003), agility is the ability to recognize opportunities for innovation and grip them by assembling necessary assets, relationships with coup and briskness, and knowledge. In addition, agility incorporates the exploration and utilization of opportunities for market arbitrage, along with the firm's capabilities on customer relationships, enhanced internal

operations and of its external business partners (*ibid.*). For the purposes of this study, we define agility as the ability of a company's to quickly adjust, as an entity, with the unanticipated micro and macro environmental changes.

As far as concerns the benefits that arise from agility, Goldman et. al., (1994) delineate an agile organization as, dynamic and having the possibility to enhance a competitive advantage and continues by saying that, in order to be dynamic, a company's competitive strategy must concentrate on knowledge development and agile processes that enable it to reciprocate to the market changes. Similarly, Pascale et. al., (1996), and Dyer and Ericksen, (2005), argue that agile enterprises gain a competitive advantage that add up to success through time. In general, several enterprises value the significance of agility in operating within the business world due to the fact that, it is crucial to the innovation and enhanced competitive performance (Thomke and Reinertsen, 1998; Swafford, et. al., 2006). In addition, through the literature on real options, agility can monitor market risk and uncertainty, therefore, firms can be adjudged to have a wide array of market-response choices (Tallon and Pinsonneault, 2011). Continuing, agility can improve performance by expanding a company's repertoire of competitive activities and the nature of its feasible responses to market changes (*ibid.*).

Linking Cause Related Marketing And Strategic Agility: The Notion of "Cause Marketing Strategic Agility" (CMSA)

In the previous chapter, the authors analyzed the concept of agility along with the variety of benefits that arise from being agile. However, according to Cockburn (2011), as cited in Gwanhoo and Weidong (2010), agility is difficult to achieve in practice. It has been stated that only 11% of organizations dealing with Information Systems were able to stand business demands and that 76% failed to cope with market changes. As a consequence, the lack of agility is often accompanied with substantial financial loss (*ibid.*).

To fill this gap in practice, the authors integrate Cause-Related Marketing within Doz and Kosonen's (2008) framework for strategic agility and they develop an integrated conceptual framework, named as "Cause Marketing Strategic Agility" (CMSA). The rationale behind the integration of these business concepts is the fact that, CRM is based on higher order values such as philanthropy (Carol, et. al., 2003; Godfrey, 2005) which are long-lasting and transcend the quick product or service changes. In addition, based on the aforementioned review of the literature on CRM, it is being recognized by organizations as a core business tool within the firm's long term strategy (Vlachos, et. al., 2009; Winterich, and Barone, 2011) due to the fact that consumers tend to be more demanding in today's era regarding the social consciousness and philanthropic activities of enterprises and predisposes their beliefs about and attitudes toward their products and services (Brown and Dacin, 1997). Thus, the integration of CRM covers consumers' demands for constant corporate philanthropic behaviors,

an aspect in today's business society that Doz and Kosonen's (2008) framework for strategic agility did not incorporate.

Strategic Sensitivity

"Strategic Sensitivity (both the sharpness of perception and the intensity of awareness and attention) combines early and keen awareness of incipient trends and converging forces with intense real-time sense-making in strategic situations as they develop and evolve. Strategic sensitivity is fostered by the combination of a strong externally oriented and internally participative strategy process, a high level of tension and attentiveness, and a rich, intense, and open internal dialogue" (Doz and Kosonen, 2008, p. 96).

To start with, Doz and Kosonen (2008; 2010), defined strategic agility as the thoughtful and purposive interplay on the part of top management among three meta-capabilities': Strategic sensitivity, Leadership unity and resource fluidity. Their analysis on the foundations of strategic agility and the dynamics of maintaining it, occurred from a detailed longitudinal analysis on Nokia in mobile communications over the past decades. The three meta-capabilities that according to Doz and Kosonen (2008; 2010), provide the foundations for strategic agility, are further analyzed below:

Leadership Unity

"Leadership Unity involves the ability of the top team to make bold decisions fast, without being bogged down in "win-lose" politics at the top. The leadership team's unity allows decisions to be reached at lightning speed once a strategic situation has been understood and the choices it opens or closes have been intellectually grasped. These decisions stick. Commitments are not delayed by personal insecurities and political stalemates at the top; nor is their implementation subject to personal agendas and private disagreements that would slow down or scuttle the effort. Even when wholehearted, commitments are still only as good as the resources put behind them" (Doz and Kosonen, 2008, p. 96).

Resource Fluidity

"Resource Fluidity involves the internal capability to reconfigure business systems and redeploy resources rapidly, based on businesses processes for operations and resource allocation, people management approaches, and mechanisms and incentives for collaboration that make business models and activity system transformation faster and easier" (Doz and Kosonen, 2008, p. 96).

At this point, the authors incorporate to Doz and Kosonen's (2010) strategic agility framework, Cause-Related Marketing as the fourth meta-capability for strategic agility:

Cause-Related Marketing Meta-Capability

Cause-Related Marketing Meta-Capability combines organizational processes of enhanced profitability along with philanthropic charities that conflates organizational consciousness for social responsibility, for the purpose of fulfilling consumer demands-higher values for socially responsible enterprises in the current customer-centric marketplace and for raising the level of moral capital of the enterprise.

Hypothesis 1: A company's CRM practices will lead to increases in awareness of its brand.

Hypothesis 2: A firm's strong brand awareness resulting from its CRM practices is positively related to the firm's sustainable competitive advantage.

Hypothesis 3: A company's CRM practices are positively related with its positive corporate reputation

Hypothesis 4: A firm's good corporate reputation resulting from its CRM practices is positively related to its competitive advantage.

Hypothesis 5: Sustainable competitive advantage is positively related with higher levels of success when a firm adopts both agile strategy and CRM practices, than when it adopts only one of the two success factor.

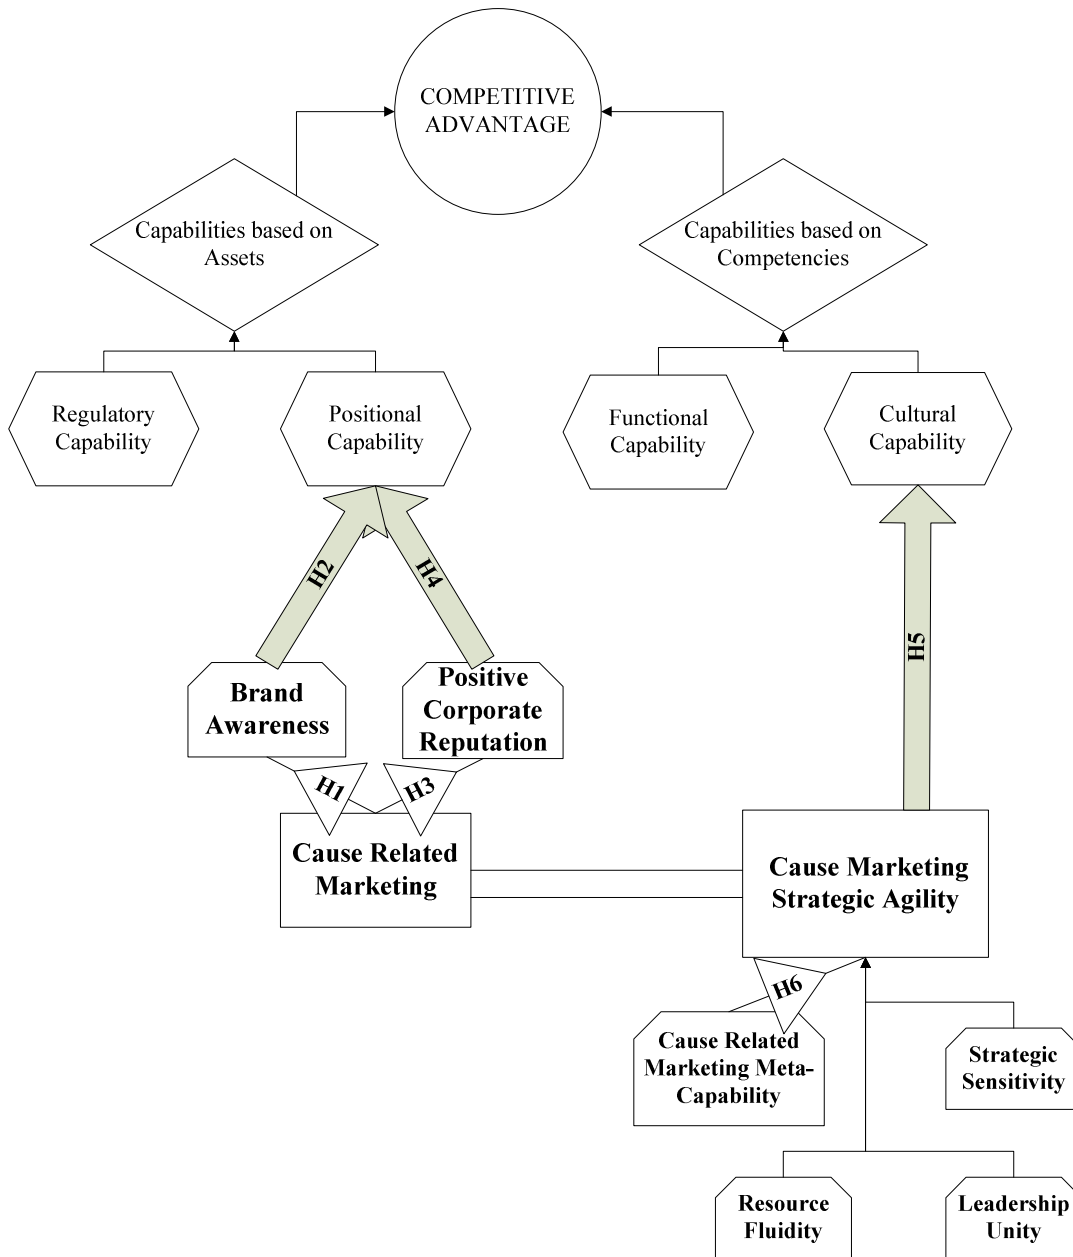

Hypothesis 6: CRM reduces the level of required strategic agility as it focuses on higher order values which transcend short term market changes or consumer needs.

In conclusion, with a view to bridge the aforementioned identified literature with the research gaps and to directly assess the link between the various concepts discussed, the following hypotheses are proposed:

The following figure 1, illustrates the synthesized concepts and integrates the hypotheses as a possible future research landscape for researchers.

Figure 1

IMPLICATIONS FOR RESEARCH AND PRACTICE

This article contributes to several streams of research and practice. As it is already mentioned, this paper reflects how CRM and strategic agility in the context of creating and sustaining a competitive advantage in a hyper-dynamic environment, can complement and magnify each other's traditional context of analysis. To our knowledge, this study appears to be the first of its kind to theoretically examine the dynamics implied by synthesizing these, so far, distinct business concepts.

Moreover, the integration of CRM and Strategic Agility makes the business community to be depended in a lesser degree by the second notion, therefore, it comes to close the theoretical gap that was clearly identified by Cockburn (2011), as cited in Gwanhoo and Weidong (2010), when he stated that despite the rise of Agility, the concept has little managerial implications, due to the fact that it is difficult to be applied and it can be justified by the majority of enterprises who fail to keep up with the constant changes of the environment.

Even more importantly, the contribution of this research consists in providing an integrated framework for businesses in order to gain a sustainable competitive advantage not only by being strategically agile, but through their marketing practices.

In prior research, these concepts have been investigated but each in a separate study, leaving the resulting cumulative knowledge disjointed. By weaving these diverse business aspects together, the present framework gives a more holistic picture of developing a sustainable competitive advantage.

Furthermore, to the best of our knowledge, this manuscript introduces for the first time the concept of Cause Marketing Strategic Agility (CMSA). Thus, researchers could evaluate CRM practices and Strategic Agility based on a new conceptual paradigm.

LIMITATIONS AND AVENUES FOR FUTURE RESEARCH

This paper has various limitations that bring to light avenues for future research. First, this study developed a model for gaining a sustainable competitive advantage more successfully, by conjoining CRM practices with strategic agility. Thus, this study can be viewed as a starting point for additional research that needs to be done by the future scholar community, in order to identify other possible routes of gaining a sustainable competitive advantage in today's turbulent competitive environment.

Second, it must be noted that our study focuses on only one key branding dimension deriving from CRM: namely, brand awareness. We focused on this dimension because, as Homburg et. al., (2010) state, brand awareness plays a special role in driving brand equity in business markets where many enterprises limit their branding activities based merely on the dissemination of the brand name and the logo. It may be interesting for future research to explore the effects of other branding dimensions generated through CRM.

Lastly, given that organizations and businesses vary according to size and consequently have different levels of corporate capabilities, it is possible that these realities could influence the way our integrated framework operates. Future research should explore, in detail, and determine if there is a relationship between the integrated model, the size of the company and to record possible

changes that might occur, so as to adjust the conceptual paradigm in several categories of company-sizes and corporate meta-capabilities.

LABOUR COSTS AND ECONOMIC DEVELOPMENT IN POLAND IN YEARS 2000 – 2008

Cieślak, Iwona¹ ; Kucharczyk, Małgorzata²

¹ Kozminski University, Email: iwona@alk.edu.pl

² Kozminski University, Email: gosiam@alk.edu.pl

Abstract

Labor costs are an important economic category. It is used in multilateral micro and macroeconomic analysis such as examination of trends in the competitiveness of economies, determining the prospects for reducing unemployment, short-term and long-term economic growth or inflation. High labor costs may be an important factor for incomplete balance in the labor market, becoming one of the sources of the natural unemployment. The relationship between an employment and the labor costs, due to the multifaceted character, is difficult for unambiguous evaluation and belongs to the one of the most complicated relations in economic processes. Because of the direct and indirect connexion between labor costs and different economic categories, determining its influence on specified macroeconomic size becomes almost impossible to examine. It causes a large variety and contradiction of the positions in the field of ideas about impact the labor costs on different macroeconomic categories. Employers interested in reducing costs and maximizing profits, as well as employees who wish to receive the highest possible remuneration for their work, presents the opposite stance. In the public discussion about height of the labor costs in Poland we can hear contradictory opinions. On the one hand, our country's comparative advantage in labor costs in relation to the "old" UE countries is highlighted. On the other hand, proclaimed is the view that height labor costs are the barrier in creating new jobs.

These article presents labor costs analysis, taking into account the problem of its height in Poland compared to the other countries and the changes of its height and structure. Particular attention is given to analysis of the impact of the labor costs on selected macroeconomic indicators such as productivity, inflation, investment an unemployment.

Introduction

Labour costs represent an important economic category used in many multilateral micro and macroeconomic analysis, such as studying trends of changes in the competitiveness of economies, determining perspectives of a drop in unemployment, short- and long-term economic growth levels or inflation. High labour costs may be an important factor in an incomplete labour market equilibrium, becoming one of the sources of natural unemployment. Due to its multifaceted nature, the dependency between employment and labour costs is difficult to evaluate clearly and

belongs to one of more complex relations in economic processes. Connecting labour costs, directly or indirectly, with various economic categories, makes the determination of their influence on a specific macroeconomic value difficult to investigate. It results in a variety and controversy of views on the effect of labour cost on individual macroeconomic categories. The view of employers, interested in restricting costs and optimising profits, differs from that of employees, who want to get the highest possible remuneration for the work performed. For years contrary opinions are heard in Poland in the public discussion on the extent of labour costs. On one hand, there are those who stress the comparative advantage of our country in comparison to the countries of the “old” EU, on the other hand there is the view that high labour costs are an obstacle in creating new workplaces.

This article presents an analysis of labour costs taking into account the problem of the size of labour costs in Poland as compared to other countries. It shows changes occurring in the size and structure of labour costs. A particular attention is paid to the analysis of the influence of labour costs on selected macroeconomic indicators, such as productivity, inflation, capital outlay and unemployment.

The concept of labour costs

Labour as one of factors of production represents an essential element in the business process. Regardless of the type of business conducted and the number employees, an enterprise incurs expenditure associated with the use of labour in the production process. The value of the labour used in the production of certain goods or the delivery of services is known as labour costs [13, p.7].

In the economic literature the term “labour costs” appeared in the 20-ies of the 20th century. It was introduced by German representatives of enterprise science – F. Litner in 1925 and F. Schmidt in 1930. Acquiring, using and maintaining labour force were presented as elements having a significant influence on an enterprise’s economic accounts. F. Litner divided labour costs into two main groups. In the first one he included wages and salaries and benefits paid by employers to employees. The second group covered tax and illness insurance, working clothes, trainings for employees and apprentices, premiums and family allowances [13, p.7].

Starting studies of labour costs in 1932 by the International Labour Office has a significant effect on the development and popularisation of the labour costs concept. It was decided that this category will also include family benefits, social securities and paid holidays. The study continued in 1949 and 1955, covering in its scope seven branches of European processing and mining industries in FRG, Austria, Greece, Turkey, Belgium, France, Italy, Great Britain and Yugoslavia [19, pp. 19-53].

With time new elements were included in the conceptual framework of labour costs. This was mainly due to employees gaining new social as well as wider use of economic calculations and changes in the corporate management style. More and more attention has been paid to the dependency between the quality of work and profits generated by an enterprise [16, p. 254]. Labour costs became of significance as recording and reporting values.

In Poland, the topic of labour costs was introduced at the beginning of the 60-ties by H. Halama. In his interpretation, the concept of labour costs was limited to the costs incurred by an enterprise in connection with employing white and blue labour workers, including the cost of labour measurement and standardisation as well as the cost of maintaining a personnel office and a social affairs office [10, pp. 176-182].

The subject of labour costs was also addressed by S. Sudoł, who seeing that labour costs are not distinguished, neither in an enterprise accounts not in statistical reporting, developed the analysis and classification of labour costs as well as a methodology for performance thereof [21, pp.8-10]. According to Sudoł, labour costs at an enterprise included all expenditure associated with the current and future state of personnel.

Then, in the 70-ties J. Kordaszewski defined labour costs as the total expenditure of an economic entity incurred on behalf of its employees, their families and apprentices [14, p. 126], whereas K.Górka and S. Chomałowski understood this concept as the total of financial expenditure and costs associated with employing personnel in a certain economic entity, differentiating between expenditure associated with [9, pp. 145-146]:

- safety and hygiene at work,
- social and welfare activities (and social policies),
- recruitment,
- transport to work.

The first questionnaire aimed at measuring labour costs in the Polish industry was proposed by Z. Lonc [17], who used the guidelines of the International Conference of Labour Statisticians. She understood labour costs as the total of remunerations paid to employees for the work performed actually (directly) and the costs (benefits) not associated directly with the work performed incurred by an employer on behalf of an employee, in both monetary and non-monetary form.

In the balance-sheet law personnel costs, defined as employee benefits, were introduced by the International Accounting Standard 19. According to this standard there are four types of employee benefits, presented in drawing 1.1.

<i>TYPES OF EMPLOYEE BENEFITS ACCORDING TO IAS 19</i>	
<i>Short-term employee benefits</i>	<i>Remuneration and contributions towards social security, paid holiday leave and sick leave, profit sharing and premiums (if payable within 12 month form the balance sheet day) as well as non-monetary benefits for currently employed workers,</i>
<i>Post-employment benefits</i>	<i>mainly pension and other retirement benefits as well as post-employment life insurance and medical care.</i>
<i>Other long-term employee benefits</i>	<i>long service leave, sabbatical leave, jubilee awards and other benefits due to long service, disability benefits and profit-sharing, premiums and deferred earnings, if payable within 12 or more month after the end of the period,</i>
<i>Benefits upon termination of employment</i>	<i>Employee benefits, payable upon the decision of the entity's manager to terminate the employee's contract before him/her reaching retirement age or upon the decision of the employee to accept the proposed termination of employment voluntary in return for such benefits;</i>

Drawing 1.1 Types of employee benefits according to IAS 19

Source: Author's work based on IAS 19.

The Central Statistical Office conducts labour costs surveys every four years, as recommended by Eurostat, using a representative method and the form Z-029. The first survey of labour costs in Poland, conducted by the Central Statistical Office in 1993, was an incomplete one, covering only manufacturing and construction activities. According to the Central Statistical Office's definition labour costs consist of a sum of gross wages and salaries (including deductions of income taxes from natural persons and contributions towards compulsory retirement pay, disability pension and sickness benefit, paid by an insured employee) and non-wages expenditures (i.e. contributions towards retirement, pension and accident insurance paid by employers, expenditures on improvement, training and re-qualification of staff) spent in order to acquire, sustain and re-qualify, and improve the staff qualifications. [25]

Costs are an objective economic category, closely associated with business activities. In macroeconomics the most comprehensive category of costs are social costs of production (SCP).

They represent the sum of human and machine labour costs incurred by a society to produce goods and services in any given time. Thus, the value of social costs of production equals the value of the global social product, manufactured at the time. Therefore, social costs of production may be expressed using the following formula [8, p.42]:

$$\text{SCP} = c + v + m$$

where:

c – the value of production means used,

v – the value of a product, manufactured by the labour performed for one's own benefit, expressed in the employees' remuneration,

m – the value of a product, manufacture by the labour performed for the society, the so called additional product.

The above formula shows that the scope of social costs of production arises from the concept of value and is much wider than monetary expressions of human and machine labour cost.

In the classical economic approach the concept of labour costs means the value of labour, measured by the cost of labour used in order to produce certain goods or render services. In the literature, labour costs are called employment costs, labour force costs, personnel costs or personnel expenditure. All the above pertain to the total expenditure associated with the human labour factor involved in a manufacturing process, the level of which is shaped by the employment structure and extent.

The difference in the process of generating costs at the level of an economic entity and the level of the entire economy allows to distinguish the following labour costs:

- labour costs *sensu stricte*, covering expenditure and costs associated with employing personnel, representing an element of accounting for prime costs,
- labour costs *sensu largo*, specifying the total labour costs of an entity, including both, expenditure charged to primary costs and the expenditure covered by profits or subsidies,
- full (social) labour costs, representing a part of social costs of production. These include all expenditure associated with recruitment and are borne by all entities – an economic entity, the state and the social consumption fund [16, p. 255].

Another definitions states that labour costs represent the total expenditure of the employing entity (i.e. the employer) associated with using the labour factor (human capital) in the economic process [18].

Whereas the International Labour Organisation labour costs as the total remuneration paid out to employees for the work actually performed and the costs (benefits) not directly associated with the work done, incurred by the employer on behalf of an employee in a monetary and non-monetary form [21].

The structure of labour costs is divided into two parts:

- the first part is the gross pay of an employee, which is subject to the deduction of insurance contributions and income tax,
- the second one is the contribution paid by the employer, not included in the gross pay of an employee.

The factors shaping these two parts of labour costs are: internal factors, that is factors existing in the enterprise itself and external factors arising from the enterprise's general environment but having a big influence on the structure of labour costs.

A business entity may shape the extent of labour costs by influencing these factors, the use or size of which depends on the internal need of the enterprise. This role is performed by internal factors, used in managing an enterprise to stimulate labour productivity by motivating employees. The are linked to the enterprise itself and are determined, first of all, by [16, p. 642]:

- size of employment,
- professional and qualification structure of personnel,
- remuneration system and pay policy,
- size of enterprise and the strength of trade unions,
- quality and modernity of production, forcing the level of personnel qualification and thus the level of remuneration,
- modernity of technologies applied,
- pace of the technology progress in the branch.

Amongst the elements, shaped by internal factors are, first of all, remunerations relating to the labour and its effect, non-wage labour costs of both, motivating and social nature as well as the costs of recruitment and vocational improvement.

Remuneration for work done represents this category of costs which could be decided on independently by the employer. The provisions of the Labour Code create the legal framework for the principals of remunerating employees by the employer. Art. 78.1 of the Labour Code states that „remuneration for work should be fixed in a manner corresponding, in particular, to the type of work performed and qualifications required for its performance, and shall take into account the quantity and quality of the work performed”[24]. When setting the rate for remuneration for work, directed only by the dispositions of Art. 78 of the Labour Code, the employer may set it at the level which will not guarantee a fair standard of life to the employee and his/her family. Taking into consideration that for an employee remuneration is the main source of upkeep for him/herself and the family and in order to restrict unfair competition, a minimum pay was introduced. Its aim is to guarantee the lowest paid employees remuneration at the level of a certain social minimum.

The minimum wage is mentioned in Art. 13 of the Labour Code, which states that an employee has the right to receive a fair remuneration for his/her work. The conditions for the execution of this law are specified in the provisions of labour law and in the State policy on pay, in particular by establishing minimal remuneration for work.

The basic remuneration is the most important part of remuneration directly linked to work and its effects. The Supreme Court defined the concept of remuneration for work in its resolution of 30 April 1986 as a required benefit of wealth increasing nature, which the employer is obliged to pay to an employee in consideration or work performed by him/her under employment contract [13, pp. 39-40]. The remuneration, understood as a payment for work performed by an employee on behalf of the employer on the basis of an employment contract, represents the basic component of labour costs, the value of which determines the value of other components.

The other components of remuneration include [16, pp. 21]:

- additions to the basic remuneration (long service allowance, position allowance),
- premiums,
- bonuses,

Indirect, non-wage employment benefits in the form of additional benefits for an employee may take the form of [13, p. 42]:

- participation in the enterprise's profits,
- purchase of shares at a preferential price,
- guaranteeing a mortgage,
- leasing a passenger car,

- purchase of goods or services offered by enterprises at preferential prices,
- health benefits financed by the employer,
- *employees' children education* allowance,
- creating employee pensions schemes.

The company's success and competitiveness depends increasingly on the quality of human resources. Attracting and investing in human capital, understood as the extent of professional knowledge, experience and capabilities acquired by an employee which permits to generate higher revenue, requires an efficient human resources management [1, p. 335]. The extent and nature of action undertaken by a business entity in this field depends on the possibilities and internal need of the enterprise.

The costs, generated by a business entity when performing basic personnel functions include:

- costs of recruitment, employment and derecruitment,
- costs of training and developing personnel.

External factors, shaping labour costs, are due to legal requirements imposed on business entities by legislators. The extent and type of solutions applicable in a given country, to a large extent depend on political, legal, social and cultural factors as well as the significance of trade unions.

Additionally, of significant importance are tendencies on the local labour market, associated with the unemployment rate and the demographic structure of the country. External factors, which predetermine the structure of labour costs and which cannot be influenced by the employer, include, first of all [16, p. 32]:

- provisions of the Labour Code,
- social security contributions,
- contribution to the Labour Fund,
- contributions to the Guaranteed Employment Benefit Fund,
- contributions to the Enterprise Social Benefits Fund
- minimum wage rate
- provisions of the Trade Unions Act.

A clear conflict of interest between employers, aiming at minimising costs and optimising profits and employees, expecting the highest possible remuneration for the work performed, resulted in

the need to determine minimal requirements, obligatory for the employer in relations with employees. In particular, the regulations pertaining to:

- defining employment relationship,
- protecting remuneration for work,
- equal treatment of employees,
- the right to rest,
- guaranteeing safe and hygienic work environment.

It should be pointed out that the provisions of labour law, included in the Labour Code, although specify the duties and right of both, employees and employers, mainly focus on the protection of worker's rights, who always is the weaker party in the employment relationship.

According to the legislator, social security contributions payable from earnings received for work, including home-based work are [25]:

- retirement insurance contribution,
- disability insurance contribution,
- sickness and maternity insurance contribution,
- work *accidents and professional disease insurance contribution*.

Another group of payments imposed by the legislator are deductions to the:

- Labour Fund,
- Guaranteed Employment Benefit Fund,
- Enterprise Social Benefits Fund,
- Pre-term Pensions Fund.

According to Art. 15 of the Labour Code, "the employer is obliged to provide an employee with safe and hygienic work conditions" [24]. Detailed regulation concerning occupational safety and health issues are outlined in Section X of the Labour Code. This requirement gives rise to the necessity to incur several expenses, in particular [24]:

- costs of adapting work stations to the requirements of work ergonomics,
- costs associated with the purchase of work clothes and protective clothing,
- benefits in the form of regenerative and restorative meals

- costs of conducting initial and control medical examinations,
- other costs of preventive health care, necessary due to work environment,
- costs of providing appropriate hygiene and sanitary equipment and necessary means of personal hygiene,
- costs of mechanisation of difficult work processes,
- costs of installing air-conditioners in the premises with difficult conditions due to high temperature.

Labour costs incurred to provide safe and hygienic work conditions are aimed at prevention, by restricting occurrence of professional diseases and accidents at work. Such occurrences result in increasing expenditure associated with the loss of work time, payment of sick benefits, compensations or material damages.

Productivity of labour costs

Labour productivity indicators are the measures permitting to evaluate the development level as well as the competitiveness of a given economy. One of the measures is the measure of labour productivity based on gross value added per one employee or worker. It shows the efficiency of using labour in the process of creating value added, by measuring the value actually produced by an employee. Contrary to the productivity indicator, based on gross product, the value of this indicator is not affected by other outlays (such as energy, materials or services). Due to limiting the number of factors affecting its value, this indicator better reflects labour productivity [2, p.28].

Diagram 1 allows to compare the relation between productivity dynamics, measured as gross value added in total economy per in total economy per person employed and the dynamics of labour costs and remuneration. Remunerations, representing the largest percentage of labour costs (approx. 75%) during the entire analysed period, underwent changes similarly to labour costs. The exception is a reduction in the disability insurance contribution, charged to employees in years 2007-2008 from 6,5 % to 1,5 %. This resulted in growing tendency in the dynamics of remuneration and a drop in the dynamics of labour costs. Analysing the examined period, we can see that in the years 2000-2004, labour productivity was growing faster than labour costs. The increase in labour productivity over that period was caused, to a large extent, by a significant drop in employed from 9 354 000 in 2000 to 8 640 000 in 2004 (Table 2). It also led to restricting the dynamics of remuneration due to the stronger position of employers in pay negotiations with employees. In the years 2004 and 2005 there is a slight increase in employment and the dynamics of labour costs and remuneration are at a level similar to that of the dynamics of productivity. A change in tendencies

in the relation between productivity and labour costs takes place in 2007. Wages and labour costs grow with the increase in employment and the productivity remains at the same level as in 2006. In 2008 the dynamics of remuneration is still growing while the dynamics in the increase of labour costs and productivity drops.

Diagram 1. Dynamics of changes in labour costs, remuneration and labour productivity per one person employed in Poland in years 2000-2008 (previous year =100).

Source: Own work based on: Annual macroeconomic indicators, GUS.

Despite unfavourable tendencies in the relation of productivity to labour costs in the last year of the analysed period, it is clear that when looking at all these years, we see a faster increase of labour productivity in relation to labour costs by approx. 8%, with a relatively small increase in employment, as seen in Diagram 2. The dynamics of productivity, higher than labour costs during the period from 2000 to 2008, speak of increase in the competitiveness of the Polish economy.

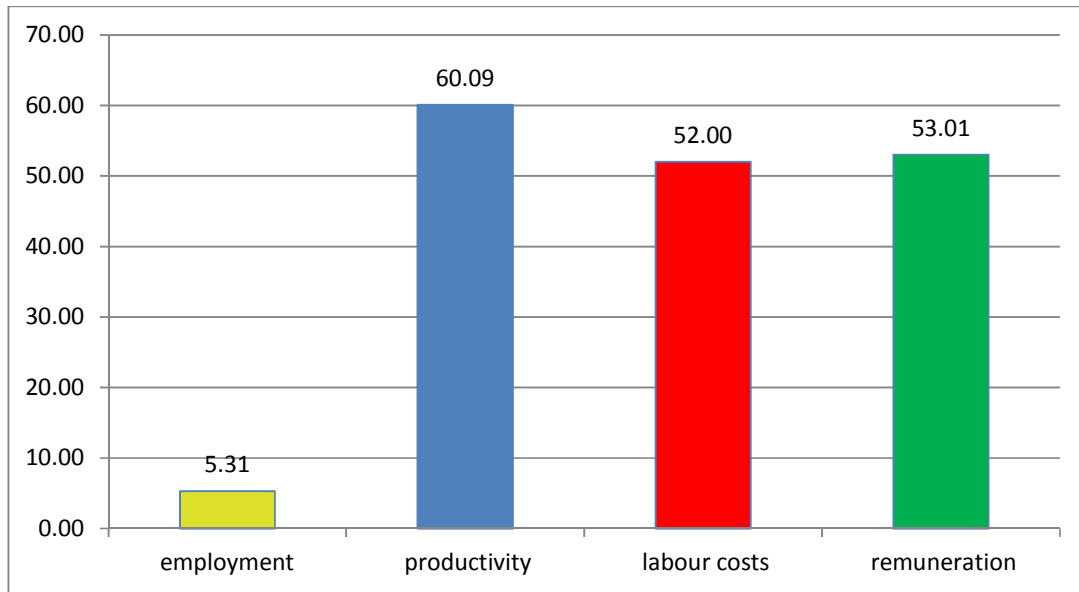

Diagram 4.2 Percentage changes in the size of employment, productivity, labour costs and remuneration between 2000 and 2008.

Source: Own work based on: Annual macroeconomic indicators, GUS.

The high dynamics of productivity in relation to the dynamics of labour costs, continuing for a longer period, leads to reduction in the share of labour costs to GDP. This share represents an index showing the cost of labour unit (one employed) necessary to produce (value) of a product assigned to this unit [3, p.37]. This dependence is confirmed by the data in Table 1, showing the percentage share of labour costs in GDP and the share of gross value added per one employed in the years 2000-2008. In the years 2000 – 2004 we see a clear drop in the share of labour costs in GDP from 39,55 % to 34,89 %. There is no significant changes in the following two years and only in the year 2007 the share of labour costs starts to grow from 34,72 % to 36,95 %. We can see a similar tendency when reviewing the share of labour costs in gross value added per one employee. Here there is also a drop in the share of labour costs in gross value added until 2004, a stabilisation in the years 2005-2006 and again an increase in 2007.

Description	2000	2001	2002	2003	2004	2005	2006	2007	2008
% of share in GDP	39,55	39,30	38,10	37,20	34,89	34,72	34,72	35,61	36,95
per gross value added unit	0,44	0,44	0,43	0,42	0,39	0,40	0,40	0,41	0,42

Table 1. Share of labour costs in GDP and gross value added per one employed in the years 2000-2008.

Source: Own work based on: Annual macroeconomic indicators, GUS.

Thus, it can be noted that in Poland there is a direct connection between productivity, total labour costs and the level of employment. When the level of employment drops there is a drop in the share of labour costs in GDP [3, p.38].

Description	2000	2001	2002	2003	2004	2005	2006	2007	2008
Number of employed in thou.	9 354	9 050	8 760	8 662	8 640	8 787	8 966	9 388	9 851
Dynamics of employment (previous year=100)	100,0	96,8	96,80	98,9	99,7	101,7	102,0	104,7	104,9
Gross value added (current prices in ml. PLN)	662224	695255	715072	744357	821665	866392	931179	1029442	1116476
Dynamics of gross value added (previous year = 100)	100,0	105,0	102,9	104,1	110,4	105,4	107,5	110,6	108,5
Productivity in thousand.	70 796	76 824	81 629	85 934	95 100	98 592	103857	109655	113336
Dynamics of productivity (previous year = 100)	100,0	108,5	106,3	105,3	110,7	103,7	105,3	105,6	103,4

Table 2 Employed, gross value added and productivity in the national economy in the years 2000-2008 (previous year=100)

Source: Own work based on: Annual macroeconomic indicators,, GUS.

When comparing changes in the dynamics of labour costs with the GDP per one resident, presented in Diagram 3, we can see that the increase in GDP per capita is higher than the increase in labour costs during the entire analysed period, with the exception of the year 2002.

In order to get a fuller picture of the extent of labour costs in Poland it is necessary to present the data relating to Poland against other countries. This will allow to evaluate Poland's competitiveness in comparison to other European countries. Using indexes published by OECD for the selected EU countries, such as GDP per capita, labour productivity and unit labour costs, adjusted by purchasing power parity, we can get better view of the real level of labour costs in Poland.

Diagram 4 presents the dynamics of the GDP per one resident, expressed in USD in current prices, adjusted by purchasing power parity (PPP). We see that during the analysed period such countries as Poland, Czech Republic, Slovenia and Hungary were characterised by a similar growth in the GDP per capita, amounting to approx. 70%. Only Slovenia noted a higher, in comparison to other countries, growth, exceeding 111%. During that period the GDP per capita in the EU-15 countries increased on average by over 46%. This means that in recent years the GDP per capita in Poland has increased in relation to the EU average, which is synonymous with the convergence taking place, i.e. the equalization of the development level of Poland and the European Union.

Diagram 3. Dynamics of changes in labour costs and GDP per one resident in Poland in the years 2000-2008 (previous year=100).

Source: Own work based on: Annual macroeconomic indicators,, GUS.

Diagram 4. Dynamics of GDP per capita in Poland, UE-15 and the selected EU countries in the years 2000-2008 (previous year = 100).

Source: Own work based on: <http://stats.oecd.org/> (05.10.2011).

Diagram 5 presents the dynamics of labour productivity, defined as the Gross Domestic Product per a unit of Human Resources involved in its production, i.e. per one person employed in the national economy [25]. When we compare the data relating to labour productivity we can see that during the entire analysed period this indicator was lower for the EU-15 than the values noted

for the countries of our region. In the years 2000-2008 the new members of the EU noted increase in labour productivity on the level of approx. 30%, with the exception of Slovenia, where the increase was even higher and amounted to nearly 46%. Amongst these countries Poland had the lowest increase of labour productivity amounting to 27.82%

Diagram 5. Dynamics of labour productivity in Poland, UE-15 and the selected EU countries in the years 2000-2008 (previous year = 100).

Source: Own work based on: [http://stats.oecd.org/\(10.10.2011\)](http://stats.oecd.org/(10.10.2011)).

Unit labour costs measure the average cost of labour per unit of GDP. Thus, these costs are linked with labour productivity and labour cost used in producing the GDP. Increasing unit labour costs lead to an increase of the share of labour costs in the output of the entire economy [24].

Analysing Diagram 6 presenting the dynamics of unit labour costs in Poland against other countries, we can clearly see that in the years 2001-2004 from amongst the countries presented in the diagram Poland was the only one where unit labour costs dropped in comparison to the previous period. Other countries noted only a drop in the dynamics of the increase of unit labour costs in relation to the previous period. Looking at the entire analysed period, amongst the presented countries the lowest increase in unit labour costs was in Poland.

The data presented in Diagram 7 indicates that during the years 2000-2008 against the selected Central and Eastern Europe countries and the EU-15 average, Poland had the lowest increase in unit labour costs with the increase in labour productivity and the GDP per capita comparable to such countries as Czech Republic, Slovenia and Hungary. The pace of labour productivity increase higher than that of unit labour costs and the fact that these differences are higher in Poland than the average for the EU-15 and other presented countries mean an increase in the competitiveness of the

Polish economy in the analysed period. Therefore, it would be difficult to agree with allegations that high labour costs in Poland cause a lowering of the competitive position of our economy.

Labour costs' effect on inflation

Inflation is an increase in the average level of prices and goods in any period [1, p. 252]. Usually, inflation is caused by an increase in remuneration and other earnings of the population, which is faster than the production. Since remunerations represent the largest part of labour costs their excessive growth may lead to an increase in labour costs and that causes an increase in costs of production and contributes to the occurrence of inflation [5, p.529]. This type of cost inflation is called salary inflation.

The graphic illustration, presenting the inflation rate against the dynamics of real wages, labour costs and productivity, shows that from the year 2001 to 2003 all these variables show a linear dependence with a negative slope of the function. Each of the variables notes a slower pace of increase in comparison to the previous year. This is the period, when the number of employed in the national economy was decreasing, which meant a lesser pressure of employees and representing them trade unions to put forward pay demands. Despite the fact that during that period the dynamics of productivity also decreased, that decrease was the smallest amongst the presented variables. During the period between 2001 and 2003, due to the inflation rate maintained at a very low level, we see the pace of increase in real wages higher than in nominal wages. From the year 2004 we see a constant increase in the dynamics of real wages; the same is with the dynamic of labour costs, although in 2008 there is a drop in the pace of increase. During the years 2000-2005 the dynamics of productivity and the inflation rate behave in a similar way, noting a drop or increase of dynamics in the same years.

During the entire analysed period the inflation increased by 23,60 %, and the real wages and productivity by approx. 60 %, with a slightly lower increase of labour costs. Therefore it can be assumed that thanks to balancing the increase in real wages by an increase in labour productivity and a lower increase of labour costs the inflation was not a salary inflation and did not lead to a wage-price spiral, whereby the rise in wages leads to a rise in prices of goods and services, which in turn is a good argument for employees and trade unions to make pay demands.

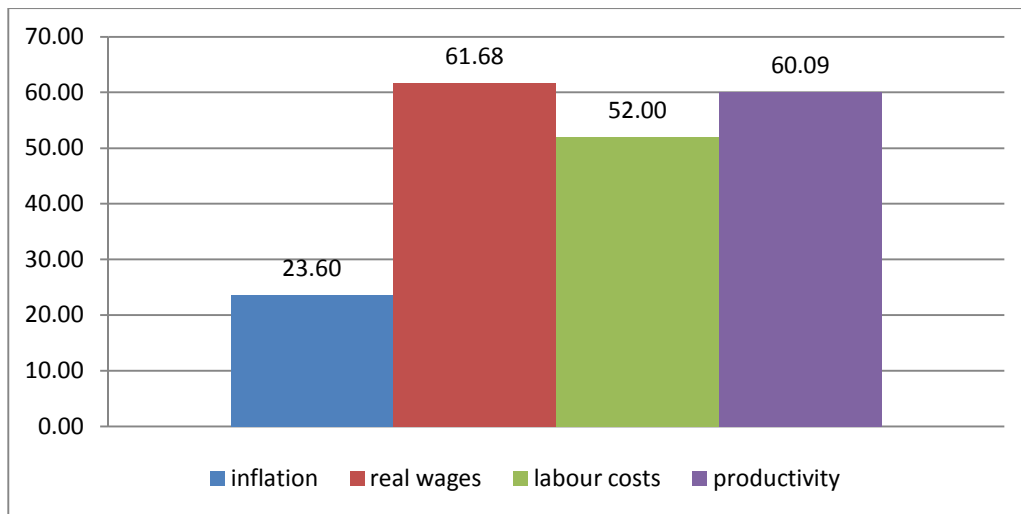

Diagram 9 Percentage changes in inflation rate, real wages, labour costs and productivity in the years 2000-2008

Source: Own work based on: Annual macroeconomic indicators,, GUS.

Diagram 4.10 shows inflation in Poland against other countries. In 2000, Poland, as much as Slovenia, Slovakia and Hungary, suffered a high rate of inflation around 10%. During that time the rate of inflation in the Czech Republic was less than 4% and the EU-15 average was 2.6%. Between 2001 and 2003 the inflation in Poland dropped sharply to 0.7%. During the next years the rate of inflation stabilised at the level similar to the values noted by the Czech Republic and the countries of EU-15.

When comparing changes in unit labour costs and inflation occurring in the years 2000 – 2008 on the basis of data published by OECD for Poland and other countries, we can see that the average rise in unit labour costs in the EU-15 countries, the Czech Republic and Hungary roughly corresponded to the rise in inflation, whereas in Poland, Slovenia and Slovakia the inflation grew faster than unit labour costs. At the same time, when compared to Slovenia and Slovakia, in Poland both unit labour costs and inflation showed the smallest percentage rise during the analysed period. In this period, the inflation grew, value-wise, to the level noted in the Czech Republic in the EU-15 countries, with a significantly smaller rise in unit labour costs. Therefore, we can presume that the reason for the increase in inflation in Poland was not the rise in labour costs, since this would lead to an increase in production costs, or the effect of this rise was minimal.

Diagram 10 Rate of inflation in Poland, EU-15 and the selected EU countries in the years 2000-2008 (previous year = 100).

Source: Own work based on: <http://stats.oecd.org/> (10.10.2011).

Talking about inflationary character of labour costs in Poland over the analysed period does not seem to be justified. When compared to other European Union countries, neither the analysis of the Polish statistical data pertaining to real wages and labour productivity nor the analysis of labour costs confirm the theory that the high labour costs in Poland cause an increase of inflation.

Diagram 11 Percentage changes in the rate of inflation and unit labour costs in Poland, EU-15 and the selected EU countries in the years 2000-2008.

Labour costs and investment outlays

Investment outlays are outlays which aim at the creation of new fixed assets or the improvement (rebuilding, enlargement, reconstruction or modernization) of existing capital asset items, as well as outlays on the so-called initial investments. An increase in investment outlays means that entrepreneurs respond positively to the signals received from the surroundings. An entrepreneur willing to take a risk associated with an investment, assumes that the business outlook and economic situation will remain favourable enough to generate profits from the invested capital

Diagram 12 Dynamics of labour costs, gross investment outlays and employment in Poland in the years 2000-2008 (previous year = 100).

Source: Own work based on: Annual macroeconomic indicators,, GUS.

Changes in labour costs may influence investments through increase in wages, which may be received by entrepreneurs as a risk to their profits and that may cause them to partly withdraw

from an investment. This will have a negative effect on the national income and through a multiplier effect on employment [21, p. 91].

Diagram 13 Dynamics of direct foreign investments and gross investment outlays in Poland in the years 2000-2008 (previous year = 100).

Source: Own work based on: Annual macroeconomic indicators,, GUS, NBP.

Diagram 12 looks at the dependency between the dynamics of labour costs and investment outlays and the number of employed people in Poland in the years 2000-2008. From 2000 there is a noticeable drop in gross investment outlays, connected with the worsening economic situation and insufficient level of national savings, representing the main source of financing. The drop in investment outlays continued until 2002 and was accompanied by a drop in employment. During that period labour costs behaved differently and their dynamics grew. The year 2003 saw a reversal of the trend and the dynamics of the three analysed indicators levelled up. The dynamics of investment outlays grew continuously until 2007. During this period we also see a rise in employment and labour costs but the pace of these changes is much slower. The pace of rise of the analysed indicators slows in 2008, which coincides with the recession suffered by the world economy at that time. The drop in the pace of rise of labour costs in 2008, linked to the reduction of disability insurance contributions charged to earnings did not translate into maintaining the pace of

increase in the dynamics of investments. During the analysed period there are years when the dynamics of labour costs was close to the dynamics of investment outlays and years when both indicators behave differently.

The concept of “foreign investments” covers “private or public investment outlays realised in a given country by means of capitals originating from another country”. Foreign investments can be divided into portfolio investments and direct foreign investments. When comparing the dynamics of direct foreign investments and gross investment outlays we see a significant convergence of these two indicators, as presented in Diagram 13. The dynamics of direct foreign investment clearly differs in size from the dynamics of investment outlays, but the direction of changes remains the same in the majority of years. It must be stressed that the inflow of direct foreign investments is of clearly cyclic nature and their extent depends strongly on the phase of business cycle and the dynamics of privatisation processes.

The analysis of dependencies between labour costs and investments in Poland and other countries is based on the data published by OECD, namely the dynamics of gross fixed assets outlays and unit labour costs. Gross fixed assets outlays increase the value of fixed assets and involve renovation of fixed assets and increase in intangible assets. They do not include outlays for initial investments or interest of investment credits and loans paid during the implementation of an investment [25]

Analysing the data from the diagram below we can clearly see that contrary to other countries, until the year 2003 Poland noted a big drop in the dynamics of unit labour costs (Diagram 6), with the exception of the year 2001. During this period in the EU-15 countries the extent of gross fixed assets outlays showed a slight rise. In Poland the value of gross fixed assets outlays starts rising continuously since 2004 and in the years 2004, 2006 and 2007 we see a swift rise in the dynamics of outlays, which reach the highest value amongst all analysed countries in the year 2006-2008. The dynamics of unit labour costs in Poland also reaches its highest value in the years 2006-2008. Therefore, we see an increase in labour costs and investment outlays, which seems to contradict the theory about the negative influence of labour costs in Poland on investment decisions made by entrepreneurs.

When comparing the values of percentage changes in gross fixed assets outlays in Poland and other European countries since 2000 until 2008, presented in the diagram below, we can see that during that period the Czech Republic, Hungary and Poland noted a similar rise in the outlays.

Diagram 14 Dynamics of gross fixed assets outlays in Poland, EU-15 and the selected EU countries in the years 2000-2008 (previous year = 100).

Source: Own work based on: <http://stats.oecd.org/> (10.10.2011).

However, the rise in unit labour costs was different in each of those countries, from the lowest, noted in Poland, through a medium rise similar to the average for the EU-15 countries occurring in the Czech Republic, to the highest, noted in Hungary. During the analysed period the highest increase in gross fixed assets outlays was noted in Slovakia, for which the increase in unit labour costs was similar to the level noted in the Czech. Therefore, during the analysed period we have not observed any visible dependency between gross fixed assets outlays and unit labour costs in any of the presented countries. Investments outlays reached similar levels in countries with a very different rise in labour costs.

The statistical data presented herein does not confirm the view expressed by some entrepreneurs that high labour costs in Poland restrict investments thus resulting in restricting employment in economy. Labour costs represent one of many elements considered by entrepreneurs when making investment decision. Some analysts maintain that investments decisions are influenced mainly by labour productivity and not its costs [1]. The dynamics of investment outlays depends, to a larger extent, on the markets' economic situation and is closely linked to the pace of economic growth.

Diagram 15 Percentage changes in unit labour costs and gross fixed assets outlays in Poland, EU-15 and the selected EU countries in the years 2000-2008.

Labour costs' effect on inflation

The relatively high unemployment rate in Poland, remaining fairly stable for many years, is seen by many as caused by high labour costs. Cuts in remunerations and labour costs are seen as the method of reducing unemployment.

Description	2000	2001	2002	2003	2004	2005	2006	2007	2008
Unemployment rate (%)	15,10	17,50	20,00	20,00	19,00	17,60	14,80	11,20	9,50
Nominal salary (PLN)	1924	2062	2133	2201	2290	2380	2477	2691	2944
Dynamics of remuneration (%) (previous year = 100)	12,71	7,17	3,44	3,19	4,04	3,93	4,08	8,64	9,40

Table 3. Unemployment rate and nominal average monthly salary in Poland in the years 2000-2008.

Source: Own work based on: Annual macroeconomic indicators,, GUS.

Table 3 shows that in the period between 2000-2003 the drop in unemployment rate from 15.10 % to 20.00 % was accompanied by a drop in the dynamics of rise in nominal average monthly salary in the national economy from 12.71 % in 2000 to only 3.19 % in 2003. This means that during this period the increasing percentage of unemployed translated into a slower pace of increases in remuneration. From 2004 there was a drop in the rate of unemployment, which continued

uninterruptedly until the end of the analysed period. Despite the drop in the rate of unemployment, the rise in salaries remained at a fairly low level of approx 4% in relation to the previous year. Only in the years 2007 and 2008 the dynamics of rise in salaries reached a rise of approx 8% with the rate of unemployment close to 10%. Comparing the data relating to the dynamics of nominal pay with the dynamics of labour costs we can see that both indicators behaved similarly, noting the biggest growth in the years 2001, 2007 and 2008.

It is clear that the change in the remuneration level was considerably delayed in reacting to the improvement in the economic situation and subsequently the demand. Such a situation is provided for by Keynes, who expected that the level of salaries does not have a great influence on employment and that salaries and prices react to the change in demand with a delay. Potential employees are unemployed since enterprises do to produce a sufficient number of goods and services and enterprises cannot produce more due to too small demand caused by unemployment. He called the combination of these two market a price-wage mechanism [6, p.92].

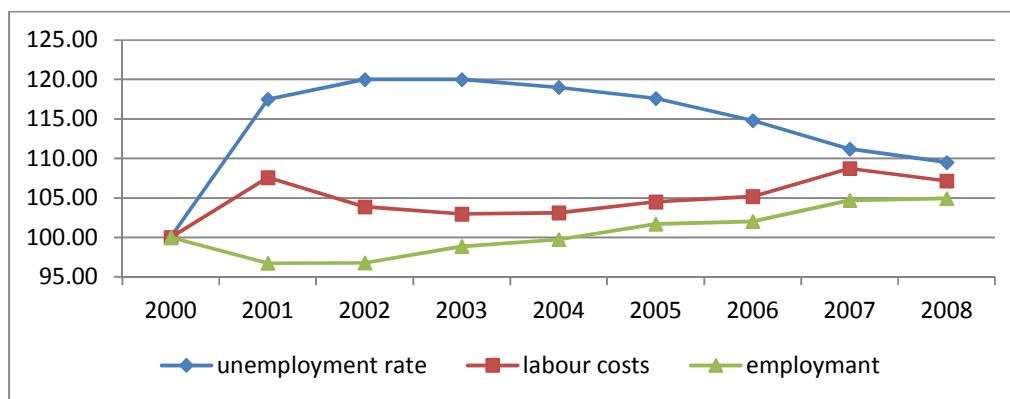

Diagram 16. Unemployment rate, dynamics of labour costs and employment in Poland in the years 2000-2008 (previous year = 100).

Source: Own work based on: Annual macroeconomic indicators,, GUS.

According to the theories which put the main stress on the cost side of production, cutting labour costs should lead to increasing the difference between production costs and the amount of revenue. So, following the minimisation of costs the enterprise's profitability should improve and employment should increase. Diagram 16, presenting the unemployment rate and the dynamics of labour costs and employment does not provide arguments for the theory presented above, which assumes a rise in employment together with a drop in labour costs. During the analysed period an inverse dependence was noted in Poland, where the increase in labour costs occurred simultaneously with an increase of employment and a drop in unemployment rate. Only in 2001 the drop in employment was accompanied by a significant increase in labour costs. Therefore, we

can assume that it is not the labour costs that restrict an increase in employment and a drop in the number of unemployed, but a limited demand for goods and services produced by enterprises.

A harmonised unemployment rate, published by OECD was used to compare Poland to other countries. It is worth noting that in 2005 that the level of unemployment in Poland and Slovakia was twice the size of unemployment in the Czech Republic, Slovenia, Hungary and the EU-15 countries. In case of Poland, we can assume that one of the reasons for such high unemployment was the large percentage of people living in the country and the poor industrialisation of the economy. Since 2005, the employment rates are levelling up, which is attributed to the convergence processes taking place in Europe after the extension of the European Union.

Diagram 17. Harmonised rate of unemployment in Poland, EU-15 and the selected EU countries in the years 2000-2008 (previous year = 100).

Source: Own work based on: <http://stats.oecd.org/> (10.10.2011).

Summarising the discussion on the influence of labour costs on unemployment rate in Poland in the years 2000-2008, we may ascertain that saying that high labour costs represent one of the main reasons for high unemployment does not find any confirmation in the presented statistical data.

Conclusion

The lack of a uniform definition of labour costs is caused by their complex structure, the large number of factors influencing them and the fact that they play a vital role in the social and economic life. Various groups of interests, such as employers' organisations, trade unions acting within a given country as well as organisations of an international character try to influence their shape, while the processes of globalisation and integration of economies within the European Union encourage it.

The detailed analysis of labour costs from the macroeconomic point of view and a comparison with other countries made it possible to refer to many circulating views and statements pertaining to economic development. This concerns such economic occurrences and processes as productivity, inflation, increase of investments or unemployment. As indicated by the research, in the analysed period productivity in Poland grew faster than labour costs and remuneration, which could lead to a drop in the share of labour costs in GDP and gross value added. This means an increase in the competitiveness of the Polish economy during the analysed period. In comparison to other countries Poland is characterised by a relatively low level of labour productivity with low unit labour costs. This situation shows that problem with increasing the competitiveness of the Polish economy lies not in the extent of labour costs but in the technological backwardness of the economy, which restricts the efficiency of management, negatively affecting productivity and therefore the competitiveness of the economy.

The analysis of the influence of labour costs on inflation showed that in the case of Polish economy we cannot speak of the inflationary consequences of shaping labour costs. In Poland, during the analysed period, the increase in real wages and labour costs was balanced by an increase in labour productivity, which helped to avoid the wage-price spiral effect. When comparing Poland with other countries, we see that Poland has a relatively low inflation and low unit labour costs. Therefore, we cannot say that high unit labour costs caused an increase in production costs, which resulted in cost-push inflation. The conducted analyses did not prove that an increase in labour costs had a negative influence on investment processes in Poland. They did not prove clearly that there is a dependence between a reduction in labour costs and a lowering of unemployment. During the analysed period there were years confirming this theory and years when this dependency did not occur. The unemployment rate started falling when Poland accessed the European Union, nearing to the levels noted for the entire Union. So it seems that it was the development incentives following the accession of Poland to the European Union and the convergence processes that had the decisive influence on the change in the unemployment rate.

Summarising the discussion on the influence of labour costs on the economic development in Poland in the years 2000-2009, we may ascertain that the presented data does not confirm the hypothesis about the negative effect of too high labour costs on the economic development of Poland.

FINANCIAL DIFFICULTIES OF ITALIAN LOCAL AUTHORITIES: PREDICTION AND DIAGNOSIS MODELS

Civitillo, Renato¹

¹ Ph. D. Student, Department of Economic, Legal and Social System Analysis (SEGIS), University of Sannio – Benevento (BN), Italy. Email: civitillo@unisannio.it

Abstract

Recently, business management literature has been enriched by numerous contributions on corporate crises and related processes of reorganization or liquidation. The majority of these studies have always been about private sector business. Nevertheless, crisis situations can arise in any type of business (Guatri, 1986; Manes Rossi, 2000), just as the same concept of crisis is intimately related to being firm, which is an open system and, therefore, constantly changing (Manes Rossi, 2000).

Based on these considerations, the analysis of crisis situations is particularly interesting, with specific reference to non-profit public companies (Guatri, 1986) and, more specifically, to local authorities, in view of their significant importance within the public field and the abundant existing legislation, however, completely revamped in recent years.

However, there is one important aspect on which it is necessary to focus our attention about local authorities crisis situations: in fact – given the institutional and public purposes that led to their birth – they cannot dissolve, but they need to live and provide essential community services and goods.

Fundamental problem is, therefore, to identify the early onset of the crisis, before imbalances and inefficiencies will irreversibly affect the company life.

The primary objective in this direction is to create a performance reporting (Borgonovi, 2009) to provide an adequate response capability in situations of difficulty or crisis, leading to the systematic dissemination, even in public, of real and concrete benchmarking techniques, essential for an effective management of local authorities (Ricci, 1998; Savioli, 1995).

Keywords: Local Authorities; Bankruptcy; Crisis condition; Public Administration Default; Crisis Diagnosis; Crisis Prediction

From general phenomenon of crisis to Local Authorities Financial crisis

Recently, business management literature has been enriched by numerous contributions on corporate crisis and related processes of reorganization or liquidation. We evaluated symptoms and

causes, with various classifications of different types of crisis, and we investigated the possible developments of the phenomenon “crisis”.

The majority of these studies have always been about private sector business.

Nevertheless, crisis situations can arise, as well as the doctrine has highlighted (Guatri, 1986; Manes Rossi, 2000), in any type of business, just as the same concept of crisis is intimately related to being firm, which is an open system and, therefore, constantly changing.

In fact (Manes Rossi, 2000),

‘the concept of crisis is inherent to being the company that, as a dynamic and open system, is constantly changing and is therefore subject to critical situations, as determined by a non-timely or adequate response to changing environmental conditions or to market demands , and thus to the loss of the economic-financial equilibrium, which ensures its survival over time’.

Based on these considerations, the analysis of crisis situations is particularly interesting, with specific reference to non-profit public companies (Guatri, 1986) and, more specifically, to local authorities, mainly because of their significant importance within the public field and the abundant existing legislation, however, completely revamped in recent years.

During the life of every type of company, as a dynamic system that is open to the market, internal and external factors of influence create a system of risks and uncertainties and, consequently, they may show different series of crises: overcoming them, it is possible to find a new equilibrium. Such situations could be considered as a physiological crisis, inherent to the same conditions of a company life.

In contrast, sometimes the company fails to respond adequately to changing environmental conditions and this situation can affect business sustainability, more or less relevant, more or less severe. This can determine a pathological state of crisis and to face them it may require changes in structure, organs or functions. This crisis is sometimes irreversible and leads to the forced dissolution of the company.

However, there is one important aspect on which it is necessary to focus our attention about local authorities crisis: in fact – due to the institutional and public purposes that led to their birth – they cannot dissolve, but they need to live and provide essential community services and goods (Manes Rossi, 2000).

This situation creates a profound difference in the treatment of local authorities crisis, as well as the need for a specific legal framework regarding local authorities bankruptcy which is distinct from the other insolvency and bankruptcy procedures provided for private companies.

So, if a local authority can never be dissolved, but we should always find its way to a desirable and sustainable recovery, it becomes imperative to understand what are the causes of the crisis, what are the warning signs and, therefore, to identify tools that can monitor the permanent existence of the institution equilibrium. Nevertheless, when crisis situations arise, it is important to look for tools to monitor developments of the next phase of rehabilitation and to ensure the restoration of equilibrium.

At the base of the crisis, are phenomena of imbalance and inefficiency, which may be internal or external source (first stage). If these conditions persist, it may cause losses of varying severity (second stage). With repetition and increasing intensity of the losses, the crisis enters in a third stage, characterized by the insolvency, that is the inability to meet its commitments. At the end, there is the final stage of collapse, defined as the permanent inability to meet liabilities.

However, beyond these observations, the main aspect is that for any type of crisis, the most dangerous threat is represented by possible delay in the intervention. Indeed, history is often marked by belated recognition of the symptoms of crisis, the illusion of excluding the state of crisis or minimize the scope, the fear of adopting measures that are inevitably painful. The net effect of these behaviors is that the process of decomposition and depletion becomes more severe, up to the limit of irreversibility.

Fundamental problem is, therefore, to identify the early onset of the crisis, before the imbalances and inefficiencies will irreversibly affect the life of a company.

In fact the crisis is, apart from rare exceptions, a phenomenon not unexpected, although sometimes it can manifest suddenly. It is a phenomenon that may be present in a latent form, and gradually undermining the financial balance until someone (inside or outside the company) is able to detect it.

Why is it necessary to have the institution of local authorities Bankruptcy Law?

The introduction of local authorities Bankruptcy Law in our legal system has its reasons in an attempt to put a stop to the legal phenomenon of chronic budget deficit of municipalities, provinces and other types of public organizations. With time, this has become absolutely not to be delayed.

The reasons that led to these circumstances are various and of different weights. Among these, we can mention: a steady rise in spending, an increasing pace of deficit (only in small part attributable to investments) and continuous increase of local taxes.

We can identify other causes in:

- political class chronic irresponsibility, regarding financial management of public bodies;

- case law too precautionary against creditors (Romano et al., 1998).

The notion of local authorities Bankruptcy can be deduced analytically from the reading of numerous provisions of Law, covering a wide historical period. The purpose of this research is not to examine the historical evolution of legislation, but it is important to list the main acts of law that have led to the current definition of local authorities Bankruptcy Law:

- D.L. 2 march 1989, no. 66 then turned into Law no. 144/1989 (art. 25);
- D.L. 18 January 1993, no. 8 then turned (with amendments) into Law no. 68/1993 (art. 21);
- D.P.R. 24 August 1993, no. 378;
- D.Lgs. 25 February 1995, no. 77 and succeeding amendments (D.Lgs. no. 336/1996 and no. 342/1997).

The end result of this sequence is represented by the D.Lgs. 18 August 2000, no. 267: Text of the laws on the local authorities (TUEL).

Therefore, the current definition of the phenomenon of local authority bankruptcy is provided by Article 244 TUEL, which specifies that:

‘State of local authorities Bankruptcy occurs if a local authority cannot guarantee the performance of functions and essential services, or there are against it demandable claims which cannot cope with the arrangements laid down in Articles 193 [i] and 194 [ii] TUEL [iii]’.

Unlike the bankruptcy of private enterprises, the declaration of bankruptcy of a local authority is a unilateral act not caused by a creditor request.

The state of instability is, thus, a very serious condition of insolvency, which must be denounced. Furthermore, it is not allowable and is not preventable by the ordinary expedient of financial loan.

In fact, the Law establishes that, if the regional body control becomes aware of any condition of instability, it shall appoint a special commissioner for the declaration of bankruptcy, with the further consequence of the complaint and initiation of a procedure by local Prefect [iv] for the dissolution of the local Council.

From the above definition of local authority bankruptcy, is deduced two fundamental conditions (De Dominicis, 2000):

- the entity’s inability to provide essential services (and related compulsory expenditure);
- inability to honor its debts, especially debts below the line, including those "black debts" contracted in previous years without complying the normal procedure of commitment accounting.

These conditions, as noted above, are due to the structural difficulties that cannot be eliminated by normal recovery tools (provided by Articles 193 and 194 TUEL).

In other words, it is clear that these are conditions or situations that show a certain deficit and serious total financial imbalance, but that may not co-exist and compete simultaneously.

In short, the two aspects of failure – to provide services and to honor debts – which are considered harmful situations disjointed and independent indices of insolvency.

Local authorities Bankruptcy versus Pre-Collapse: differences and similarities

As mentioned earlier, we understand that the financial default does not arise, thus, with a casual deficit, but is related instead to a real and concrete structural imbalance in the local authority financial situation (Mulazzani, 2001).

In this respect, it should be emphasized that in local authorities, while the Budget [v] is the schedule of activities that each administration plans to implement, the Financial Report [vi] (consisting of three tables graphs) represents the summary of the entire past management, by which local authority shows transactions actually occurred during the reference year.

Just in this connection, it must be observed that Article 228 TUEL provides that local authority must set up the Table of Structural Deficits Parameters [vii] and the Table of Performance Management Parameters [viii] for three years.

Therefore, it is only with the Financial Report that we can understand how the budget estimates have been performed and the ability of administrators in treating and managing the public affairs.

More particularly, it should be noted there are tools that may represent, at least, an aid for the measurement of such performance, and they are represented by so-called indicators or parameters.

This system of indicators and parameters is designed to monitor overall activities put in place by local authority, and to direct it toward positive standards, by creating processes of competitive benchmarking.

Such a system of indicators is so important that the Law provides for local authorities not only the need to develop indicators and operational parameters, but - in addition - their inclusion in the Financial Report with the Table of parameters of structural deficits.

To understand the importance of this table, it should be emphasized that, according to the doctrine, when it shows a situation of structural deficit of the local authority, the situation is considered so serious as to talk of “pre-collapse”, thus bringing to light how this precarious situation of deficit may lead, under certain conditions, in a situation of real and substantial bankruptcy.

However, although it is necessary to admit the existence of a physiological link between the situation of structural deficit (or pre-collapse) and a real local authority bankruptcy, it is necessary to highlight that there are important differences between the two conditions.

Indeed, the lack of financial resources may show a deficit situation, but, if promptly addressed (as in the case of local authorities in pre-collapse), it can lead to avoid the extreme situation and the unilateral proclamation of the state of bankruptcy.

Certainly, the situation of pre-collapse, is a condition of emerging structural deficit, and is common to institutions in a state of bankruptcy, but for them the deficit state assumes the objectivity of absolute gravity and solvability, even by the ordinary tools of reorganization and financial maneuvering.

We can argue, therefore, that the difference between situation of bankruptcy and condition of pre-collapse lies in this: in the first case, the declaration of collapse is a starting point and it is aimed to identify specific responsibility on whose basis is then possible to reach a decision of a temporary disqualification for directors responsible, while in the latter case it is not possible any special pronouncement, neither for responsibility nor for disqualification to certain public office due to the facts of pre-collapse.

In particular in a situation of bankruptcy a recent Law [ix] provides that administrators responsible (because judged by the Judicial Organs in charge) of damage in the five years preceding the occurrence of bankruptcy, may not hold significant positions in public and private institutions for a period of ten years, if the Court finds that the circumstances and causes of bankruptcy are derived from acts or omissions of administrator found guilty.

Similarly, mayors and presidents of the provinces that are responsible for the bankruptcy are not candidates for a period of ten years for position of mayor, president of the province, president of the Regional Council and other high offices in the communal, provincial, regional and European level.

However the situation of structural deficit is not without consequences, and involves the sequential subjection to various controls and fulfillments.

Specifically, they are subjected to a series of controls by the Department of the Interior. Moreover, they are obliged to adopt a series of measures in order to allow recovery of deficit and the payment of "black debts" such as:

- hiring freeze;
- reorganization of the staffing plan;

- increase in cost of services on individual demand etc.

Local authorities Bankruptcy Law: the procedure

Regarding the procedure we must point out that, in previous legislation, the management of events before and after declaration of bankruptcy was assigned within the organization.

This caused many difficulties because the management of pre-existing condition could lead to negative consequences on ordinary activities after the bankruptcy (Danielli and Pittalis, 2010).

For this reason, with subsequent laws we move to a clear separation of powers between the past and the present management. In this way local authority should take care of management of the organization after the bankruptcy, from which to take a new route avoiding to fall back into a new situation of bankruptcy.

Indeed, after the declaration of bankruptcy, all efforts are aimed at enable a balanced management: this phase ends with the preparation of hypothetical balanced and healthy budget which is built by eliminating all causes that led to structural collapse of the situation.

In fact, to ensure that local authority pursues a real and effective rehabilitation, the Law provides for the drafting of this important document which is, basically, a budget for the year following the bankrupt declaration.

Then it must be submitted to the Department of the Interior for his official approval.

As just pointed out, is sufficiently clear that in a state of bankruptcy we have a “dual management”, which two actors involved: the Extraordinary Settlement Body [x] and the Council of the local authority.

The Extraordinary Settlement Body mainly deals with local authority's management after the bankruptcy. In particular, it has three main functions:

- Detection of Local Authority's debts;
- Acquisition and management of assets;
- Payment of Local Authority's debts.

The Council, instead, should declare the state of bankruptcy but, in addition, it must also evaluate the generating causes, on the basis of a report prepared by the auditors.

This is because the declaration is not a simple aseptic acknowledge, but the first measure of determination and designation of responsibility.

This declaration produces mainly two kinds of consequences.

The first of these concerns local authority's creditors: in this case, the declaration determines the freezing of some of their rights and guarantees.

The second consequence of the declaration affects management of the organization and introduces several constraints on expenditure and the income management and lasts until compilation of hypothetical balanced and healthy budget.

In other words, management is not based on the budget of next year (as is usual) but takes as reference the last budget adopted before the bankruptcy [xi].

After the declaration of bankruptcy, local authority is not obliged only to contain costs (as discussed above) but it must take any kind of action aimed at achieving incremental variations of incoming resources. These measures are identified in Article 251 TUEL, and consist, in general, in raising fees and taxes to the maximum extent permitted by Law. This resolution, therefore, is not revocable, and retains its effectiveness for five years starting from the hypothetical balanced and healthy budget.

After approval of hypothetical budget (within 30 days) the next step is to approve the budget for which the hypothesis applies.

This because it is necessary that the hypothetical budget becomes a real budget to legitimate action of the Council.

The duration of the procedure is five years after approval of the hypothesis.

To further facilitate the healing process, the law clarifies that local authorities can get a bank loan only in cases provided by Law (for the duration of the process).

Possible causes of local authorities Bankruptcy

As noted above, local authority bankruptcy takes place because of a financial imbalance that prevents it to perform its functions and its services.

Regarding this aspect, it is important to remember that since the eighties, local authorities are no longer in a situation of financial dependency by the State. This means that while previously, in situations of budgetary imbalance, the Government intervened with its financial resources to cover the situation, now they must develop an adequate system of financial autonomy to become entirely self-sufficient.

In particular, we can argue that local authority Bankruptcy can be caused by the following internal and external dangerous factors:

- mismanagement (e.g. deficit, "black-debts", etc.);

- management goals are too ambitious;
- short-term management policies;
- mismanagement of cash flows;
- excessive debt exposure;
- inefficient management control system;
- inability to promptly identify potential causes of damage and/or inability to act promptly to remove them;
- uncontrolled increase of expenditure;
- growing deficit (without making investments);
- continuous increase of certain local taxes;
- discontinuity in management;
- lack of business management tools to support management;
- negative events that involve the market.

From these factors we can argue that most dangerous situations can be found mainly from the lack of a systematic vision of the institution.

Results and Conclusions

By analyzing statistical data regarding the phenomenon of local authorities bankruptcy up to now, we can show that it involved a relatively small number of institutions.

Specifically, since 1989, were 448 institutions that have approved the state of bankruptcy (in which only one Province: Napoli) [xii].

On the basis of different rules apply, we can divide bankruptcy as a function of various external financial resources available to cover debts. It appears that:

- no. 414 local authorities have declared their bankruptcy by November 8, 2001, for which the State has guaranteed costs payment of restructuring loan, unconditionally;
- no. 5 local authorities have declared bankruptcy between November 8, 2001 and December 31, 2003. For five of them, was established a State contribution under Article 5 of Law no. 240/2004;

- no. 29 local authorities have approved the bankruptcy after January 1, 2004. For them it is possible to have an extraordinary contribution of the State (D.L. no. 159/2007 as amended by D.L. no. 248/2007).

One of the most significant considerations - in the opinion of the writer - in analyzing the bankruptcy phenomenon as a function of time. Indeed, as shown in Figure 1, the number of bankruptcies (frighteningly large in the first few years following its introduction) has quickly and steadily reduced over the years, remaining (from 1997 to present) always below the dozen cases reported each year.

In particular, the falling graph shows that bankruptcy Law, in the first five years, has been warmly welcomed by local authorities, when he revealed those with the most difficult financial situations that could lead to a economic and financial collapse of the administrative structure.

Following this "start-up" period, deliberations of bankruptcy (as rightly should be) were taken only in a few cases.

This demonstrates that the aim of transforming this procedure in an exceptional tool (to be applied only when it was impossible to manage the financial collapse) had actually been achieved (despite a discipline, at that time, not fully mature).

However, it is important to point out that the drastic reduction of local authority defaults has another explanation, simple but very persuasive. Until 2001, bankruptcy had its own "convenience" because the deficit was covered by a loan financed directly by the State.

Today, instead, declaration of bankruptcy causes damage to all:

- employees: those who are redundant (compared to the national average ratio employee/population) may lose their jobs;
- suppliers: due to the constraints arising from the declaration;
- citizens (especially): as mentioned earlier, after the collapse there is an obligation to increase local taxes to the legal maximum.

The circumstances outlined above allow us to easily admit that the probability for a local authority in bankruptcy to reach a situation of real and tangible rehabilitation is very difficult without a consistent activity of "support" at State or Regional level.

The problem is that we need to reflect jointly on these two aspects:

- it is vital to assist local authorities in difficulty by a Regional or State support;

- it is important to avoid systematic safeguards action, to encourage a real and long-lasting recovery will.

The Italian Local Authorities Bankruptcy Law has tried to reconcile these two conflicting requirements.

In this direction, Article 119 of the Italian Constitution establishes that:

‘To promote economic development, social cohesion and solidarity, to remove economic and social imbalances, to facilitate the effective exercise of the rights of the person, or to provide for purposes other than the normal exercise of their functions, State allocates resources and performs additional special interventions in favor of specific municipalities, provinces, metropolitan cities and regions.’

It is precisely in the constitutional dictate that we must consider and evaluate rules providing for extraordinary interventions in favor of local authorities in a state of bankruptcy. Thereby, these additional resources would allow, together with the indispensable financial efforts previously described, to reach a real recovery.

It is, therefore, necessary to create a performance reporting to prevent and detect in time any pathological situations, ensuring a growing economic culture in local authorities, which is considered a structural factor to be protected and developed.

The performance reporting can arise as a tool for prediction of the crisis, by comparing estimated parameters and empirical facts. This makes it possible to reveal the onset of the crisis, but also identify its causes, allowing appropriate action to address them (Booth, 1993).

In this way, nowadays, benchmarking experiences are spreading at various levels (Camp, 1991), especially in local authorities, who decide to rework some of the indicators in order to make comparisons.

The benefits that may arise from the implementation of benchmarking techniques in a variety of local authorities (Padovani, 2000), including:

- Formulate realistic achieving goals, as already experienced by other institutions;
- Regular and systematic review process in pursuit of continuous improvement;
- Consensus-building process in the formulating targets;
- Easy identification of critical areas of management.

However, we emphasize that any wrong use of benchmarking can lead to marginal improvements or harmful consequences, given that it requires, of course, considerable money,

manpower and time to be performed successfully. It is important, therefore, to give particular attention to the choice of critical services to be improved, or the identification of benchmarks and performing comparisons.

Ultimately, we can say that it is not easy to come to a complete and unambiguous conclusion on topic of local authorities bankruptcy law.

If it is true that many are betting on the actual value of the recovery process, considering it capable of producing a true 'cultural revolution and modernization of the bureaucracy' favoring 'the establishment of collaborative relationships between Central Government and local authorities' (Danielli and Pittalis, 2010), we found a widespread view (including that of many "experts") who are opposed to the same evaluation of this tool.

In support of positive evaluation there are mainly empirical findings related to some statistical analysis on bankruptcy phenomenon (Figure 1).

However, many evaluate the effectiveness of the recovery process very differently.

In this case, the most effective argument used is represented by another empirical fact: many entities in bankruptcy are back in a new situation of financial default. For example, Arpaia (in the Province of Benevento), Lungro (in the Province of Cosenza) and Soriano Calabro (in the Province of Vibo Valentia).

The key issue is try to determine whether they are simply exceptional cases compared with a prevalence of stable rebalance, or examples that demonstrate the ineffectiveness of bankruptcy Law to produce a real recovery. In this perspective, the procedure would be seen not as a definitive solution, but as a mere palliative, because it can only provide a temporary benefit, a "breath of fresh air", to local authorities in crisis.

In this way, probably, is more clearly explain the recent trend aimed at making stronger control over local authorities by the Court of Auditors, by widening of documents submitted to it. In fact, the most significant concerns the power assigned to the Court of Auditors to transmit documents to local Prefect in cases in which occur: if differing behaviors emerge from financial management, or there are accounting irregularities or budget imbalances that can cause bankruptcy, local Prefect may appoint a special commissioner for the

In other words: the prevention would be better than cure.

In this sense, we can express a clear appreciation for Italian Constitutional Law no. 3/2001. It established (unlike in the past) that local authority may use a financial loan only for investment: it achieved the intention to remove the connotation of systematic assistance tool (created by the practice), replacing it with the role of special intervention measure.

These considerations highlight the extreme difficulty in expressing an overall opinion on the topic. So, probably the crucial point is another. Perhaps - I believe - we can argue that it is not possible to express an overall opinion.

Of course we can improve this tool but, at the same time, his exceptional character reduces the need of wanting to make it perfect and flawless in every circumstance, because in view of the complex situations that it is facing, it is very difficult to think about its universal effectiveness.

Finally, it is essential a reflection in the international context.

In Italy local authorities Bankruptcy Law (as previously described) provides an essential function: a local authority can never “fail” because it have to provide its essential services to the community. Even temporarily.

In other countries, instead, the situation is quite different.

In the United States of America, for example, the procedure requires the preparation of a restructuring plan. However, if this is not approved by creditors of the City, the situation is particularly confusing, because the Bankruptcy Judge could impose (in theory) a tax increase, cost cutting and asset sales. But this, in fact, never occurred. In very few cases discussed in the literature (White, 2002), U.S. Courts have rejected the restructuring plans by appealing to the coercive power of local authorities to collect taxes.

Indeed, the U.S. framework is more complex.

New York City, for example, has legislation which provides, in case of financial loss, replacement of the mayor with a special commission and the payment of the deficit entirely by the citizens.

Even more “interesting” is the case of the city of Chicago. On August 17, 2009, Mayor Richard Daley has been forced to declare the “closure” of the City. It is undoubtedly an extreme measure, but necessary, because of lack of funds recorded in the budget of the City and that has allowed, through the imposition of a mandatory day off and not paid, a savings of \$8.3 million.

But there are other examples.

In California, in 2010, the debt reached a record \$24 billion, and so were estimated cuts of \$4.7 billion, but above all, it was decided the closure of most public offices for three days a month [xiii].

Beyond the examples, the comparison with these experiences undoubtedly puts in evidence the social value of the Italian local authorities Bankruptcy Law, capable to guarantee the permanent presence of the Public in providing functions and services to citizenship and, especially, apart from any financial difficulties in which it might incur.

Abstract

The present paper examines the accounting principles relevant to the privatization of state-owned property through the sale and lease of assets under the Greek governmental accounting standards and the International Public Sector Accounting Standards (IPSAS). More specifically we explore the accounting information quality and availability as well as the accounting methods and practices that are adopted in order for an asset's value to be reliably presented before entering in the privatization process.

The comparison analysis reveals crucial differences between the two accounting frameworks in terms of asset recognition and valuation. More specifically, the Greek governmental accounting standards appear to present limited information in the cases of asset registration, measurement after recognition, determination of depreciation charges and assessment of impairment losses, which in turn, significantly affect the quality of the information regarding assets' condition. Even though, the newly Greek governmental accounting system seems to be influenced by the International Financial Reporting Standards (IFRS) and differs, in several cases, from the Greek Accounting Standards for the private sector is does not sufficiently account for information relevant to privatization decisions.

The study explores a very timely issue, that of state-owned property privatization, which is of high interest not only for the Greek government, but also for other countries, which mainly due to the global debt crisis are currently in the process of privatizing state-owned property. We try to shed light on how accounting could assist governments in better informing their decision-making processes.

Keywords: Privatization, IPSAS, modified cash basis, Greece

Introduction

During the last thirty years public sector accounting has undergone considerable changes the most significant of which may be considered the general trend towards migrating to accrual accounting (Christiaens and Rommel, 2008; Carnegie and West, 2005). Within this realm, several stakeholders ask for high quality accounting information in order to inform their decisions and accounting standard setting bodies had developed standards aiming at satisfying their needs. Nevertheless, there is not yet a unanimous view on which accounting standards or paradigms better suit the public sector (Lapsley et al. 2009). In this paper we focus on the possible effects of accounting on privatization decisions.

The Greek government has recently decided to proceed in privatizing part of the state-owned property. Apart from the public utilities that are to be sold, the privatization program includes the sale and lease of several assets (land and buildings). In order for these transactions to result into beneficiary outcomes to the government and consequently to the public, the use of proper accounting methods is necessary. Especially when it comes to issues that precede the sale or lease, such as the asset's identification and valuation, which are considered to be particularly problematic in the public sector (Blondal, 2004). Several cases of underpricing and undervaluation during the process of privatization have been witnessed internationally (Grout et al, 2004). As stated by the International Consortium on Governmental Financial Management (1997), the absence of the appropriate accounting framework could result in failing to generate the desired results from the privatization. At the same time, potential investors/buyers demand accounting information of higher quality and reliability, before deciding to proceed to investments, and the public demands transparency in every transaction. Consequently, in cases of sale or lease of state-owned assets, the quality of the accounting framework, deriving from the accounting treatment and the relative disclosures, is of crucial importance for both central government and investors.

The present paper analyses the accounting framework related to privatization of property, through the sale and financial lease of assets. This study however does not examine the accounting treatment during the process of privatization, but it rather explores the accounting information quality and availability, and the accounting methods and practices that are adopted in order for an asset's value to be reliably presented, before entering into the privatization process. Having privatizations as the starting point, the following issues are examined: the asset's initial recognition and measurement after initial recognition, the depreciation charges and impairment losses, the treatment of finance lease and sales and leaseback and the provided disclosures.

More specifically, a comparison is conducted between the existing accounting methods adopted by the Greek central government, and the accounting treatment under International Public Sector

Accounting Standards (IPSAS) for the same issues. The purpose is to compare Greek governmental accounting practices and disclosures to accrual (IPSAS) that are considered to promote best accounting practices in the public sector (IFAC, 2011). The importance of the analysis presented in this paper lies on the fact that the Greek government has recently adopted the modified cash basis of accounting. We strongly believe that the examination of the two approaches in contrast will reveal significant implications for governmental decision-making. These implications could have a particular value for other countries which apply a similar to the Greek, governmental accounting system, and which might (or already) face an urge to proceed in privatizing state-owned property. Additionally, the European Commission's (E.C.) decision to assess the suitability of IPSAS for the member states until the end of 2012, gives another dimension to the examined issue.

The rest of the paper is organized as follows: in the next section the special characteristics of governmental accounting and the two accounting systems of IPSAS and GGAS are presented. In section three the comparison between the accounting treatments for property is conducted. We finally conclude with remarks and future research proposals.

Literature Review

Governmental accounting has to satisfy the needs of a number of different users (Hernández and Pérez, 2004). Internal users of financial information include, among others, politicians, public managers, employees while external users include citizens, voters, taxpayers, suppliers, banks, rating agencies. These users should be able to base their decisions on reliable and relevant information about the financial position, financial performance and cash flows of the government. According to the National Centre for Education Statistics (NCES) (2003, p.27) in order to meet the varied needs of this wide range of users, governmental accounting has to "provide more relevant information that will result in greater accountability by state and local governments and enhance the understandability and usefulness of the annual financial reports to users of these reports to enable them to make more informed economic, social, and political decisions".

Nevertheless, governmental accounting presents fundamental differences between -and within- countries (Grossi and Soverchia, 2011). These differences range from the recording systems to the measurement rules and the disclosures (Luder and Jones, 2003; Jones, 2007). Traditionally, countries like the United States, Australia, New Zealand, U.K. and Ireland are characterized as oriented to the Anglo-Saxon approach, and their accounting for the public sector is influenced by the privatistic model. On the other side, continental European countries like Germany, France, Portugal, Italy, Spain and Greece adopt a different orientation, where the influence of the private sector accounting is basically absent (Grossi and Soverchia, 2011). Depending on the specific needs of different countries, four different bases of accounting have been developed and adopted. The cash basis and

the accrual basis of accounting constitute the two opposite poles, while the other two bases that are recognized in between are the modified cash basis and the modified accrual basis of accounting.

Accrual accounting in the public sector

According to Christiaens *et al.* (2010) accrual accounting was introduced to improve the financial information system of public sector entities. In general, under accrual accounting, transactions and other events are recognized when occurred and not only when cash is received or paid. The International Monetary Fund (IMF, 2001) considers the accrual basis as superior compared to other models, since it is more comprehensive and consistent. Moreover, accrual accounting is considered to improve comparability of the financial performance between jurisdictions and provide a greater accountability of public resources, as the financial data will become more transparent (Guthrie, 1998, Christiaens *et al.*, 2010). The accrual financial statements are viewed as simpler and easier to understand (Ball *et al.*, 1999; Brumby *et al.*, 1999), and harder to manipulate (Buti *et al.*, 2002). Furthermore, accrual financial statements are believed to provide a richer set of information for analyzing the sustainability of fiscal policy and the quality of fiscal decision-making (IMF, 2001). More specifically, accrual accounting provides disclosures in supplementary notes, which include information on contingent liabilities and commitments (IMF, 2001b), provide a longer-term perspective for judging policy impacts (Athukorala and Reid, 2003) and better information for managing liquidity (IMF, 2001). All the above are believed to lead to better information for planning, financial management and decision-making (Athukorala and Reid, 2003; FEE, 2007).

The IPSAS

The IPSAS project was introduced in 1996 and is heavily influenced by the International Financial Reporting Standards (IFRS). Although IFRS were issued for the private sector, they are reviewed and amended so that they can be applied to the public sector. However, a lot of debate has been taking place whether standards that were developed for the private sector are suitable for the public sector (e.g. Chan, 2003; Christensen, 2007; Johansen and Lapsley, 2005). The IPSAS Board though, supports the notion that the ultimate objective of financial reporting is the same for both sectors. Moreover, many international organizations which promote sound financial management and accountability (e.g. OECD, NATO, United Nations, European Commission) and support the modernizing of the financial information system, have adopted an accrual accounting system compliant to IPSAS (Harthorn, 2008; Christiaens *et al.*, 2010). Despite this support, though, Christiaens *et al.*'s (2010) survey concluded that IPSAS do not play a significant role in the majority of the local and central government accounting reforms in Europe. What is more than that is the fact that many of the examined countries that are planning to introduce accrual accounting, are not going to use IPSAS. According to International Federation of Accountants (IFAC, 2008) although

accrual accounting practices are spreading within the public sector, the majority of the governments adopting IPSAS, choose the cash basis IPSAS. Nevertheless, although IPSAS provide a more uniform, transparent and commonly accepted standard that could help the public sector to operate with integrity and professionalism (UNESCO, 2008) there is still a lack of empirical research that would indicate that the benefits of a transition from the cash to the accrual basis, outweigh the relative costs (Wynne, 2007).

The Greek governmental accounting model

The Greek government has recently adopted the modified cash basis of accounting. The Presidential Decree that governs the accounting standards for the central government passed on March 2011 and is effective from the 1st of January 2011. Previous to that, the accounting basis used by the central government was the cash basis of accounting. According to the Greek Ministry of Finance (Budget 2009, p. 105), the basic advantage of preparing the financial statements under the cash basis of accounting is the reliability of the provided data, since the latter derive from transactions (receipts and payments) that are measurable and unchallengeable. But this is not the whole truth. For example, public hospitals accumulated arrears to suppliers around 1.3% of the Greek Gross Domestic Product (GDP) over the period 2001-2004 and 1.6% of Greek GDP for the period 2005-2008 that were eventually assumed by the government (OECD 2009, p.69). By the end of 2009 the arrears to suppliers by Greek hospitals was about € 5.6 bil. This amount approximates to 2.4% of Greek GDP (Budget 2011, p. 115). The corresponding expenses were not evident in the cash budgetary system. Therefore the financial statements could have been easily manipulated even under the cash basis of accounting.

Greek government following recommendations made by international organizations (IMF, OECD) regarding the modernization of the governmental accounting system, resulted into adopting the modified cash basis in 2011. Nevertheless, many institutions of the public sector, including local governments, institutions of social security and public hospitals had to apply accrual accounting which was introduced by sectoral accounting plans for years.

At first it is very important to distinguish between the cash basis and the modified cash basis. The modified cash accounting system recognizes transactions and other events on a cash basis, but also takes into account the unpaid accounts and the receivables at year's end, by keeping the books open for about a month after the end of the year (IFAC PCS, 2000). The modified cash basis captures all financial assets and liabilities and the flows related to such assets and liabilities, but excludes physical assets (current and non-current) and also all intangible assets. Therefore depreciation and amortisation are excluded and replaced with the actual cash flows involved in acquiring and

disposing of assets avoiding thus, major complexities of the generally accepted accounting principles (Hiltebeitel, 1992).

According to literature (Hiltebeitel, 1992; Parry, 2010), the modified cash basis presents several advantages, since it is broadly in line with the approach currently adopted by most governments, extending common practice by also identifying and disclosing additional information (on government borrowing and lending and on current and contingent liabilities), which are required for fiscal management and for control improvement. At the same time, many of the technically complex issues of valuation and measuring flows associated with the application of full accrual are avoided.

More specifically, the Greek Ministry of Finance (Budget 2009, p.108) highlighted as the most important advantages of the newly adapted method the fact that the modified cash basis transfers in a future period several of the problems that many of the countries, which tried to modernize their fiscal management through the adoption of accrual accounting, had -and might still have- to face. Such problems mostly refer to the initial registration and valuation of assets of the central government, as well as the amount of the accumulated receivables and liabilities of the Greek public sector.

Accounting for State-Owned Property

In order to compare the provisions found in the GGAS to the IPSAS in relation to state-owned property, we focus on IPSAS 17 (Property, Plant and Equipment) and IPSAS 13 (Leases).

State assets' identification and valuation, is often the most time-consuming and difficult task, since governments have traditionally not kept accurate and up to date registers of them (Blondal, 2004). Greece could not be an exception from the rule, since, according to the Bank of Greece (2010, p. 182), "the Greek government does not know the exact size of the state-owned property, mainly due to the non-existence of a complete and accurate cadastre."

Asset's measurement

The most significant issues that arise when comparing GGAS to IPSAS in terms of assets' measurement could be summarized in the following three directions: The registration issue, the revaluation issue, the depreciation and impairment assessment issues.

Regarding the registration issue, unfortunately, none of the two accounting systems provide guidelines for the accounting treatment of complicated cases, such as the violation or claim by third parties, of the state-owned property. More specifically, as already mentioned Greece does not have a complete and accurate cadastre. What is more than that is the fact that the non-existence of a cadastre for the public property has led to a continuous violation of the property by third parties,

while, the long lasting legal claims block the exploitation of a great part of the property (Bank of Greece, 2010). According to estimations conducted by the Hellenic Public Real Estate Corporation in 2009, only 13.47% of the public assets are entirely free, while the 40% is violated and the rest of the property is engaged to other legal and/or technical issues. According to ELIAMEP it appears that the majority of the Greek state owned non-financial assets counts somewhere between 70.000 and 110.000 pieces, are engaged with complex legal and technical issues, and thus cannot be exploited (ELIAMEP public debate, 21.02.12).

Subsequently, it is very difficult to estimate the value of the Greek public property. Former estimations, present a total value that ranges between 270 and 300 billion euro, although IMF's 2009 report (IMF, 2009) provides an indirect estimation of the Greek state-owned property by calculating the public sector's net capital stock (the sum of all buildings, highways, infrastructure, land, etc.) at approximately 124 billion euros. Nevertheless, according to the chief executive of the Hellenic Republic Asset Development Fund (HRADF), due to the previously mentioned difficulties there is no reliable estimation of the public property's value (ELIAMEP public debate, 21.02.12).

For those assets that have been normally registered, the initial recognition under both systems is at historical cost. In cases where an asset is not registered, GGAS distinguishes two cases: assets with significant value are recognized at fair value estimated by certified valuers, while assets of insignificant value are registered at nil value.

An important difference between GGAS and IPSAS arises when it comes to the revaluation issue. Concerning P.D. 15/2011 no reference is made to measurement after initial recognition. On the other hand IPSAS 17 allows two alternative models. The cost model defines that an asset shall be carried at its cost less any accumulated depreciation and impairment losses, while the alternative, revaluation model, allows the systematic revaluation of the asset, in order to ensure that the carrying amount does not differ materially from the fair value.

Moreover, under the modified cash basis of accounting adopted by the Greek government, no depreciation is conducted except for these cases related to 'expenses of perennial depreciation'. IPSAS 17 recognizes depreciation charges and defines the allocation of the depreciable amount of an asset on a systematic basis over its useful life. Concerning the existence of any impairment losses, P.D. 15/2011 does not provide any requirement to assess whether there is an indication of impairment. On the other hand, IPSAS 17 defines that an entity shall assess at each reporting date whether there is any indication that an asset may be impaired. Either IPSAS 21 "Impairment of non-cash generating assets" or IPSAS 26 "Impairment of cash generating assets" will be applied depending on the nature of the asset, but only for the assets that are carried at cost, since the assets that are carried at revalued amounts do not materially differ from their fair value. Finally, P.D.

15/2011 provides a significant amount of requirements concerning disclosures, which are the same with IPSAS's requirements. Surprisingly enough, the requirements for disclosures include information about revaluations, depreciation charges and impairment losses, for which no reference is made throughout the rest of the P.D. 15/2011 text.

The importance of the differences between the two approaches, and the complexities which could arise, can be further highlighted by providing a very simple example. Let's assume that the state had constructed a building Y years ago with a construction cost of X euro. During year 20XX the building is included in the privatisation programme. According to GGAS, during the Y years no depreciation is charged on the building cost and furthermore no impairment test is conducted. And of course, no revaluation is conducted. Since there are no accurate data of the asset's current value, an estimation has to be performed by certified valuers in order to conclude about its value. It is obvious that the government does not possess any type of reliable information, from the asset's records, regarding its value, and therefore a misjudgement about its value is likely when deciding to privatize the building.

On the other hand, if IPSAS 17 were applied, after the initial recognition the government would be able to decide whether to use the cost or the revalued model for the purposes of measurement after recognition. In the first case, the depreciation charges would have been counted during the Y years on a year basis. Furthermore, the depreciation method, the residual value and the useful life would have been reviewed systematically. Moreover, the asset would have been tested for impairment losses, ensuring that at the time of the sale the nominal value of the asset would be reliable and accurate. If the government chose the revalued model, the systematic revaluation of the asset, would again ensure that the carrying amount would not differ materially from the fair value. Both cases provide the government the opportunity to keep track of the asset's value and to have better information long before entering into the sale negotiations.

Accounting for privatisation

The differences between GGAS and IPSAS are not extensive as regards to the registering of the proceeding of the transaction. The privatization of state-owned property can be executed either by disposing the asset by sale or by financial lease. Moreover, as stated in the 2010's interim report of the Bank of Greece, in order to proceed with the utilization of the Greek property, the emphasis should be presently given to modern tools of management, such as the sale and leaseback and lease and leaseback techniques.

Concerning sales, the accounting treatment followed by GGAS, recognizes the outcome of the transaction directly in income. Whether the sale price is above (below) the residual value, the difference is immediately recognised as gain (loss) from asset disposal. IPSAS 17 on the other hand,

does not recognize any revenue, but instead it treats the outcome of the transaction in the surplus/deficit when the item is derecognized.

In the case of lease, GGAS, distinguishes operational from financial lease, and provides specific recognition and measurement requirements for each type. The treatment deriving from IPSAS 13 "Leases" is comparable to what provided by GGAS, although more informative and analytical in some instances. The disclosures that are required regarding finance leases are the same for both accounting models.

The P.D. 15/2011 recognises four different cases for the sales and leaseback commitment. The accounting treatment is similar for the two accounting models. The estimation of the fair value necessary for assessing the values of the asset to be the subject of a financial lease is conducted by certified valuers.

Conclusion

The scope of this study is to explore the accounting treatments suggested by the P.D. 15/2011 and IPSAS in relation to privatisation of property by sale and financial lease. It aims at comparing the Greek practice with the relative accounting promoted by the IPSAS. IPSAS are considered to promote best practice from the international experience in the form of guidelines, and thus we believe that they constitute an interesting benchmark to the Greek governmental accounting standards.

Although the modified cash basis developed in Greece turned out to be influenced in several cases by the IFRS, the brief overview of the two accounting bases, presented above, highlights the substantiality of their differences. When it comes to the issue of privatizing a state-owned asset, either by sale or finance lease, the differences between the two approaches are crucial, mainly to what is related to the recognition and valuation of the assets.

It is evident that the accounting treatment as described in GGAS for state property is neither useful nor informative for privatisation decisions from several fronts. Therefore, Greek accounting standard setters and policy makers should take into account the provisions of IPSAS in order to improve the information content of the disclosed data related to state-owned property. Such an approach coincides with the philosophy applied so far as to the development of GGAS. In several parts of P.D. 15/2011 the legislator has borrowed principles from IFRS or from Greek Accounting Standards applicable to the private sector. Accounting information could become a powerful tool to the hands of Greek government in order to proceed with exploitation decisions for the private State property that would be beneficial for the public economy and therefore the citizens. Relying solely on ad-hoc valuation of property only in cases that an asset is to be sold does not help towards

registering the value of state –property that would help Greece to enforce its bargaining position during public debt negotiations. Moreover, this valuation is not technically, at least in principle, difficult to be performed as the state property under question does not include heritage assets or collections which in the international literature (e.g. Carnegie and West, 2005) consist controversial issues

Nevertheless, although IPSAS appear to be significantly more informative compared to the Greek standards, there appears to be an information gap on the issue of registration. The Greek cadastre is considered to be incomplete and inaccurate and the grand majority of the state-owned assets are unknown, violated and claimed, leaving only a small percent of registered assets (Bank of Greece, 2010). Therefore, we believe that guidelines on the accounting treatment of such cases provided by accounting standards would be very helpful in order for the state to keep track of a potential part of the state property. After all, the “Registration Guidebooks” issued for the local and regional governments provide specific provisions for each of these cases.

As a next step, we believe that by conducting interviews with executives who hold key positions in the central government we will gain a better understanding of certain choices of the government and different perspectives on the treatment of the examined issues may be revealed. Moreover, we believe that the analyses of the way other countries have proceeded in registering their state property and overcoming legal problems like the ones Greece experiences will provide useful input in deciding the most proper way to move on dealing with them.

Abstract

In this paper we study the effects of Emirati culture on the buying behavior of cosmetics for women in the UAE. We argue that cultural categories act as stable parameters in which national identities are constructed by facilitating recognition and assimilation of established values. Little research, however, has been done in knowing what constitutes the process of institutionalization of new cultural categories or in other words, how new values enter traditional categories. We address this gap in research by offering an in-depth study of how Emirati women portray their identity through the use of cosmetics and more specifically Western brands. The foundations of the different perspectives in marketing research addressing the complexities and the dynamic relationships between consumer actions, organizational performance and cultural meanings are set as a conceptual framework of reference. We show that through the use of Western brands in cosmetics eventually Emirati women prefer to focus on aspects related to eye and lip make-up, following international trends while also remaining faithful to the predicaments of Islam. We conclude by highlighting how this study confirms the expectations regarding the relationship between the Emirati cosmetics consumption and the transitioning towards Global Consumer Culture Positioning (GCCP).

Keywords: Emirati Culture, Cosmetics, Brand management, Intercultural communication, Consumer Culture Theory

Introduction

“The culture of the past is not only the memory of mankind, but our buried life, and study of it leads to a recognition scene, a discovery in which we see, not our past lives, but the total cultural form of our present life” (Frye, 1973, p. 346).

Professional practitioners as well as scholars in the field of marketing and in particular advertising, and the related social sciences have shown that distinct cultural categories play a vital

role in shaping market strategies as well as successful plans of action (Bartlett & Goshall 1997) (Bartlett & Ghosbal 1997) (Eckhardt 2005) (Frith et al. 2005) (Ghoshal & Nohria 1993) (Grafton-Small 1993) (Cherrier et al.) (Klein 1935) (Souiden 2002) (Meyer & Bernier) (Jarillo & Mart_anez 1990) (Rugman & Verbeke 2003). In what Arnould and Thompson (2005) define as “consumer culture theory” (CCT), the foundations of the different perspectives in marketing research addressing the complexities and the dynamic relationships between consumer actions, organizational performance and cultural meanings are set as a conceptual framework of reference. The main tenet of this paradigm revolves around the heterogeneity rather than homogeneity of culture as a system in which values, norms, habits, lifestyles and basic assumptions are not neatly shared by national groupings but rather represent distributed meanings over a continuum that can nicely create overlaps across populations. In that sense, values are nothing else but propositions which can be compared, contrasted and even opposed. Provided cultural categories influence purchasing behavior, adapting advertising campaigns as well as marketing efforts to the local socio-cultural context accomplishes many things: it generates shared understanding about the identities of products and services and the group of consumers purchasing them (Baalbaki & Malhotra 1993) (Baalbaki & Malhotra 1995); (Jain 1989) (Ozsomer & Simonin 2004) (Sorenson & Wiechmann 1975); it defines boundaries for inclusion that are more easily accessed by actors of the different industries depending on their generic business strategies (Shanklin & Griffith 1996); and it sets the basic expectations of organizational success in complex markets where adoption rates may vary according to compatibility and relevance to the given consumption groups (Ozsomer & Simonin 2004). Cultural categories act also as extremes of the spectrum in which to position unique attributes and competitive sources of strategic significance for companies indulging in global marketing campaigns the impact of culture on consumer***.

Nonetheless, since the seminal piece by Levitt (1983) on the globalization of markets, the debates on whether to standardize or to localize have been raging (Birnik & Bowman 2007a). Recent marketing and organization research on the standardization movement has primarily focused on the difficulties to globalize especially when considering those countries that exhibit distinct cultural values, traditions, religions and economic policies (Barkho 2007a) (Sheth, J. 2011). More studies are seeing the light on the front of the differences that clearly distinguish markets and therefore require market strategies and advertising campaigns to locally adapt in such adhocracies. To just name the principal sources of uniqueness, we consider market heterogeneity, sociopolitical governance, chronic shortage on resources, unbranded fierce competition and inadequate transportation or mass communication media infrastructure to constitute the fundamental characteristics defining the rules of the game in emerging markets versus the more industrialized capitalist societies (Sheth, J. N. 2011).

On the other hand, systematic review of the literature on marketing mix standardization practices in multinational corporations identifies evidence that there are clearly two key benefits to standardization. The initial studies (Levitt 1993); (Douglas & Wind 1987) (Ohmae 1989) focused on strategy anchored around standardized products that would take both advantage of increasingly homogeneous customer preferences on a global scale thus increasing customer base, while at the same time reinforcing brand name and product characteristics. One fundamental argument however remains. We cannot treat all markets in the same way since cultural categories play an important role in the evolution of marketing strategies. The reverse however, also holds true and studies on the impact of advertising campaigns in their local context have pointed to a range of ways in which communication channels bring socio-cultural changes. Having concluded the above, in this paper we are interested in the cultural categories that are affected most by visual advertisements and marketing mix campaigns since one of the key criticisms addressed against the existing literature on marketing standardization refers to the lack of the interdisciplinary studies and we believe that CCT constitutes the right entry point bridging the gap. More specifically, this study addresses three crucial questions: How are new cultural categories established in the syncretic approach offered by the Emirati setting, where traditional and Western values meet? Furthermore, what are the key implications for multinationals in the fast-growing cosmetics industry operating in the oil-rich Arab gulf states? And finally, how does the process of establishing shared meanings in an emerging category relate to the creation of new symbolic forces and boundaries that structure personal and national consumer identities?

To address these questions, we take a consumer-centric approach that studies the relationship between advertisements in the cosmetics industry --- for Western luxury brands promoted in the UAE, which constitute a different contemporary local context identified as a new cultural category in 2012 but focusing on different generational groups. The smallest unit of investigation being the personal identity of an Emirati woman, we find individual make-up and sensory choices to reflect a person's conception of social, gender, and religious identification. Accordingly, cosmetics promote means with which to ascertain one's deeply-seated patterns of personal identity construction and conception of brands.

It is particularly interesting to note that under the broad banner of Islamic teachings, women as well as men should not exhibit sexuality in public. In other words traits that denote one's sex-appeal ought to be veiled or at least not underlined. Clearly, other proscriptions apart from the suggesting attires include tattoos, plastic surgery, wigs or hairpieces as well as, and most significantly explicit make-up and perfume (Belk et al. 2008). We find that Emirati men and women with the growth of petrodollar-fuelled wealth and the profound integration through trade into the global economy have experienced a concomitant shift in discourses on beauty, modernity in the

media and cultural acceptance from the traditional integrity values as well as a new affirmation of national identities. In line with (Kalliny & Gentry 2007a) findings that contrary to common notion, U.S. culture and the Arabic culture are not vastly different, we chronicle how Western luxury and specifically beauty brands have been precursors and significant actors in the transition while quickly capitalizing on the changing scented winds and cultural landscapes. These constructs based on appearance not only delineate modern Emirati styles, but also serve as a basis for judgments on what Emirati society needed to explore, build upon and aesthetically revise for the continued growth and wellbeing of the region. In sum, it provides the ground for a re-evaluation of a larger set of categories that have institutionalized over time and are in the stage of transforming the deeply seated meanings of Arab culture. Analysis of qualitative data expressing the relation between Emirati and Western cosmetics products shows the increasing convergence towards a communal understanding of public consumption that stresses status and wealth, versus a more religious prohibitive constraint which, through this interaction, is rendered less authoritative and more permissive.

THEORETICAL FOUNDATIONS & RECENT RESEARCH

Cultural categories establish meaning systems which in turn affect consumption behavior. Several studies provide strong evidence that advertisements which are congruent with a cultural value system create a higher impact on consumers' responses (Boddeyn et al. 1986) (Treise et al. 1994) Buzzell, 1986. In a nutshell, actors in the markets cannot be engaged in the modern discourses of marketing and advertising campaigns unless cultural categories are devised and respected. Researchers have demonstrated the relevance of the cultural arena in studies that range from wine industry (Zhao 2005), to mutual funds and financial services (Lounsbury & Rao 2004), automobiles (Rosa et al. 1999) and art (DiMaggio 1987) (Khair & Wadhvani 2010). Cultural distance as a category including the cultural and economic factors is considered to be a critical variable in international marketing (Singhapakdi et al. 2001), while paired comparison in cross-cultural research provides useful insights into marketing practice (Albers-Miller & Gelb 1996).

In addition, design parameters specify a possible type of intervention that can be used by practitioners in a determined context in which the decision has to be made. This idea can be assimilated to actionable knowledge discussed by Argyris (1996), whereby the generalization is actionable if it allows users to apply it beyond those settings in which it was initially created. In relation to marketing mix standardization, three design parameters can be highlighted: 1) deciding on the overall approach and then assessing which markets to include; 2) focusing on the standardization of either the marketing processes or the programs; 3) investigating to what extent standardization is to be implemented within the sub-elements of the marketing mix (Birnik & Bowman 2007b). The focus of our research paper, however, lies with the way in which through

adaptation of local marketing campaigns multinational cosmetics brands affect the transition of cultural categories. A clear migration on consumption patterns in the UAE has denoted the emergence of modern behaviors associated with Western lifestyles and this constitutes the core of our analysis over time in relation to the visual stimuli provided by advertisements and the textual content. This research adds to the growing call for research on the contemporary Arab consumers as markets where materialism is exhibited as much as in non-Arab settings (Al-Olayan & Karande 2000) and where there exists a higher level of vanity expressed regarding physical appearance and concern for achievement (Cherrier et al.). In a recent study by the Dubai Chamber of Commerce & Industry (DCCI), women in the UAE spend 38% more on make-up than their counterparts in France, a market and a culture home to the biggest and most popular beauty brands. Only between 2003 and 2010, imports of such product category has risen from \$381 Million to \$1,115 Million in the UAE alone. Dubai is the center and strategic transit hub with its reward-winning Duty Free Stores. Dr. B. Rettab, senior director at the DCCI's Economic Research & Sustainable Business Development sector says that cosmetics in the region and well-being products are often considered a daily necessity, especially when sales are driven by a young population and a sizeable middle class.

With hindsight, it makes sense to acknowledge that despite the disciplinary turmoil undergone in consumer research during the decade of the 80s in the West (MacKenzie & Lutz 1989) (Belk & Pollay 1985) (Belk et al. 1989) (Holbrook & Batra 1987) experiential and cultural dimensions of consumption were neglected, but most importantly became later the source of novel, in-depth insights (Arnould & Thompson 2011) (Peter & Olson 1983) (Zaltman 2000). These missed opportunities in turn became the focus of research informing different constituencies including the social scientific, managerial and public policy communities which were seeking more-socially grounded understandings of consumers' behavior. CCT is particularly interesting for its emphasis on the symbolic aspects of purchasing experiences related to the product's brands, image, and marketing mix that unfold over the consumption cycle, including acquisition, utilization, possession and disposition processes. Over the last two decades, CCT has identified and forged four main research areas in which scholars have sought to avoid the reification error by addressing holistically the purpose of re-evaluating what to know and what is known. We will briefly review these in the interest of those who may not have followed the development of the theory and as an integrative frame of reference for those who have.

Personal Identity Projects.

If we accept the premise that consumer theory roots its concerns on cultural aspects of consumption, whereby business organizations engage customers with their marketing endeavors and in turn, see customers co-produce useful and relevant meaning, then a corollary argument

consists in assuming that people in the process, construct narratives of identity (Belk 1988); (Hill 1991); (Holt 2002); (Levy 1981). Interestingly, this type of projects is goal-driven but the objectives and real motivation of consumers may be tacit in nature, then it is equally important to recognize that they may be interrupted by internal contradictions, ambivalence and ambiguity, points of hesitation and entangling dilemmas. Sometimes they may even be marked by pathology (Hirschman 1992); (Mick & Fournier 1998); (Ozalp 2008). What matters to scholars is the possibility to map positions in the complexity of markets that allow consumers to inhabit symbolic, cognitive structures that offer valuable benefits. The combination of these interactive and heuristic processes produces scripts or stories which reinforce the institutionalization of cultural categories that are enacted on the global stage. (Kozinets 2001) for example examines the construction of meanings and practices amongst Star Trek fans and describes it as “sacralizing articulations” which commit fans’ selves quite heavily in the produced discourses. In turn, it also reveals the affective investment of followers who are hungry for a space in which to consume semi-mythological narratives as by-products of commercialization efforts carried out by business enterprises. **Of particular interest to this study we find the acts of non-conformism ((Holt 2002)) to play a fundamental role in establishing new cultural categories while also placing individuals back into the spotlights of personal sovereignty.** In the UAE, and Dubai more consistently, using vibrant colors to make-up as well as strenuous scents to perfume one-self have turned into non-subversive exhibition of a society geared towards the assimilation of newly shaped and accepted collective perceptions belonging to the process of globalization.

Marketplaces, Malls Cultures and also City Centers

At the intersection between the spaces created by and with customers engaging in marketing stimuli lies the study of what is produced at the meso-level of interaction. A whole group of scholars in CCT have devoted their efforts to unravel the processes with which consumer blueprints are generated and this for the different broad geographical areas of North America, Africa, Asia and Eastern Europe. Interestingly, this stream addresses feelings of solidarity amongst consumers who re-create cultural worlds through the pursuit of similar purchasing habits. Notice that like in the personal identity or “self” projects, the insights in this genre of CCT produce results that revolve around the idea of “neotribalism” (Maffesoli 1996). According to the French sociologist the forces of globalization erode the so-called traditional bases of conviviality and instead encourage a dominant logic of individuality. In such transformative structures, consumers participate in rituals of collective identification while sharing common consumption interests and leisure avocations (Firat & Venkatesh 1995) (Muniz Jr & O’Guinn 2001) that carry more meaning even than the brands themselves (Fournier & Lee 2009).

UAE's culture and sub-cultures, especially in the Dubai Emirate can no longer be considered as a traditional unit of people shopping in small boutiques, *souqs* and local shops. The rapid and astounding rise of shopping malls has offered spaces where to connect and mesh with brands from the remainder of the globe. Multi-cultural restaurants or retail stores like "Les Galeries Lafayette" within those spaces, in this case the Dubai Mall, represent only a sample of possibilities. The retail sector is strengthening and Dubai is vying with London for top spot as the world's leading shopping destination. Whether Mall of the Emirates or the iconic "City Centres" across the region featuring amongst an ever-growing portfolio, real estate experts are guiding investors on the right track.

Accordingly two schools of thought have developed whereby, in the tradition of marketplace subcultures, youth and youth approaches to consumption have been more pervasive. On the one hand, it seems that UAE university students are more influenced by factors of gender, income levels, family size and father's occupation rather than purchasing habits (Simadi 2006). On the other, although teenagers create temporary consumption communities, it is also shown that localized meanings are sought (Kjeldgaard & Askegaard 2006), in stark contrast to the global cultural capital or the dominant lifestyle norms, as the traditional garments and attire denote. Re-negotiation is therefore constantly at play between the styles and systems exhibited by global, iconic brands and the more intrinsic nature of Islamic predicaments embodied by UAE consumers.

Socio-historic Approaches: Is there a Consumer Society & How does it transit through time?

As Arab consumers oscillate within the flows of traditional versus modern value systems, the domain of CCT addressing socio-historic events is concerned with the institutionalization mechanisms informing the consumer society. Class hierarchies, as the core structures in which societies evolve, represent the primary concern. In this vein, post-assimilationist consumer research suggests that local acculturation becomes hypercultural (Askegaard et al. 2005) (Blanchflower & Oswald 1999), rendering the quotidian (costume, Arab foods, crafts and music) consumable, in other words part of the meta-system in which transactions occur. **Our study reinforces this view by seeking to provide evidence around the concept of assimilation of cosmesis as a means to enhance UAE culture and elevate it to the standards of global requirements, whereby wealth attitudes are revealed rather than veiled.** Accordingly, the concept of materialism and vanity associated with the bestowing of bodily beauty is of particular relevance to cultural categories as they have been historically affiliated to Western values ((Burroughs & Rindfleisch 2002) (Mick 1996) and need special attention in the context of how institutionally, these become integral parts of a new Emirati identity.

Ideologies of the Mass Media Embedded in Consumers Behavior

Islamic identity is certainly fundamental under this approach whereby ideologies are considered large sets of values and norms affecting material realities. Folklore and popular culture texts represent the sources of ideals which are adopted as much as they are coveted by viewers and listeners of these mall-marketplace narratives.

With Islam acting as the binding factor, the culture across the entire Middle East can be said to be very much similar. The adaptability and acceptance of other women from the region to Western cosmetic trends has thus been facilitated by this general ideological framework in which the UAE has immersed itself since it decided to go global.

For the purposes of this research and in seeking to demonstrate Hypothesis 2 described in the methodology, we showed to our interviewees four images of elegantly made-up women. See Collage-1 below. These were selected from cosmetic advertisements in local fashion magazines which portray different ethnic styles related to make-up styles that clearly differ in their characteristics. In addition, these photos got edited to eliminate all brand names of the marketed products.

Collage-1.

What we found is that the most preferred image for ladies originating out of other Middle Eastern countries was image #4. This specific representation of beauty is noticeably more akin to international make-up trends and is diametrically opposite to the make-up style of Emirati ladies. However, the next preferred image was image#2, the one that was popular with the Emirati ladies. In case of the Emirati ladies, the next preferred image was image # 4. This could be attributed to the fact that the younger generation of the Emirati ladies are now not only opening up to the western cosmetic brands but are also embracing western cosmetic approaches. Test Statistics, provides the actual result of the Chi-Square Goodness-of-Fit test. We can see from the numbers that our test statistic is statistically significant: $\chi^2(3) = 18.290, p < .0005$. See Exhibit-B. We can, therefore, reject the

null hypothesis and conclude that there is a considerable relation between culture and women's preference towards the complexion of the model. Majority of Emirati ladies selected image #2, even though image #1 had a make-up style that the Emirati ladies could perfectly relate with. Finally, this shows how a multi-layered system of aesthetic values is being understood, processed and then lifted to relatively new systems of global interaction.

CONTEXTUAL FRAMEWORK FOR CULTURAL CATEGORIES IN UAE

There are many misconceptions about doing business in the Middle East and it's only by doing your own research and by actually experiencing it for yourself that you can begin to break down some of the myths and stereotypes that surround Middle East culture which after all, is so diverse that one country's approach to business is likely to be somewhat different from another's. As an example, take the prohibition in the Kingdom of Saudi Arabia for women to drive compared to the easiness with which a European lady can access to an Emirati driving license. Amongst the more culturally fundamental values eliciting curiosity, the importance of Islam holds a predominant position. The Islamic faith is not simply restricted to times of prayer. On the contrary, it transcends all areas of life in the Islamic world including values, guidance on how to conduct your life, community relations and the way in which people do business, as well as what is acceptable and what is not in terms of attire and embellishments, including cosmetics and perfumes. One needs to firstly understand that Muslims are obliged to pray five times a day and whilst some Muslims do not necessarily pay a daily visit to a mosque to do this and will pray in the home or office, any commercial activity such as ads times will still need to be planned around prayer times.

From doing business in the Arab world to embracing the role of cosmetics and their changing significance over the years there is only a thin line. Traditional modes of using make-up in fact originated during the Middle Ages when the women of Europe borrowed from the cosmetics first prepared by the Egyptians, Syrians, and Phoenicians. Some of these included lipsticks, nail polishes, eye shadow, eye liner (kohl), perfumes and powders, hair dyes (henna), body lotions and oils, even wigs. A symbol of the vanity of the medieval ladies of European courts was the high peaked, pointed cap with its trailing veil of silk. Much of Western contemporary jewelry also is a result of inspiration from adornments of the ancient and medieval Arabs (Al-Sadi et al.). By highlighting participants critical interpretation of today' Western beauty brands' meanings this study extends prior theorizations that construe consumer activism as an ethos founded on the Quran, the understanding of good citizenship and the will to reconcile apparently incongruent cultural propositions under the banner of global citizenship.

Modernism within Traditional Heritage

Traditional societies are considered to be static, with relatively little specialization, low levels of urbanism and literacy, while also supporting themselves on hierarchical structures and authoritarian political styles (Cheng & Schweitzer 1996), in opposition to modern societies bound by a focus on democracy or high citizens' participation. By this description, overall Arab societies although not homogeneous, can be considered traditional in many respects. Hospitality is a core concept exhibited by such culture whose century-long Bedouin tribes have been known for graciously inviting the foreigner into their generous offerings. In addition, heritage is fundamental and based on the precept that the Quran is immutable over time as well as intrinsically intertwined with any Muslim's life. Accordingly, one would expect the focus on the past to be more prominent in Arab culture, which could be the case for some countries but not for the UAE and their constant emphasis on futuristic visions of what the seven Emirates will become. This transformative effort can be read repeatedly in Government's messages. This excerpt from the document on *Vision 2021* is illustrative:

Emiratis will be confident citizens, steadfast in carving out their **future** in a spirit of entrepreneurship and responsibility, engaged in the course of their nation and embracing moral values for richer fulfillment.

In many surprising ways, the emphasis on work ethic and moral concerns as integral part of a future to come where clenching to tradition for the sake of it completely disappears, nicely dovetails with a Western, whether American or European, world-view. Modernity and progress are highly valued in the UAE. In the publication of "The Rise of a Nation" (2011) Arabic images and footage from the UAE have been collected under the banner of Gulfimages.com to precisely graphically record the fast changes experienced in all realms, from architecture, to engineering, commerce and trade and social or political arenas. In it, Senior Gulf News editors Francis Matthew and Najla Al Rostamani recount the process of compiling the images that are showcased in the stunning Gulf News publication. This amazing photo book tells the story of the United Arab Emirates through 1600 photographs captured over 30 years and clearly demonstrates the important structural and aesthetic transformation undergone in the UAE.

METHODOLOGY

A total of 69 usable questionnaires were obtained from surveys administered to Emirati women between February and March, 2012. We selected a right mix of local Emirati women and women from other Middle Eastern countries. Ideally, we wanted a higher proportion of local women in our survey which eventually comprised nearly 50% of our respondents. There were also a few

respondents from other countries like India and Malaysia, who formed a very small fraction of the overall pool of respondents.

For our survey, we made an attempt to target women from different age groups. This has helped us get a holistic and truly representative picture of the perception of the local Emirati women towards cosmetics. However, our inability to converse in the local language was an obstacle. Hence, the younger college-going generation, who we could communicate with, formed a major portion of our respondents. Respondents were aged between 16 and 34, 18% were younger than 18, 65% was spread almost equally for those between 18 and 21 and 21 and 25, and women above age 28 formed a small percentage of 10% only.

The survey was not restricted to the rich and affluent Emirati women. Rather, the views have been incorporated from the low and mid income groups as well. The dominant income range for our survey was 15–20,000 AED per month (approximately between 4.200 and 5.500 USD), yet 22% of women were having monthly family income of less than 10,000 AED (2.800 USD), with an equal percentage constituted from people with an income between 10-15,000 AED (2.800 and 5.500 USD), 32% were in income bracket of 15-20,000 AED, 17% comprised from 20-25,000 (5.500 and 7.000 USD) and a small segment of 7% above monthly income of 25,000.AED.

The results showed that nearly 65% of the respondents preferred Western cosmetic brands over the local brands. This clearly implies that Western cosmetic brands have gained popularity amongst the local women. According to an expert interview, the brand advertisements worked only as a retention tool and not as an influencing factor for the buying decisions of local population. However, opinion about advertisement influences the buying decision was shown by nearly 50% of the respondents.

The main question body consisted of several Likert scale based questions. The respondents had to answer whether they agreed, disagreed or were neutral to each statement. The responses were then recorded and tested for factor analysis. The initial number of factors was the same as the number of variables used in the factor analysis. However, not all 14 factors were retained. In this study, only the first four factors were used.

In order to decide how many components to retain and which items to keep within each component, the communality of each item was checked to see how it contributed to the extraction of factors. Extraction method was a principal component analysis (PCA) with rotation method as Varimax with Kaiser normalization. The cut-off point was fixed at 0.6 for item extraction to judge the item as having a high communality and worth retaining. If the item extracted was less than 50% (i.e. communality less than 0.5) it was rejected from the outputs. Second, the percentage of the explained variance of each of the extracted factors was examined to decide on the number of factors

to retain. Finally, the loading of each item on the factors retained used to decide on the number of items to use for each factor was verified.

The cut-off point was fixed at 0.5 for item extraction to judge the item as having a high communality and worth retaining. If the item extracted was less than 50% (i.e. communality less than 0.5) it was rejected from the outputs. Likewise, we fixed the cut-off point of 0.55 for the loading of the item on the factor retained. Items with loading of less than 0.55 were rejected. Fixing a high cut-off point for item loadings on factors was necessary especially for scale items like the ones used in this research. Kaiser-Meyer-Olkin Measure of sampling adequacy came to be 0.689, and Bartlett's Test of Sphericity shows level of significance was much less than .05. See Exhibit-A. The items retained and the content of the components were then further used for testing the following four hypotheses.

Hypothesis #1: There is a positive relationship between the consumption of facial color cosmetics by an Emirati woman and the influence of her social circle.

Emirati women are astute and experienced shoppers. The social circles in which they engage highly affect the way these women shop. It is also quite clear that there is a strong connection between the younger generations who wish to demarcate their inclusion in the latest fashion trends showing a noticeable interest in the inclusion rather than segregation, from what takes place on the scene of fashionable beauty, stylish expression of aesthetic values and modern lifestyles. This is why most mothers take interest in every opportunity to educate their daughters in the best ways to shop, including recommending versus condemning brands. In that sense, society and social circles give utilitarian tips that motivate purchasing behavior and become a clear case of word of mouth that constantly keeps communication going round. While this generation becomes more and more comfortable with shopping habits, companies need to get closer to them by providing focused offerings, especially in fashion, health and beauty products and services. Emirati women are also superb communicators and share their shopping experiences with their friends, whether in person or online on the many Arab media platforms. Accordingly, in order to validate these perceptions, a few questions relating to susceptibility of informational and normative influence with friends, enjoyment of shopping with relatives, in turn related to sentiments towards shopping tendency, were asked. We rated them on Likert scale from 1 to 5.

Social circle influencing buying decisions in cosmetics was strongly shown by approximately 49% of Emirati ladies. In this case, the respondents agreed with each question and every question related to the importance of the social circle. Then there were 31% of the Emirati ladies who said they were neutral to the influence of social circle with respect to their buying decisions. In this case, respondents agreed with certain questions while they disagreed to or were neutral to some other

questions. Thus the net result rendered them neutral towards the social circle and its importance. Lastly, 19% of the Emirati ladies strongly disagreed to the fact that social circle had any influence on their buying decisions. In this case, the respondents either disagreed to or were neutral to every question. Thus the net negative effect of these respondents resulted in them being independent minded. We conclude that the hypothesis was proved and show there is a positive relationship between the consumption of facial color cosmetics by Emirati women and the influence of their social circle.

Hypothesis #2: There is a positive relationship between the consumption of facial color cosmetics of an Emirati woman and her perception of beauty portrayed through images.

As discussed above, this hypothesis was proved and it constitutes a solid piece of evidence in favor of the importance for organizations to pay heed to word of mouth as well as to use assimilative values from the West. Something we will take further into the discussion. Hereby, a description of the images:

Image1: The image had a model with loud and heavy eye make-up and lip make-up. This was similar to the make-up style of the Emirati ladies. However, the model had a darker complexion as compared to the Middle Eastern ladies.

Image2: The image had a model portraying a make-up style that was exactly similar to the style of the Emirati ladies. The model selected for this advertisement had facial features and complexion that were similar to the local ladies, but was not a Middle Eastern model.

Image 3: The advertisement had a Middle Eastern model but the make-up style used was very different. It did not have heavy eye make-up or lip make-up. There was no particular feature of the face that was standing out in the image.

Image 4: The advertisement had a western model and exhibited a make-up style that was very different from the one the local ladies have. The make-up style bordered on the lines of a natural look but still had different facial features standing out.

Hypothesis # 3: An advertisement that addresses the health concerns of a woman has a positive co-relation with the consumption of the facial color cosmetics by an Emirati woman.

See Exhibit-D. To prove this hypothesis, Likert scale based questions (1, being strong inclination towards health concerns) helped us understand if scientific claims had a positive impact on the buying decision of Emirati women. The two questions that were used to prove this hypothesis were:

- I prefer cosmetics that are backed by “scientific claims”

- I tend to purchase products that are “Allergy Tested”

These questions then came together to form a factor. A two sample analysis was then run on the data based on the respondent's age. See Exhibit-A.

The first sample included responses from women who were below the age of 28 years. The second sample included respondents who were above the age of 28. The two samples were run at a significance level of 95%. $t(67) = 2.5173$, $p = .0071$.

Participants below age 28 ($M = 2.645$, $SD = .893$) than those with age above 28 ($M = 1.783$, $SD = .267$). The results stated that the age group below the age of 28 years was neutral to scientific claims, i.e. that scientific claims in advertisements and product information or allergy tested products would not influence their final buying decision. The second sample tended to agree that they would be influenced by scientific claims and would be influenced to buy products that were scientifically backed.

Through our survey we also tried to understand the brand consumption pattern of the local women in three different segments and the result of each of them are shown in Table-1. In addition, according to the expert interviews, Emirati women spent maximum in the skin cosmetics segment. The main products are foundation, concealer and powder. MAC was a clear winner in this segment with the highest number of votes, followed by Clinique and L'Oreal. After skin cosmetics, eye cosmetics are next most heavily consumed. The main products in this segment are Kohl (Kajal), eyeliner, eye shadow and mascara. In this segment there was a close competition amongst MAC, L'Oreal and Christian Dior with MAC topping the segment by a small margin. Finally, the experts say that lip cosmetics are the fastest growing sector in facial color cosmetics. The main products in this segment are lipstick, lip gloss and lip liner. MAC again was a clear winner in this segment with no other brand in close competition.

Hypothesis #4: There is a positive co-relation between the spending on facial color cosmetics and the ageing of an Emirati woman.

This hypothesis was run based on our literature study and our expert interviews. They stated that as women age they consume more of cosmetics, thus spending more on the purchase of facial color cosmetics. To prove this hypothesis we ran a cross tab analysis, based on the usage of cosmetics and spending on cosmetics as one base parameter and compared this with responses from different age groups.

Exhibit-C: When readings these computations we are interested in the results for the Continuity correction. We can see here that Chi-square (1) = 26.398, $P = 0.049$. This tells us that statistically there is significant association between Age and Consumption. That is consumption of cosmetic for

Emirati women get affected with changing age, but we reject our hypothesis, as it is higher within age 18 to 25 and subsequently reduces with advancement of age.

The results of the cross tab analysis showed that as the Emirati woman ages, her spending on facial color cosmetics decreased. Her frequency of shopping also saw a dip and so did the usage of facial color cosmetics.

QUALITATIVE ANALYSIS

Data and Methods

Content analysis is considered to be most appropriate in applying a methodology meant to examine whether patterns in visual media support the research questions. We focus primarily on two aspects of the ads --- first, we seek to collect information about the categories that relate to cosmetics, perfumes and the relevance of the attributes of these to the notions of beauty, luxury and social success. Due to the nature of the research, however, we then investigate the presence of categories that have to do with the traditional versus modern content of the ads.

Advertising is considered the most visible component of the marketing mix to the vast public, whereby figures support this statement. Coulter (2002) indicate that on average U.S. consumers are exposed to between 3,000 and 5,000 advertisements, and most of the time consumers feel overwhelmed by the cluttered messages. This arguably involves addressing the issue of advertising as having two broad effects on society: an economic and a social impact. In the UAE, as reported by Barkho (2007b) the advertising cycle indeed exaggerates the economic cycle impacting growth rate of ad spend across to three to four years. Advertising revenues, particularly in this part of the Middle East, are projected to surpass current figures while the trends in the Cosmetics Industry already underpin buoyant growth of consumption.

With it, the need for media support is visible in the structural developments implemented in the broadcasting industry, whether in the print media as favorite display, television and radio, and online with the technological platforms. Research findings have been mixed regarding the attitude of viewers with respect to the information content of ads. Nonetheless, Richins (1991) finds that young Emirati audiences like college students are more prone to thinking of ads as an important source for beauty tips, which help them select fashion items and engage with personal care as well as cosmetics. In addition, students were reported to have more favorable opinions about the value of advertising in providing them with social role models and symbolic imagery than did adults (Pollay 1993). The literature spanning over the last two decades on the societal effects of advertising include negative criticisms related to corruption of values through the promotion of stereotypes (Wills Jr & Ryans Jr 1982), and the encouragement of unnecessary consumption and purchases Anderson et al., 1978; Andrews, 1989 (Reid & Soley 1982). Given the cultural emphasis of this

paper, it is worth noticing that consumers tend to exhibit higher negativity depending on their national identities. Accordingly, Russian (Andrews et al. 1994) or German (Witkowski & Kellner 1998) consumers are less inclined to such views than U.S. consumers who are highly sensitive to these negative social consequences. This again could be due to the high exposure to advertisements and the imagery conveyed by the bombastic messages.

Consumer behavior researchers have also employed photographs as stimuli to elicit consumers' subconscious thought processes and, including, to develop theories (Belk et al. 1989) Coulter et al., 2001; (Holbrook & Batra 1987), (Wallendorf & Arnould 1991). Furthermore, the recent developments in the mind and brain sciences support the view of thought processes being orchestrated by images which form in the algorithmic approach involving memory, current stimuli and the amalgamation of the neuronal artifacts.

In case of the sample population we were testing, the Emirati ladies were well-travelled and well versed with the international brands. In general, the Emiratis are big spenders and have a tendency to indulge in brands. They look at brands as a way of life and not as luxury. However, we wanted to understand if the brand consumption was influenced by the status and standing of an individual in the society. Thus we tried to understand the pattern of consumption of the cosmetic brands by the Emirati ladies and whether this consumption pattern was related to their status and income. In the survey, we had questions that addressed the average monthly income, average monthly spending on cosmetics and the brand consumptions in different segments of cosmetics.

Here, Dolce and Gabbana, Christian Dior, Chanel and Estee Lauder were the high end brands in the varied cosmetic segments. MAC, L'Oreal, Clinique and Lancôme were the low end brands. We tried to establish if there was a particular brand consumption pattern in each income bracket. The initial assumption while doing this analysis was that higher the average monthly income the greater would be the consumption of high end brands, and thus higher the average monthly spending on cosmetics. The ones with higher average monthly income would thus tend to indulge more in higher brands, thus trying to assert their status and position in the societal rank.

However, having analyzed the spending patterns across the different income segments, we realized that there was no particular pattern that could be established about the brand consumption. All the cosmetic brands had a presence irrespective of the income level. The ones with low monthly income would indulge in high end brands like Chanel as well as consume low end brands like L'Oreal. Similarly there were no defined brand consumption patterns in the high income level. This segment too indulged as much in high end brands as they did in low end brands. This can also be confirmed by the fact that MAC was the most preferred brand across all different cosmetic segments. MAC was a clear winner across all the income levels too.

Thus it could be concluded that in the case of Emirati ladies, cosmetic brand names didn't play an important role. Brands, as a status symbol, were not a major influencing factor in the buying decisions of the Emirati ladies. In the particular instance of cosmetics, brands were not considered a means of expressing an individual's standing in the society nor was it related to self-esteem. The brands had spearheaded their presence across all the income brackets. The consumption of the products was according to the brand loyalty and product preference. It was thus interesting to notice that consumption of a cosmetic brand was not a matter of status for Emirati ladies.

Standardized versus Localized Cultural Value Systems

Value systems include the set of beliefs, norms and attitudes to which a given culture subscribes by ensuring reward and punishment mechanisms that stabilize the inherent tensions. Without a thorough understanding of such values, marketers lose grasp of what promotes a given consumption pattern (Durgee & O'Connor 1996) (Durgee et al. 1996). Then again, as Margaret Mead (1928) reminds us:

Courtesy, modesty, good manners, conformity to define ethical standards are universal, but what constitutes courtesy, modesty, and definite ethical standards is not universal. It is instructive to know that standards differ in the most unexpected ways.

Therefore, although value systems exist in all societies, they may differ significantly in terms of what each represent. For example, Indian and Egyptian society is considered to be fatalistic as well as communitarian, versus Denmark or Holland perceiving greater value in being individualistic and having control over external phenomena. Thus, by taking into consideration the dimensions in which opposite propositions of value systems are expressed, we argue that priorities, rules and principles can be built to assist group members in adapting to the cultural environment. In this context, for this piece of research we are particularly interested in the dimension between **collectivism versus individualism** mediated by the cosmetics industry in the Emirati culture and which spans over the period of the last fifteen years.

Many factors affect the advertisement content. Culture is one such significant factor. Numerous descriptive studies have been done on the content analyses of advertisements in culturally sensitive regions (Okazaki et al. 2010). However, very few have a practical or a desirable outcome. While analyzing, one needs to understand the perspective of the consumer and the nature of the product. The advertisement needs to communicate the right message to the right segment of the audience. If the advertisement fails to strike the right chord with the right audience, the sheer purpose of the advertisement fails. To strike the right chord, the advertisement needs to have the correct mix of the "hard sell" and "soft sell" appeals.

To codify participants' interviews, we selected a group of five cultural categories: **Tradition, Beauty Enhancement, Harmony with Others, Thriftiness, and Attitude towards Enjoyment**, based on the results of previous seminal work in the field (Kalliny & Gentry 2007b). Although this group of values should not be seen as conclusive, it represents a solid base to test consumers' attitude in the cosmetics category vis-à-vis the main cultural dimensions as per the preceding discussion.

In this part of the study, we had ten visual advertisements with different products being showcased in each. We edited the advertisements by removing the brand names in certain cases or by removing the product image in other instances. These edited visuals were then put in front of ten respondents from different nationalities and these respondents were asked to answer questions based on each of the ads. The questions basically tested the ease and confidence with which the respondent could identify the product that was being advertised in the edited visuals. Given below are the outcomes of the three main printed ads that signified the importance of the right mix of hard sell and soft sell appeals so as to strike the right chord with the audience.

From the responses, a few very important conclusions were reached. In the first example, the edited advertisement was devoid of the brand name. Yet it very clearly indicated that the product being announced was the bag pictured between two ladies pulling its handles. Even though there was no description of the advertised product nor was there any information related to it, the totality of the respondents could identify the product easily. Since the population in Dubai is well versed with brands, they know what products to look out for in an advertisement once the brand name is given. However, in the case where the image had been edited to remove the perfume bottle, it was the product image that made the difference and made it easy to identify the product that was being advertised. Thus we concluded that at times where the umbrella brand encompasses numerous items, such as apparel, accessories, leather goods and cosmetics, the presence of brand name in the visual helps to shortlist the products but cannot pinpoint exactly which product being promoted.

Accordingly we advise to balance out such printed ads by giving further information regarding the product. In this case, the product image provided the required hard sell appeal. In the third evaluation, we used an ad with strong emphasis on the soft sell aspect that is the subtle, indirect and more intuitive type of appeal. Again the brand name was removed but that was enough to only receive two out of ten proper answers on what the message was, and even that, with relatively more hesitation than in other cited tests. Eventually, the tag line providing indication on what was promoted needed to be present for respondents to reach out onto the message.

DISCUSSION

Legislation in the Arab world pertaining to the regulation, lawmaking or censure of ads content is practically inexistent. Accordingly, advertising professionals need to draw guidelines from the cultural cues and categories to ensure proper assimilation of their publicized message.

The lucrative beauty and cosmetics industry is set to get even bigger in the region, with some industry experts expecting beauty sales to exceed \$3 billion by 2010. This is the prediction of Epoc Messe Frankfurt, organizers of BeautyWorld Middle East, an annual trade fair for beauty products, cosmetics and perfumery held in Dubai. "Almost 60 per cent of the GCC population is under 25 years old, ensuring a high growth rate in the beauty market. The beauty products and services market is worth more than Dh7.3 billion in Saudi Arabia" (GulfNews - Jan. 28, 2009). With trends pointing to strong double-digit growth over the medium term, sales of cosmetics in the Middle East look set to go on par with that of fragrances, according to a senior market source. Currently, the division is in favor of fragrances which account for over 70 per cent of beauty product volumes. The regional market for beauty care products is worth well over \$100 million a year. "The Middle East is very much a fragrance driven market, but the last few years have seen the cosmetics industry emerging strongly," said Alexis Szabo, brand manager for the Middle East and Africa at MAC Cosmetics, part of the Estee Lauder Group. "In most mature markets, the split is very much even, and this should happen even in the Middle East in a few years." MAC, which prices its products for the mid-market, has opened its seventh store in the UAE at Burjuman Centre. The UAE accounts for 25 per cent of regional revenues, with Kuwait in second place.

In American culture, consumption is perceived so positively that it becomes a symbolic valence to combat unhappiness. Accordingly, advertising often promises ways to prevent tragedy rather than endure it (Stern 1995). There may be a branded brain. Watching advertisements, on average 3,000 a day for the average American adult, that is five times more than two decades ago, may not just be the new modern lifestyle. It may indeed even alter the brain, that three pound constellation of relationships between billions of specialized cells, in turn shaped by the interplay of genetic inheritance and environmental influences. In fact, researchers are demonstrating that there are very specific areas in the brain atlas triggering reactions because they already are susceptible to such influences which the ads cater to. Therefore, distinguishable patterns in the reactions from viewers can lead to clearly identifiable psychological categories scholars and marketers can use to map the dimensions which engage people at a more profound level. Deconstructing the anatomy of choice allows researchers to dig further into the very delicate function of problem-solving and by extension, that of decision-making. The creation of belief is the essence of modern marketing, in all its facets.

In this part of globe, further east from the Mediterranean cradle, exploration is still at the inception stage, but telluric changes are in fact occurring in the markets and at a very fast pace. Based on our research, in this section we wish to put forward five recommendations for assisting international cosmetics organizations to implement better advertising practices. First of all, the quantitative research showed that contrary to popular belief, Emirati women tend to spend less with age, thus we take this to be an opportunity to promote more scientific claims on how cosmetics may curb the effects of time on women's faces and even their skin's health. Second, we assessed that Middle Eastern women preferred and were more aware of international make-up trends. In comparison, Emirati ladies chose to put heavy emphasis on eyes and lips but preferred a more localized style of image. This is truly relevant for advertising companies and their different segments, insofar that they can actually contain the population of middle eastern women by playing it out with only two images, since the second most preferred for each nationality turned out to be the first choice of the other, and vice versa. In turn, this also exposes a startling fact which hints at the expatriate population being positioned at another pole of the continuum. The UAE is a culturally sensitive region. Traditions and culture play an important role in the day to day life decisions of the Emirati population. In our research we took heed of the importance and influence of culture in the buying decisions of Emirati ladies. Since the UAE is a highly collectivist country, social circles play an important role in an individual's life. This was confirmed by our research and we learned that Emirati women are strongly influenced by their social circle, in terms of their buying decisions. This implies numerous suggestions, starting from the word of mouth importance for brands of cosmetics, to the portraying of groups of women sharing moments of entertainment while preparing for their beautification habits.

Another important learning was that the population of UAE is not ready for out an out soft sell advertisements. Since majority of the publications cater to a cosmopolitan population, the brands need to understand the importance of communicating effectively with the entire consumer base. Thus, the advertisement needs to have the right mix of soft sell appeal and hard sell appeal. The hard sell appeal of the advertisement ensures that the main message of the advertisement is clearly conveyed to its reader. Taking into consideration such facets will ensure proper delivery of the meaning of the brand.

Finally, throughout our research and the interaction with industry experts, we felt that social media were expected to grow and become a favorite medium for advertising in UAE. Cosmetic brands normally prefer print ads, however, the younger population of UAE is becoming more tech savvy and internet friendly. Companies need to start establishing more consistently their presence online and in social media. This would help them to connect with the thriving and large young generation of consumers. In addition, the cosmetics industry is growing in this market today only

because of the expanding retail landscape. It is therefore vital for cosmetic companies to look at the region and its people with the needed sensitivity in order to ensure continuous growth in the years to come. We are thus reiterating the fundamental need to pay paramount attention to the cultural subtleties of the region, not so much in terms of subtleties that differentiate the East from the West, but rather as categories of values which are transitioning and can be leveraged in favor of greater understanding addressing the huge potential of opportunities.

CONCLUSION

Research states that the relationship between culture and advertising is multidirectional. There are three major agents who form part of this relationship - the advertising agency, the governing body and the consumer (Gao, 2009). The UAE region is very conservative in terms of portrayal of visual as well as verbal content in advertising. Thus the role of the advertising agencies and the governing body (national media council - UAE) play a very vital role in how a product is positioned through advertising. In this article, we have sought to show that culture in a multidirectional relationship is of particular relevance due to the heterogeneity in value systems in the region. Our focus has been on Middle Eastern women and more specifically Emirati ladies who shop for facial cosmetics, while favoring Western brands. The region, however, is cosmopolitan in nature and this creates a typical tension between standardization versus localization of the advertisements. We have thus suggested that international companies ought to consider at least three different strategies: Global Consumer Cultural Positioning (GCCP), Foreign Consumer Cultural Positioning (FCCP) and Local Consumer Cultural Positioning (LCCP) (De Mooij 2010). From our study, the dominant cultural positioning strategies in the UAE are the GCCP and LCCP owing to the cosmopolitan nature of the region. There is therefore an ever growing focus on the choice of language and visual content that needs to be incorporated in an advertisement in order to communicate effectively with the local as well as the cosmopolitan population. We contend that for a brand and an ad to be truly successful in conveying its promotional message and influencing the mind of consumers, three main issues need to be overcome. That of using a single advertisement which encompasses universal appeals to cater various audiences' needs; that of receiving favorable responses from the consumers onto its advertising mix; and finally, customizing and balancing the message in order to reflect local sentiment and addressing the diversity within the region.

In this delicate process of approximation, we see that the identities in the Middle East have been forged by an incessant interaction with global foreigners which has overturned a status quo into a dynamic exchange of multidimensional messages. Within this cradle, a new modernity has established itself and produces futuristic landscapes of moving colored sands. It is at organizations' reach to be with the flow and to extend a hand to such overwhelming beauties.

Abstract

In recent years, a political, economic, commercial, social and cultural dialogue get intensified among the Mediterranean countries. In particular, the establishment in 2008 of the Union for the Mediterranean, under the impulse of the French Presidency, represents the last act of the Euro-Mediterranean integration process, that binds more strongly the EU and Mediterranean countries, in particular those of the Southern and Eastern shores.

The agriculture is an economic activity of great interest in the Mediterranean area due to the weight of employment and the contribution to the richness it brings to certain countries. In this work we analyze the intensity of agri-food trade among the EU Mediterranean states (Italy, Spain, France, Greece, Cyprus, Malta and Slovenia) and the partner countries of the Southern and Eastern shores by using the Traistaru index, widely used in literature. All agri-food products (24 two-digit classes of the harmonized system) are examined during a 15-years period from the Barcelona Process (1996 to 2010).

The results show, even if empirically, that some factors affect on the intensity of bilateral trade, in particular the geographic proximity, and moreover that some products are more sensitive on specific markets, highlighting a certain competitiveness among Mediterranean countries.

Keywords: Trade Intensity; Agro-food products; Mediterranean countries; Euro-Med Policy

Introduction and work aim

In recent years, the political, economic, commercial social and cultural dialog, among the Mediterranean countries, has intensified. The European Union (Eu), in particular, has made the Mediterranean a key area of its foreign policy, generating with the countries that face a situation of interdependence of various kinds (Castellini and Pisano, 2009).

It is due to French President Nicolas Sarkozy last act of the Euro-Mediterranean policy in 2008 with the launch of the Union for the Mediterranean (UfM) (Bicchi, 2011), which encompasses 43 countries including 27 Eu (Galati, 2010). The UfM continues the Barcelona Process, signed in 1995, for the creation of a Euro-Mediterranean regional partnership with the aim to achieve by 2010 a free trade area (Crescimanno, 2007), and the Neighbourhood Policy in 2003 (ENP) initiated by the Eu with the

Mediterranean countries that with Caucasians ones, in order to ensure a balanced economic and social development through the intensification of trade relations.

The agricultural has always been one of the most discussed issues in the bilateral relations between the Eu and the countries of the region Middle East and North Africa and perhaps the one that has prevented a full implementation of the Barcelona Process. In fact, this sector plays a key role in the economies of Mediterranean countries, particularly the southern shore for the importance that it has on employment and the contribution to economic growth (Crescimanno and Galati, 2009; Ascuito et al, 2007; Hervieu 2006). In act, despite of the numerous association agreements signed between the Eu and several non-Eu Mediterranean countries, many agricultural issues are still open. Indeed, the close similarity between the two shores of the Mediterranean agriculture, which is associated with a marked difference in labor costs for the benefit of the countries of the South shore, may be a gap for European agriculture difficult to recover.

But how strong (or weak) are now agricultural trade relations between Mediterranean countries? What is the intensity of trade in the agri-food industry and what factors influence them most? What are the most sensitive products? In order to give answers to the questions mentioned above, this paper aims to present a framework of agri-food trade between Eu Mediterranean countries and non-Eu Mediterranean partner countries.. This analysis is based on the intensity of trade, in particular making use of some indicators proposed in the international trade literature.

The remainder of the paper is as follows. The literature review is provided after the introduction in the second chapter. The methodological approach and the data collection are explained in the chapter three.

Literature review

In relation to the trade intensity between two countries or groups of countries there is a large literature which are cited below the main contributions. In particular, Drysdale and Garnaut (1982) define two approaches of study on bilateral trade: the first, developed by Linder (1961), Tinbergen (1962) and Linnemann (1966), based on a gravity model of bilateral trade, and a second approach that is based on the intensity of trade, which was pioneered Brown (1949) and was later developed by Kojima (1964), Traistaru (2004), Baxter and Kouparitsas (2005), Edmond and Li (2010), Weldemicael (2010). The index that measure the intensity of trade have been applied in several empirical studies, including the empirical studies of Frankel and Rose (1997, 1998), to verify the eligibility of a country to become part of an Economic and Monetary Union with specific reference to the industrialized countries, Zhang-Yue Zhou et al. (2006), to analyze business opportunities that bind Australia to China, Calderon et al. (2007), that extend the analysis of Frankel and Rose also to developing countries and link the impact of trade between countries at business cycle synchronization.

Other studies have been conducted by Traistaru (op.cit.), who uses the intensity of trade as an element of analysis for the synchronization of business cycle among the eight countries of Central

Europe and Eu countries in order to identify benefits input costs and the former CEECs in the eurozone; by Bernini Carri and Sassi (2009) that deal with the intensity of trade in the agricultural sector between the Eu and Africa; by Edmonds and Li (op.cit.) that determine the extent of China's trade with different countries of the world by comparing it with that of Japan with similar trading partners; by Jules and Tapsoba (2010), which calculates the intensity of trade in order to verify the synchronization of economic activities in African countries aimed at achieving a monetary union; by De Castro (2012) that analyzes the intensity of bilateral trade between the BRIC countries and the Eu.

Methodological approach

The empirical analysis proposed in this paper makes use of indicators that measure the intensity of agri-food trade, currently defined by the association agreements or stabilization and association agreements between the countries of Southern and Eastern shores of the Mediterranean (Albania-ALB, Algeria-DZA, Croatia-HRV, Egypt-EGY, Israel-ISR, Lebanon-LBN, Libya, Montenegro-, Morocco-MOR, Occupied Palestinian Territories, Serbia, Syria-SYR, Tunisia-TUN, and Turkey-TUR) and those of the Northern shore, Eu members (Cyprus, France, Greece, Italy, Malta, Slovenia, Spain)¹⁰. For the analysis have used the money flows of exports and imports taken from the United Nation Commodity Trade Statistics Database (UNComtrade) for each of the codes making up making the agri-food aggregate production (classes 01-24 of the harmonized nomenclature, according to the two digits classification¹¹). The reference period is 1996-2010. Libya and the Palestinian Territories have been excluded from the analysis since the statistical series relating to these two countries is very fragmented, while the confluence of statistical data (in some years) related to Serbia and Montenegro (SCG) has led to treat the two countries as a single aggregate. The produced analysis start from the definition of the structural framework of the agri-food exchange among the Mediterranean countries. In particular, for the studying of the structure of trade between each Eu member state (defined as countries with a reporter) and Mediterranean non-Eu countries (partner countries), we analyzed the period 2008-2010, showing for each country the products with the largest volumes of imports and exports, and therefore more sensitive for the Euro-Mediterranean association agreements. Concerning

¹⁰ Cyprus, Malta and Slovenia joined the EU in 2004, are always treated as EU member states for the entire period (1996-2010), this choice has allowed us to verify if the input in the EU context has weakened over the years or less commercial traffic of these countries with other countries are not EU members. The data on trade flows are expressed in current values and refer to the CIF prices for imports and FOB prices for exports.

¹¹ 01: Live animals; 02: Meat and edible meat offal; 03: Fish & crustacean, mollusc & other aquatic invertebrate; 04: Dairy prod; birds' eggs; natural honey; edible prod nes; 05: Products of animal origin, nes or included; 06: Live tree & other plant; bulb, root; cut flowers etc; 07: Edible vegetables and certain roots and tubers; 08: Edible fruit and nuts; peel of citrus fruit or melons; 09: Coffee, tea, mati and spices; 10: Cereals; 11: Milling products, malt, starches, inulin, wheat gluten; 12: Oil seed, oleagi fruits; miscell grain, seed, fruit etc; 13: Lac; gums, resins & other vegetable saps & extracts; 14: Vegetable plaiting materials; vegetable products nes; 15: Animal/veg fats & oils & their cleavage products; etc; 16: Prep of meat, fish or crustaceans, molluscs etc; 17: Sugars and sugar confectionery; 18: Cocoa and cocoa preparations; 19: Prep.of cereal, flour, starch/milk; pastrycooks' prod; 20: Prep of vegetable, fruit, nuts or other parts of plants; 21: Miscellaneous edible preparations; 22: Beverages, spirits and vinegar; 23: Residues & waste from the food indust; prepr ani fodder; 24: Tobacco and manufactured tobacco substitutes

the analysis of trade intensity for each agri-food products we have analysed the 1996-2010 period. For the calculation of the intensity of bilateral trade the level of strength and vitality of trade between two countries, we have used the index proposed by Traistaru (1984) (1), applied to the flow of imports and exports that binds Eu countries to Mediterranean non-Eu partner countries studied.

The index proposed by Traistaru (1984), is defined according to the mode as below:

$$(1) \quad Tr_{ij} = \frac{1}{T} \left(\sum_{t=1}^T \frac{M_{ij,t} + X_{ij,t}}{X_{i,t} + M_{i,t} + X_{j,t} + M_{j,t}} \right)$$

Where: where $X_{ij,t}$ expresses the exports of country i to country j, $M_{ij,t}$ expresses the imports of country i from country j, $X_{i,t}$ and $M_{i,t}$ are, respectively, exports and total imports of country i, while , $X_{j,t}$ and $M_{j,t}$ are the world's exports and imports of country j.

The analysis results, may, however, feel the effects of exchange rate between the national currency (in this case euro for reporter countries) and that of the countries where you export, especially those that have different currencies, but also the income level of countries including are realized the exchanges. In this study, another important effects is related to the border trade that can generate, the physical proximity of the countries between such exchanges are made, the flow of indirect transit.

Results

The agri-food trade in the Mediterranean basin

The analysis of the agri-food trade between the seven countries considered reporters and Mediterranean non-Eu partner countries, has allowed the identification of the most important target markets, both incoming and outgoing, and identify at the same time, the main agri-food trade products.

The agri-food exports of the Eu Mediterranean countries towards the non-Eu Mediterranean partner countries, on average in 2008-2010 period amounted to 6.05 billion dollars, compared while the import level equal to 5.25 billion dollars (Table 1).

Table 1 - Agri-food trade of the Eu Mediterranean countries (average of the period 2008-2010; \$)

	Export	Import	Volume of trade	Export (%)	Import (%)
Italy	1,090,405,189	1,650,652,727	2,741,057,917	39.78	60.22
France	3,531,707,360	1,866,998,321	5,398,705,682	65.42	34.58
Spain	848,880,287	1,263,005,581	2,111,885,868	40.20	59.80
Greece	377,053,177	271,644,481	648,697,658	58.12	41.88
Cyprus	78,128,576	29,923,898	108,052,475	72.31	27.69
Malta	7,673,219	14,453,260	22,126,479	34.68	65.32
Slovenia	121,475,690	148,881,649	270,357,339	44.93	55.07
TOTAL	6,055,323,501	5,245,559,919	11,300,883,420		

Source: our elaboration on data UNcomtrade

The country with the highest value of exports is France (3.53 billion dollars), which also holds the record for imports (1.87 billion dollars), showing, however, a significant propensity to export (65.42%). Cyprus, despite the limited volume of trade, with a value of 78.13 million dollars, is the countries reporter more inclined to export. Italy and Spain with, respectively, 2.7 and 2.1 billion of dollars, have a second and third volumes of trade; however this countries have a dependence on imports, that for Italy reaching a share of 60.22% and for Spain stands at 59.80% of the volume total exchange. Heavily dependent on imports are also Slovenia and Malta, respectively for 55.07% and 65.32% of the total trading volume.

With reference to the single agri-food codes and concerning the scenario of Italian exports, Croatia emerges as the main market with 235.91 million dollars, followed by Turkey, with 172.61 million dollars, and Tunisia, with 142.79 million dollars. among the products commercialized there are cereals products (code 10), with a share of 22.42% for the Turkey and 57.76% for Tunisia (Table 2). For Italy the Turkey is the most important imports market with 511.12 million dollars, followed by Tunisia and Morocco. It should highlight how the three main markets in question represented by the fresh fishery products (code 03) which, in particular, in the case of Morocco, occupies the largest share of imports (50.87%) (Table 3).

For France, major trading partners are Algeria, with 1.53 billion USD, Morocco, with 716.66 million dollars, and Egypt, with 510.32 million dollars; for these markets, the largest share of exports concerns the same agri-food products represented by the cereals, respectively, 68.29%, 67.96% and 68.25% (Table 2). On the import side, it stands the figure of Morocco (982.67 million dollars), followed by Turkey (447.38 million dollars) and Israel (220.25 million dollars). In particular, in the relationship with the Morocco, the edible vegetable products intercept the largest share, accounting for 50.43% of imports (Table 3).

Regarding to the Spanish scenario, as regards exports, the figure stands out among all of Algeria with 248.80 million dollars accounts for 29.39% total exports in the period considered (2008-2010), followed by the Morocco with 208.57 million dollars and Tunisia with 80.11 million dollars. It is

interesting to underline how the animal and vegetable fats (code 15), represents an element shared among these three Spanish partners, respectively, showing a weight of 21.97%, of 11.06% and 16.18% (Table 2). As regards imports, the main supply market for Spain is Morocco, which has only an intercept value of imports amounted to 861.66 million dollars; the codes with the greatest impact are the "fresh fishery products" for 57% and 59%, the "edible vegetables", for 21.21% and "Meet, fish and seafood" for 9.37%, with Turkey and Tunisia.

As regards Greece, the major markets for exports are Albania, with 122.30 million dollars, Turkey, with 82.55 million dollars and Algeria, with 45.48 million dollars. The code 24, regarding the tobacco and manufactured tobacco substitutes, is the one most important, in particular for Algeria, with a weight of 63.30% (Table 2). With regard to imports, the main markets are the Turkey, with 157.33 million dollars, Egypt, with 47.43 million dollars, and Morocco, with 20.21 million dollars; the main agri-food segments are, respectively, the fresh fishery products (24.82%), edible vegetables (76.30%) and ornamental plants (code 06) (92.37%) (Tab.3).

Regarding Cyprus, Syria is the most important partner for the export, to which there is, for the 24 codes of agri-food products, the volume of exports amounted to 24.9 billion dollars. The Tobacco covers the greater the weight (96.36%), followed by vegetable fruits nut food preparation (code 20), and animal, vegetables fats and oils (code 15), presenting a weight less than 2%. Lebanon, with 21.96 million dollars, and Egypt, with 16.56 million dollars, representing, respectively, the second and the third reference market for Cyprus. The main market for the imports is Israel (14.68 million U.S. dollars), to intercept the largest slice are the edible fruit (23.59%) followed by edible vegetables (21.27%) and ornamental plants (18.87%); important is the position occupied by Egypt (6.83 million dollars) and Lebanon (3.60 million U.S. dollars).

Regarding Malta, you may encounter, as the main market for exports, Tunisia, in fact, with a weight of total exports over the period 2008-2010, amounting to 37.56% (2.88 million dollars), stands on Egypt (2.05 million dollars) and Turkey (1.03 million dollars). Regarding Tunisia, it are the cereals that intercept the biggest share in exports of 89.24%, followed by 5.98% and 2.68% respectively, the classes fresh fishery products and beverages (code 22) (Table 2). On the import side, the focus markets including Malta, Morocco stands out with 7.07 million dollars for which, among agri-food sector, there was a strong interest for the products of animal origin (58.27%), followed by Turkey with 2.62 million dollars and Egypt with 2.05 million dollars.

Finally, concerning the Slovenia, it is clear, as concern exports, that primacy belongs again to Croatia (92.79 million dollars), followed by Serbia and Montenegro and Albania, these partners are united by the important impact of the codes 22, related to beverages, and 21 concerning the miscellaneous edible preparations weighing, respectively, 21.28% and 12.27% for Croatia, of 23.47% and 35.76% for Serbia and Montenegro and, finally, of 20.08% and of 62.18% for Albania. Regarding imports, the main supply Slovenian market is Croatia, for which there is a value of imports amounted to 127.77 million dollars, followed with a much lower weight, Turkey and Morocco. Among the agri-food codes

considered, appreciably affect the miscellaneous edible preparations, with regard to Croatia, with a weight of 17.72%, followed by the edible fruits (48.54%) and edible vegetables (41, 08%), in relation to Turkey and Morocco (Table 3).

The intensity of the agri-food trade in the Mediterranean basin

The Traistaru index calculated for 1996-2010 period shows the intensity of agri-food trade among the countries of the Mediterranean basin; which is the level of intensity of trade that links the various countries and what are the agri-food products holding more weight in terms of trade compared to world trade of these countries.

The Italian position is rather diversified, as the factors that influence the intensity of trade are numerous and in some cases difficult to be isolated. The index of Traistaru, in 13 of the agri-food products, does not exceed the value of one, and for no codes exceeds the value of 5. In detail we have that relationship with Morocco and Tunisia has significant intensity of trade in fish products, with Egypt for edible vegetables, with Turkey, for edible fruits and various milled products and starches, with Israel, for seed oleaginous fruits, with Tunisia, for animal and vegetable fats, with Serbia and Croatia, for sugar and sugar-based products, and finally with Israel for cocoa and cocoa preparations. Overall, the greater intensity of exchanges linking Italy to Turkey, Tunisia and Croatia (Table 4 and Figure 1).

For the France, the most important variable in determining the intensity of trade historical links with the former colonies such as Morocco and Algeria. In fact, Morocco is the most representative partners for the French agri-food trade, at least in terms of intensity of bilateral trade and even of world trade; the most important products are edible vegetables for Morocco (6,98) and cereals for Algeria (4.20).

Spain, in the period in question, has the strongest trade links with Morocco highlighting that in this case, the geographical distance assumes greater importance to the variables that can affect the intensity of trade between two countries. In fact, for 5 agri-food classes and exactly fishery products, live three and other plants, edible vegetables, oil seed and preparation of meat (classes "03, 06, 07, 12 and 16, respectively") the index of Traistaru is positioned at the highest level and then considered in all partner countries, Morocco has a privileged role. There is also a strong intensity with Algeria for milling products (4.20) and with Israel for sugars and sugar confectionery (1.28). Overall, the greater intensity of exchanges linking Spain to Morocco, Turkey and Tunisia.

Greece has a very strong intensity of trade with Albania and Turkey, demonstrating empirically that geographical proximity is again an element that has a decisive bearing on the exchange of the two countries. The highest index is recording with Albania as part of processed products and in particular in the milling products (8.41) and beverages (2.48). Have very strong bilateral trade with Serbia and Montenegro in the field of sugar and derivates (2.83), with Egypt for vegetables (2.70) and with Turkey for fishery products (2.46).

(*) codes 01-24 of the harmonized nomenclature

Fonte: nostra elaborazione su dati UNComtrade

The small republic of Cyprus, however politically divided in two, has not generally a significant intensity of trade at least for most of the codes comprising the agri-food industry, as evidenced by the value of the Traistaru which is maintained at rather low levels.

The role of Malta is even less effective, the exchange is notable only by Egypt and Morocco, as with a generic voice-which includes various food preparations-with an index value of 2.31 and 1 respectively, and with Serbia and Montenegro for sugars and sugar-based products (2.61). In all other cases the value of the index is below the 1.

Most active is the commercial weight of Slovenia, which is characterized by strong ties with Croatia, its partner in more than 20 agri-food codes. The exchange is lively for preparations of cereals, flour etc.. (10.13), followed by prepared meat and fish (8.64), and at the third place the animal and vegetable oils and fats (8.06). According to Slovenian partners but are far behind Serbia and Montenegro for trade in dairy products and vegetables. Trade with countries of the southern Mediterranean are very weak.

Selecting for Italy, France, Spain and Greece the first three items in which the Traistaru index presents the highest value in respect of each partner country it has been possible to identify the products most sensitive and for which there might be more competitiveness inside the Eu Mediterranean countries.

In particular, Italy, with eight out of eleven Mediterranean partner countries has a significant intensity of exchange of products of milling products (code 11), with five countries for sugar and products made of sugar (code 17).

At the same time contending with France and Spain on the Albanian market of sugar and with Spain and Greece that of milling products etc.. A similar competition emerges for the Algerian market with France and Greece on cereals and edible vegetables, with Spain and Greece on Tunisia for the fish products, and the same with Spain and France, for the animal and vegetable fats.

France has a higher intensity of trade for sugar and cereals with five of the eleven partner countries examined, Spain with eight out of eleven countries for voice sugars and Greece with four countries, Algeria, Egypt, Israel and Serbia for tobacco.

Finally, it is interesting to note that the top three traded codes do not include meat and edible meat.

Conclusion

The results reported in this work indicate that among all the countries bordering the Mediterranean there is an intensive agri-food trade. This intensity of trade is also due to the Euro-Mediterranean policy conducted by the European Union and starting with the Barcelona Process.

France holds a very important role in the agri-food trade, in fact it is the country with the largest volume of trade and a good export potential to countries of the Southern Mediterranean, followed Italy and Spain, but in this two countries the value of the import is more than the export one.

The index of Traistaru used to calculate the intensity of bilateral trade in the period 1996-2010, indicates empirically that the intensity of trade is stronger between those countries that are geographically closest, as is the case of Spain and Morocco, Greece and Albania, Italy and Tunisia, Syria and Cyprus, Slovenia and Croatia or those with cultural affinities as France and Algeria.

Moreover, the index calculated for each individual item of the seven Eu Mediterranean countries and eleven Mediterranean non-Eu partner countries, has emphasized that for some codes the intensity of trade is stronger, it is especially fish products, sugar and dairy products, cereals, vegetables products.

Finally, selecting for Italy, France, Spain and Greece the first three items in which the agribusiness index Traistaru presents the highest values with respect to each partner country, it was possible to identify the most sensitive products and for which there might be more competitiveness.

Italy, for example, with eight Mediterranean extra Ue partner countries has a significant intensity of exchange of products of the milling industry, malt, starches, etc., and it contends the market with France, Spain or Greece.

Similar scenarios are found for other Eu countries.

Abstract

The objective of this paper is to evaluate the determinants of Italy's agri-food exports in the markets of Mediterranean non-EU partner countries and, particularly, the impact of Agreement Association signed in the Euro-Mediterranean partnership. The Mediterranean Sea situated at the crossroad of three continents, the European, the Asian and the African one, has ever been of great strategic interest for several geo-economical powers and in particular of the European Union as one of its foreign policy main protagonists. Italy as a centred Mediterranean country which is sharing agri-food production with some Mediterranean partners could profit from the EU's relationships with the partners of the area even further. The authors estimate a gravity equation including some of the main variables founded in the literature review, useful to highlight the main factors which are able to influence in a significant way the level of the bilateral exchanges. The results of this study show that the variables traditionally included in the gravity equation present the expected sign. In particular, the Italian agri-food flows heading towards the Mediterranean partners is positively correlated to the income of the destination country and the colonial link and negatively to the distance incidence of the agricultural surface on the territorial land, the belonging to a specific geographical area and the Association Agreements.

Keywords: Trade flows, agri-food, Euro-Mediterranean partnership, Association Agreement, Gravity model

Introduction

The Mediterranean Sea is considered as one of the most important ocean area in the world, the shores of its certain countries have sprung some of the richest civilization mankind has ever known (Abbadi, 1984). This area, situated at the crossroad of three continents, the European, the Asian and the African one, has ever been of great strategic interest for several geo-economical powers. EU, in particular, has made the Mediterranean Sea one of the main protagonists of its foreign policy, not only for the physical nearness among the countries which overlook it, but for the trade and colonial bonds of some countries of EU with their old colonies as well (Constant LaForce, 2011). Since the signing of the Rome Treaty in 1957, EU has maintained and strengthened a variety of special relationships with

several Mediterranean countries, firstly in Yaoundé Conventions (1963-75) and the Lomé Convention field (1975) and later in the framework of specific political and economic relationships which have characterized the past fifty years¹². In this articulated political background, sometimes contradictory and far from the strategic interests of such an important geo-political area, the agricultural matter has ever represented one of the most interesting themes, within the bilateral relationships, above all with the creation of the Euro- Mediterranean free-trade area. Agriculture plays, in fact, a significant role in a lot of countries which overlook the Mediterranean Sea, both in the social and economic field (Hervieu, 2006), justifying the strong structure of trade protection both parties have adopted, with the imposition for several agricultural goods the barriers price.

There are a high number of empirical applications in the economic literature which have used the gravity model to explain the determinants of bilateral trade and the impact of free trade agreements in the Euro-Mediterranean region. These results highlight an increase in EU's exports towards the Mediterranean partners after that the association agreements came into effect but, on the contrary, less significant results, and sometimes negative, of the implementation of the same agreements on the Mediterranean partners, pointing out a deep asymmetry in the exchanges and a low differentiation of the exported products by the Mediterranean partners towards EU's countries (Hagemejer and Ciselik, 2009; Ruiz and Villarubia, 2007; Bensassi et al., 2010).

Through the formulation of this gravitational model, Ferragina et al. (2004) esteem the trade volume really produced by the liberalization after the agreements in 1995 and the predictable additional trade after an urged integration, pointing out a wide, but not exploited, trade potential between EU's countries and the Mediterranean partners. Therefore, the gravity model is also used to provide a quantitative assessment of the Euro-Mediterranean partnership and discusses its implication for the ASEAN countries' new regional policy (Peridy, 2005). With specific reference to the agri-food sector, the gravity model has been widely used to analyse the influence of Association Agreements on the fruits and vegetables trade between Southern Mediterranean Countries and the European Union (Castellini and Pisano, 2009; Emlinger et al., 2008; García-Álvarez-Coque and Martí Selva, 2006), but also to examine the impact of Turkey's possible integration into to European Union on the country's agricultural exports (Atici et al., 2011), and to quantify the effects of the commercial liberalization of the exchanges between Morocco and the EU countries on the specialization of the agricultural sector (Idir, 2004).

Italy as a centred Mediterranean country which is sharing agri-food production with some Mediterranean partners (olive oil, wine, citrus fruits) could profit from the EU's relationships with the partners of the area even further. The purpose of this paper is to evaluate the determinants of Italy's export trade flows toward the Mediterranean non-EU members countries,, through a gravitational

¹² Since the 70's The European Economic Community has strongly maintained political relations with the Northern Africa and the Near East countries, firstly in the Global Mediterranean Policy (1972) and later with the Renewed Mediterranean Policy (1990), the Barcelona Agreement (1995), Neighbourhood European Policy (2004) and the Union for the Mediterranean (2008).

model which, even if simple enough in its formulation, it is particularly effective in the analysis of the international trade.

After an overview of Italy's agri-food trade flows, the foundation of gravity model is described. Then, the econometric methodology is explained. Finally, the results of the gravitational model are presented and discussed and the theoretical and managerial implications of the study are highlighted.

Overview of Italy's agri-food trade flows with non-EU Mediterranean partner countries

From 1996 to 2010 the bilateral trade of Italy with the Mediterranean non-EU member countries has been showed an increasing trend, both for total exchanges and for the agri-food ones. With a specific reference to the latter, the value of export grows up to about 1,106.6 millions of dollars and import value reaches about 1,579.5 millions dollars (see Table 1).

Italy's agri-food exchanges with the countries of the area have intercepted an average of 5,2% of the total exchanges (3,2 % of exports and 7,8 % of imports). The agri-food, in particular, has got a significant weight in Italy's total bilateral exchanges with Morocco (10,2%), Albany (9,2%), Tunisia (7,5%) and Croatia (7,1%).

Table 1 - Italy's Agri-food trade flow with Mediterranean non EU partners countries (Million of \$)

Years	Export			Import		
	Total	Agri-food	%	Total	Agri-food	%

Source: Our elaboration on UNComtrade data.

The analysis of agri-food flows shows a clear asymmetry of the exchanges. In the reference period, Italy designed in the near markets of North Africa and Near East an average of 3% of the total agri-food exports' value, whereas the original productions of these countries have represented about 3.7% of the world Italian imports.

On the contrary, for the non-EU Mediterranean countries, Italy represents a privileged partner absorbing more than 8,5% of their total agri-food exports; it represents, in particular, an important outlet market for Albany's agri-food productions (35,2% of the total agri-food exports head towards Italian market) and Tunisian's ones (33,3%), though we can't overlook the importance of the Italian market towards Croatia (10,3%), Egypt (8,8%), Morocco (7,2%) and Turkey (6,1%).

What comes out from the analysis of the trade flows for each partner country is, furthermore, a clear delineation of the reference markets towards Italy both for the supply and for sale of agri-food productions. More specifically, Italy designs its own agri-food productions above all towards Balkan markets and towards Croatia (24,5%), Turkey (11,8%) and Albany (11,4%) in particular, while it supplies above all from Turkey (32,7%), Tunisia (25,0%) and Morocco (13,7%).

Italy's relationship with the Mediterranean non-EU partner countries is based on the Euro-Mediterranean Association Agreements, with the countries which signed the Barcelona Declaration¹³ (Algeria, Egypt, Israel, Jordan, Lebanon, Morocco, Occupied Palestinian Territories, Syria and Tunisia) and the Stabilisation and Association Agreements, with the western Balkans potential EU candidates¹⁴ (Albania, Bosnia-Herzegovina, Croatia, Montenegro and Turkey). The negotiated bilateral agreements with the intention, on the one hand, to pursue the ambitious aim to create a sole Mediterranean market (well-known as free-trade area) and, on the other hand, to move the Balkan countries closer to EU with a view to their future entry, characterized by a strong heterogeneity linked not only to the countries but to the kind of product exchanged as well. In specific reference to the agri-food exchanges, both EU and its partners have built a well-structured protection system which, for the Southern Mediterranean countries, for example, consists in some typical production of this area as fruit and vegetables, durum wheat and meat (Garcia-Alvarez-Coque, 2002).

Such a system has got an effect, on the European side, to apply ad valorem and specific duties only for some of these products. In fact, the amount of these latter products depends on the import prices according to an income price system used for fresh fruits and vegetables, for instance. In the South, the protection level towards agri-food products import coming from EU countries keeps on maintaining on high levels, Egypt, Jordan, Syria and Morocco in particular (Crescimanno et al., in press). During the Association Agreements and Association and Stabilization, taking into account the strong conversational abilities of the market conditions of the adopted measures, some specific negotiations for the agri-food products have been started¹⁵. They don't concern all the agri-food

¹³ Within the Euro-Mediterranean partnership, signed in Barcelona in November 1995, the EU signed Association Agreements of bilateral nature with all the Mediterranean partners. The first agreement come into effect is that between the Palestinian Regions (1997) followed by that with Tunisia (1998), Israel (2000), Jordan (2002), Egypt (2004), Algeria (2005), Lebanon (2006). The Agreement with Syria signed in 2004 still must come into effect.

¹⁴ Within the Balkan region, the first Stabilization and Association Agreement come to effect is the one signed with Croatia (2001) followed by the one with Albany (2009) and Montenegro (2010). Turkey, one of the candidates to join EU, is linked to the latter by a customs union.

¹⁵ Agri-negotiations which have been closed with Jordan, Egypt, Israel and Morocco are an example, but only the ones with Egypt and Morocco came into effect respectively in June 2008 and February 2012.

products, and start from the abolition of the customs house duties, and the equivalent effect measures, to the elimination of just the ad valorem part of the duty for the products for which there is an income price system, and also the reduction of the duty in price quota and specific calendars.

Foundation of Gravity Model

The gravity model has been used extensively in the past 50 years in the analysis of bilateral trade between home and partners' countries, to explain the determinants, the potential and the direction of bilateral flows, explain and predict the effects of free trade agreement on trade flows in various sectors, including the agri-food.

Tinbergen (1962) and Pöyhönen (1963) were the first authors who applied the gravity equation to analyse the bilateral trade between two countries. Previously, other authors had also used the same model for the analysis of migration (Somermeyer, 1961), telephone and airline traffic between cities (Hammer and Ikle, 1957).

The gravity models have been several times criticized for the absence of strong theoretical foundations; for this reason, many theoretical studies, in the past few years, have tried to establish the theoretical foundation of such a model. The first explanation was developed by Linnemann (1966) and asserts that the gravity model is a reduced form from a four-equation partial equilibrium model in which the trade flow between two countries is a function of the export supply and import demand. Anderson (1979) used a linear expenditure system assuming that the preferences between importing countries are homothetic and uniform; besides he assumes that the products are differentiated by origin. Bergstrand (1985, 1989), starting from Heckscher-Ohlin's theoretical model (H-O), deduces equations of bilateral exchange flows as function of national incomes, per capita incomes and distance.

More recently Deardoff (1998) has discovered how to derive the gravity model starting from H-O's model; for the author himself, in fact, the classic model of the international trade reproduces the gravity principles leading to the same results as the monopolistic competition models, in which each country specializes itself in some varieties of the product becoming the only exporter of them.

There are a huge numbers of empirical applications in the literature of international trade that have contributed to the refinement of the explanation of the variables considered in the analysis and to the addition of new variables (Martines-Zaroso, 2003). The first gravitational models didn't include the distance between the trade determinants so that they couldn't be exactly defined as gravitational models. Only after, Bergstrand (1985) introduced the role of transport costs as proxy of the distance. The introduction of the distance in the equation is justified in some works, among which Lipsey and Weiss's ones (1974), who demonstrated that the distance is positively associated with the levels of transport costs, but with more unexplained variation than one would expect (Frankel, 1997). Bergstrand (1985, 1989) introduces, later, the price and exchange rate variables, because it has a plausible and significant effects on aggregate trade flows. Fontagné et al (1998), introduce cultural and historical factors, Frankel and Wei (1993) introduce the belonging to an agreement both as dummy

and as explicit measure of customs house and no-price barriers rights (Emlinger et al., 2008; Fontagné and Péridy, 1995).

In his basic formulation, the gravitational model applied to the bilateral trade between two countries is an empirical relationship based, as said before, on Newton's universal gravitational law, in which the attraction strengths correspond to incomes of the two countries whereas the repulsion ones to the geographical distance which separates these two countries.

$$T_{ij} = A \frac{Y_j Y_i}{D_{ij}}$$

T_{ij} is the value of trade flows between countries i and j , Y_j and Y_i are the national incomes.

D_{ij} is a measure of the distance¹⁶ between them and A is a gravitational constant and depends on the measure unit of the other parameters. Using the logarithmic it is possible to transform the equation 1 into a following form:

$$\ln T_{ij} = A + \alpha \ln Y_j + \beta \ln Y_i - \theta \ln D_{ij} + \varepsilon_{ij}$$

The inclusion of the term of error allows the esteem through a linear regression using the Ordinary Least Squares (OLS). The model used here combines the Heckscher-Ohlin's (H-O) Theorem on the comparative advantage, which explains the trade between two countries based on the differences of endowments factor and shows that the largest differences in endowments factor between two countries lead to a higher level of trade. The new trade theory started by Helpman and Krugman (1985), which links the bilateral trade to the countries' political situation, among which the exchanges take place and drawing a relationship between monopolistic competition model and gravitational model, was validated later by Helpman (1987) through a gravitational equation, and recent theoretical development related to trade costs (Anderson and van Wincoop, 2003, 2004).

The gravity model specification

To answer the purpose of this research, or rather to evaluate the determinants of Italy's agri-food exports in the markets of Mediterranean non-EU partner countries, a gravity model has been esteemed which includes some of the main variables founded in the reference literature, useful to catch the main factors which are thought to be able to influence in a significant way the level of the bilateral exchanges. The esteemed gravity equation is specified as:

$$\ln EXP_{ij} = \beta_0 + \beta_1 \ln GDP_j + \beta_2 \ln D_{ij} + \beta_3 \ln ISA_j + \beta_4 \ln Area + \beta_5 \ln AA_{ij} + \beta_6 \ln His_{ij} + u_{ij}$$

The dependent variable is represented by Italy's agri-food exports towards Mediterranean partners (EXP_{ij}). The explicative variables take into account both the standard ones of the gravity model, that is

¹⁶ The distance puts together all the questions linked to the transport and transition costs deriving from trade activities.

the economic variables linked to the country's economic dimension and the Gross Domestic Products of countries j (GDP_j) and the economics cost of flows such as the distance between countries i and j (D_{ij}) in particular. Finally, u_{ij} is normally distributed error component capturing any random influence.

In the proposed model other explicative variables have been inserted. It's about the incidence of the agricultural surface on the territorial land of the countries j (ISA_j), the presence of Association Agreements between countries i and j (AA), and the variable which represents the presence of colonial link (His). These latter two variables are expressed with dummies and are equal 1 if between two countries there are trade agreements or colonial links and 0 otherwise. Finally the variable "Area" has been introduced, concerning the belonging of the partner country to Maghreb Region (Algeria, Morocco or Tunisia), Machrek Region (Egypt, Jordan, Lebanon or Syria) or Balkan countries and Near East (Albania, Croatia, Serbia and Montenegro, Turkey and Israel).

Regarding the variable which expresses the income, there are two different formulations in literature. The first inserts the country's total GDP which is positively related to the trade flows and causes a dimension effect¹⁷. While the second, considering the GDP per capita, causes, instead, an income effect. For the latter variable, the coefficient sign can be negative, in Linder's hypothesis (1961), according to which countries with different per capita income levels have similar preferences but different for typology of product, or positive, in H-O's hypothesis according to which countries with different per capita income levels deal with countries with similar per capita income levels.

Even if the two formulations are equivalent (Castellini and Pisano, 2009) in the paper we have decided to consider the entire GDP. In fact, the per capita GDP is usually chosen for the estimation of bilateral exports for specific products while total GDP is often used in the case of aggregated exports' estimation (Martinez-Zarzoso and Nowak-Lehmann, 2002). In particular, we have chosen to refer to the values expressed in equality of spending power being this form the most preferred one (Frankel, 1997; Boisso and Ferrandino, 1993, 1996) mainly to deperate the GDP value from the exchange rate of the several currencies of the countries taken into account.

The variable colonial bounds has been inserted in the model to verify if the cultural and historical bounds can still influence today the exchange structure, expecting, in this case, a positive sign of the coefficient. Besides, a positive sign of the variable coefficient relating to the presence of Association and Association and Stabilization Agreements between the two parts is expected, considering that these latter have been signed just to intensify the exchanges and to favourite the Euro-Mediterranean integration.

The variable related to the agricultural specialization of the partner country expressed as percent ratio between the agricultural surface and the total territorial one has been inserted to verify its

¹⁷ The bigger the countries are the more goods and services they produce and put on the market but at the same time they produce more income by the sold of these goods and services and so, their inhabitants are able to import more.

relationship with the export flows. The first hypothesis is that countries in which agriculture has got a modest weight use imports to satisfy the domestic demand, a negative coefficient is expected.

Eventually, the distance expressed in Km between the capitals of the considered countries should be negatively related to the dimension of the agri-food flows; as Lipsey and Weiss demonstrate (1974). In fact, the distance between two countries is positively related with the level of transport costs and it influences the capacity to create personal contacts and other communicational forms which in turn influence trade.

The gravity equation is referred to 11 Mediterranean Countries (Albania, Algeria, Croatia, Egypt, Israel, Lebanon, Morocco, Serbia and Montenegro, Syria, Tunisia and Turkey).

In relation to the origin of the necessary data for the implementation of the model, the export data (in current dollars) are obtained from the database United Nation Commodity Trade Statistics (UNComtrade), for the number of entries which form the aggregate of the agri-food productions (class 01-24 of the harmonized nomenclature, according to the classification a two digit). The distance expressed in km between the capitals is obtained from the City distance Tool (www.geobytes.com). The data concerning the GDP of the partner countries are extracted from the World Bank data, while the ones concerning the agricultural surface and to the total surface are Faostat data. The reference period is the fifteen-year period 1996-2010.

Results and discussion

The results of the estimation, carried out using the SPSS software was done through Ordinary Least Square (OLS), of the gravity equation are presented in Table 2. As we can see, it is possible to notice that, the model has got a relatively low explanatory power with a R^2 of 0.628, that is, the 62.8% of the variation in the export is explained by our selected specification of the gravity model. The results of the model show that the most of the coefficients of the basic gravity equation are statistically significant at level less than 1% and have in the most cases the expected signs.

The coefficient of the economic dimension variable of the country is positive and statistically significant with a value of 0.401, this reflect that the trade flows are positively influenced by the variable associated to size. This result confirm, moreover, as other authors previously highlighted, that bigger economic dimensions of the partner countries can lead to a wider opening towards imports (Canavari et al., 2007).

*** indicate that the estimated coefficients are statistically significant at 1 percent

Reference period: 1996-2010

The Italian exports towards the Mediterranean partner countries are positively affected by the Area and Colonial link. Regarding the first variable, its coefficient is statistically significant and its sign is positive, highlighting that the Italian agri-food exports are increasing passing from the Mediterranean Southern area to the Balkan one, pointing out, furthermore, a modest integration ability with Italy's Maghreb and Machrek markets. This can be justified by the effect of the presence of a protection system less restrictive towards agri-food productions between EU, and the potential candidates to European Community on the one hand. On the other hand, it's justified by: the geographical nearness with the countries themselves (as Croatia for example), their nearness from the cultural point of view as well, from historical links (with Albany for instance, which is an ex Italian colony) and the agri-food specialization of some partners (Turkey in particular as the main Mediterranean agricultural power). The variable colonial link is also positively related to the value of Italian exports in the area, showing that the historical bonds between the countries still play an important role in the tendency of the commercial flows and so in the strengthening of the economic bonds between the countries.

While, the distance variable appears, as a "resistant factor" being negatively related to the exports flows and with a statistically negative coefficient. The negative impact of geographical distance is due to the transport costs, paid both for exports and for imports. This factor is very important for the agri-food products and in particular for fresh products. But as Vlontzoo and Duquenn affirm (2007), it also reflects a "cultural distance" and the lack of information. What emerges demonstrates that, though the technological innovations in the logistic system and in the goods transport in particular, there is more still a significant premium for proximity to the destination markets related to the regularity requirements imposed by the retailing companies (García-Álvarez-Coque, 2006).

Another resistance factor is the influence on Italian exports of the variable which expresses the incidence of agricultural surface on the territorial land of the partner countries (ISA), which measures the sectional specialization level. The coefficient of the variable is negatively correlated to the

dependent variable and statistically significant. In other terms, when the specialization in the agricultural sector in the partner countries increases, the Italian exports in those countries decrease.

Finally, the coefficient for the dummy variable Association Agreement is negative and it isn't statistically significant. This result, which disagrees with the basis hypothesis, shows that the signatures of the Association Agreement between European Union and the partner countries have had a low significance impact on the bilateral trade and haven't achieved the aim to integrate the Mediterranean economies in the Euro-Mediterranean market.

The present model has been submitted to several diagnostic tests to verify the presence of collinearity and heteroskedasticity. According to collinearity, we have analyzed the values of Tolerance and Variance Inflationary Factor (VIF) related to β parameters. Referring to the first, values between 0,426 and 0,833 have been found, showing, therefore, that the multiple correlations between the variable at issue and the other repressors are low. Even the analysis of the values VIF, which have resulted in a range between 1.200 and 2.350, reveals that there are no sign which indicates the presence of collinearity between the independent variables of the model.

Concluding remarks

The present paper has studied the Italian agri-food exports in the 1996-2010 period in or towards the Mediterranean non-EU partner countries and, through an empirical analysis carried out using a gravity model, the possible influence on them of some economic, historical-cultural, geographical-territorial variables. The results of the model suggest that the variables traditionally included in the gravity equation present the expected sign. In particular, the Italian agri-food flows heading towards the Mediterranean partners are well explained by the conventional gravity variables such as income of the destination country, distance and colonial link, in addition to other factors such as incidence of the agricultural surface on the territorial land and the belonging to a specific geographical area.

The studied variables, moreover, for what they can result explicative of the proposed gravity model, could be, nonetheless, modified and/or integrated widening the information, on the infrastructural endowment of the partner countries, which represents one of the factors which influence the trade exchanges between the countries.

From the analysis it seem as the relationships between Italy and the Mediterranean partners haven't felt the effects of the subscription of agreements, and of association ones in particular, signed with the countries of the Southern shore of the Mediterranean Sea. Countries as Morocco, Tunisia and Algeria (belonging to the Maghreb region) which first signed the Association Agreements with EU during the Barcelona Agreement in 1995, are still today poorly integrated with EU and with Italy in particular, being, on the contrary, privileged the Balkan countries, potential candidates. This can be explained even in the light of the strong protectionist structure built by the Southern countries for the agri-food productions. However, agriculture plays in these countries a strategic role under the economic and social point of view and it is characterized by the presence of production methods and corporate and

first commercialization structures which are not updated (García-Álvarez-Coque, 2007) and make these countries themselves less competitive in the international market.

The results show, therefore, as the geographical distance between the countries represents still today, though the innovations in the logistics and the transport system, an obstacle for the exchanges. According to what Frémont said (2010), the effect nearness hasn't worked much, in fact, in Mediterranean countries' favour and in particular in Maghreb countries' one for their unsuitable infrastructures. From this point of view, today new opportunities to the Southern countries and to Italy as well, are offered in the framework of the Euro-Mediterranean policy for transports to update their harbour structures, since the sea transport is the 75% of the volume of the Mediterranean countries' foreign trade (Frémont, 2010).

The improvement of the Italian agri-food exports is therefore linked, on the one hand, to a careful revision of the agreements in view of a total opening of exchanges in this area also for the agri-food productions, and, on the other hand, to a more efficient logistics and infrastructural organization of the region, which represent in the whole an obstacle to the integration of the area.

Abstract

The main goal of this study is to analyse the impact of the board composition in the listed Italian family firms on performance, comparing this impact between family and not family.

This variable has not an indifferent impact on business performance. Indeed, a lot of studies underline the importance of the board composition through the composition-performance relationship, also if this relationship considers only financial indicators to measure the performance.

The research method is the analysis of a sample composed by listed Italian family and not family firms (FTSE MIB and STAR) and the data used were taken from AIDA database and the "Borsa Italiana" website, that is the Italian website containing the official data of the listed companies.

For this study it was decided to consider family firms if two criteria were both respected: first, the family controls a relevant percentage of the ownership and, second, at least one family member occupies management roles and participates in the Board.

This study contributes to the literature on family corporate governance and shows that the family role has a positive effect of company performance.

Keywords: family firms, corporate governance, performances, independent members

Introduction

In the literature of family firms the corporate governance is a relevant topic debated in the last twenty years especially for the relationship between family and business (Neubauer & Alden, 1998). A well-functioning board of directors is a critical source for family and business; this relationship emerges in particular inside the board of directors.

The researchers in their works usually adopt different theories like the Agency Theory, Contingent Approach, Life-cycle Approach, Stewardship Theory and Social Capital. In particular, the attention is focused on the composition of the board of directors and its influence on business performance, but the obtained results are sometimes contradictories, and it is not clear how board composition affects firm performance.

Our study analyses the composition-performance relationship in the family and not family business, considering the family as a relevant variable, even if in literature sometimes it is forgotten. Also Dyer (2006) refers to the family as “the missing variable in organizational research” and he warns that “failing to use the family as a variable in organizational research can lead to incomplete or misleading findings” (Speckbacher and Wentges, 2007). In particular, after considering the impact of board composition on performance in family firms, we compare the achieved results with the same ones obtained by not family firms, in order to understand if there is a relevant difference.

Consequently, the main goal of this study is to analyze the relationship between board composition and performance, both in the listed Italian family firms and in the listed Italian not family firms, underling the importance of the family variable in the effects on performance. This topic is particularly significant in Italy, as the family firms phenomenon is widespread.

For this research it's also important to underline that Family firms differ from other firms in terms of the importance that has the existence of family ties among the participants in the firm (Miller, Le Breton-Miller, Lester and Cannella, 2007), specifically among the members of the board of directors.

This article is structured as follows. Firstly, it analyses the theoretical background about the family firms definition and the composition of boards of directors in general. Secondly, the research method is outlined, as well as a brief presentation of the analyzed sample. Finally, the discussion of the results with the conclusions and contributions are given with the limitations of the study.

Theoretical background

Family firms

A family business can be considered as the initial stage of a public company, in a process that involves about one or two generations. The exact origin of the family business model cannot be pinpointed; family businesses were certainly prevailing in the economic fabric of the first industrial revolution and the pre-industrial periods. Similarly to a public company, a family business can reach large size and satisfactory economic performance, finance itself and reach a good level of growth. Consequently, a family business can be considered capable of facilitating development in a framework, which is globalised as the current one is (Miglietta, 2009).

Between the Sixties and Seventies, the management and economic literature on family businesses is characterised by a series of analyses (the first ones to be performed) on family businesses, which were considered under a systemic perspective; it is believed, however, that the development of a family business can be hindered by the fact of its ownership coinciding with its governance (Levinson, 1971).

Around the Eighties and following in the Nineties, a series of events emphasised the interest of business researchers in the subject. Among these events, there are the restructuring process of big companies in the United States and the crisis that in Europe struck the State controlled corporations; on the contrary, in Japan the family business model results to be successful. To these events, the problems related to the Agency Theory must be added (Fama, 1980; Kaplan & Atkinson, 2002; Levinthal, 1988; Nalbantian, 1987; Prendergast, 2000; Rasmusen, 1987; Ross, 2004; Shavell, 1979), with particular reference to the so-called “moral hazard”, stemming from the fact that the management’s actions are characterised by opportunistic behaviour that is not aligned with maximising the creation of corporate value (Arrow, 1968; Darrough & Stoughton, 1986; Holmström, 1979; Mirrlees, 1999; Williamson, 1985). These problems are easier to solve in a family business. In addition, scholars are interested in the potential of family businesses to deal with competitiveness on the national and international level (Barry, 1989; Lamoreaux, 1994).

In the last years, family businesses have been given increasing attention, and several recent studies have reported and stressed that in Continental Europe, Asia, and Latin America the vast majority of publicly traded businesses are family controlled (Claessens, Djankov and Lang, 2000; Faccio and Lang, 2002; La Porta, Lopez-de-Silanes and Shleifer, 1999). These scholars also suggest that family businesses play an important role in economic activities worldwide and contribute to creating wealth and jobs, with reference to both narrow and broad definitions of family business (Astrachan and Shanker, 2003). The quantification of family businesses in the United States and Europe is the subject of several studies (Colli, Perez and Rose, 2003; Corbetta, 1995; Larner, 1970; Neubauer and Lank, 1998; Shanker and Astrachan, 1996; Sluyterman and Winkelman, 1993).

Attention focuses more and more on family businesses; however, it is not that easy to find a definition for the expression “family business”, and ambiguities persist in the literature. The editorial note of the first issue of *Family Business Review* asks: “What is a family business?” (Lansberg, Perrow and Rogolsky, 1988). People seem to understand that which is meant by these words, yet when they try to give a precise definition they quickly discover that the phenomenon is indeed very complex (Hoy and Verser, 1994). The question continues to be asked because in the literature several different definitions are given for family business.

Some studies define family businesses on the basis of the criteria of the ownership and control. In particular, a family business is a “firm in which significant voting rights or ownership is controlled by a member or members of a single family” (Barnes and Herson, 1976); other studies use as distinguishing criterion the share of capital owned by a single family (Alcon, 1982; Lansberg, Perrow and Rogolsky, 1988). In a family business, one or more families having kinship or similar ties are the owners of the full risk contributed capital (Ferrero, 1980). In a family business, one or more families linked by kinship or similar ties or by strong alliances contribute with full or limited risk capital, personal or collateral guarantees or managerial skills; these families owe a full risk capital share that entitles it to controlling the business even without the absolute majority of the capital (Corbetta and Dematté, 1993). It follows that a family business can be composed of a single family, as is the case of

the generation establishing the business, which is headed by the founder assisted by the other members of his/her family; as an alternative, the business includes of different families, in particular after a generational handover has occurred and the company is in its second generation. The family business is run with the aim of establishing, enhancing and reinforcing a long term vision approved by a prevailing coalition, controlled by family members or a limited group of families (Sharma, Christman and Chua, 1997). In this context, the family members or the limited group of families are the economic person of the business, i.e. the person or group of people that has and exercises power in it (Airoldi, Brunetti and Coda, 2005; Ceriani, 1996; Ferrero, 1980); at the operational level, the economic person is represented by the administrative body, which centralizes the decision making power or is the leader of the decision making process (Cavaliere and Ranalli, 1999; Onida, 1960, 1965), i.e. the subject that determines the actions of the company (Farneti, 2007) and affects the top management model, which is the expression of its work (Bruni, 1990). More recently, other scholars have established the minimum threshold of 20% in capital ownership by family members as the criterion for classifying an enterprise as a family business (Villalonga and Amit, 2006); this creates the possibility for the family to hold power to appoint members of the governing bodies.

According to other authors, an enterprise is classified as a family business if (Chua, Chrisman and Sharma, 1999): i) at least 50 per cent of the shares are owned by the family, and the family is responsible for the management of the company; ii) or at least 50 per cent of the shares are owned by the family, the enterprise is not family-run, but the CEO perceives it as a family business; iii) or family ownership is less than 50 per cent, the company is family-run, the CEO perceives it as a family business and a venture capital or investment company owns at least 50 per cent of the shares.

Another criterion used for the definition of the family business is the number of family members involved in its management. In particular, a business must be owned and managed by members belonging to one or more families (Stern, 1986); or there must be at least two family's generations involved in its management (Ward, 1988), also with the aim of conveying managerial skills to the next generation (Churchill and Hatten, 1987). The criterion of the involvement of family members in the management has been emphasised even in recent times (Di Mascio, 2008).

In recent years, the definitions for family business have been based on a mix of criteria related to the ownership and control (Smyrniotis, Romano and Tanewski, 1998). In our work we use a mix criterion in order to identify the family business sample, that is:

- a control participation in the capital by the family/ies;
- the presence in the Board of at least one family member.

Our criterion well reflects the Italian context.

Despite their multiplicity, all definitions include a strong interaction between the family, considered as an entity, its members and the activities performed by the business (Miglietta, 2009). The relations between family and enterprise are subject of significant scientific considerations: their objectives and

visions are different (Pieper and Klein, 2007). On one hand, the family has as its main objective the maintenance and support of its members, and this is the reason the family invests its own resources in the business activities, based on entrepreneurial values (Bertini, 1995; Catturi, 1995; Coda, 1988; Sorci, 1986; Vergara, 1986), which are also inspired by tradition, unity and affection (Salvato, 2002; Ward, 1997). On the other hand, the enterprise aims at satisfying human needs expressed by the market (Ferrero, 1980): the counter-value from the sale of goods and services is used for the remuneration of the production factors used, including the employees' and the employer's labour force. Both the family and the business are motivated by a series of shared values, among which are the continuity of the economic activity (Coda, 1988; Onida, 1954; Giannesi, 1960; Zappa, 1957) and the creation of value (Catuogno, 2006; Cuccurullo, 2006; Tiscini, 2006): if the family is focused on perpetuating the business since it is a place of work and a source of profit for its members, the business strives for long-term survival (Miglietta, 2009). This results in a considerable synergy between the family and the enterprise (Corbetta, 1995) as well as in the necessity for the management to share the family's values, so as to make corporate culture (Schein, 1985) instrumental to entrepreneurial success (Montemerlo, 2009). In addition to these values, the trust in the relations between the family members and between the family and the management is considered by scholars as an intangible resource which is necessary for guaranteeing the survival of the business (Steier, 2001; Welter and Smarborne, 2006). The determinants of such trust, which must be both properly placed and earned, have been analysed and involve both the individual and behavioural qualities of the people who work in the business (LaChapelle and Barnes, 1998).

The literature also focused on the analysis of the performance achieved by the family businesses. Some authors have asserted the neutrality of family ownership to economic performance, in absolute terms or in terms related to the share of capital held by the family (Sciascia and Mazzola, 2008). In contrast, other analyses have found that the economic performance of large listed family businesses is higher than the economic performance of public non-family companies; in addition, the performance achieved by medium-large sized family businesses, both listed and non-listed, are higher if compared with non-family companies of the same size (Anderson and Reeb, 2003). Other studies have highlighted that the best economic performances were achieved by family companies, listed or non-listed, led by their founders (Adams, Almeida and Ferriera, 2003; Barontini and Caprio, 2006; Cucculelli and Micucci, 2008; Villalonga and Amit, 2006), while other researches focused on the analysis of the performance achieved by family businesses being in their second or third generation, and observed a destruction of value (Pérez-González, 2001; Villalonga and Amit, 2006). Other studies have shown that the presence of a family in the ownership affects negatively business performance (Faccio, Lang and Young, 2001; Volpin, 2002).

Corporate Governance theoretical framework.

The literature on corporate governance focuses on the application of theories and models to family businesses (Aronoff and Ward, 1996; Del Bene, 2005; Corbetta and Dematté, 1993; Fama and Jensen, 1983; Magretta, 1998; Montemerlo, 2000; Neubauer and Lank, 1998).

Among the several theories that have been developed to deal with the issues of Corporate Governance, the most relevant and renowned are the Agency Theory, the Resource Dependency Theory and the Stewardship Theory. It is important to understand their focus, their use of governance and how these theories can be applied in the governance of family businesses, as shown in the following chart (Chart 1).

Theoretical framework	Focus	Application in governance	Application in the governance of family businesses
Agency Theory	Minimization of problems caused by the separation of ownership and control	Relationships between principal and agents, usually among owners and management	Effects of the separation between ownership and managerial control
Resource Dependency Theory	Political approach to manage interdependencies between organisations	Networks, inter-company, intra-company governance	Power and resource aspects of relationships in family businesses
Stewardship Theory	Altruism, good steward, Managers are trustworthy	No alignment problems, stewards, relational governance	Effects of no alignment problems between owners and managers

Chart 1 - Corporate Governance theoretical framework

Source: Mustakallio, 2002

The *Agency Theory* states that the primary function of the board of directors is to monitor the actions of agents in order to protect the principal's interests (Fama, 1980; Fama and Jensen, 1983; Prendergast, 2000; Rasmusen, 1987; Shavell, 1979). In particular, the board of directors should monitor the manager's actions to protect the owners' interests from managerial opportunism (Kaplan & Atkinson, 2002; Nalbantian, 1987). As a consequence, the presence of a high number of independent members is positively related to family performance, even if in family businesses the agency problem is less intense because property rights are largely restricted to the agents' decision. In addition, family businesses have less agency costs because most of the owners, managers and board members belong to the same family. In family businesses, the agency problems arise due to the controlling shareholders, who do not always act in the interest of non-controlling shareholders and thus lead to a potential expropriation of minority shareholders (La Porta, Lopez-de-Silanes and Shleifer, 1999).

According to the *Resource Dependency Theory* (Pfeffer, 1982), continuity depends on the business ability to access and control environmental resources such as labour and relational resources, which can help the business to reduce environmental uncertainty. The board can facilitate the acquisition of resources which are crucial to the success of the business, and its role thus becomes determinant. The Resource Dependency Theory asserts the possibility of managing and controlling resource scarcity within organisations through interdependencies with other organisations in their environment, focusing on strategic actions of organisations (Mustakallio, 2002). In particular, different forms of governance structures such as inter-firm or intra-firm networks are used to manage the dependency of critical resources. The Resource Dependency Theory underlines two main elements (Pfeffer, 1982):

- the needs of organisation to respond to the demands of the organisation that controls the critical resources (the issue of external constraints);

- the need of managers to manage their external dependencies to ensure survival of the organisation and also to acquire greater independence and freedom from external constraints.

The *Stewardship Theory* (Alas and Tafel, 2006; Barney 1990; Davis, Schoorman and Donaldson, 1997; Donaldson 1990a and 1990b; Tricker, 1999) outlines that fewer outside members are needed in the board of directors and that the main role of the board is to support the management (Del Bene, 2005). Managers are motivated by collectivistic behaviour and internal directors or affiliated directors lead the business to higher performance. The Stewardship Theory identifies situations in which managers behave as stewards and gain higher advantage from pro-organisational and collectivistic behaviour rather than from individualistic and self-serving behaviour as presumed by Agency Theory. This theory stresses the fact that the board structure should mainly include internal employees or affiliated outsiders who are mutually or linked to the organisation by family and social ties (Sundaramurthy and Lewis, 2003). The Stewardship Theory stresses the benefits of duality between CEO and the chair, a structure that would be deemed to be dysfunctional in agency theory. From these different theories, the direct relationship between the composition of the board and performance of the business does not emerge clearly; this research therefore needs to investigate such relationship in consideration of two types of boards, i.e. family members and independent members and needs to find out a theory which can explain the results in the context of family business.

Methodology

The sample

This study is based on a sample of listed Italian firms, included in the FTSE MIB and STAR indexes. FTSE MIB is the main benchmark index of the Italian equity markets and it captures about 80% of the domestic market capitalization. FTSE MIB measures the performance of 40 Italian primary and with high liquidity companies and it seeks to replicate the broad sector weights of the Italian stock market. STAR index, instead, is the index dedicated to 73 medium companies of the Italian equity markets, having market capitalization between 40 million and 100 million of Euro and respecting the followings features: high transparency and communicativeness; high liquidity (no less than 35% of float); Corporate Governance aligned to the international standards.

Our aim, in considering this sample, was to test the research questions in companies that represent the Italian excellence, both large-size companies (FTSE MIB) and medium ones (STAR). When the size of companies is a significant variable with important effects on some managerial processes, we analyze separately the first sample (FTSE MIB) and the second one (STAR).

Considering the sample of listed Italian firms of the FTSE MIB and STAR index, we excluded banks, insurance and other financial companies, as we wanted focusing on the industrial sector in order to achieve a satisfactory homogeneity. We also eliminated foreign industrial listed companies, as we preferred concentrating on Italian families.

The number of companies finally selected is equal to 80, articulated in family (53) and not family (27) respecting the previously illustrated criterion (a control participation in the capital by the family/ies and the presence in the Board of at least one family member), as shown in the following chart (Chart 2).

	FTSE MIB	%	STAR	%	Total	%
Family Firms	9	36%	44	80%	53	66%
Not Family Firms	16	64%	11	20%	27	34%
Total	25	100%	55	100%	80	100%

Chart 2. The sample

Source: personal elaboration

It is interesting to observe as in the Italian Stock Exchange about 66% of FTSE MIB and STAR companies are family firms. This is due by the fact that the STAR index comprises medium-size companies (80%), even if the percentage of family firms is also significant in the FTSE MIB index (36%).

Research questions and method

The main goal of this study is to analyze the relationship between board composition and performance, both in the listed Italian family firms and in the listed Italian not family firms, underling the importance of the family variable in the effects on performance in the consolidated financial statements. The analysis conducted considers five years (from 2006 to 2010).

Analyzing the board composition, we used the distinction between family members and independent members:

classifying the family firms, we consider companies with at least one family member in the board;

the independent member is a board member non-executive: he has not recently maintained, even indirectly, with the firm or persons linked to the firm, relations such as to influence their independence of opinion.

To identify family and not family firms we use data included in the "Corporate Governance Report" published on the "Borsa Italiana" website supported by the "business profile", while to quantify the number of independent members it was sufficient the "Corporate Governance Report".

To reach the declared goals, three main research questions were formulated:

RQ1: Does the family have a positive impact on performance?

RQ2: Are the independent members more widespread in the family firms or in the not family firms?

RQ3: Does the independent members presence in the board influence positively the performance?

To answer the RQ1, the most relevant financial and economic ratios between family and non family firms were compared.

To answer the RQ2, it was sufficient to calculate a percentage of the independent members in the board, while answering the RQ3, the Pearson correlation ratio was used to identify a positive or a negative relation between firm performance and board composition.

About Pearson ratio (p) it's also important to underline that:

if $p > 0$ there is a direct correlation;

if $p = 0$ there is no correlation;

if $p < 0$ there is a indirect correlation;

if $0 < p < 0,3$ the correlation is weak;

if $0,3 < p < 0,7$ the correlation is moderate;

if $p > 0,7$ the correlation is strong.

Findings and results

About the RQ1 - *Does the family have a positive impact on performance?* - the most relevant financial and economic indicators were compared between family and non family firms.

Referring the economic performance, we consider the following indicators, supported by literature (Ferrero, Dezzani, Pisoni and Puddu, 2003; Foster, 1986; Helfert, 1997; Higgins, 2007; Ingram, Albright and Baldwin, 2002; Value, 2001): ROE (Return on equity), ROA (Return on assets), ROI (Return on investment) and ROS (Return on sales). Referring to the financial performance the following indicators were analyzed, supported by literature (Baginski and Hassel, 2004; Ferrero, Dezzani, Pisoni and Puddu, 2003; Foster, 1986; Giroux, 2003; Helfert, 1997; Higgins, 2007; Meigs, Williams, Haka and Bettner, 2001; Value, 2001): liquidity ratio, current ratio, debt ratio and fixed asset coverage ratio.

In the following chart, we compare the economic performance between family and not family firms (Chart 3).

Analyzing the *economic performance*, in particular focusing the attention on the mean of each indicator (whose trend is confirmed by the median), it's evident that:

not family firms outperform in the ROE (+4,69%), ROA (+0,15%) and ROS (+1,61%) compared with family firms; in particular they evidently excel in the ROE indicator due also to the leverage effect of the high level of debt ratio;

family firms outperform in the core business, how ROI shown (+0,70% compared with not family firms).

	Family Firms	Not Family Firms
Companies (No.)	53	27
Companies (%)	66,25%	33,75%
Roe 2010	6,48	8,26
Roe 2009	0,94	10,35
Roe 2008	6,91	13,76
Roe 2007	12,09	13,71
Roe 2006	10,68	14,48
Roe - mean (2006-2010)	7,42	12,11
Roe - median (2006-2010)	6,91	13,71
Roe - standard deviation (2006-2010)	4,35	2,69
Roa 2010	5,76	6,05
Roa 2009	3,41	6,15
Roa 2008	6,79	7,37
Roa 2007	9,17	8,04
Roa 2006	9,33	7,59
Roa - mean (2006-2010)	6,89	7,04
Roa - median (2006-2010)	6,79	7,37
Roa - standard deviation (2006-2010)	2,48	0,89
Roi 2010	8,50	7,88
Roi 2009	5,32	7,43
Roi 2008	10,62	11,03
Roi 2007	12,75	11,11
Roi 2006	12,11	8,36
Roi - mean (2006-2010)	9,86	9,16
Roi - median (2006-2010)	10,62	8,36
Roi - standard deviation (2006-2010)	3,02	1,77
Ros 2010	7,00	9,55
Ros 2009	4,03	7,26
Ros 2008	7,04	9,26
Ros 2007	9,94	10,69
Ros 2006	9,86	9,13
Ros - mean (2006-2010)	7,57	9,18
Ros - median (2006-2010)	7,04	9,26
Ros - standard deviation (2006-2010)	2,45	1,24

Chart 3. Comparison between Family and Non Family firms in the economic performance

Source: own elaboration based on AIDA database.

Observing the economic indexes trend, using the following graph (Graph 1), it is possible to underline that 2006 and 2007 were in general the best year both for family and non family firms.

Graph 1 - Trend of the economic indexes for family and non family firms and average comparison.

Source: own elaboration based on AIDA database.

Particularly for family firms a decreasing trend during the 2007-2009 period is always verified and it is much more evident than in the non family ones. Besides family firms always outperform in 2010 with respect to 2009. Looking at the average of the five years, Roe and Ros are much better in non family firms (especially due to the 2009 low performance of family firms); Roa and Roi are nearer instead (Roi being better, as we note before, in family firms). The comparison between the median of the five years for family and non family firms shows outperformance in the same sense of the comparison between means, but the difference is always greater. An important evidence also regards the variability during the time of the economic indexes of family and non family firms: as it is possible to observe looking at the graph or, more precisely, at the standard deviation values, the variability of each index over the time is much greater for family firms, showing a more instable behaviour than in the non family ones.

In the following chart, we compare the economic performance between family and not family firms, with the differences between FTSE MIB and STAR indexes (Chart 4).

	FTSE MIB Family Firms	FTSE MIB Not Family Firms	STAR Family Firms	STAR Not Family Firms
Companies (No.)	9	16	44	11
Companies (%)	36,00%	64,00%	80,00%	20,00%
Roe 2010	8,63	14,33	6,03	-0,58
Roe 2009	5,41	16,85	0,02	1,48
Roe 2008	13,32	20,73	5,69	4,25
Roe 2007	19,07	18,19	10,90	7,23
Roe 2006	10,32	17,97	10,74	9,84
Roe - mean (2006-2010)	11,35	17,61	6,68	4,44
Roe - median (2006-2010)	10,32	17,97	6,03	4,25
Roe - standard deviation (2006-2010)	5,18	2,32	4,47	4,21

Chart 4. FTSE MIB and STAR: comparison between Family and Non Family firms in the economic performance

Source: own elaboration based on AIDA database.

Analyzing the economic performance in family and not family firms comparing FTSE MIB and STAR it emerges that:

- not family firms in FTSE MIB outperform in the ROE (+6,26%), ROA (+0,19%) and ROS (+1,26%) compared with family firms;
- family firms in FTSE MIB outperform in the ROI (+0,28%) compared with not family firms;

- family firms in STAR outperform in the ROE (+2,24%), ROA (+2,80%), ROI (+5,51%) and ROS (+3,41%) compared with non family firms.

It can be interesting to look at trend behaviours of the economic indexes, comparing FTSE MIB and STAR (Graph 2).

Graph 2 - Trend of the economic indexes for different kinds of firms and average comparison

Source: own elaboration based on AIDA database.

For each economic index and kind of firm that we consider, it is shown, column by column, the year index value (a mean of the year values of the firms of the same kind) across the period 2006-2010 and, in the last column, the mean of the five year index values reported before (an upper or lower standard deviation difference about this mean is also visible).

Generally, it is possible to note an outperformance of the FTSE MIB firms in the four indexes. Taking then in account the difference, in FTSE MIB firms, between the family and the non family ones, a near or higher level of the five years mean index is reached by the non family firms; these firms have also a less variability in performance across the time and so their results are more regular and reliable. Considering the STAR firms, always looking at the five years mean index, the performance mean levels are higher for family business firms, even if they show a considerable variability across the time; the variability is sometimes lower in non family firms even if it has to be referred to a lower level too.

Concluding about economic performance, it is possible to affirm that:

- in general family firms outperform in the core business;
- the size, beyond the family, is a relevant variable which influences the performance; indeed, the STAR family firms (which are medium companies) outperform in the ROE, ROA, ROI and ROS compared with STAR non family firms.

In the following chart we compare the financial performance between family and not family firms (Chart 5).

Analyzing the *financial performance*, in particular focusing the attention on the mean of each indicator (whose trend is confirmed by the median), it's evident that family firms outperform in the liquidity ratio (+0,10), current ratio (+0,31), debt ratio (-0,82) and fixed asset coverage ratio (+0,63) compared with not family firms; in particular it emerges a minus debt exposure, due to a major percentage of equity on the total financial sources.

It can be interesting to look at trend behaviours of the financial indexes, using the following graph (Graph 3).

The financial indexes, compared to the economical ones, show a less variability across the time and they do not point out a very particular situation for year 2009 for family firms, like the economics ones. Family firms always outperform in all financial indexes.

The analysis of the medians confirm this conclusion, because median values are in this case very similar to the correspondent mean values.

In the following chart, we compare the financial performance between family and not family firms, with the differences between FTSE MIB and STAR indexes (Chart 6).

Analyzing the economic performance in family and not family firms comparing FTSE MIB and STAR, it emerges that:

family firms in FTSE MIB index outperform in the liquidity ratio (+0,03), current ratio (+0,21), debt ratio (-0,55) and fixed asset coverage ratio (+0,03) compared with not family firms;

family firms in STAR index outperform in the liquidity ratio (+0,07), current ratio (+0,30), debt ratio (-0,83) and fixed asset coverage ratio (+0,71) compared with not family firms.

Concluding about financial performance, it is possible to affirm that:

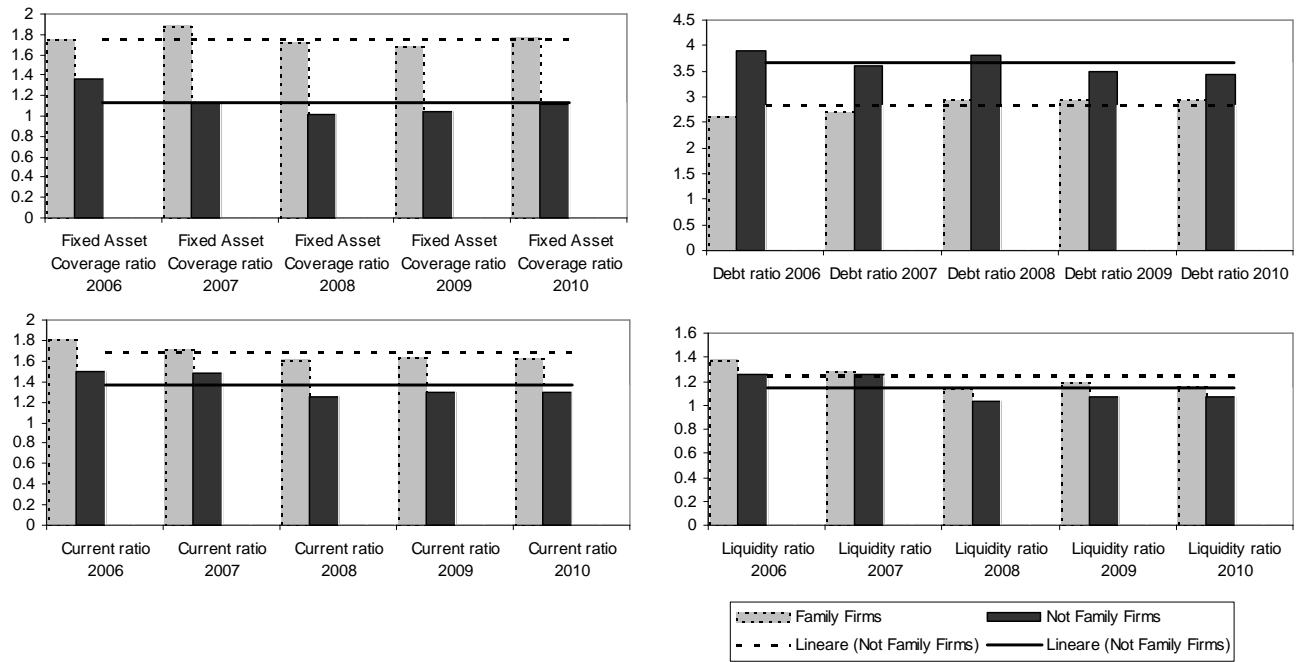

- in general family firms outperform in the financial aspects compared with not family firms;
- analyzing the financial aspects, the size of the company is not a relevant variable.

It can be interesting to look at trend behaviours of the financial indexes, comparing FTSE MIB and STAR (Graph 4).

	Family Firms	Not Family Firms
Companies (No)	53	27
Companies (%)	66,25%	33,75%

Chart 5. Comparison between Family and Non Family firms in the financial performance

Source: own elaboration based on AIDA database.

Graph 3 - Trend of the financial indexes for family and non family firms and average comparison

Source: own elaboration based on AIDA database.

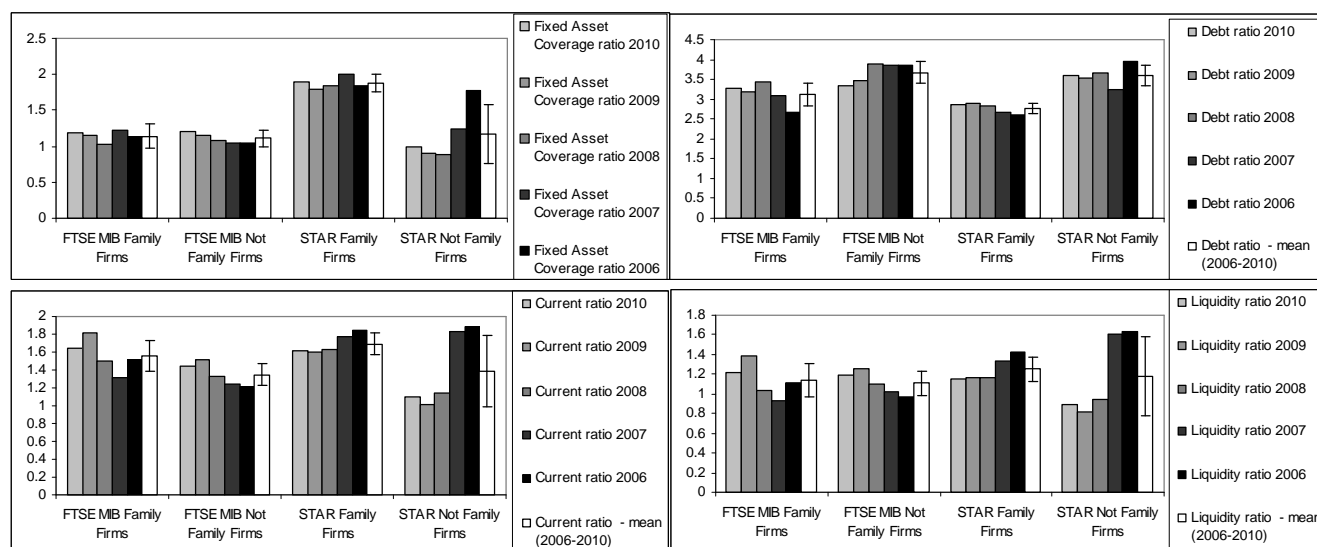

As in graph 2 for the economic situation, for each financial index and kind of firm that we consider, it is shown in the graph, column by column, the year index value (a mean of the year values of the firms of the same kind) across the period 2006-2010. In the last column is then represented the mean of the five year index values reported before (an upper or lower standard deviation difference about this mean is also visible). It is possible to note a generalized outperformance of the STAR family firms in all the indexes. Especially in the last two years (except for the debt ratio) STAR non family firms have also good relative positions, but the worst levels of the first three years may influence to consider their pattern less regular and reliable (as it is shown by a big value of standard deviation too). Considering the FTSE MIB firms, financial indexes are generally near or better, in their levels, for the family firms with respect to the non family ones. The variability is not so different but generally bigger for family firms.

About the RQ2 - Are the independent members more widespread in the family firms or in the not family firms?- we compared independent members in family and not family firms (Chart 7).

	FTSE MIB Family Firms	FTSE MIB Not Family Firms	STAR Family Firms	STAR Not Family Firms

Chart 6. FTSE MIB and STAR: comparison between Family and Non Family firms in the financial performance

Source: own elaboration based on AIDA database.

Graph 4 - Trend of the financial indexes for different kinds of firms and average comparison

Source: own elaboration based on AIDA database.

It is possible to affirm, focusing the attention on the mean of data (whose trend is confirmed by the median), that the number of independent members in the board is always higher in the not family firms than in the family firms, both in the FTSE MIB index and STAR index. In our opinion, this is due to the family behaviour which tries to decrease the independent members in the board to the minimum. The purpose is probably to reduce the external interferences in the decisional process, especially in medium-size companies (STAR index). The trend of the percentage of independent members in different kind of firms is represented in the following graph (Graph 5).

	Family Firms	Not Family Firms	FTSE MIB Family Firms	FTSE MIB Not Family Firms	STAR Family Firms	STAR Not Family Firms
Companies (No)	53	27	9	16	44	11
Companies (%)	66,25%	33,75%	36,00%	64,00%	80,00%	20,00%
Independent Members (2010)	35,09%	47,23%	38,46%	50,71%	34,55%	40,69%
Independent Members (2009)	34,67%	46,65%	39,64%	50,08%	33,86%	40,93%
Independent Members (2008)	34,70%	44,31%	37,33%	49,60%	34,21%	37,10%
Independent Members (2007)	36,33%	43,02%	46,16%	48,04%	34,46%	36,17%
Independent Members (2006)	35,58%	43,43%	45,30%	47,92%	33,84%	36,44%
Independent Members - mean (2006-2010)	35,28%	44,93%	41,38%	49,27%	34,18%	38,27%
Independent Members - median (2006-2010)	35,09%	44,31%	39,64%	49,60%	34,21%	37,10%
Independent Members - standard deviation (2006-2010)	0,69%	1,91%	4,07%	1,24%	0,33%	2,35%

Chart 7. Independent members: comparison between Family and Non Family firms

Source: own elaboration based on "Corporate Governance" report.

Graph 5 - Trend of the percentage of independent members in different kind of firms
Source: own elaboration based on AIDA Database and "Corporate Governance" report

The graph shows that in 2006 and 2007 the firm segment (FTSE MIB or STAR) is more important than the difference between family and non family firms to distinguish high or low percentages of independent members in the board (being higher the one referred to the FTSE MIB firms). In a more recent period (2009 and 2010) instead, it seems to be more important the difference between family and non family firms. This is due to an increasing percentage of independent members in STAR non family firms but, above all, to a remarkable decrement of this percentage in FTSE MIB family firms (especially in 2008).

Indicators	Independent Members (mean 2006-2010) (family firms)	Independent Members (mean 2006-2010) (not family firms)
ROA (mean 2006-2010)	-0,03	0,24
ROI (mean 2006-2010)	0,04	0,42
ROS (mean 2006-2010)	-0,03	0,15
ROE (mean 2006-2010)	0,03	0,32
Liquidity Ratio (mean 2006-2010)	-0,23	0,02
Current Ratio (mean 2006-2010)	-0,30	0,04
Debt Ratio (mean 2006-2010)	0,31	-0,10
Fixed Asset Coverage Ratio (mean 2006-2010)	-0,10	-0,14

Chart 8. Correlation between Independent members and economic-financial performance
Source: own elaboration based on AIDA Database and "Corporate Governance" report

About the RQ3 - Does the independent members presence in the board influence positively the performance? - we correlated the presence of independent members in the board and the economic-financial performance (Chart 8).

Graph 6 – Percentage of independent members versus different economic and financial indexes.

Legenda: in the scatter plots the dots are different for family firms (FF) and non family firms (NFF)

Source: own elaboration based on AIDA Database and "Corporate Governance" report

As it shows, the main evidences are the following:

- in the family firms: about economic performance, there is not a correlation between Independent members and economic performance, while there is an indirect weak correlation between Independent members and financial performance;
- in the not family firms: about economic performance, there is a weak correlation between Independent members and ROA and ROS, while the correlation is moderate about ROI and ROE. There is not a correlation between Independent members and liquidity and current ratios, the correlation is weak between Independent members and debt ratio, while there is an indirect weak correlation between Independent members and fixed asset coverage ratio.

The percentage of independent members versus different economic and financial indexes is represented in the following graph (Graph 6).

Looking at the scatter plots it is possible to reach a general feeling of low linear correlations, according to the results of chart 8. Besides no other appreciable type of correlations (different from the linear ones) seems to appear.

Conclusion, implications and limitations

The main goal of this study is to analyse the impact of the board composition in the listed Italian family firms on performance, comparing this impact between family and not family.

As we mentioned above, the formal definition of family firms we used in this work is:

- a control participation in the capital by the family/ies;
- the presence in the Board of at least one family member.

Therefore, the possible Board compositions we considered are:

- a Board with a family member presence;
- a Board without a family member presence.

In the case of a Board composed by at least one family member, we always find in our sample a control participation in the capital by the family/ies. Due to this consideration, we can say that a company, in which the Board has a family member, is considerable as a Family Firm; vice versa, a company without a family member in our sample has never a control participation and, for this reason, is classifiable as a Not Family Firms.

Referring to *RQ1*, our analysis reveals that Family firms (Board with at least one family member) outperform than Non Family Firms (without a family member) in economic and financial performance, showing the ability of the family to access and control environmental resources like Resource dependency theory affirms.

Indeed, Family Firms outperform in the core business, as underlined by ROI analysis. To be more precise, the first factor of ROI - the ROS index - is better in Family Firms than in the others especially in the STAR index, as the lower is the size the higher is the direct control by the family on all the business variables (internal efficiency, external efficiency, competitiveness, selling mix, production capacity effectiveness, operating leverage, etc.). The behavior of the second factor of ROI - the capital turnover - not explicitly calculated in our research, but easily understandable by an algebraic deduction, outperform in family firms than in the others, both in FTSE MIB and in STAR indexes, showing an higher capability of family firms in commercial power, that has an important effect on liquidity. ROA of Not Family Firms outperform than Family ones, as the incidence of the not-operative area of the company (financial and extraordinary).

About financial performances, indeed, family firms outperform in all the indexes considered by the analysis, especially with regard to liquidity and current ratios.

About the financing composition, family firms has a lower debt ratio, that is, they are more financially independent by external parties. This consideration can explain why in Not Family Firms ROE is bigger than in Family Firms, due to the leverage effect.

We successively analyzed another aspect of Board Composition, the presence of Independent members. Particularly, referring to *RQ2*, our analysis reveals that the Independent members, who should guarantee an effective Corporate Governance with an important effect on performances, are more widespread in Not Family Firms, both in FTSE MIB and in STAR, where is not demonstrated that economic and financial performances are bigger.

To understand more analytically this finding, we correlated the Independent members presence in the Board (both in Family and in Not Family) with economic and financial performances. Referring to *RQ3*, it emerges that in Family Firms, there is not a correlation between Independent members and economic performance, while there is an indirect weak correlation between Independent members and financial performance. Instead, in the Not Family Firms, there is a weak correlation between Independent members and ROA and ROS, while the correlation is moderate about ROI and ROE; furthermore, there is not a correlation between Independent members and liquidity and current ratios, the correlation is weak between Independent members and debt ratio, while there is an indirect weak correlation between Independent members and fixed asset coverage ratio.

Synthesizing, Independent members are not a leverage variable to improve performances neither in Family nor in Not Family Firms.

Concluding, this study contributes to the literature on family corporate governance and it shows that the family role has a positive effect of family performance, underlining the importance of the family members. Probably, the family board members have an important relation with the family performance, helping the firms to open the communication between the family and the firm.

The structure of the board of directors influences the performance in Italian listed companies, even if independent members are not significant.

This research presents some limits that can be summarized as follows:

- few listed family firms;
- the selected firms belong to different sectors, consequently it is possible that the economic and financial ratio are influenced by the particular sector;
- the method used can be improved adopting some econometrical model.

Further research will have the aim of eliminating these limits, also taking in consideration the Corporate Social Responsibility as an important key to success, according to company's ethical values (Kooskora, 2011), and verifying how this critical factor is considered in Family Firms (Kooskora, 2011).

ECO- LABELS: CAN CARBON LABELS WIN CONSUMER'S SUPPORT?

D'Souza, Clare¹; Hota, Saeed²

Abstract

The aim of this paper is to re-examine the impact labelling has on consumers by comparing environmental labels with carbon labels. The intention of this research is to illustrate how carbon labelling, if at all, can increase consumer confidence as a consequence of the opportunity to make more informed choices. This research provides an assessment that would impact the general viability of the carbon claims. From this a platform was presented for marketing based arguments. The article evaluates environmental labelling and argues on the vitality of carbon labels that are contingent on certain marketing perspectives. While some consumers may consider carbon labels as just another environmental labelling scheme, when viewed from a longer-term perspective for the retailer, it would be more risky not to invest in carbon labelling. : Marketers need to understand that it is not just the labelling but a whole host of factors that need to be considered to attract the green consumer to make choices based on carbon labelling. There has been a mixed reaction in terms of using carbon labelling, when one examines the critical mass but there will always be a ready and willing segment to target. Indeed, there may well be an opportunity for carbon labels to be embraced globally to what currently presents as a global encumbrance. The topic is innovative in marketing as this is an emerging contemporary topic and little work has been undertaken in the area of marketing.

Keywords: carbon labelling, environmental labelling, green behaviour, eco-labels, green marketing

Introduction

Environmental labels, Fair trade labels, Food miles, and while this generation move towards Carbon Labels, it prompts the question: How many more 'environmental' labels do consumers require to make an informed choice? In comparison with other environmental labels, one would beg to ask how effective are these carbon labels in attracting consumers to make a difference in their purchasing behaviour.

From a marketing perspective, environmental labels advocates marketing promotion and have long known to be a support mechanism towards consumer determination for green choices. They are used by firms as a competitive advantage or a positioning concept to promote a green image and often viewed as a cooperative association between government regulators and businesses. Labels have a tendency to improve sales and assist firms to improve all around environmental performance (OECD, 1997). Carbon labelling is regarded as a type III environmental label and is relatively new to many

industries. The novelty of this approach has led to many critiques, debates and discussions and some of the questions raised in this article have important inference for marketers in terms of trying to promote these labels to consumers.

While it may seem appealing that countries coming together to create a critical mass of companies and consumers to impel considerable carbon reductions, there is no deficiency in the plethora of labels being introduced over the last thirty years. Eco labels or environmental labels as they are known are not very different from carbon labels. Ecolabels such as the Blue Angel first emerged out of Germany in 1978. They have 11,500 products and services in approximately 90 product categories which carry the Blue Angel eco-label. Different countries have introduced these environmental labels, with the exception of the US which does not have a government-sponsored, multi-attributed eco-label program, twenty other countries such as Canada, Australia, Germany, Japan, Sweden, Brazil, India, Luxembourg have long developed these labels (Case, 2004) the late entrants in the markets are **Environmental Choice Australia** ecolabel, launched in 2001 which provides to the community and commercial markets an environmental mark of recognition for a wide range of products and services.

While carbon labelling is seen as a critical process to address the key market failure in the climate change debate, much of this effort has resulted in a weak argument, adding limited value in terms of feasible directions in attracting consumers to adopt them. We already have environmental labels in circulation, what lessons can be learnt from these labels? The aim of this paper is therefore to re-examine the extent to how labelling imposes on consumers. This is done by comparing environmental labels with carbon labels. The paper also attempts to provide an assessment that would impact the general viability of the carbon claims and compare it with environmental labelling. To this end, the article evaluates environmental labelling schemes and argues on the vitality of carbon labels that are contingent on certain marketing perspectives. The intention is to increase consumer confidence as a consequence of the opportunity to make more informed choices.

Carbon Labels vs. Environmental Labels:

In UK some of the companies that have been actively involved in carbon labelling are Pepsi Co, Boots, Innocent Smoothie, Halifax, Continental Clothing Company, Mey Selections, Tesco, Aggregate Industries, Cadbury Schweppes, Coca-Cola, The Co-operative Group, Halifax, Kimberly-Clark, Marshalls and Scottish & Newcastle. There are over 30 companies in Japan and there have been signs of carbon labelling initiatives also undertaken by some European countries (Gabrielle, 2008). Pilot studies have been undertaken in countries such as Australia and South Korea to carry a carbon label and examine their benefits thereof.

The objectives behind carbon labels are similar to that of eco-labels. By definition the term carbon labelling is to provide information on the carbon footprint of a product and influence diverse players. It is generally expected that carbon labelling may facilitate consumer participation in climate change responses (Hogan and Thorpe 2009). Momentarily it stands as a voluntary instrument that can be complementary to supporting environmental regulations. Carbon labels are said to be a moving target

and involves taking into consideration a range of activities. It includes the carbon footprint even before the goods are produced, calculates the foot print during storage and distribution, and finally the carbon footprint at the end-users' home. Ecolabels are much easier to measure than carbon labels. While carbon labels may not be such a bad idea, because it allows consumers to have an environmental insight on carbon measures of the product, the fact remains that to get it right, manufactures and carbon labelling organizations will have to be involved in a humongous task, involving various costs and time and it eventually might turn out to be *just* another environmental label to the consumer.

Environmental labels such as the Blue Angel, Nordic Swan and, Australian Choice labelling are non-manufacturer's type of labelling having greater credibility. An independent third party endorses these labels by assessing a firm's environmental standards. They act as a certification process and often trust worthy by consumers due to independent verification (Hassan and Vandermerwe, 1994; Muska, 1999). Manufacturers' labels on the other hand are type II labels and often relate to general claims such as 'recyclable', 'ozone friendly' or '60% phosphate free'. They appear in written or symbolic form (D'Souza et al, 2006). Each country establishes their own standards when it comes to eco-labelling. Similarly, in the case of carbon labelling a number of independent entities, such as Carbon Trust in the UK, SGS (Geneva) have initiated carbon monitoring and calculation methodology programs to allow companies to audit their emissions. In addition, BSI has introduced a standard (PAS2050) that can calculate emissions of greenhouse gases for goods and services over their lifecycle but is short of 'real life' application to diverse products (Azapagic, 2008). The UK experience is being used to inform either EU or international approaches. This has resulted from the rather arbitrary and adhoc manner by which carbon labelling requirements have been introduced. The above discussion clearly reveals the diversity in trying to establish a clear criteria or standard measures. This needs to be maintained as a similar practice across continents, so that a uniform standard at the international level is maintained when it comes to marketing these products globally.

Carbon Labelling and Consumer Interpretation

There are many important unanswered questions relating to the claims made by carbon labelling and whether a well-designed carbon label will enhance consumers to adapt to environmental practices? The literature on the general consensus of labelling is apparent in favour of influencing consumers with sufficient information to make informed choices through adequately providing reliable information; however a more reliable platform is required for making environmental claims. Within the central thrust of environmental labelling, past research has shown that there remains the mistaken notion that consumers can make informed environmental choices. Even a superficial evaluation of the green market shows that most consumers appear ignorant in identifying the differences in environmental labels. In most cases, consumers are unaware of regulations or the implications that permit business to place such labels on their products (Plant & Plant, 1991; Iyer, 1999).

While research has shown that consumers command appropriate label information, yet, there appears to be considerable ambiguity with labelling information. This is echoed in survey responses conducted in earlier studies (Muller, 1985 and Robertson and Marshall, 1987; Caswell & Mojduszka, 1996). A survey identified that for 70% of the respondents, although purchase decisions were at least sometimes influenced by environmental messages in advertising and product labelling, most respondents reported that environmental claims were not particularly believable (Chase and Smith, 1992). In another survey 83% of the respondents indicated they preferred buying environmentally safe products and 79% reported they considered a firm's environmental reputation in purchase decisions; however, only 15% said that environmental claims were extremely or very believable (Dagnoli, 1991). In the US survey, a 1990 Roper poll showed that Americans poorly regarded advertising and labelling claims pertaining to the environment, believing that this was green washing (Schwartz and Miller, 1991). Concern over 'misrepresentation about environmental attributes, not very transparent, truthful, discriminatory, based on sound science, substantiated and misleading to consumers' were some of the common responses found by researchers (Carlson, Grove & Kangun, 1993; Davis, 1994, Gray-Lee, Scammon & Mayer, 1994; Polonsky, Bailey, Baker & Basche, 1998). More recent studies have shown that environmental labels were accurate and easy to understand (D'Souza et al., 2007).

At this juncture, consumer scepticism about questionable environmental claims shows mixed consumer reactions about the environmental claims made by environmental labels. Most of the studies have answered in the imperative, labelling schemes per se were found not to have added real value in terms of providing viable information for consumers, while in reality they could have. The implications for carbon labelling are quite apparent. Given that consumer confidence is poor in the case of environmental labelling, carbon labelling may face similar issues as a carbon footprint is a credence attribute which cannot be reasonably verified by consumers (Hogan and Thorpe, 2009). Survey reports by Ipsos Mori (2008) in the UK estimate that around only a third (34%) of consumers make decisions on the impact on climate change of making and transporting the product, while just about 38% claim to comprehend what the term 'carbon labelling' means. Secondly, like environmental labelling, the benefits of carbon labelling are indecisive as it is highly reliant on consumer perceptions of the reliability of the information and access to that information (Babiker, 2005). It is clearly evident from some of the studies indicated that there is no impact on carbon labelling from UK customers and consumers may be in fact be overstating their green behaviour (Gabrielle, 2008). Thirdly, there is the risk of consumer confusion about the reliability and interpretation of information provided in the carbon labels (Hogan and Thorpe, 2009). Germany's Oko Institute developed the Anec report which compares many labelling schemes including the Carbon Trust label (416, pp 30-34), The report concludes that the data used to calculate footprints can be undependable and differ over time; consumers appear confused over the information and are unable to identify other environmental impacts. In fact, in comparison to carbon labels, eco-labels are a preferred option (OKO Report (2010).

The above discussion raises several important marketing related issues with respect to consumer research.

Consumer Research and Opportunities

Regarded below, as problematic are some issues on carbon labelling for marketing: Unfortunately, despite the propaganda in the early 1990s, green products have not only failed on good performance but have failed on attracting the critical mass of consumers that was generally expected. There have been concerns expressed by Industry over packaging and the methods used to calculate the products carbon footprint. These complexities would arise, not only with associated costs but also from the administration of each product line when it comes to giving individual measures and separate batches of a product category that are packed or manufactured in different factories (Brooks, 2008). It is hoped that carbon labelling raises awareness, but it is reported that the benefits of carbon labelling are not convincing, as it all depends on consumer perceptions of the reliability and access of the information that was transmitted, especially when these scheme are voluntary. Experts are also orchestrating their views and have warned that carbon labelling may not have the capacity to drive product switching but certainly create the need for public policy reforms (Ipsos Mori, 2008). Firms also have to balance the advantages of carbon labels against the need for other labelling schemes, according to Richard Naylor, UK environment manager at Scottish & Newcastle. He said that the company was unlikely to carry carbon labels on individual beer cans as it also had to make space for responsible drinking labels and did not want to overwhelm the customer with information (Murray, 2008).

None-the-less the upside of carbon labelling is that carbon labelling tells consumers just how much CO₂ and other greenhouse gases have gone into the production process. It measures greenhouse gas emissions of a product over its total lifecycle (Brooks, 2008). This will give manufacturers an innovative measure; secondly, it has the capacity to drive the supply chain's environmental value by reducing their carbon intensive products. Lastly, it is intended to facilitate consumer participation in climate change. Not just with environmental labels but other labelling schemes as well have shown to have a significant effect on behavioural change: nutrition labels, organic certification and Fairtrade mark (Teisl et al 2002; Stern 2007). Yet the question that is debated is does carbon labelling have the power to influence consumer choice as it has so intended? There are sound reasons to believe that consumers are willing to change their consumption behaviour to preserve the environment (Kassarjian, 1971; Brooker, 1976; Du Preez, Diamantopoulos and Schlegelmilch, 1994). Consumers differ in their knowledge of and concern about the environment. On the one hand, there are those who strongly believe that environmental or carbon labelling is not a matter for debate. But rather a moral obligation that finds strong roots in the behaviour of consumers. It is not just the labelling but a whole host of factors that need to be considered to attract the green consumer to make choices based on carbon labelling. Given below are arguments on the vitality of carbon labels that are contingent on certain marketing perspectives. The following issues need to be considered:

Firstly, understanding green behaviour, for example whether a consumer will undertake to purchase items endorsed with carbon labelling specifically, simply does not stand up to drawing a general examination, instead there could be other factors that require examination such as brand loyalty, psychographics and other behavioural determinants. Straughan and Roberts (1999) reports that consumer concerns about the environment that matter can have a poor effect but the extent to which the individual consumer believes that his or her actions are likely to make a difference. There is also a consideration for altruism (a concern for the welfare of others). While perceived consumer effectiveness has been found as an important moderating factor of the attitude environmentally conscious behaviour relationship, it can also have a direct effect on behaviour (Berger and Corbin, 1992; Ellen et al, 1991). In terms of carbon labelling it can be seen as trusting the value put on the label. Eco-labels on one hand have credentials as they are endorsed by third party, in the case of carbon labelling, the owner or manufacturer is expected to endorse these labels. This would determine how much confidence consumers have for the manufacturer. Bagozzi and Dabholkar (1994) has identified in a means-end chain analysis that egoistic and altruistic goals compel environmental behaviour, but that altruistic goals have a greater tendency to dictate, if such is the case then carbon labels will appeal to this sort of behaviour.

The fundamental assumption is that attitudes (Hartmann, Ibanez and Sainz, 2005) and positioning are seen as critical factors in the success of green branding strategies (Coddington, 1993; Meffert and Kirchgeorg, 1993). For this reason it is necessary that positive attitudes on carbon label brands occupy central position. Other studies have considered the symbolic or emotional aspects of green brands indicating that, if green brands can induce positive emotions in certain green groups by providing information that the brand is green, just having knowledge that a brand is green may satisfy customers (Hartmann and Ibanez, 2006). Labels tend to signal the unobservable quality of the product (Kirmani and Rao, 2000). It may well be worthy to notice in terms of carbon labelling that green consumers often derive auto-expressive benefits through the socially visible consumption of green brands, making the selection of a green brand their way of illustrating environmental consciousness to society (Belz and Dyllik, 1996).

Secondly, will positioning of carbon labels attract a larger proportion of the market share; this statement can be contended by arguing on the basis of loyalty and the shift to products that have carbon labels endorsed. There is due consideration given to Lam, Ahearne et al (2010) research, who have suggested that under market disruptions events such as recalls, sales promotion and innovations can impact consumers' loyalty status. They envisage that if the perceived value of a brand is conceptualized and operationalised as functional utilitarian value, it may not confine other non-utilitarian factors like socio-psychological benefits which make consumers brand loyal (e.g., Gardner and Levy 1955; Bagozzi 1975; Holbrook and Corfman, 1985; Sweeney and Soutar 2001), though brands give self-definitional benefits beyond utilitarian benefits (e.g., Aaker 1995; Aaker 1999; Escalas and Bettman 2005; ; Stern 2006; Park, MacInnis, and Priester 2009). Lam et al (2010) state it raises two issues, it contends that consumers stay loyal or switch brands only to maximize functional utility or is

there an underlying relationships that compels brand loyalty in the face of these market disruptions. Lam et al (2010) propose that brand switching can also result from customers' social mobility between brand identities. As such those that are brand loyal may not want to switch given the functional utility their brand has to offer. Thus it is highly unlikely that positioning carbon labels will influence this group of customers.

Studies proposing that the attention in environmental consumer research should be shifted from general attitude studies towards the study of actual product choices (Rokka, and Uusitalo 2008), under this assumption, carbon labelled products should continue to raise awareness but it will be unclear as to how consumers will trade off between price, quality and carbon footprint (Deurer, 2008).

Thirdly, products endorsed with carbon labels should correspond to green attributes. It is just not the endorsement of the labelling; the brand should also be able to differentiate itself from other brands. On the other hand, even if consumers regard functional values of a brand, Orth and De Marchi, (2007) suggest that the functional benefits are largely associated to inherent advantages of the consumption status of the product and correspond to attributes of the product. In effect, Coddington (1993) has pointed out that green marketing implies the satisfaction of consumer's emotional needs. In response to this and other manifestations, notably, emotional benefits such as, intrinsic value felt by consumers when using green products, often driven by this 'warm glow of giving' can be derived from the brand (Menges, 2003; Boyce et al., 1992). Similarly, Ritov and Kahnemann, (1997) expressed those consumers had a feeling of well-being ("warm glow") also associated with acting in an altruistic way. The 'warm glow' benefit which was experienced by consumers who rate low on measures of environmental consciousness was also found by Hartmann and Apaolaza Ibáñez, (2005).

Based on Reinhardt (1998) view on differentiating a green brand from a traditional brand, we apply a similar analogy to the three elements for successful green brand differentiation which was used by Reinhardt (1998): A carbon endorsed brand must be capable of creating a willingness among customers to pay for environmental quality. As some of the research has shown that green brands have not met with success due to their poor quality and high price (D'Souza et al 2007); A carbon endorsed brand must establish credible information about the environmental attributes of its products. This would mean, it is just not the label information, the product environmental attributes are also important; a carbon endorsed brand must be capable of defending itself against imitation by competitors. However, it is likely that competing brands will also have carbon labels endorsed.

Suggestions for future research:

In order to strengthen desired outcomes for carbon labels, more research is required on the benefits that consumer intend receiving. Since carbon labels uses various metrics to measure the carbon usage, further research will be required to identify if the whole marketing system needs to engage in this iterative processes?

Conclusions

The paper provides a broad explanation that draws an analogy from environmental labels to carbon labelling to determine what lessons can be learnt. From this a platform was presented for marketing based arguments at the level of the consumer and to facilitate relationships in the value chain with other stakeholders such as the retailer. When viewed from a longer-term perspective, it would be far more risky *not* to invest in carbon labelling. Marketers need to understand that it is not just the labelling but a whole host of factors that need to be considered to attract the green consumer to make choices based on carbon labelling such as the following related factors: consumers' green behaviour, understanding the basis of positioning in terms of loyalty issues and product attributes. There has been a mixed reaction in terms of using carbon labelling, when one examines the critical mass but there will always be a ready and willing segment to target. Indeed, there may well be an opportunity for carbon labels to be embraced globally to what currently presents as a global encumbrance.

Abstract

In the Nineties, in the climate of deregulation taking place in Italy, the law N. 179/1992 (article 16) introduces the Integrated Programs (PIN), a tool able to regenerate the urban, construction and environmental context, by leveraging on a new “public-private” nexus. The PIN is the first instrument of a set, named Complex Programs, that modify territorial actions, plans, the relationship between municipalities and lobbies and consider economic, social and environmental aspects in territorial and urban planning.

Traditionally the repartition of tasks and urbanization costs between public and private subjects, has not produced good results in terms of services and urban facilities in the urbanized areas, at least until the nineties. Only at the beginning of the 1990's were several laws and decrees passed that tried to reformulate the public-private relationship, such as in the Complex Programs and in some innovative urban planning practices based on the principle of equalization. In both cases, the assessment of conveniences for public and private subjects assumes a central role, as explained in the article.

Keywords: integration, development, planning, feasibility, assessment

Contributors Note

The introduction, sections 2, 3 ,4 and conclusions have been written by Claudia de Biase, sections 5, 6 and 7 have been written by Fabiana Forte.

Introduction

The article 16 of the law N. 179/1992 maintains that the municipalities can promote the formation of the Integrated Programs (PIN) which must be “... characterized by the presence of multiple functions, by the integration of different types of intervention, including urbanization, by a sufficient scale to affect the urban reorganization and by the possible competition of multiple operators and financial resources, both public and private” (Art. 16, L. 179/1992).

The big news of this type of instruments is the flexibility of contents and funding. The PIN has been designed as a “piano di dettaglio” (i.e. a plan that realizes interventions included in Urban General Plan) that takes distances from the other Italian ones thanks to the multiplicity of functions, to the

integration of multiple types of intervention, to the particular scale it refers to and to the possible convergence of public and private resources.

The PIN is an implementation tool that orbits within the overall planning activity, but with the ability to overcome it, although territorially defined limits. Moreover, the PIN is a flexible tool that can be applied both to the urban and building rehabilitation and to new constructions. It is established in the second paragraph of Article 16 that, in fact, provides that the PIN can be "*covering areas in whole or in part built or to be assigned also to new construction*".

The concept of "integration", included in the name of these Programs (PIN), can be referred to several levels:

- Integration of the different urban functions;
- Integration of public and private subjects;
- Integration of financial resources.

It is, therefore, a composite instrument in which the urban component is intimately interwoven with social-economic and environmental components.

The main element of the PIN is the contemporary technical and financial planning aiming at ruling cost, time and mode of execution of operations. It is based on negotiation and consultation processes and it mainly aims to the revitalization of specific areas in crisis. Another element to underline is the new concept of urban decay, referring not only to the physical and urban component but also to the environmental, social and economic ones.

The building and urban centre renovation becomes, therefore, the new central theme that governments, private operators, enterprises and citizens, engaged in the activities and structure of urban land use, have to face. Over the time, in fact, a constellation of different planning instruments has been set up in the renovation field: from *Piano Particolareggiato* – PP (L. 1150/1942), passing through *Piano di Edilizia Economica e Popolare* - PEEP (at least in the initial phase was also aimed at restoration) and through *Piano di Recupero*, arriving at the PIN and the so-called Complex Programs (Ombuen et al., 2000; Urbani, 2000; D'Angelo, 2003).

An overview of the Italian Complex Programs

The set of *Complex Programs* includes:

- Programma di Recupero Urbano (PRU);
- Programma di Riqualificazione Urbana (PRiurb);
- Contratti di Quartiere I and II (CDQ);
- Programma di Riqualificazione Urbana e Sviluppo Sostenibile del Territorio (PRUSST);

- Programma Innovativo in Ambito Urbano that, in the course of a few years, have totally changed the “public-private” nexus in implementing and managing the land transformations.

As noticed by Ferrero (2000), "The toolbox of Italian urban planning has been enriched by a series of new operative tools created with the aim, on one hand of overcoming the rigidity of the traditional plan, the other to responding to increasingly complex configuration problems city, urban policies, decision-making processes". There is a first attempt to combine (with not always virtuous results) the system of guarantees, embodied in the urban planning tools, with the executive potentialities due to the availability of ad hoc funding, to the streamlining procedure, to the consultation and construction of public/private partnership. The new set of Complex Programs maintains, for the first time, an overview of the actions on the territory according to a so called plan-project logic producing a great advancement over the traditional separation between urban planning and program implementation. The new scenario that arose in the Nineties is also due to the reorganizational process of the institutions and of the administrative action, which began precisely with the law N. 142/1990, continued with the law N. 241/1990 and was finally ratified in the measures promoted by the Ministry of Public Administration in recent years.

A focus on Simplification Instruments (laws N. 142/1990 and N. 241/1990)

From the Nineties until recent years, legislative actions have produced both direct and indirect changes on the urban planning instruments.

Some problems have determined territorial uneasiness that is still unsolved:

- Inelasticity of urban plans;
- Unrealized programming of actions;
- Difficulties in getting areas to destine to public aims;
- Poor collaboration with private stakeholders;
- Poor democratic choices;
- Inefficiency;
- Long taking process by the public administration.

Because of the above cited problems, some incomprehensible, maybe unlawful behaves have derived. These behaves consist of: so common unauthorized building, the neglect of partially realized areas and buildings, with the scarce maintenance of the already realized ones, the inadequate presence of services, the difficulties by citizens to show their needs, the impossibility to participate to the plan process. It seems that these behaves are due to never totally realized or not efficiently managed plans. Of course, negative implications on life quality derive and are well known. In fact, since the Eighties,

the EEC has underlined these problems in the *Carta Europea dell'Assetto del Territorio* (1983) and has started the Progetto Pilota Urbano (1989).

In Italy, as already said, ten years later (the first program has been enounced in 1991), the *Complex Programs* have been introduced in the field of housing policy and have strongly affected the urban planning. The new aspects are: all the *Complex Programs* can vary the urban plans; public administration and privates cooperate to the program (even if public administration must decide public aims); both private and public economic resources can be used and, eventually, administrative times are shorter. These *Complex Programs* have tried to make the process of planning more flexible and believable and, above all, have used new simplification tools contemporary introduced.

At national level, in fact, the law N. 142/1990 (article 27), refined with subsequent laws and finally confirmed by the Decree N. 267/2000 (article 34), introduces the first simplification tool "*Accordo di Programma*" for the government assistance program agreement. This tool is designed to coordinate the actions of public authorities co-involved in the implementation of works and intervention programs. According to the law N. 142/1990, the *Accordo di Programma* is intended to establish "*works, assistance or intervention programs that require, for their full implementation, the integrated and coordinated action by Municipalities, Provinces, Regions, State or other Public Authorities, or in any case of two or more of the above mentioned subjects*". The agreement of the concerned Authorities determines timing and methods of compliance, as well as arbitration proceedings and actions to be taken in case of default of those subscribers. In particular, the *Accordo di Programma* is introduced to allow the context-based evaluation of all the interests involved in the final measure, the overcoming of excessive bureaucratization of the administration.

As already mentioned, the *Accordo di Programma* relates to the "public works". As a consequence, it is easy to understand the weight that it can play in urban transformation, especially since the work covered by the *Accordo di Programma* can change the planning instruments (Decree N. 267/2000, article 78), despite not having any value in the institutional sector (Decree N. 267/2000, article 34).

By law N. 241/1990 and N. 662/1996, some innovative simplification tools are added to the *Accordo di Programma*. Nowadays these new simplification tools are fully entered in the process of planning.

The main simplification tool is the *Conferenza dei Servizi* that offered to governments the ability to examine contextual issues and the acquisition of authorizations, approvals and agreements by all relevant public subjects (law N. 241/1990, article 14 as modified by law N. 127/1997, article 17). This means that to a plurality of steps is replaced by only one step, with obvious advantages in terms of rapidity and, indirectly, of simplification (Gerundo, 2000).

The *Conferenza dei Servizi*, bringing together in the same time and in one place all the involved subjects, each in relation to the role institutionally held, reduces the time for bureaucratic practices. The *Conferenza dei Servizi* is a deliberative subject and, consequently, its decisions have effect and value of all the acts provided for by national and regional laws needed to approve the proposed work and, therefore, to implemente it. The use of the *Conferenza dei Servizi* can be requested either by a

public authority, when the action to be executed is in the public interest, and by a private entity interested in implementing any intervention. In either case, the resolution of the *Conferenza dei Servizi* change the town plans. As seen, the *Accordo di Programma* and the *Conferenza dei Servizi* produce significant impacts on local planning instrument, despite having only the purpose of streamlining and accelerating procedures. Based on these practices, there is the introduction of additional tools specifically aiming to simplify urban planning, called *Complex Programs*.

The Complex Programs

The set of different procedures that, over time, have been introduced, constitute the new set of programs named *Complex Programs*. These programs are characterized by several elements:

- Institutional consultation;
- "Public-private" interaction;
- Efficiency in implementation of changes to be introduced;
- Explicit impact on the choices of previous urban plans.

These programs involve both physical and functional aspects within a planned framework of costs, time and mode of acting. The *Complex Programs* are able to formalize the commitments and financial needs of public and private operators, while the transformation takes place with flexible interventions and open to new players and new funding arrangements.

Attention is going to be focused on the main *Complex Programs*. Of course, the PIN is going to be excluded from the review since nowadays it is an implementation instrument of urban planning in most of the Italian Regions; the same happens for the PRUSST since it is the only territorial program instrument that neither has been financed after 1998 nor has been used by Italian Regions.

Programma di Recupero Urbano (Decree N. 398/1993 and law N. 493/1993).

The PRU consists of a systematic set of actions aimed to the maintenance, modernization of primary urbanization, with particular attention on the problems of accessibility of the facilities, network services and secondary urbanization, building completion and integration of existing urban complexes, ordinary and extraordinary maintenance, restoration, rehabilitation and conservative building renovation of buildings. The PRU is reserved for the recovery of neighbourhoods of public housing, including outdoor areas necessary for the realization of an organic approach. This program allows you to "*address the problems of the settlements of ERP with a variety of tools and a variety of sources and economic actors who had never been previously possible, thus being able to pursue the goal of integration between urban spaces and functions more effectively than had been possible hitherto*" (Roda and Segnalini, 2001). In the PRU, the traditional concept of recovery goes from the limited size of one building to the whole residential system; in reference to the Plans of law N. 457/1978, the PRU foresees also, and above all, quality intervention on infrastructure, with reference to areas of recent and former expansion, to degraded areas of affordable housing and popular. By this tool, the intervention of

private resources becomes essential, because the PRU requires the use of private economic funds and so the private operators have to agree with public institutions.

The PRU, unlike other programs that are funded through participation in national announcements, may be subsidized directly by the Regions that decide where and when to implement it, even with the activation of *Accordo di Programma*. This is the reason why more than one Italian Region considers the PRU just as an implementation plan.

Programma di Riqualificazione Urbana (DM dated 21/12/1994)

The PRIURB was introduced just a year after the PRU, but it has a different goal of intervention. While the PRU, as we said before, is focused on public and popular residential areas, the PRIURB intervenes at any deprived urban area. In this case, the decay has to be of interest to:

- Building components;
- Planning;
- Environmental organizations;
- Economic needs;
- Social needs.

The presence of five forms of decay seems to get the PRIURB close to the European programs aimed at revitalizing neighbourhoods in crisis. Actually, this is only partly true, because the funding is restricted to work on building and planning components. The PRIURB uses the funds of the law N. 179/1992 (article 2). Most of these funds are reserved for large-size municipalities.

At present the programs do not have national financial resources, therefore, only the Regions that have specific laws to support these initiatives can implement PRIURB.

Contratti di Quartiere

These programs (CDQ) are in line with the EU dispositions and they aim to the integration of spatial interventions on social, economic and physical components of the city, in search for a solution against urban decay. Since Eighties, in fact, the EU has initiated integrated interventions in favour of "neighbourhoods in crisis" (Chierichetti, 2000) which, as noted, are urban areas where there is a particular incidence of adverse factors related to both the social environment (the concentration of people experiencing severe discomfort) and spatial scope (the construction and environmental degradation).

In the following years, when the phenomenon of immigration intensified social tensions, many European cities started to revitalize the urban areas where the situation was more worrying in terms of the physical and social degradation (Commissione Europea, 1995). In 1990, France has adopted the system of Contrats de Ville, with the aim of reducing exclusion in 187 urban districts; in 1991, England has adopted the City Challenge, a five-year program of action to fight economic decline and exclusion,

which operates in 31 urban areas; Netherlands have introduced the Stads vernieuwing in the major cities (Avarello and Ricci, 2000).

The logic that unites all these programs is, in fact, the prediction of a set of activities synchronously acting on the social, economic and physical part of the city strongly characterized the neighbourhood. In this case the intervention on the physical component is instrumental to improving the economic and social components.

Since social cohesion is a priority for European action, against the impoverishment and marginalization of some urban areas, the EU (1989-1993) directs funding to cities Objective 1 and 2 and includes numerous pilot projects against social exclusion. On this track, with Decree 22 October 1997, the Italian Ministry of Public Works approved the Contratto di Quartiere, aiming to financing experimental measures in subsidized housing. The integrations appearing in Contratto di Quartiere are related to the renewal of character building, to energy conservation and to work on social integration and, in particular, on employment. Another major innovation is the direct involvement of users in the program: the Municipalities, in fact, once obtained by the another Institution (Comitato di Edilizia Residenziale) the certainty of funding, should promote the participation of an local residents organizations to define the final design of recovery public housing estates. Undertaken with the aim of promoting the rehabilitation and social construction of neighbourhoods marked by widespread decay of buildings and the urban environment and lack of services in a context of low social cohesion and marked homelessness, the Contratto di Quartiere must be included or in plans for affordable housing and popular, or in areas with degraded buildings, or in areas subject to urban renewal, or in areas with similar characteristics.

According to the model of European programs, the Contratto di Quartiere has "the primary objective ... [combining] urban-action construction [with] the increase in employment-oriented measures and the reduction of social problems" (Roda, Segnalini, 2001, pag. 169).

The experience of Contratti di Quartiere continued with Contratti di Quartiere II (law N. 21/2001) that moves following the same logic, with some differences:

- Funds are no longer directly from the funds Gescal former, but from other state funds;
- There is co-financing process involving State (65%) Regions (35%).

Programma innovativo in ambito urbano

The last instrument, in chronological order, approved by the Conferenza permanente per i Rapporti tra lo Stato, le Regioni e le Province autonome di Trento e Bolzano on 13th November 2003, is the PIAU. This innovative program is against urban decay and in favour of social conversion of areas close to both railway stations of large cities and port areas. Today, in fact, these areas have turned into areas of "first asylum" for foreigners arriving in the city and, therefore, they are areas of "merger with the local population..." (Cundari, 2005). According to this, only the Municipalities with Port Authorities and large railway junctions can promote this plan.

The PIAU aims to facilitate testing of models, procedures and tools needed for the organization of change processes in urban environments, "assuming that railway stations and ports, establishing themselves as the new urban centres and land capable of triggering processes of integration between infrastructure connection between the port and terrestrial communications networks-often through heavily urbanized areas and sometimes the same centres of the city-port and commercial equipment, management, service" (available on www.infrastrutturetrasporti.it). The PIAU is in accordance with the existing urban planning instruments enforceable in case of any discrepancy requires a variant planning. Financial resources secured to the cited program, (article 4, law N. 21/2001) are divided among the municipalities involved in the implementation of the program based on some characteristic data (density, spatial concentration, unemployment rate, complaints to the judicial authorities, passenger stations, freight stations, passenger traffic ports, freight port), from which indicators of urban significance, intermodal and social disadvantages derive.

The new public-private relationship in the production of public facilities: some economic-financial aspects

The need to involve private subjects in the production costs of public facilities and infrastructures that enable improved standards of urban living has always been present in Italian legislation. In particular the *Piano di Lottizzazione Convenzionata* introduced by art. 28 of the national urban planning law and successively modified by art.8 Law 765/1967, has represented a partial effort to impose this involvement in production costs of fixed social capital. However, this provision has not proved particularly effective: it has poorly contributed to the infrastructural equipment of urban areas. This is due to the fact that private investors are frequently more concerned with implementing their own interests rather than assuming a collaborative role with the urban project as a whole.

Similarly, the building permit fees, introduced by law n.10 as long ago as 1977 ("oneri concessori") despite being instituted to reduce public administration construction budgets for urban facilities, have also proved to be inadequate. This is both because the calculation estimate method of building permit fees is inaccurate and because real building costs have not been updated over the years (although this is required by law). Consequently there has been an increasing differential between the real costs of producing public facilities and the revenues from building permits, with corresponding problems and gaps in local authority budgets. It's then possible to sustain that the repartition of tasks and of the urbanization costs between public and private subjects, has not produced good results in terms of services and urban facilities in the urbanized areas, at least until the nineties.

In the face of such a situation, only at the beginning of the 1990's several laws and decrees were emanated to try to reformulate the public-private relationship, as in the Complex Programs. In the same period "having recognized the inefficiency of the authoritative command and control tools, some administrations have been trying to implement and manage urban and regional plans through the use of tools that intervene in the market, orienting the behavior of the agents toward socially

shared goals” (Micelli, 2002). In those innovative experiences the participation in the planning choices and implementations is extended also at privates on the basis of the principle of equalization.

Complex Programs and feasibility

With the Integrated Programs, introduced by the Minister of Public Works with law n.179/1992 (see introduction), the involvement of private subjects was re-proposed for realize urban facilities and building works aimed to activate the urban, building and environmental renewal, observing planning tools or, if necessary, changing them. The evolution of this kind of programs, characterized by common goals and identifying as “*Programmi Complessi*”, highlights a new scenarios where cities are called to re-thinking themselves over trough new and more flexible procedures, on the basis of programs deliberated by the local administrations. These programs demonstrate a growing need to make not only the selection process of the programs more transparent and efficient in order to be financed with public resources but also the process of formulation and implementation of intervention proposals.

In other words, the *evaluation* in its different forms and procedures assumes a central role as “instrument for rationalizing the action of public administration and means for legitimizing and certifying the choices” (Bentivegna, 2000).

For the first time in Italy, within these kinds of programmes, the theme of *economic conveniences* emerges; that can be realized by both public and private subjects respectively through the implementation of the program (Forte, 2002). It’s infact necessary to verify the economic and financial feasibility of the program on the basis of:

- the amount of funding for public interventions by private resources estimated on the basis of parametric costs (*economic convenience for public subject*);
- b)the market values of buildings realized by private subject after deducting all costs of production, estimated on the basis of parametric costs (*economic convenience for private subject*);
- the market value of buildings object of “assignment” to private subject (*economic convenience for private subject*).

In that way, public and private conveniences became the determining factor for the selection of proposals on the basis of the verify of feasibility in both financial and economic aspects.

The economic feasibility concerns the convenience of the program from the point of view of all community; in that specific case, intended as the entity of financing of public interventions trough private resources (urbanization works and public facilities). The financial feasibility concerns the conveniences that realize the private subjects through the sale of buildings realized with the program, after the deduction of the construction costs, building permit fees and taxes.

Specifically with the *Programmi di Riqualificazione Urbana*, the Minister of Public Work has redacted a Guide in which is defined a methodology for an adequate economic representation of the programs. In that Guide are indicated two different possible procedures: a) the instant comparison of costs and revenues, do not take into account the temporal variation; the difference between summary of revenues and summary of costs allows to the Net Value of investment (it must result positive to verify the convenience); b) the calculation of cash-flows, where costs and revenue are distributed during a defined time series; the difference between costs and revenues discounted to an adequate rate allows to the Net Present Value of investment.

From an appraisal point of view, the forecasting capacity to preview the economic factors that come into play in the evaluation of feasibility of the programs (market values, production costs, rates of return, financial taxes, etc.) is obligated to compare themselves with the uncertainty. It's a typical characteristic of the market and concerns the building activities, the building times, the entity of revenues. As Stanghellini says << in these conditions that characterized all Complex Programs, the static evaluation models that assume the ordinary behavior of economic agents and the continuity of time and the conditions of reference, hardly provide reliable indications. The risk, then, must be evaluated with more complex models, able to measure it and to indicate the strategies for reducing it...>>. (Stanghellini, 1995).

Equalization and appraisal

As previously, since the beginning of the 1990s, in Italy, a growing number of urban plans have been based on so-called "perequazione" or equalization tool (the equal distribution of developing rights to all land-owners involved in the plan) and on the principle of the transfer of development rights. Equalization in Italy represents a cultural innovation; it is an alternative option instead of expropriation to acquire lands for public use (Forte, Fusco Girard, 1998; Forte 2005). Also if it is not established by state law, it has been implemented in practice over the past twenty years with the drafting of some regulatory plans and regional laws, as in Campania Regional Law n. 16/2004, that explicitly introduced that criterion .

The aim of equalization is "to fairly distribute development rights and obligations towards the municipality, or other qualified public entities, between those property owners affected by the transformation brought about by urban development. The principle of equalization allows the public administration to acquire free of charge from private individuals, in exchange for benefits granted to them, areas to be allocated to works of public interest" (Bartolini, 2011).

Also in that case the *economic evaluation* assumes a relevant role: the investigation of the costs of production of urbanized space is correlated to the benefits or advantages deriving from opportunities that local administration gives by mean decisions on the uses of land. The aim is to verify the efficacy of urban planning rules both from the private and public point of view.

The evaluation of conveniences became the basis of the agreement between private developer and local administration. That evaluation entails the identification of all economic variables that take part into the transformation process (Forte, 2009). From the appraisal point of view, the most tested approach is the transformation value; its consists of verifying inequalities between the market value of the area in its existent condition (in Italy until 2007 this value coincides with the value of allowance on the basis of traditional expropriation procedure) and the transformation value that the equalization procedure makes possible. The estimation of the transformation value derives from the difference between the total revenue, calculated on the basis of market value of the buildings produced with the transformation and the production cost of transformation (costs of construction of private buildings, costs of urban facilities and a normal percentage for profit).

All the most recent Italian experiences of programming and planning express a strong demand of evaluation, at the different levels of plan and during the different phases of elaboration (ex-ante, on going and ex post). All the experiences refer at market, necessarily: for the pluralities of subjects involved, for the need to verify the efficacy of urban planning indicators adopted into the plans, both from the private, public and community point of view (the role of participation), for the creation of a new market of virtual building volumes, etc.. It is particularly in the above context that the scientific contribution of economic-appraisal analysis has become even more necessary, especially in the current economic situation where public funding is increasingly scarce.

Conclusions

Finally, the PRU, the PRIURB, and the PIAU assume the role and effects of variation of the urban plan, while the CDQ works in compliance with existing planning instruments. Beyond these specific differences, what unites the complex programs is the goal of a complete redevelopment of the area, or rather a portion thereof, in the sense that the interventions act on a strictly planned urban development and, at the same time, also invest the economic and social spheres.

This element is undoubtedly positive, if there is a clear framework to address planning, otherwise, given the "independent" of interventions, there is a risk that could trigger processes of change that are difficult to control and manage (Blasi, Padovano, Petrella, 2000). In sum, in order to produce consistent and effective results, the programs can not aim, as it happens very often, to impromptu choices or a *summa* of random actions. These programs have to face the decay problem in a continuous, entire and complex way, by taking as reference a whole planning strategy.

Both Complex Programs and the principle of equalization are by now acknowledged by numerous regional laws in matter of governance and use of territory. All these laws express a strong demand for evaluation at the different levels of planning (strategic, tactical and implementation levels). In this perspective the scientific contribution of appraisal activity represents a necessary and effective tool in the assumptions of shared choices for the development of cities and territories.

Abstract

This study focuses on information sources influencing the decision-making process when selecting higher education institutions, by students in South Africa and Swaziland. The main objective of this study is to investigate the sources of information used by a sample of 403 students at two Universities, one in South Africa and one in Swaziland when selecting a Higher Education Institution. The secondary objective is to determine whether there are significant differences between students of the two universities in terms of the importance and performance of these sources that are provided as an extension of the normal services provided by institutions of higher education. The findings indicated that both samples prefer to be informed about Higher Education Institutions by web sites. A high premium is also placed on university publications and high school teachers to obtain information. This implies that although impersonal methods are the most preferred methods, a great premium is placed on personal interaction e.g high school teachers to obtain information. In terms of the perceived performance of the information sources, a slightly different sequence was measured. The best perceived information source is high school teachers followed by the web site and word of mouth. However significant differences were measured between the expectations of the students and the perceived performance of the information sources which applies that their expectations were not met. Consequently it needs clear planning from the authorities. Some practical implications for Higher Education Institutions, limitations and suggestions for future studies will be articulated.

Keywords: information sources, higher education, marketing

Introduction

Decision-making, when selecting educational services, is even more complex and significant for students these days, compared with what it used to be in the past. Students, nowadays, have a much broader spectrum of HEIs and programmes available from which to choose, and are being bombarded by advertising, news articles and direct marketing that provide large amounts of information on HE services. Often prospective students feel overwhelmed by the amount of information available and the potential risk involved when making the wrong choice. Moogan and Baron (2003) described them as being often inexperienced with vague selection criteria and very limited knowledge of the brands

available. Students' need for reliable information conveyed through appropriate sources of information has increased, to help them make the best possible decision. Subsequently HEIs are attempting to convey increasingly detailed information about their institutions and the courses offered to prospective students (Veloutsou, Paton & Lewis, 2005). Conversely, Haywood and Molesworth (2010) found that detailed information was mostly ignored by undergraduate students when selecting a university, in favour of simpler criteria, and those they consider most relevant to their needs when making a secure decision.

This emphasizes the need for HEIs to look carefully at students' decision-making and information-search process, in order to communicate the correct information via their preferred information sources. Therefore, this study will explore the type and importance of information sources used during this decision-making process – focusing on two African countries: South Africa and Swaziland. In the following sections consumer behaviour when evaluating higher educational institutions will be reviewed, with emphasis on the information-search phase of this process.

The article is structured as follows: the literature on marketing of HEIs as well as consumer behaviour and information search of students when evaluating higher educational institutions is reviewed. Then the research methodology is described, followed by the findings of the study. Finally, the limitations of the study and the future research possibilities are presented.

The Information Search of Students when Evaluating Higher Educational Institutions

In order to communicate effectively with prospective students, it is necessary to identify what the information needs and preferred sources of information of their target market are. They have to understand factors influencing students' decision-making processes when selecting higher educational institutions or courses – to ensure that students make the right decision in favour of their institutions. On the other hand, information is more widely available, easier to access and likely to be presented in a manner that would assist prospective students in making informed choices. Thus, understanding students' perception and their use of information sources are of tremendous importance for higher educational institutions.

Information search is the process in which the consumers search for suitable information to make a purchase decision. It is the second stage in the generally accepted model for consumer decision making where two main tasks are performed, namely internal information search and external information search. Internal sources are stored in the consumer's memory and this type of information can be obtained from previous searches or personal experience, and is typically the only source consulted when making routine or low-involvement purchase decisions. External information search implies that consumers look for additional information from external sources, which can be personal or impersonal, related to the commercial field or not. External information search is applicable when making routine or high-involvement purchase decisions. A variety of commercial or marketing sources are employed by HEIs to reach prospective students such as advertisements in magazines,

newspapers, radio and television, websites, emails, brochures, recruiting catalogues, glossy alumni magazines, guidebooks and private counsellors or marketers employed by the HEI (Wiese, van Heerden, Jordaan & North, 2009). Consumers often rely on personal sources when the purchase is of particular significance and when they are evaluating a service as oppose to product. Zeithaml, Parasuraman, and Berry (1990) notes that the level of risk perceived is higher and the search for information more extensive when the service is provided by experts (in this case HEIs) – causing the consumers to feel relatively more vulnerable when compared with other services – where they already have knowledge and experience of what to expect.

Studies on the selection of HEIs identified the several potential personal information sources: parents, guardians, friends, family members, as well as parents and friends (Domino; Libraire; Lutwiller; Superczynski & Tian, 2006, Hu & Hossler, 2000; Wiese, van Heerden, Jordaan & North, 2009; James (2000); Moogan, Baron, and Harris (1999). External sources included university prospectuses, open days, websites, visits to high schools, career advisers and news in the media, advertisements and promotional activities (Moogan, Baron , & Harris, 199; Moogan & Baron, 2003; Maringe, 2006). However the literature sources also seemed to disagree on the importance of the information sources that were consulted by prospective students. The conflicting findings of these studies revealed that there seems to be a difference in the degree to which prospective students use and perceive the value of information sources – in particular in the South African context.

When reviewing the literature several negative comments on HEIs' ability to communicate the right messages to students through appropriate sources of information are reveal. Haywood *et al.* (2010) clearly disapprove of the exploitation of the gullibility of prospective students in the UK. This is usually done by over-emphasizing the glamour and pleasures of student life. Moogan and Baron (2003) comment on brochures distributed by HEIs, that are frequently written at an inappropriate level, with confusing content. Briggs (2006) stated that the information supplied by institutions frequently fails to meet potential students' requirements; and this author advises that messages should provide a clearer association between specific institutions and the courses they offer. James, (2000) warns that open days, in particular, can be "superficial" by concentrating on the tangible aspects, such as the attractive buildings, sports and library facilities or accommodation, because the most important elements of education cannot be viewed.

In the light of the above discussion the need for this current study becomes imperative, specifically the investigation of differences and changes in the information needs of students in African countries.

Problem Investigated

As institutions of higher education are very competitive they often take a business stance in order to compete for human and financial capital. This, consequently, gave rise to higher institutions greater emphasis on student recruitment in order to influence student decision making in favour of them. This is even more so as universities increasingly seek to develop an international presence and seek to

attract international students. Overall the problem is a lack of information on information needs and source preferences of prospective students.

Research Objectives

The primary objective of this study is to identify the most important information sources that students consult when in a process of selecting a university in South-Africa and to compare it with a sample of students from Swaziland. The secondary objective is to determine whether there are significant differences between South African and Swaziland students. The research is a follow up on a similar investigation where an attempt was made to determine whether differences exist between different levels of student performance in South Africa.

Research Methodology

Conceptualising the purpose of the investigation

In order to achieve the primary objective of the research, the information sources consulted when selecting an institution of higher education is investigated.

The following secondary objectives were formulated:

- To evaluate the expressed levels of importance of information sources of a sample of South-African and Swazi students when selecting an institution of higher education;
- To determine the existence of significant differences between South African and Swazi students when choosing information sources
- To evaluate the expressed levels of performance of information sources of a sample of South African and Swazi students when selecting a institution of higher education
- To determine the existence of significant differences between South African and Swazi students when evaluating the performance of information sources
- To determine the existence of significant differences between the importance of information sources and the perceived performance thereof of South African and Swazi students when selecting a new institution of higher education

Research hypotheses

With regards to the objectives the researchers formulated the following hypotheses:

- Ho: There exist no significant differences with regard to the importance of information sources consulted and the perceived performance thereof when evaluating an institution of higher education.
- Ha: There exist significant differences with regard to the importance of information sources consulted and the perceived performance thereof when evaluating an institution of higher education.

- Ho: There exist no significant differences between South African and Swazi students with regard to the importance of information sources consulted and the perceived performance thereof when evaluating an institution of higher education.
- Ha: There exist significant differences between South African and Swazi students with regard to the importance of information sources consulted and the perceived performance thereof when evaluating an institution of higher education

The sample framework

A sample of 420 questionnaires was distributed at random to students at the management faculties of two universities, one in South-Africa and the other in Swaziland. All respondents agreed to participate to the survey and were supplied with a self administrative questionnaire. Only 14 questionnaires or part thereof was discarded. A summary of the composition of the sample is provided in table 1. The sample comprised of 49, 6% male and 50.4% female students. Twenty percent of the sample was under the age of 19 years old while 22.5% were twenty and the remaining group above 20 years of age. Fifty seven percent of the sample was from South Africa while 43 percent were from Swaziland.

		No	%
Age	16-17 years	3	0.5
	18-19 years	79	19.5
	20	92	22.5
	20-21 years	112	27.5
	22+	118	29.0
Gender	Male	200	49.6
	Female	205	50.4
University	South Africa	232	57
University	Swaziland	174	43
Total		406	100

Table 1: Summary of sample characteristics

The measuring instrument and reliability measures

A structured questionnaire was developed to measure the importance and performance of information sources when deciding on a specific institution of higher education. A five-point Likert-type scale was used to measure the levels of importance and performance. The list of sources of information was based on extensive literature research and the findings of focus groups consisting of students and lecturers at a institution of higher education..

Data collection and analysis

The data was gathered and captured by trained field workers over a period of six months.

The SPSS version 17.0 statistical package was utilised to analyse the data. For this analysis the Kolmogorov-Smirnov Test was employed based on the assumption that if the significant values exceeded 0.05, normality could not be assumed and the researchers had to rely on employing non-parametric analysis techniques. As normality could be assumed after applying the Kolmogorov-Smirnov Test the researchers employed the ANOVA test to test the null hypothesis and the alternative hypothesis.

An item analysis was carried out to test the reliability of the questionnaire and an Cronbach's alpha of 0,87 and 0.926 for the expectations and performance respectively were obtained.

Findings

Table 2 indicates a comparison between the levels of importance that the samples of the two universities attach to the information sources. University web sites were overall rated the most important source of information when looking for information about an institution of higher education. Significant differences were however measured between the two samples with the Swazi sample rated it significantly more important, also in first position and the South African sample as second most important information source. University publications were overall rated as second most important variable but were rated third by each sample respectively. No significant differences were however measured between the two samples. The overall third most important information source was information obtained by high school teachers. Statistical significant differences were measured between the two samples with the Swazi sample rated it significantly more important (second place) than the South African sample (fourth place). The information source that was overall rated least important was advertisements on radio. No significant differences were however measured between the two samples.

When considering the means and ranking of the total sample it is clear that there are significant differences between the levels of importance to which university students rate the difference information sources related to institutions of higher education to assist them in choosing the most appropriate one. The total sample indicate the universities web site is the most preferred information source, followed by University publications and high school teachers. As a result one can argue that due to the increasing importance of information technology, web sites as a means of disseminating information became very important because students can utilize this source whenever they have a need to access it. University publications and high school teachers were regarded as second and third most important information sources. On the contrary TV and radio advertisements turned out to be not as important as one would have expected. Surprisingly word of mouth as information source to disseminate information was also amongst the least important information sources.

	Swaziland		South Africa		Totals		T Value	P Value
	Mean	SD	Mean	SD	Mean	SD		
High school teachers	1.60 2	0.90	1.71 4	0.99	1.67 3	0.97	-.798	0.425
Word-of-mouth (friends & other people)	2.43 11	1.34	1.79 6	0.90	2.07 10	1.17	-4.918	0.000
Advertisements on the radio	2.24 10	1.17	2.20 11	1.07	2.11 11	1.12	-2.049	0.040
Events on campus (music festivals, sports events)	2.09 7	1.14	1.85 7	0.96	1.96 6	1.06	-1.961	0.050
Advertisement in magazines/newspapers	2.13 9	1.03	1.87 8	0.88	1.99 8	0.96	-2.484	0.013
University publications (newsletters & brochures)	1.69 3	1.05	1.63 3	0.89	1.66 2	0.97	-.048	0.962
Advertisements on TV	1.97 5	1.06	2.00 10	1.11	1.99 8	1.09	-.097	0.923
University web site	1.41 1	0.80	1.59 2	0.91	1.51 1	0.87	-2.378	0.017
Campus visits & Open days	1.81 4	1.05	1.55 1	0.84	1.68 4	0.94	-1.919	0.055
Other students (alumni)	1.98 6	1.01	1.95 9	1.01	1.96 6	1.01	-.304	0.762
Parents	2.12 8	1.26	1.75 5	0.96	1.90 5	1.12	-2.621	0.009

Table 2: Importance of information sources used when choosing a Higher Education Institution

Table 3 indicates a comparison between the perceived performance of the Swazi and South African universities information sources. While the overall best perceived information source were high school teachers it was rated first by the Swazi sample and fourth by the South African sample. No statistical significant differences were measured between the two samples. The second overall best perceived information source was the universities web sites. Both samples rated this information source in second place and no statistical significant differences were measured between the two sample groups. The third overall best perceived information source was word of mouth. While the South African sample rated this information source better in terms of performance, no statistical significant differences were measured between the two groups.

When considering the means and ranking of the total sample it is clear that overall high school teachers were rated the best perceived information source provided by Institutions of Higher education. This was followed by the Universities web site and Word of Mouth. The two least best perceived information sources when looking for information about an institution of higher education

were advertisements on both TV and radio. The least best perceived information sources were indicated as advertisements about the institutions of higher education on both TV and radio.

Table 4: Importance versus perceived performance of information sources

Table 4 indicates the importance as well as the perceived performance of the information sources available when searching for an institution of higher education in Swaziland and South Africa. The table indicates that there are significant differences between the means of importance and perceived performance on all variables, thus H_a hypothesis is accepted. The universities web site were rated as the important sources of information, but were rated second in terms of perceived importance. The second most important source of information was University publications but was rated fifth in terms of perceived performance. The third most important information source was rated high school teachers but was rated first in terms of perceived performance. Statistical significant differences were measured between the level of importance and the perceived performance of the information sources on all variables. This means that students' expectations are not met. This is also the case with all the other variables. It appears that the institutions realize which the most valuable sources are, although they seem not to meet the students' expectation in this regard.

Conclusion and Recommendation

The primary objective of this study is to identify the most important information sources that are available for potential students when in a process of selecting a university in South-Africa and to compare it with a university in Swaziland. In addition the perceived performance of the mentioned information sources in both countries were determined. Emphasis is placed on the comparison between two universities in Africa, one in South Africa and one in Swaziland in terms of their preferred data sources when searching for an institution of higher education. Where intense competition between universities exists to attract the most promising students and retaining them, the most effective methods to accomplish these goals should be implemented. This includes attempts to utilise the most effective information sources to disseminate information that will enable students to make an informed decision regarding their preferred Higher Education Institution.

From the literature it is clear that students are well served by a wide array of information sources that may disseminate relevant information. Due to economic reasons, Institutions of higher education should determine which available sources of information will serve the purpose best. It may be argued that all students that have enrolled at a particular university may have similar needs. Contrary to this the literature amongst others reveals that students needs and wants changes over time as they mature. Due to culture differences these needs may also differ from one geographic area to another. Where an information source is for example well known and established it might occur that the existence of it might be taken for granted and consequently the importance thereof may be less compared to a less established information source. In the survey that was conducted it was evident that the Swazi sample overall attached a lower level of importance to the information sources compared to the South African sample. In addition the perceived performance of the information sources were also rated lower by the Swazi sample compared to the South African sample. Due to these dissimilarities each region should carefully examine/monitor their own results and take pro active measurements to ensure that their own target market is satisfied.

Recommendations and Management Implications

It appeared from the study that it should also be useful to consider to determine the rate of establishment of a particular information source and to compare it with the rate of importance that is attach to it and secondly also compare it to the level of perceived performance that the sample attached to the information source.

Bearing the above mentioned in mind the diverse nature of Higher Education Institutions, should in collaboration with their students, determine the most efficient sources of information before embarking on a recruitment campaign. This process is important regardless of the positioning attempts that might already be in place by universities.

Students will as part of their decision making process at one stage or the other, have a desire to acquaint themselves with the specific characteristics of a particular Higher Education Institution. In

order to create and benefit from a competitive advantage, Higher Education Institutions management should concentrate on the most appealing sources to disseminate information. The combined study performed in South Africa and Swaziland revealed that the sample of students prefer to be informed about Higher Education Institutions by means of the web sites. South African students, however place a slightly higher premium on campus visits and open days compared to the Swazi sample. Although university publications were overall rated second by the total sample it was rated in third position by the respected sample groups. High school teachers were also rated as highly important, especially by the Swazi sample.

This implies that although impersonal methods (web site) are the most preferred method (overall), a great premium is placed on personal interaction to obtain information. This is probably due to the important nature of the outcome that will determine the decision makers' future career. Although the samples has put a high premium on impersonal methods, they seek support for their decision by more personal information sources in order to ensure that their decision is based on solid grounds tested with experts. This is a clear indication that management should incorporate these views in their marketing strategy. Similarly, UK students put a higher premium on university prospectus, university open days and the web site. The first and the last implies that students also prefer to investigate the prospects on an indirect way but also see the universities open days, where interaction can take place, as an important source of information to choose between universities (Veloutsou et al., 2005).

Of the overall four most important information sources, significant differences between the South African and Swazi sample were only measured in terms of university web sites as information source. Regardless, it was rated by both samples relatively important. The difference might be due to culture differences in the sense that South Africans might be after a more personal approach in order to ensure that the best decision is made. Contrary to another investigation in one region in South Africa where the sequence of the level of importance of various information sources were the same and without any statistical significant differences between the two groups, this survey shows slightly differences between the sequence of the importance attached to the information sources. However four of the information sources were identified by both samples as the four most important variables although not in the same order. Management of the universities in the two countries should pay attention the outcome that applies to them.

The least preferred information sources to consult for decision making purposes were advertisements by various kinds of media that includes the radio, television and the printed media. This outcome is debateable as no evidence is available that they regard these methods of obtaining information as unimportant purely because they know it is available. However it might also be that these kinds of information sources mainly provides limited information about an institution and are merely a resource of reference.

Regarding the perceived performance of the information sources, both samples together indicated that high school teachers, the web site and word of mouth were indicated as the overall three best

perceived information sources. While the Swazi sample perceived high school teachers as best information source it was perceived fourth best information source by the South African sample. However no statistical significant differences between the two samples were measured. The university web site was perceived second best by both samples although statistical significant differences were measured between both samples. Word-of-mouth, that was overall perceived third best information source as well as by the South African samples. However the Swazi sample perceived it fourth best. Statistical significant differences were measured between the two samples. Parents as information source were however rated in third position by the Swazi sample.

Significant differences were measured between the expectations and the perceived performance of all information sources to disseminate information. This resulted in dissatisfaction. It is however evident that regarding the most important information source, the universities web site, it was perceived second best information source while high school teachers as information source were perceived best. It was however rated third in terms of importance.

The study clearly indicates the merit for engaging and concentrating on identified information sources. Regarding the web site, that is impersonal; management should keep in mind that it should be made accessible over a wide geographic and social spectrum and be welcoming and reassuring to prospective students. Finally from a marketing perspective, recruitment (function of management) of the most promising students should keep in mind the outcome of the study in order to position itself with the aid of the most appropriate information sources.

Abstract

Around the world, some of the largest firms in many countries are controlled by family business groups such as Fiat in Italy, Ford in the US, Hutchison Whampoa in Hong Kong, Samsung in South Korea and many others. Further, many family groups have a long history. Although family business groups are a significant and long standing phenomenon in most parts of the world, their resilience to globalization in their use of different governance structures and relational capabilities have received little attention from a cross-cultural perspective. Drawing on our previous work, the study provides a theoretical framework to classify family business groups' key traits on the basis of their etic/emic distinction from a cross-cultural perspective.

Keywords: etic, emic, cross-cultural perspective, family business group, family business, business group.

Introduction

Although family business groups are a significant and long standing phenomenon in most parts of the world, their resilience to globalization in their use of different organizational structures have received little attention from a cross-cultural perspective. In particular, both the conceptualization of their governance structure and of their relational capability needs to be further explored. Existing research mainly focuses on their strategic, organizational and financial capabilities by devoting very limited attention to the different cultural settings in which family business groups operate. The aim of this paper is to provide a theoretical framework with a twofold objective:

- First, drawing on the literature it seeks to identify and critically assess the relevant dimensions that can better explain the distinctive semantic traits' that belong to the family business group;
- Second, to provide a taxonomy of family business groups from a cross-cultural perspective by adopting GLOBE (Javidan and House, 2004; Chhokar et al., 2007) and by relying on the emic/etic distinction of their key traits (Pike, 1976). The underlying assumption is that while their etic dimensions do not vary across different cultural clusters, family business groups would have distinctive emic dimensions depending on the different cultural cluster they belong to.

The proposed theoretical framework presents several benefits. Not only it allows a more holistic interpretation of the concept of family business group by simultaneously taking into account all the relevant dimensions, both the etic and the emic ones (Pike, 1976). Taking into account the work of Pinder & Moore (1979) on the taxonomizing of organizations, our framework will provide a fuller understanding of the phenomenon by allowing a classification of the family business groups' key traits from a cross-cultural perspective.

Literature Review

Family business groups and their distinctive traits

Interest in the governance that characterizes family business groups is not new in the literature. Furthermore, family business groups are increasingly important players of the private sector of many emerging as well as developed markets (La Porta et al., 1999). Accordingly, family business groups have emerged as a distinct theme in the literature and have thus attracted the interest of a wide range of scholars from different disciplines. In particular, renewed interest in this topic has recently spurred from the definition developed by Granovetter (1995, 2005) and tends to overcome this main shortfall by providing a richer insights over the existence of a particular set of ties by which governance can be exerted by the founding family. Similarly, when discussing family business groups, Steers et al. (1989) outline the importance of the strong social ties that families use in order to place their members in the key positions so to strengthen the power of the family. Granovetter (2005) and Pieper (et al., 2009) also highlight the importance of the persistence between formal and informal ties to ensure both the longevity and the long-term sustainability of family business groups. Overall, all these accounts widely refer to the key traits that characterize the inter-organizational relations within family business groups that are namely the "nature", the "type", the "intensity" and the "persistence" of the ties (Della Piana et al., 2010a; 2010b).

The nature of inter-organizational relations

Although many scholars have analyzed business groups characteristics (Granovetter, 1995; Chung, 2001; Khanna and Yafeh, 2005; Cestone et al., 2005; Cuervo-Cazurra, 2006; Gopalan et al., 2007; Hsieh, 2009; Della Piana et al. 2010b) as well as family business groups (Harvey et al., 1994; Aronoff et al., 1995; Ensley, 2005; Minichilli et al., 2010), there is still an unsolved dispute about what constitutes a family business group. Family business groups are often seen as a specific type of business groups possessing a set of distinctive features. The first trait regards the nature of inter-organizational relations; specifically we refer to the shareholding as "*a set of legally-separate firms with stable relationships operating in multiple strategically unrelated activities and under common ownership and control*" (Cuervo-Cazurra, 2006: 420). In this sense the business groups is identified as a type of firm network, characterized by a multiple set of stable relationships on the basis of a common ownership (Della Piana and Cacia, 2009). Accordingly, if we analyze business groups based on their ownership we can identify three different types: family-owned, widely-held, and state-owned as illustrated in the Table1.

These types of business groups have different actors who own, control and manage them so this results in different agency costs, different levels of diversification and performance (Cuervo-Cazurra, 2006). In this context, family-owned business groups are a particular type of business groups often characterised by large shareholdings that enable and provide incentives for the family to exert strict control over management (Shleifer and Vishny, 1997). Family business groups also do not suffer from agency problems of separation of ownership and control as do other types of business groups (Claessens et al., 2000). Besides, using family members and trusted intermediaries as managers solves the agency costs of managerial misbehaviour thanks to the social control provided by the family relationships (Davis, 1983). These circumstances allow family-owned business groups to generate superior performance (Shleifer and Vishny, 1997; Maury, 2006).

	<i>family-owned</i>	<i>widely-held</i>	<i>state-owned</i>
<i>Ownership</i>	<i>individual or family</i>	<i>dispersed among many shareholders - no controlling stake</i>	<i>citizens - firms are officially owned by the government /national/sub-national /local level</i>
<i>Control</i>	<i>individual or family</i>	<i>Managers - no distinct majority</i>	<i>Politicians</i>
<i>Management</i>	<i>individual or family</i>	<i>Professionals</i>	<i>Professionals</i>
<i>Separation of the roles</i>	<i>No</i>	<i>Managers are appointed by the board, which in many cases is controlled by the managers</i>	<i>The politicians and civil servants manage the firm either directly or indirectly, through the control of appointed managers.</i>
<i>Professional managers</i>	<i>under close control by the family</i>	<i>control decision-making</i>	<i>control decision-making</i>

Table 1 - Business Groups Taxonomy (Source: Cuervo-Cazurra, 2006)

La Porta, Lopez-de-Silanes and Shleifer (1999) show that family-controlled firms often use pyramidal ownership structures to exert control over a large network of firms. The family achieves control and exerts governance over the entire business group by establishing a chain of ownership relationships: the family directly controls a firm, which in turn controls another firm, which might itself control another firm, and so forth (Almeida and Wolfenzon, 2006).

The type of inter-organizational relations

The classification from the standpoint of ownership in itself does not highlight the features and the role of different types of inter-organizational relations. In particular, Granovetter (2005: 429) highlights the importance of relationships types, describing them as “*persistent formal and/or informal ways*” in which the ties are established between firms, that are established through equity alliances and interlocking directorships. He further argues that “*the level of binding is intermediate between ... two extremes that are not business groups: sets of firms linked merely by short-term strategic alliances, and those legally consolidated into a single entity*”. In line with Khanna and Rivhin (2006), we argue that as products of social construction, family business groups most likely cannot be reduced to the

distinctive presence of specific types of ties between firms such as equity holdings, family bonds, or interlocking directorships. Nonetheless, inter-firm ties play a significant role in the family business governance and scholars have consistently identified groups due to the presence of particular types of ties (Khanna and Rivhin, 2006). For instance, research shows that family businesses can rely on networks and long-term relationships that might foster trust and altruism (Le Breton-Miller and Miller, 2009; Pieper, 2007; Astrachan, 2010) and frequently have a long-term perspective (Le Breton-Miller and Miller, 2009; Pieper, 2007).

The intensity of inter-organizational relations

While scholars have extensively debated about the nature of inter-organizational relationships as well as about the types of inter-organizational relationships, surprisingly very limited attention has been devoted to the interplay between these two traits and in particular to their coexistence. By adopting a family embeddedness perspective, research has extensively highlighted the importance of the simultaneous presence of shareholdings (formal ties) and personal ties (informal ties) (Hamilton and Biggart, 1988; Granovetter, 1995, 2005; Mahmood et al., 2011). In particular, several authors point out that business groups are characterized by particular types of ties (Khanna and Rivhin, 2006; Pieper, 2007; Astrachan, 2010) and these mostly entail equity alliances and interlocking directorships (Granovetter, 2005). Indeed, the mere existence of interlocking directorships in itself does not shed any light over the features and the role of different types of relationships and the way in which these ties might be valuable for the governance of the family business group. Other researchers (Ben-Porath, 1980; Pollak, 1985; Aronoff and Ward, 1995; Harvey, 1999) refer to these ties as implicit ties that are often an effective substitute for the relatively more formalized, explicit, contractual relationships. This is particularly visible in the family system, where the key features that influence the firms' operations are the pre-existing, implicit and social ties among family members and often the family system, thanks to the presence of trust, no longer needs hierarchical control (Powell, 1990; Ring and Ven de Ven, 1992; Ernst and Bleeke, 1993; Barney and Hansen, 1994; Holm, Eriksson and Johanson, 1999; Schulze, 2003; Gulati, 2005; Lorenzoni and Lipparini, 1999; Ferrin and Dirks, 2003; Lubatkin, 2005). In this context, family relationships can provide competitive advantage in addition to firms' specific resources. Family can add and shed resources to the business in various ways, through financial, labour, intellectual, cultural and trust capital by facilitating the decision-making process, thereby providing family businesses with an edge over its competitors (Le Breton-Miller and Miller, 2009; Astrakhan, 2010).

The persistence of a specific set of inter-organizational relations

Although the nature, type and intensity stresses the importance of "family bonds" and "family bridges" between the family and its business in creating unique resources and wealth, we believe that to capture the goal of the family business group, which is maximizing the interests of the founding members across generations and the long-term profitability of the group as a whole, is necessary to assess the persistence of the specific set of inter-organizational relationships.. Though there are many

examples of long-lived family businesses, their sources of longevity are not well understood (Astrachan, 2010). There are many factors that complicate the task of assuring long-term survival to family businesses. As family and business grow older and larger over time, family ties often ebb making norms, obligations and informal control more difficult to maintain. For example, as ownership disperses, control over the business becomes harder to be exerted (Astrachan, 2010). Apart from business vitality, research shows that persistent family values are crucial for maintaining family ownership in the long run (Pieper, 2007). Memili and colleagues (2011) highlight that in family businesses the entrepreneurial behaviour is related to growth and the number of generations the family has been in business. For example, they further argue that amongst publicly listed family companies, family ownership is inversely related to acquisitions. Other empirical evidence shows that entrenched CEOs, especially those with long tenures, have a constraining effect on growth, whereas entrepreneurship and growth are promoted by families that are involved in business oversight and management (Zahra, 2005). Similarly, Claver and colleagues (Claver et al., 2009) find that a long-term orientation and non-family management are positively related to international growth.

Family business groups from a cross-cultural perspective

Although there is a quite established consensus about the existence of the distinctive traits that characterize family business groups, namely the nature, the type, the intensity and the persistence of inter-organizational relations we tend to lack a fuller appreciation on how governance structures and relational capabilities are likely to differ across different cultural settings. To fill this gap, the theoretical framework underpinning our research relies on GLOBE (Javidan and House, 2004; Chhokar et al., 2007) and on the etic/emic distinction introduced by Pike (1976).

Globe

For the purpose of our research we adopt GLOBE (Javidan and House, 2004; Chhokar et al., 2007). GLOBE's intent is to explore the cultural values and practices in a wide variety of countries and to identify their impact on organisational practices and leadership attributes. To this end, House et al., (2004) examine national cultures in terms of nine dimensions:

- *Uncertainty Avoidance* is defined as the extent to which members of a society strive to avoid uncertainty by reliance on social norms, rituals and bureaucratic practices to mitigate the unpredictability of future events.
- *Power Distance* is defined as the degree to which members of society expect and agree that power should be equally shared.
- *Institutional Collectivism* reflects the degree to which societal practices encourage and reward collective distribution of resources and collective action.
- *In-Group Collectivism* reflects the degree to which individuals express pride, loyalty and cohesiveness in their organisations.

- *Gender Egalitarianism* is the extent to which a society minimises gender role differences and gender discrimination.
- *Assertiveness* is the degree to which individuals in societies are assertive, confrontational and aggressive in their social relationships.
- *Future Orientation* is the degree to which individuals in societies engage in future-oriented behaviours such as planning, investing in the future, and delaying gratification.
- *Performance Orientation* refers to the extent to which a society encourages and rewards group members for performance improvement and excellence.
- *Humane Orientation* is the degree to which individuals in organisations or societies encourage and reward individuals for being fair, altruistic, friendly, generous, caring and kind to others.

On the basis of the nine cultural dimensions listed above, the GLOBE study identifies ten societal clusters: South Asia, Anglo, Arab, Germanic Europe, Latin Europe, Eastern Europe, Confucian Asia, Latin America, Sub-Sahara Africa and Nordic Europe. National culture provides a fruitful area for research in family business groups¹⁸. We argue that extending this line of enquiry family business groups holds great potential to gain a fuller insight on whether they are managed differently across different national cultures. In particular, the paper attempts to provide a fuller appreciation of family business group's governance and relational capabilities.

Etic vs Emic

Following a thorough review of the relevant literature on family firms (Sharma, 2004; Astrachan, 2010; Cruz et al., 2012; Pittino and Visintin, 2010; Memili et al., 2011) and business groups (Leff, 1978; Ghemawat and Khanna, 1998; Morck and Nakamura, 1999; Chung, 2001; Friedman et al., 2003; Khama and Yafeh, 2005; Cestone and Fumagalli, 2005; Almeida and Wolfenzon, 2006; Gopalan et al., 2007) we endorse the idea that the key traits of family business groups (nature, type, intensity and persistence) are likely to vary across different cultural settings. Recently, several contributions explore economic action within a wide variety of organizing contexts in which family businesses are embedded. In particular, two related issues find widespread acknowledgement: the importance of the broader social context in affecting economic behavior, and the wide variety of organizational contexts in which this occurs (Granovetter, 1985; Rao et al., 2000; Steier, 2003; Uzzi, 1996). In line with this work, Aldrich and Cliff (2003), Steier (2001), Steier et al., (2009: 1158) share the view by which "*family firms and their family stakeholders are usefully viewed as embedded in social relationships*". Through their work, firstly they illustrate that family actors are embedded in multiple social systems, and that the nature of embeddedness has economic implications.

¹⁸ There is a substantial body of literature available about national culture but there is very little that adopts a holistic approach to assess its effects on the governance of family business groups. While existing research mainly adopts Hofstede's dimensions of national culture, GLOBE captures more comprehensively and less ambiguously the elements of national culture as illustrated in Table 2 in the Appendix.

Although there is wide consensus that the organizational context is crucial to fully understand family business groups very few studies devote attention to their cultural context. Veliyath' study (et al., 2000) for instance investigates the CEO's social embeddedness and overt and covert power as determinants of CEO pay in a sample of Indian family-controlled firms. From the findings it emerges that family shareholding and the percentage of inside directors on the board are found to be the predominant influences on CEO pay. Similarly, a very recent study conducted by Masulis et. al., (2011) using a dataset of 28,635 firms in 45 countries, investigate the motivations for family-controlled business groups. They provide evidence consistent with the argument that particular group structures emerge not only to perpetuate control, but also to alleviate financing constraints at the country and firm levels. At the country level, family groups, especially those structured as pyramids, are more prevalent in markets with limited availability of capital. Bertrand et al., (2008) analyze how the structure of the Thai families behind these business groups affects the groups' organization, governance and performance. Interestingly, groups that are run by larger families (more male siblings of the group head) tend to have lower performance.

Overall this evidence in terms of governance structures and relational capabilities of family business groups embedded in very different cultural settings leads us to assume that their key traits are also likely to vary accordingly. In order to produce an useful taxonomy of family business groups and their key traits, the emic/etic distinction as it has been introduced by Pike seems particularly valuable. Emic refers to " *logical-empirical systems whose phenomenal distinctions or "things" are built up out of contrasts and discriminations significant, meaningful, real, accurate, or in some other fashion regarded as appropriate by the actors themselves* " (Pike, 1976: 571). Etic depends upon " *phenomenal distinctions judged appropriate by the community of scientific observers* " (Pike, 1976: 575). For the purpose of the research the framework is therefore useful to identify those key traits of family business groups that do not tend to vary across different cultural settings (the etic dimensions that characterize family business groups) from those that are likely to vary (the emic ones).

A Cross-Cultural Framework

Figure 1 below provides a graphical representation of our cross-cultural framework.

Proposition

Drawing on sections 2.2.1 and 2.2.2, we attempt to test the following propositions.

Family business groups belonging to different cultural clusters are likely to display similar governance structures thus the nature of their inter-organizational relations is likely to be an etic dimension.

Family business groups belonging to different cultural clusters are likely to display different relational capabilities thus their type (both formal and informal ties), their intensity and their persistence are likely to be emic dimensions. More specific propositions could be further developed, such as:

Family business groups tend to rely more extensively on formal ties on those clusters that score high in power distance.

Family business groups tend to rely more extensively on formal ties on those clusters that score high in institutional collectivism.

Family business groups tend to rely more extensively on informal ties on those clusters that score low in power distance.

Family business groups tend to rely more extensively on informal ties on those clusters that score low in in-group collectivism.

Intensity between formal ties and informal ties is likely to be greater for those family business groups in clusters scoring high in uncertainty avoidance.

Persistence is likely to be greater for those family business groups in clusters scoring high in long term orientation.

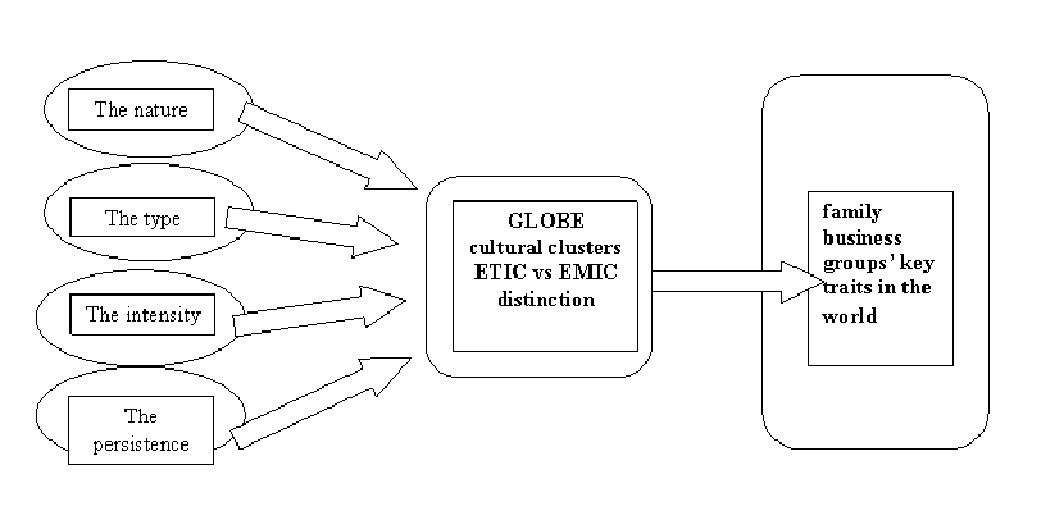

Figure 1 – A cross-cultural framework of FBG' key traits based on etic/emic distinction

Research design

This research is exploratory and its aim is to introduce a theoretical framework on the basis of which we can more accurately depict the family business groups' key traits from a cross-cultural perspective. "Case studies represent a methodology that is ideally suited to creating managerially relevant knowledge" (Gibbert et al., 2008) and they are considered most appropriate as tools in the critical, early phases of a new management theory, when key variables and their relationships are being explored (Yin, 1994; Eisenhardt, 1989). Therefore case study research is particularly useful at the early stages of theory development, in which key themes and categories have yet to be empirically isolated (Eisenhardt, 1989; Elg and Johansson, 1997; Parkhe, 1993; Yin, 1984). In particular multiple case studies provide a more solid basis for generalization and can provide substantial opportunities for theory-building

(Steier and Miller, 2010). For the purpose of the research 10 explorative case-studies belonging to the 10 GLOBE clusters will be selected drawing from a variety of different sectors. According to Kerlinger and Lee (2000: 586), *“exploratory studies have three purposes: discovering significant variables in the field situation, discovering relationships among variables, and laying the groundwork for later, more systematic and rigorous testing of hypotheses”*. Since the purpose of the research is to develop an analytical framework which will require further testing, the selection of multiple case studies was deemed as appropriate. As highlighted in the work of Birkinshaw, Brannen and Tung (2011), qualitative methods can take us beyond Hofstede (1980) and GLOBE (Tung & Verbeke, 2010) to generate other interpretations of culture that will enable us to make sense of complex FBG phenomena. Finally, as for the reliability of the research (Gibbert and Ruigrok, 2010; Denzin and Lincoln, 1994), data collection and data analysis will replicate previous work (Della Piana, et al. 2010a, 2010b).

(Source: Hofstede, 2006) √=direct correspondence, ~ = weak similarity
Hofstede (2006) has discussed the equivalence between his dimensions of national culture and those of GLOBE. While there is direct correspondence for uncertainty avoidance, power distance and collectivism (with institutional collectivism) the remaining six GLOBE dimensions are not found to have a direct correspondence among Hofstede's four dimensions. For example, Hofstede's masculinity is split into assertiveness and gender egalitarianism in GLOBE.

Abstract

This paper presents a theoretical framework for a program of research in the Israeli context designed to elucidate the nature of women's involvement in top management teams (TMTs), notably boards of directors, while examining the antecedents and outcomes of the internal TMT processes. The investigation focuses on what actually happens in upper echelon teams, attempting to explain the underlying mechanisms driving the dynamics within the "black box", underscoring implicit power relations and shadow negotiation between female and male members. Findings of a preliminary study point at overt structural elements, such as underrepresentation of women in top management teams. Moreover, implicit aspects of women's involvement in upper echelons of organizations also emerged, notably, subtle silencing of their voices and communal features of their participation. Future research directions are delineated, emphasizing an international-comparative perspective on gender in top management teams in different national, socio-political, cultural and economic contexts and using mixed- and multi-source format.

Keywords: gender, TMTs, "black box" dynamics, context.

Introduction

This paper portrays a conceptual framework driving a program of research, embedded in the Israeli context, aimed at discerning the patterns of women's involvement in top management teams (TMTs) as well as the antecedents and outcomes of these internal dynamics. The investigation endeavors to explicate the underlying mechanisms of the processes within the "black box", underscoring implicit power relations and shadow negotiation between female and male members. Major finding of a pilot study are also displayed.

Research on women in TMTs has been conducted mainly in North America, Western Europe, Australia and New Zeland where social, cultural and political framework underscores egalitarian values and practices (Nielsen, 2010). Extending research on TMTs, embracing gender perspective, beyond these settings deems important due to the alleged influence of the social, political and cultural context (Huse, 2008). Our research follows this argument.

Indeed, Israel features two characteristics which presumably impinge on women's inclusion and their actual involvement in TMTs such as board of directors. One of these features is the national security doctrine, which evolved in the process of a national liberation struggle and nation building. Notwithstanding the formal democratic regime, such social ethos presumably influences the implicit

power construction in organizations, including TMTs (Muhlbauer, 2001; Desivilya & Yassour-Borochowitz, 2008).

The second characteristic entails coercive religious rule, highlighting a patriarchal value system, which has constantly mitigated women's influence in the political, economic and organizational arenas, pressuring them to revert to their traditional gender roles. The national security ethos and the traditional gender role hierarchy compel women to assume the role of mothers, where those taking part in the military system, namely men, enjoy a significant social, economic and political advantage which conceivably leaks to TMTs (Muhlbauer 2001; Desivilya & Yassour-Borochowitz, 2008).

Our research program traces the subtle, largely implicit influence of these two contextual features on the antecedents of TMT dynamics and on actual patterns of women's involvement in such teams.

In addition to elucidating the contribution of the socio-political and cultural context to gender dynamics in TMTs and outcomes, our research explicates in greater depth what actually happens in such leading forums. Previous research examined women's involvement in upper echelons of organizations mainly by looking at rates of membership in board of directors and their effects on financial performance as well as on indicators of corporate social responsibility (Adams & Ferreira, 2009; Bernardi & Threadgill, 2010; Bujaki, 2010; Carter, D'Souza, Simkins, & Simpson, 2010; Torchia, Calabrò, & Huse, 2011). Few studies have attempted to open the "black box": examined what is going on in mixed gender boards of directors (Dahlen Zelechowski & Bilimoria, 2003; Huse & Solberg, 2006; McGann and Wheeler, 2011; Nielsen & Huse, 2010). Moreover, gender perspective has rarely been employed in studying TMTs (Sheridan, Haslam Mckenzie, & Still, 2010). Thus, phenomena such as construction of power relations, biased evaluation and stereotyping in negotiation and decision-making processes were hardly investigated. Moreover, most of the studies embraced a quantitative approach, relying on small samples of executives. In addition, triangulation of the findings, obtained by quantitative methods has been hardly undertaken (Nielsen, 2010).

Our research program is designed to fill some of these gaps by enhancing the understanding of women's organizational involvement patterns in comparison to men's. We are particularly interested to discern the subtle and hidden aspects of gender construction in such senior teams and their effects on power relations between women and men as reflected in decision-making processes.

Several reasons warrant our research focus: (1) Diverse TMTs have become more prevalent in organizations; (2) Studies highlighting gender diversity dynamics have been scarce (Casey, Skibnes, & Pringle, 2011; Klenke, 2003; van Knippenberg, Dawson, West, & Homan, 2011); (3) The importance and potential impact of strategic decisions made in upper echelon teams and their effect on setting and developing ethical norms of corporate behavior, makes their composition and patterns of involvement of various participants highly significant issues to the stakeholders (Casey, Skibnes, & Pringle, 2011); (4) Extending research on gender dynamics in TMTs is also important in order to substantiate various arguments for inclusion of women in such upper echelon forums. Scholars who studied the Norwegian case of women's participation in TMTs, notably, Huse (2008) and Storvik and

Teigen (2010) ground their case for women's inclusion on boards of directors in three domains: societal – prompting equality and social justice; individual – enhancing women's career by mitigating "glass ceiling" and business - improving performance. Casey et al. (2011) and McCann and Wheeler (2011) underscore the social justice argument. Extant research on the participation of women on boards of governance of public and private sectors organizations by and large pointed at a significant gender gap; namely, women are underrepresented at the upper level of economic and political institutions. Such a situation not only violates the fundamental principle of gender equality in society, but also does not utilize women's expertise in promoting economic and social development (Casey et al., 2011).

In order to embed our study in the relevant context, the next section of the article presents a brief factual background concerning Israeli women's standing in the socio-political and economic arenas in general and in top management teams in particular. Subsequently we proceed with the main thrust of the paper – the conceptual framework. Then, major findings of the pilot study are displayed. The article culminates with major insights accumulated thus far, exposition of further queries and delineation of future research directions.

Women in TMTs in Israel

Already in 1948 with independence it was declared that "the state of Israel... will ensure complete equality of social and political rights to all of its inhabitants irrespective of religion, race or sex". Three years later the Equal Rights for Women Law was enacted. In 1993 the Israeli government has introduced a new clause into the Law of Governmental Companies that stated that there should be a "suitable gender representation in the boards of directors of governmental companies". Until equal representation is achieved the ministers are to appoint as far as possible directors from the underrepresented gender. In 2007 it was amended that suitable representation is 50%. This new clause has increased the number of women directors in governmental companies from 7% in 1993 to 44% in 2010. But, only in 3 out of the 36 boards of directors the chair of the board is a woman and only 2 serve as CEOs in governmental companies.

The implementation of equality laws was supported by the socialist political atmosphere but had to combat two major obstacles. The first was the security obstacle. Even though women had to do national service in the army they did not have very prestigious jobs in the army and did not reach high echelons. As a result their social capital did not include the high ranking officers who retired at an early age and were immediately recruited by their old army friends, who already held high positions in civilian life, for either high managerial jobs or focal political offices. The second obstacle was the fact that religion was inseparable from the state and many by laws and norms were instituted accordingly.

In the Israeli parliament there are only 22 women out of 120 members. The situation in the parliamentary committees is even worse. In the finance committee 18% are women, in the Foreign Affairs and Defense committee 6% are women, in the Constitution Law and Justice committee 8.3%

are women and in the Economic Affairs committee there are no women at all. Out of the 28 ministers in the Israeli government only 3 are women. No woman was ever a finance minister, a transportation minister, a tourism minister or a defense minister. All in all, out of the 216 ministers that served in the Israeli governments since independence only 12 were women. It is not surprising then that Israel is placed in the 52 place out of 134 in the Global Gender Gap Report – 2010 of the World Economic Forum.

Women constitute a half of the Israeli workforce. The average monthly salary of women is 60.4% of what men earn as a result of the strong gender division of labor and the low pay in "feminine" jobs. In 2007 women represented 11% of all director generals and chief executives and 36% of senior managers (Slater, 2009). The data on the composition of the boards of directors in public companies companies from the TA-100 index (The TA-100 Index is one of the Tel Aviv Stock Exchange's leading indices, published from 1992. The index consists of the 100 shares with the highest market capitalization that are included in the TA-25 and TA-75 indices) shows lower representation of women in comparison to men. The Catalyst research study in Israel (2011) shows that while women account for 47% of the workforce their proportion in management positions in the economy as a whole is 29.6%. This percentage drops even further in companies traded on the TA-100 Index, in which women-managers constitute only 18% and 15% on the board of directors. The distribution of women directors among the different branches points at the public companies that have the lowest representation of women: in computer companies only 3% of the board members are women, in the oil exploration companies 6%, in the services companies 10% and in the insurance companies 11%. The public companies that have the highest representation of women are: the fashion and garment companies which have 33% women directors, the financial services - 25%, the food industry - 22% and the real estate and construction companies - 20%. At the top level, 5% of the CEOs and 5% of the board of directors' chairpersons are women.

Conceptual Framework

The theoretical foundation of our research program pools together two main bodies of literature: the role of diversity in the processes of decision making in teams and gender perspective on management. We commence with the role of diversity in team decision-making.

Scholars in the area of organizational behavior and management have argued that the quality of a team's interactions, such as decision-making processes and consequently its outcomes (e.g., strategic decisions) are significantly affected by the group's ability to manage its internal relations. Diversity constitutes one of a team's parameters potentially affecting such a capacity. The contemporary organizational reality displays a considerable diversity in work group composition (Desivilya Syna & Palgi, 2011; Nielsen, 2010). Gender constitutes a significant component of diversity in work teams, nowadays also manifested in TMTs.

Diversity denotes variation in a wide range of team members' characteristics, including professional background and expertise, tenure, and salient demographic features such as age, gender,

race and ethnicity (Nielsen, 2010; van Knippenberg et al., 2011). Mohammed and Angell (2004) distinguished between surface-level and deep-level diversity. Surface-level diversity refers to the extent of demographic variation in a work unit, whereas deep-level diversity purports to disparities in personality, attitudes, and values. Harrison and Klein (2007) distinguished among three different elements of diversity: variety (differences in information, knowledge and expertise), separation (differences in position or opinion among unit members, which reflect disagreement or opposition on a horizontal continuum), and disparity (differences in control of valued social resources such as pay and status among unit members which are distributed on a vertical continuum).

The division into three elements of diversity has helped to sort out the inconsistent research findings with respect to the effects of diversity on team decision-making and performance. Thus, the *variety* aspect of diversity presumably accounts for the benevolent influence on team decision-making processes and performance. Internal collaboration and consequently attaining high quality decisions is crucial in TMTs. Variety in members' characteristics (such as gender) brings to such upper echelon group a potential to view issues from a variety of perspectives and consider greater array of options to solve organizational problems (Cannella, Park, & Lee, 2008; Harris & Klein, 2007; Nilsen, 2010). In contrast with the positive effects of *variety*, *separation* and *disparity* elements of diversity tend to disrupt team functioning and impede its outcomes (Cannella et al., 2008; Harris & Klein, 2007; Nilsen, 2010). Hence, it is of paramount importance to mitigate the adverse impact of diversity, while fostering its benevolent influence in TMTs.

The central conceptual framework designed to explain the mechanisms underlying the disruptive effects of diversity (through separation and disparity), blocking the potential benefits of diversity (through variety), was based on Tajfel's and Turner's (1986) *social categorization* and *social identity* theories, Byrne's (1997) *similarity-attraction* paradigm and the notion of *faultline* (Lau & Murnighan 1998). The main tenet of the *social categorization* and *social identity* conceptual framework posits that people tend to define and distinguish themselves from others based on their group membership. Encountering individuals from different groups sets up the categorization process and gives rise to a tendency to form a more favorable image of one's own group in comparison to the attitudes toward individuals from dissimilar groups. This process allows individuals to protect and maintain positive social identity. The similarity-attraction paradigm offers a different explanation to the biased tendency to favor members of one's own group over "outsiders." According to this model, people are more attracted to and prefer to interact with similar individuals because they expect thereby to reaffirm their values and beliefs. Both explanations point to the same outcome of *in-group favoritism*, which accentuates preexisting stereotypes and prejudice, and enhances antagonism between diverse team members, thus increasing the odds of conflicts and tensions among sub-groups in teams. Moreover, *in-group favoritism* may affect the preliminary characteristics of TMT composition, through both formal and informal recruitment processes of new members of TMTs, reflecting a tendency to attract "similar"/"in-group" others while deterring "outsiders". Evidence pointing at such inclinations emerged from research on CEO involvement in selection of new board members: nominees tended to

be "hand-picked" so as to avoid scrutiny and criticism of the management and thereby reducing performance pressure on the senior managers (Shivdasani & Yermack, 1999).

Other scholars refined the underlying mechanism accounting for the negative impact of separation and disparity in teams with diverse membership, employing the *faultline* model. This notion refers to hypothetical dividing lines that may split a group into subgroups and give rise to polarization between in-group and out-group identities. Faultlines may be activated by a single salient attribute in a specific context— for example, gender while dealing with affirmative action.

Van Knippenberg et al. (2011) extended and further developed the social categorization and faultline theory in order to explicate the contingencies underlying the negative effects of diversity in contrast with its positive impact on team performance. These scholars suggested that the actual adverse influence of social categorization depends on its salience, rather than on the mere presence of differences in group membership. Previous research showed that categorization salience is related to the level of *comparative fit*, which increases with greater within group similarity and greater between group differences. Salience is also associated with the subjective meaningfulness of social categorization (*normative fit*), which can be provided by societal stereotypes, such as gender stereotypes (Bezrukova et al., 2009; Pearsall et al., 2008). Paucity of social categorization salience leaves faultlines dormant and devoid of their disruptive influence regardless of the internal team diversity (Jehn & Bezrukova, 2010).

Previous studies also indicated the conditions fostering positive effects of diversity (through variety). Rentsch and Zelno (2003) showed that congruent perceptions among team members with regard to the positive value of openness and constructive controversy in promoting group goals precipitated constructive dynamics of handling intra-team conflicts which resulted from internal diversity. Research also pointed out that positive ramifications of diversity depend on the motivational orientation of the team, notably team-identity and shared objectives, which serves as a framework for organizing and coordinating behavior (Desivilya, Somech, & Lidgoster, 2009; Hinds & Mortenson, 2005; van Kippenberg et al., 2011; Wegge & Haslam, 2003).

In sum, diversity tends to exert negative impact on team dynamics, notably decision-making and performance, exacerbating internal tensions between subgroups in teams, especially when social categorization potential is highly salient. Such adverse influence can be attenuated by means of shared objectives, values and shared team identity. We assume that limited experience of joint membership of women and men in TMTs may obscure the development of such benevolent team climate, instead accentuating faultlines and in-group favoritism by male team members, in turn, impeding the advantages of diversity.

We turn now to the second body of literature – women in management – to shed light on the barriers of genuine collaboration in decision-making processes due to the salience of social categorization in the case of gender diversity.

The literature shows that obstacles are placed in the path of women in management positions. The glass ceiling and walls are accorded practical expression in the considerable disparity between men and women in senior and junior management posts alike (Eagly & Fischer, 2010). According to feminist researchers in this field, women's under-representation in top management is a product of the same gender culture that gives men an advantage by rewarding talents and skills considered male, whereas women attain secondary roles only due to their perceived lack of appropriate management skills (Calas & Smircich, 1992).

In management context women are perceived as "other", "different" or "not belonging". This, then, is not about real, objective differences in management skills between the sexes, but symbolic disparities shaped by emotions and cognitive processes (Erikson-Zetterquist & Styhre, 2007; Liff & Ward, 2001).

Studies show that the way women deal with obstacles in the management sphere is mainly based on adapting to the gender culture prevailing in organizations, i.e., an attempt to demonstrate appropriate qualities and skills in accordance with male criteria. These tendencies expose instances of "gender blindness", or in other words, a lack of awareness by both men and women holding management posts of the influence of gender on the structuring of relations, and the male-female balance of power in organizations (Eagly & Fischer, 2010; Lewis, 2006).

Gender structuring in organizations also hinders the chances of women breaking through the glass ceiling and walls due to difficulty in negotiating effectively to enhance their status. This difficulty is bound up in women's inferiority in positioning themselves in the negotiation process with men. Although women are good negotiators on the overt, content level – they clearly define contentious issues and identify viable options for resolving them –, they display inferior performance in 'shadow negotiation', which is connected to defining relations with the other party. They are not sufficiently resolute with regard to the legitimacy of their position and the seriousness of their intentions, which hinders them and is reflected in inferior negotiation outcomes in comparison with men (Kolb & Williams, 2000). Such disadvantage can also be manifested in diminished influence of women-managers in strategic decision-making processes at upper echelons of organizations.

Women's poor negotiating results regarding their status in an organization are also explained by the effect of gender stereotypes, particularly when these are activated implicitly, without the women being aware of it. The findings of Kray, Thompson and Galinsky (2001) indicate that women actually validate gender stereotypes in their behavior when facing men across the negotiating table – they are overly considerate of the other side while relinquishing their own self-interest. Only when they are aware of gender structuring (due to explicit and blatant activation of the gender stereotype) are they capable of expressing vigorous opposition and shattering the stereotype by means of assertive and forceful behavior during negotiation. However, this kind of behavior is rare; in the main women play into the hands of their male colleagues as they are unaware of gender structuring in organizations. In view of this "blindness" they have difficulty in exerting their influence and making themselves heard

(Meyerson & Kolb, 2000; Townsley, 2003). In sum, the evidence presented above seems to suggest that gender constitutes a subjectively meaningful parameter of social categorization thereby fostering its salience, which in turn precipitates the activation of faultlines and their disruptive influence on group decision-making processes and performance.

How do those potential barriers play out in the context of TMT's Recent study on gendering aspects in regional development boards in Australia, showed that these teams are not gender neutral, however the manifestations of gender construction are rather subtle (Sheridan, Haslam Mckenzie, & Still, 2010). They are evinced in women's service orientation while interpreting their contribution to the community in contrast with men's "doing" orientation. The findings also show a clear preference of men and women for "masculine" way of "doing business" (emphasis on attaining concrete outcomes, such as increasing employment rates) rather than women's way (improving social aspects), although due to limited resources in actuality they use feminine approach.

As to the relationship between women's involvement on boards and companies' performance, the results of economic studies are inconsistent with regard to both direction and magnitude of these bonds (Storvik and Teigen, 2010; Terjesen, Sealy, & Singh, 2009). For example, Miller and Triana (2009) study on the impact of demographic diversity among fortune 500 American organizations showed that women's presence on boards seemed to increase organizational innovation. Female directors also tended to have positive effect on power relations among board members, mitigating CEO dominance and devoting more attention to monitoring CEO.

Other studies evince a more complex pattern of relations between women's involvement on boards and organizational performance. Adams and Ferreira (2009) study on women board-directors' impact on governance and performance apparently capture all three aspects of diversity: variety, separation and disparity. The results seem to suggest that boards with more female directors foster participation and involvement of directors in decision-making by means of higher attendance and committee tasks and by greater compatibility with shareholders' interests. Female directors tend to reveal tougher monitoring patterns thereby having a positive contribution to corporate performance. However, the latter positive effect seems to be confined to firms with weak governance patterns (low ability to resist takeovers). Implementing gender quotas in firms with strong governance appears to decrease shareholder value.

In a similar vein, Nielsen and Huse's (2010a) survey study showed that women's impact on board effectiveness depends on the nature of tasks performed and is mediated by board processes: women's higher ratio enhances strategic control via facilitation of board development, open debate in the context of decision making and mitigation of conflict, but has barely any impact on operational control. The same scholars also found that women directors' contribution to board decision-making and their strategic involvement was mitigated by their nontraditional professional experience and perception of women as strangers rather than their acceptance as equal partners. The authors

explained women's reduced impact on the board by the stereotype threat mechanism (Nielsen and Huse, 2010b).

Torchia, Calabrò and Huse's (2011) recent study also indicated the contingent nature of women's participation and performance relationships. These scholars showed that women's participation on boards of directors can have positive impact on innovation, provided that they constitute a significant minority; namely, form a critical mass (at least 3 women on the corporate board) rather than are present in such teams as *token* members. Moreover, their findings pointed out that the nature of women's involvement on the boards – taking part in strategic tasks – mediated this positive effect.

McCann and Wheeler's (2011) analysis of FTSE 100 companies and female non-executive board membership casts doubts on the claim, that women's appointment to boards of directors positively affects corporate profitability and profile. Further research is needed to establish the relationship between women's involvement in governance boards and corporate performance, while using multi-dimensional and comparable measures.

What can we learn from extant research on women's subjective experiences on boards of directors?

Research on the experience of Norwegian women on boards of directors, following the quota legislation and in the course of its implementation, seem to suggest that it has been by and large positive. Female directors felt welcome, highly esteemed and at ease voicing their opinions (Storvik & Teigen, 2010).

Similar findings were obtained in a study on corporate boards in Finland. Women board directors reported by and large positive experiences: were actively involved in these forums, reportedly exercising their power more than men. At the same time female respondents revealed greater flexibility, adaptive tendency and expressed higher willingness to have more women on the board in comparison to their male counterparts (Virtanen, 2011).

Casey's et al. (2011) comparative study of women directors on boards in Norway and New Zealand also evinced mostly positive experiences. Women in both countries viewed their appointment to boards of governance as a result of merit and competence, almost none (one) reported discrimination or sexual harassment and the majority claimed that gender has not been a problem for them personally, however might have been an issue for other women. The latter projective tendency of the interviewees seems to point at implicit power dynamics in the relationships between female and male directors and traces of faultline salience (van Kippenberg et. al., 2011).

By contrast to the reported positive findings, Ragins, Townsend and Mattis' (1998) study on American boards revealed equivocal findings, highlighting the subtle, implicit influences of gender construction in the corporate sphere. Women and men in TMTs differed markedly in their perceptions of the corporate climate, barriers women face on their way to the top, and the necessary strategies to be employed by women to circumvent these obstacles. Men tended to place the burden on individual

women, while women advocated a systemic change in corporate culture – transition from exclusionary to inclusionary culture.

Research findings, mentioned above, indicate mostly positive reports, especially in Scandinavia and New Zealand. Yet, they provide merely a glimpse on the dynamics in the "black box". For instance, almost no data exist with respect to team level aspects such as team orientation (perception of shared objectives and team identity) which was found to attenuate the negative influence of faultlines (van Kippenberg et. al., 2011). Moreover, hardly any insights have been accumulated so far on the nature of the relationships among board processes, contextual factors and outcomes in the domain of corporate performance and practices. Our research program aims to fill in some of these lacunas.

Drawing on Kolb's and McGinn's (2009) construction of the term negotiation as an ongoing activity in organizations, we intend to unravel how women, in comparison to men, engage in negotiating *authority* (or legitimacy), *value* (in recognition and reward), *support* (developing networks) and *commitment* (definition of "successful" team member).

Based on the integration of two corpuses of knowledge (diversity in teams' decision-making and women in management) we endeavor to learn about women's formative experiences as members of TMTs, specifically: (1) to illuminate the voices of women in decision-making processes and their impact on shaping organizational policy and practice at the strategic level;

(2) to examine the participants' awareness of gender influence on the structuring of relationships between women and men in senior teams in order to elucidate the salience of social categorization. Our focus is on different types of boards of directors in order to learn about contextual influences on TMT dynamics (overt and latent motivation underlying nomination of gender-diverse members to the boards, selection procedures, team climate and identity). We have constructed a logical model which underlies our research program. It encompasses three categories: input – contextual elements, throughput – board processes and output – board performance outcomes and board practices. Based on this conceptual framework, our program of research investigates in greater depth contextual elements which give rise to negative effects of diversity versus the mitigating forces fostering its benevolent influence on team level factors, such as team orientation, communication and negotiation processes and look at the outcomes of board dynamics.

Initial research phase

We conducted two pilot cases on boards of directors. The first was conducted on a board of directors in a kibbutz based on a qualitative approach, using 2 research tools - observation of the board's meetings and individual interviews with 3 key persons who took part in the process: the community manager (male), the organizational consultant (male) and a member of the core-group (CG) (female). The process studied was an attempt by the kibbutz to form a new vision for the community.

This initial study explored the following queries:

- What are the latent and overt motivations for recruiting board members (to what extent do they reflect intentions to recruit "in-group" members?)
- How do women express their human capital in TMTs in comparison to men? (How do they express their voices?)
- What is their impact? In what areas? (Are they heard and taken into account?)
- What are the processes and dynamics within the TMTs (their use of the potential benefits of gender diversity in TMTs; types of coalitions within them; domains of decisions-making on which women are particularly firm)
- What are the effects of gender related TMT dynamics on the organization's performance?

The findings indicated women's under-representation in top management and prevalence of male culture, as demonstrated by the following results:

The community manager attempted to instruct our observer, as follows: *"you do not have to focus the observation on women, as we have no such issue..."* However, statistical data showed that: (a) four member steering committee included one woman; (b) only 2 women were in the first meeting of the Core Group (responsible for economic and community management; composed of 25 members, 10 active throughout the process); (c) among the age group representatives there were 6 women out of 20 participants; (d) out of the 4 age-group discussions only one speaker was a woman; (e) in the course of the second meeting no woman was elected to be the group speaker and as indicated by the observer *"Women are a minority but their voice is dominant and well heard... all in all men were more dominant."*

The phenomenon of gender blindness also emerged, as reflected in the following findings: (a) gender issue was not raised in the interviews with the community manager and the organizational consultant; (b) as a reaction to the interviewer's probe, both men claimed that *"gender is a non-issue in the process;"* (c) in the entire process, including the group discussion, there was no specific mention of the gender issue; (d) the same happened in the final version of the vision that was brought to the ballot.

Gender construction, in particular their "out-group"/"stranger" status (inferior), was evident in the nature of women's influence, as manifested by the following results:

- The observer stated: *"A woman came in the middle of the meeting saying she must bring up a personal problem relating to the issue. The team told her, we are dealing with a vision and not with private issues..."*
- The organizational consultant interpreted this act in the following manner: *"She reacted out of her personal frustration..."*
- According to the organizational consultant: *"More women participated in the discussion on education, but more relevant to the vision was the input of a man who used to be a teacher..."*

- A participant stated: "I am raising this issue because my wife told me to do so, if I don't I will get into trouble..."
- A woman, steering committee member (ex-school principle) claimed in the interview: "They chose me because of my ability to produce events and not because of my ability to think;" "... I said that I understand the lack of trust in the community;" "I am sorry that some things were not mentioned in the vision such as transparency, modesty of managers, such as not right away demanding a new car... These are not vision words, but it is a shame that they are not there..."

In sum, the pilot study suggests that women's influence in the TMT was largely based on communal features. Although the dynamics points at women's involvement, it also reveals subtle silencing of their voices ("strangers"/outsiders).

The second pilot study included preliminary interviews with two female directors and three male directors and chairpersons of governmental and public stock-exchange boards. The findings seem to corroborate the case study results. Specifically, a woman-director underscored the silencing of voices of determined and critical female directors, as reflected in the following quotations: "*M. was suspended from the board following her query concerning another male member controversial director... "If I agree, I get a smile from the chair, if I am asking a challenging question or raise issues, I feel threatened..." "Once they recruited a female director with no capabilities, I tried to say something, but it did not help..."* (A.)

Another female member of top management team in advertising company, pointed at senior women-managers' involvement in less-prestigious roles than their male counterparts: "*In advertising business most senior women are in charge of clients' management and in media, whereas in 'creative' there are more men. There is a stigma that women are better in client management and media and men are superior in 'creative' ...Also in strategy planning roles, women can rarely be found...*(R.)

She also indicated subtle marginalization of women's voices, including her own experiences: "*I did feel I am a partner in decision-making, but my voice was somewhat subdued, I believed that if I do a good job, I will get the recognition...it was my fault I should have been more firm* (R.). The dominance of male culture in TMTs was evident in this interviewee's portrayal of the desirable profile of a woman director or top management team member: "*a bitch, sharp, be able to step on others, very strong ... not really stabbing behind the back, but very firm...*(R)

A male director from the banking sector reported similar perceptions to the presented above concerning women's functions in TMTs: "*women TMT members mainly provide services, such as legal counseling, audit services, but are much less involved in business divisions than men...*" (D.) Another highly experienced male director in various governmental and public listed companies and a chairperson in a some of them, also indicated the structural aspect of women's underrepresentation in corporate boards. However, he stressed that women who reach these top forums, are very professional, active and capable to evince dominant behavior.

The third male interviewee, who serves as director in several corporate boards in different sector and also acts as a chairperson in one of them, expressed a highly positive attitude concerning inclusion of women into corporate boards. He based this positive stance on his experience in gender diverse corporate boards (mainly in the third sector and municipalities, where directors participate on a voluntary basis with no financial compensation). As manifested in the following quotation, he also highly evaluates women's involvement and activities on the boards: *"I am an enthusiastic supporter of women on corporate boards. They are very successful, their quality is often better than men's...professionally men and women seem equal, but as far as commitment is concerned, I would rate it women – 80% and men 40%, and coping with stress, it's 90% for women and 20% for men...You can count on women ...they will be there in crisis situations."* (N.) Notwithstanding, the positive credit ascribed to female directors, implicitly this women-directors "fan" emphasized their distinction and superiority over men in communal functions.

Discussion: Initial insights and future research directions

The findings of the preliminary studies seem to point at both overt as well as hidden aspects of women's patterns of involvement in TMTs. The explicit level reveals structural characteristics; namely, significant under representation of women in the upper echelon teams, corroborating previous research (Burgess & Tharenou, 2002; Carter et al., 2010; Slater, 2009; Terjesen, Sealy, & Singh, 2009).

Beyond the overt domain, our initial research provides evidence of implicit nature in women's patterns of involvement at senior teams. Women in in top management teams appear to perform by and large communal functions (team maintenance, providing services, organizing and actually doing the work). Moreover, their voices are often subtly silenced, presumably due to stereotype threat, gender blindness and overall treatment as strangers (out-group members) in TMTs especially in light of the dominant male culture. The latter findings lend further support to results of a few prior studies (Casey et al., 2011; Nielsen & Huse, 2010b; Ragins, Townsend, & Mattis, 1998; Sheridan, Haslam Mckenzie, & Still, 2010).

Our initial data as well as previous research warrant further research on the actual gender dynamics in top management teams as the proportion of women in these decision making bodies is only part of the problem. The main issue revolves around roles played by those women who reached the top positions (Cockburn, 1989). As succinctly put by Wajcman (1998) upon conclusion of her research in the US: "A modernized corporate masculinity may readily accept formal equality for women and even welcome women's presence in their workplaces. Indeed some "liberated" male executives confess that they are learning from women and adapting a softer management style. At the same time, however, men may be acting to contain changes in the gender order "going too far". Male power is not dying out." (pp. 29-30)

A thorough and comprehensive study deems important in order to foster a more profound understanding of the 'place' of women in top management teams, especially how they negotiate authority, value, support and commitment (Kolb & McGinn, 2009; Nielsen, 2010; Terjesen, Sealy, &

Singh, 2009). Our initial results seem to suggest that women members in TMTs struggle in negotiating their position, acknowledgment of their contribution and what is considered successful TMT member, but often end up conforming to the male rules of the game. How do women negotiate support; namely, develop networks and what kind of human capital do they bring to corporate upper echelon forums has yet to be discerned in future research.

Conceivably, the socio-political context contributes to women's motivation to take part in board of directors, the motivation (or lack of it) to recruit them by male corporate members, the dynamics on boards, affects the performance outcomes (Huse, 2008; Terjesen, Sealy, & Singh, 2009). Although our preliminary study was embedded in a specific socio-political, cultural and economic setting, discerning the contextual influences necessitates a comparative, international research. Of special interest would be to explicate it in countries scoring low on their commitment to gender equality, notwithstanding their democratic regime, such as Cyprus, Greece and former communist countries such as Poland and Lithuania, in addition to Israel. Getting a comprehensive evidence with regard to the relationships among the input throughput and output elements of our model, a multi-source and mixed method research needs to be employed.

ECOTOURISM MANAGEMENT IN PERIODS OF CRISIS: LESSONS FROM THE BIOSPHERE RESERVES IN CENTRAL AND EASTERN EUROPE

Diamantis, Dimitrios¹

¹ Les Roches Hotel Management School, CH-3975 Bluche-Crans-Montana, Valais, Switzerland. Email: Dimitrios.Diamantis@lesroches.edu

Abstract

The sustainable and ecotourism strategies in Central and Eastern Europe have advanced over recent years. These regions, which have historically been associated with environmental degradation as a result of atmospheric and water pollution amongst other forms of pollution, are now taking steps towards the integration of sustainability in their political agendas. Evidence of this progress can be seen in a variety of actions that have been introduced at a national level to incorporate more sustainably sound policies. Similar circumstances also exist at a local level, where the level of awareness towards sustainability has increased. By utilizing the concept of the 'biosphere reserve' as an example of local level participation in sustainable development, three reserves will be reviewed followed by a brief assessment of their sustainable and ecotourism practices. The purpose of this paper, therefore, is to articulate an agenda of discussion of different destinations in Central and Eastern Europe that have different ecotourism practices as well as share different stages of crisis. The paper will begin by outline the sustainability practices in the region and then will discuss three biosphere reserves that have different types of crisis. The paper will conclude with certain suggestions in overcoming such crisis issues in ecotourism destinations.

Introduction

Crisis management strategies are a new topic in tourism research. If one considers the enormous size of the tourism industry as well as the variety of tourism products that exists these strategies should have been an important component of the tourism organizations and destination planning and strategies. In tourism, crisis does exist ranging from the negative economic, social and environmental effects in tourism development up to the lack of proactive management strategies to overcome these negative effects. As in any industry, the important issue with crisis management is how a crisis can be predicted? Generally speaking, there are four types of which a crisis can be predicted (Fink, 1986):

- The prodromal crisis stage: when a crisis exists in their products and services but an organisation is unable to respond;
- The acute crisis stage: when a crisis exists and demands urgent action;
- The chronic stage: when a crisis exists and a company devise certain strategies to overcome the situation; and
- The crisis resolution: when a crisis exists and a company has proactive and reactive strategies to overcome the crisis.

With regards to ecotourism, the majority of crisis that exists is in the effective application of the concepts. Here, there are a number of crises, starting over the meaning of ecotourism and sustainability up to to the effective application of the eco-products in the destinations. Therefore, ecotourism products and destinations seem to be situated in the first three stages that of prodromal, acute crisis and chronic stage. The prodromal crisis stage reflects to the inconsistencies that exist in the definitional perspective of sustainability and ecotourism. Different destinations and organisations seem to define ecotourism in distinct way, which make ecotourism a slippery term. The acute crisis stage can well be suited in mass tourism destinations or other areas that because of their existing problems with carrying capacity approach ecotourism to rejuvenate their destination status. The chronic stage can be seen in destinations that devise certain strategies to overcome the negative effects of ecotourism development. The crisis resolution, however, do not exist in a wider context as the majority of ecotourism destinations tend to be reactive to a crisis (the chronic stage) than proactive to a crisis (the resolution stage).

The purpose of this chapter, therefore, is to articulate an agenda of discussion of different destinations in Central and Eastern Europe that are situated into these three different stages of crisis. The chapter will begin by outline the sustainability practices in the region and then will discuss three biosphere reserves that have different types of crisis.

Sustainability in Central and Eastern Europe

The articulation of the concept of sustainability within tourism spans across the globe, a clear indication that the concept has attracted wide attention both from the public and private sectors (WTO, 1995, 1996, 1997; EC, 1995; Murphy, 1994; Mowforth and Munt, 1998: 105-111; WTTC/WTO/EC, 1995; Ashford, 2000; Hanrahan, 2012). Since the political transition and reforms of the late 1980's, environmental and sustainable practices in Central and Eastern Europe (CEE) have come to light, and these practices have paralleled the increased global awareness of sustainability issues (Yarnal, 1995; Hall, 1992; Hall and Kinnaire, 1994; Hall, 1998; Fletcher and Cooper, 1996; Smeral, 1993). This wave of interest not only emerged as a result of government commitment to environmental protection during the early years of their political reforms, but filtered through to local levels with the help of practitioners who promoted rural and natural tourism products (Hall and Kinnaire, 1994; Hall, 1998: 351-353; Ilieva, 1998; Kombol, 1998; Ratz and Puczko, 1998).

Since the formulation of the Rainbow environmental protection program in the Czech Republic, environmental issues came to prominence highlighting the effect of national level influence. As a result new institutions were formulated, environmental legislation was adopted and new economic instruments were introduced. In 1995, the State of the Environmental Policy strategy was created and the Environmental Remediation Program was launched to monitor the environmental conditions. In Hungary, the Commission on Sustainable Development was established in 1993 as a permanent interministerial level for the coordination of national and international programs. In Poland, the

Committee for Sustainable and Regional Development of the Board of Ministers was introduced in 1997 with an aim to devise long-term strategies for sustainability.

An assessment of two indicators which reflected the progress made towards sustainability in selected countries of CEE, indicated a positive picture (see tables 1, 2):

- National decision-making structures: The examination of national decision-making structures with regards to sustainability revealed that most of the selected countries have a 'national sustainable development co-ordination body' or are in the process of creating one. In a similar vein, countries score positively on all of the other indicators, except in the case of the Local Regional Agenda 21 (WTTC, 1999); and

Country	National Sustainable Development Co-ordination Body	National Sustainable Development Policy	National Agenda 21	Local Regional Agenda 21	Environmental Impact Assessment Law
Bulgaria	In progress	In progress	In progress	Yes	Yes
Czech Rep.	Yes	Yes	Yes	Yes	Yes
Federal Rep of Yugoslavia	No	No	Yes	No	Yes
Hungary	Yes	Yes	Yes	Yes	Yes
Poland	Yes	Yes	Yes	Few	Yes
Romania	Yes	Yes	In progress	No	Yes
Slovenia	Yes	No	Yes	No	Yes

Table 1. National decision-making structure with regards to sustainability

- Strategies and policies: With respect to the policies and strategies indicator, the picture that emerged was rather more mixed (see table 2). Most of the selected countries have an environmental educational system in schools as well as eco-labelling and Recycle/ Reuse programs. At the other end of the performance scale, environmental indicator programs and green accounting practices are not that broadly conceived (WTTC, 1999; Hanrahan, 2012).

Country	Environmental Education in Schools	Environmental Indicators Program	Eco-label Regulation	Recycle/ Reuse Program	Green Accounting Program
Bulgaria	No	No	Yes	Yes	No
Czech Rep	Yes	Yes	No	No	No
Federal Rep of Yugoslavia	No	No	Yes	Yes	No
Hungary	Yes	No	Yes	Yes	No
Poland	Yes	In progress	In progress	Yes	No
Romania	Yes	No	No	Yes	No
Slovenia	No	In progress	Yes	Partial	No

Table 2. National instruments and programs with regards to sustainability

Given this positive performance at the national level, the apparent question is whether the sustainability issues have permeated the local levels of operation? In an attempt to illustrate if this is the case from the biosphere reserves perspective, a review of certain case studies will indicate the role of biosphere reserves as well as the state of their sustainability practices.

Biosphere reserves are a special type of conservation area, which were created with the aim of achieving a sustainable balance between conserving biological diversity, promoting economic development, and maintaining associated cultural values (UNESCO, 1996; Bridgewater and Cresswell, 1998). Overall, the review of their practices will also highlight any constraints associated with the progression of sustainable and ecotourism practices in certain states of the CEE.

Biosphere Reserves: An Overview

The biosphere reserves concept was launched in 1976 as a key component of UNESCO's Man and the Biosphere (MAB) program. Their definition suggests that they are (UNESCO, 1996:16):

“ areas of terrestrial and coastal/marine ecosystems or a combination thereof, which are internationally recognized within the framework of UNESCO's program on Man and the Biosphere in accordance with the present Statutory Framework”.

Biosphere reserves are nominated by national governments and have to meet certain criteria and adhere to a minimum set of agreements before being admitted to the worldwide network of UNESCO. In particular, each biosphere reserve should perform the following tasks (UNESCO, 1984, 1996; Phillips, 1998; Bridgewater and Cresswell, 1998):

- Conserve biological diversity;
- Maintain healthy ecosystems;
- Learn about traditional forms of land-use;
- Share knowledge on how to manage natural resources in a sustainable way; and
- Co-operate in solving natural resources problems.

There is presently a network of 352 biosphere reserves in 87 countries out of which 129 are in Europe (see table 3), comprising a mix of terrestrial and marine elements. Here, approximately 90% of the biosphere reserves cover some form of designated protected area while the remaining have no nationally designated area associated with them.

Table 3. Biosphere reserves in Europe

Source: UNESCO (www.unesco.org)

Overall most of the territorial activities in biosphere reserves take place in three areas or zones (see figure 1) (Bioret et al, 1998):

- *The core areas for nature conservation:* legally protected areas devoted to long term protection;
- *The buffer or support zone:* areas surrounding the core zone protecting them from any human impact. Different research activities are undertaken in this zone such as training, education and recreation as well as different outdoor recreational activities; and

- *The transition or community zone:* the largest of all areas, covering the wider community around the biosphere reserves, where research initiatives are promoted and developed.

Figure 1. Biosphere reserve zonation structure

One key obstacle faced by the biosphere reserves was that they were viewed as areas designated for the protection of valuable ecosystems and where various forms of ecological research could be conducted (Batisse, 1993).

Given that tourism is a major economic sector for the biosphere reserves, the situation becomes more complex. This situation initially affects the structure that tourism operates in, and subsequently the type of tourism products that are trade related and offered to visitors. In addition, the concept of biosphere reserves was created as an ideal working example of sustainably protecting endangered environments and was a benchmark for other destinations, however this was not always the case as numerous negative impacts became evident in the reserves. With this in mind, this paper will examine the state of the environmental practices at biosphere reserves in the Czech Republic, Poland and Hungary where sustainable practices have been advanced.

For every case examined, there will be a review of the biosphere reserves structure followed by their current sustainable and ecotourism practices. All the biosphere reserves have different tourism priorities and sustainable practices, but they share a common notion in their intention to channel their environmental consciousness and awareness into the development of tourism.

AGGTELEK BIOSPHERE RESERVE

The *Aggtelek* was declared a biosphere reserve in 1979, occupying 19,247 hectares in the northern part of Hungary (see figure 2). Approximately two-thirds of the biosphere reserve is covered by forest with the remaining attributed to other natural interests such as grasslands (Toth, 1998).

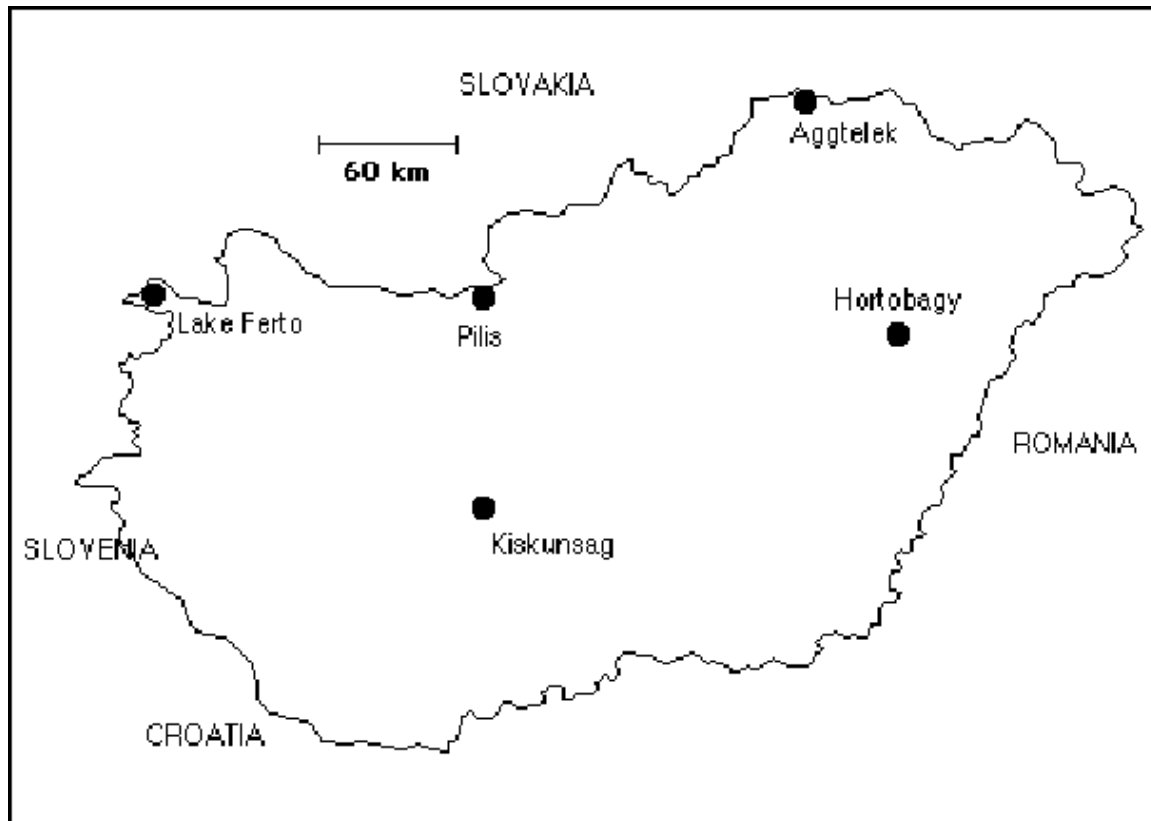

Figure 2. Biosphere reserves in Hungary

There are two main villages (Aggtelek and Josvafo) inside the biosphere reserve and 18 adjoining villages. The cultivated areas like croplands, old orchards and vineyards tend to form an ecological buffer around the more urbanized section of the villages.

Perhaps the key problem in the Aggtelek reserve was the decline of traditional agricultural land-use as well as the decline in the population. In particular, the following weaknesses were observed for this region (Toth, 1998):

- The age-structure of human population was becoming skewed in favor of the older proportion of the population;
- The economic circumstances were becoming more limited in the rural regions;
- The traditional source of income has declined (i.e. agriculture);
- The high percentage of cultivated areas were being abandoned; and
- The level of health-service, education and other public utilities were declined.

One of the main challenges faced by the biosphere reserve was to preserve the traditional land-use patterns by maintaining the balance between natural areas and cultivated lands. In this respect a management program was formulated with the following objectives (Toth, 1998):

- The preservation of the so-called harmonic landscape;
- The preservation of habitants and species diversity;
- The involvement of the local population at all levels of the management program;
- The development of a partnership among the communities;
- The preservation of the cultural heritage through promotion of traditional handicrafts; and
- Promotion of rural tourism in the region.

Each of these objectives was divided up into three different planning levels notably that of nature conservation, community development and tourism. With respect to tourism development, the focus was divided between the infrastructure of rural tourism development and identifying the carrying capacity for tourism development. The results so far have indicated that local citizens are involved in the program development and implementation, through the development of a new local business predominantly selling traditional products. In addition, the opening of a number of guesthouses was also observed, pointing to the positive contribution of the biosphere reserve initiative upon the local area.

Trebonsko biosphere reserve

Trebon Basin or Trebonsko was declared as a biosphere reserve in 1977 (Jelinkova, 1998). It occupies an area of 700 Km² in the southern part of the Czech Republic adjacent to the Austrian border with a total population of approximately 25 000 inhabitants (see figure3).

At the center of the biosphere reserve is the historic town of Trebron (9000 inhabitants) where the biosphere reserve administration is located. The medieval core of the town with its unique architecture was declared as the town monument in 1976. Týeboå also has a special status as a Spa town with a tradition of medical treatment using peat from local deposits.

Since 1979 the core area of the reserve has the legal status of a protected landscape area according to Czech legislation. This region is also part of Important Bird Areas of Europe (IBA) as well as incorporating 20 small-scale protected territories (nature reserves or monuments of national or regional importance). The Western part of the Trebon region was also declared as a Protected Area of Natural Accumulation of Water in order to preserve the quality of its groundwater, which is accumulated in thick sediment layers of the Trebon Basin (Jelinkova, 1998).

Although the Trebon region is partly a man-made landscape, its natural potential and values are very high. The concentration of numerous animal and plant species living in a relatively small area is something quite unique for this type of countryside in Central Europe. The species native to both the northern tundra and the warm continental lowlands grow and live in close proximity here as well as species associated with both extremely wet biotopes and extremely dry biotopes.

Figure 3. Biosphere reserves in Czech Republic

The most important ecosystems are protected within the core area of this biosphere reserve such as wetlands, fishponds, floodplains and wet meadows as well as specific biotopes of old sand dunes which are also among the most valuable ecosystems in this Biosphere Reserve (Jelinkova, 1998).

Unfortunately, the biosphere reserve suffered during the last 20 years from serious tourism development impacts and other human activities. Some of its traditional human activities (agriculture, forestry, and fish farming) were practiced with extreme intensity and with modern technologies that did not respect the natural ecological limits and the carrying capacity of the landscape. Such types of management caused negative changes in the fragile ecosystems such as eutrophication and loss of biodiversity as well as visual degradation of the countryside. In addition, the improper dumping of waste, intensive use by visitors and traffic in the form of hiking were observed in the core zone, indicating a disturbance in the legally protected zone of the reserve.

Ecotourism and sustainable practices in the reserve are practiced in the form of tours, mainly for the purpose of observing the flora and fauna of endemic and natural species. Adventure tours, as well as bio gardening (the cultivation and processing of medical herbs and species), are also part of the range of ecotourism products offered to visitors. The negative side to these proactive practices is that there are no guidelines for the development of ecotourism and no frameworks have been developed for maintaining its attractiveness.

As a result of the increasing number of initiatives being developed in the reserve, a number of programs to estimate the carrying capacity of the zones were actioned. The results of this study with respect to tourism attractions indicated the following:

- Potential tourists have no information about the tourism attractions or the facilities of the region;
- The biosphere reserve has only limited opportunities to influence the turnover of ventures operating in the area;
- There is a lack of data with regards to tourism arrivals in the reserve; and
- There is a lack of programs to monitor the effects of tourism in the zones of the reserve.

Overall the state of sustainable and ecotourism practices in the examined area are at the initial planning stages. With the lack of comprehensive management frameworks concerning the practice and the effects of ecotourism, the situation could have disastrous effects, especially if one considers the potential direct and indirect negative impacts in the core zone of the reserve.

Tatra Biosphere Reserve

Since 1992, five national biodiversity protection projects have been implemented in Central Europe aiming to encourage the creation of transfrontier biosphere reserves. One of these reserves is that of the Tatra situated on the borders of Poland and Slovenia (see figure 4).

The Tatra are the highest mountain massif of the alpine folding of the Western Carpathians. The total area amounts to about 750 km², of which 174 km² is within the boundaries of Poland. The idea of establishing a MAB biosphere reserve in this location originated in the Polish Tatra National Park (TPN) and the Slovakian Tatra National Park (TANAP). A group of experts appointed by the Council commenced the elaboration of a concept for future biosphere reserves in the area of both national parks (Kokovkin, 1999). One critical issue facing the reserve concerned the zonation of such transboundary reserves. Zonation became a subject of numerous consultations and negotiations aimed at obtaining a single dense core representing both parts of the reserve. As a result of manual work, the biosphere reserve was designated an area of 145600 hectares, of which over one third is constituted by the core zone shared by both countries (see table 4).

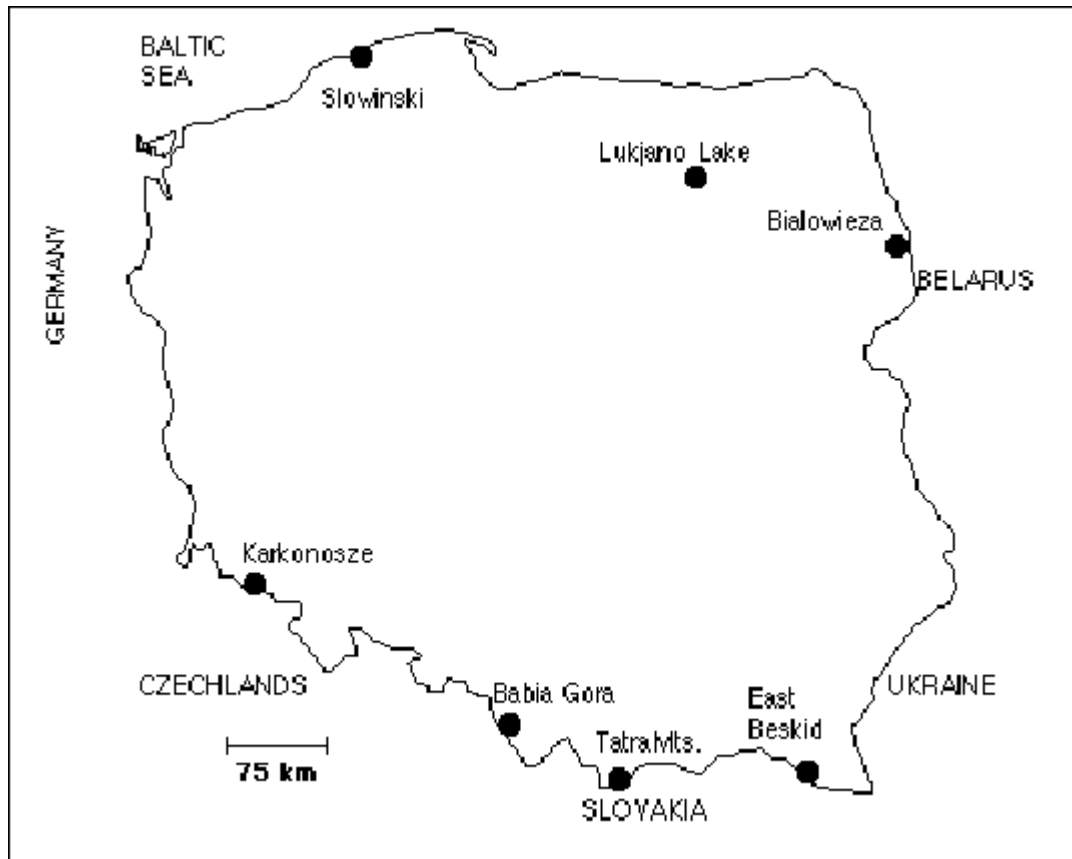

Figure 4. Biosphere reserves in Poland

Table 4. Tarta biosphere reserve (in total hectares)

Source: Kokovkin, 1999

Here, ecotourism activities are of a very small nature, usually taking place in cultural and transitional zone areas. It was estimated that ecotourism accommodates around 10000 visitors per year, most of which are independent travelers. There are no nature guides or specific conservation objectives, training for nature guides or interpretation programs. The majority of the ecotourism clientele are occasional in nature, in that they are likely to be involved in a number of other tourist activities such as cultural and rural tourism. During last year their strategy focused upon five key areas, as follows (Kokovkin, 1999):

- International co-ordination and infrastructure;
- Economic activities and population;

- Protection and assessment;
- Education and promotion; and
- Implementation support.

The strategy, which does not focus primarily on tourism, is based on 19 goals and a detailed planning mechanism for managing the ecosystems between the two countries (see table 5).

<i>Strengthen the international framework for the conservation of the Tatra biosphere reserve</i>
<i>Improve coordination of activities implemented within the territory of the reserve</i>
<i>Develop infrastructure for effective cooperation between the two countries</i>
<i>Ensure ecologically sustainable forest management</i>
<i>Make agriculture complementary to biodiversity protection</i>
<i>Coordinate tourism development on the wide territory around Tarta reserve</i>
<i>Provide means to improve the quality of life of local communities</i>
<i>Minimize pollution of local sources</i>
<i>Improve knowledge on biodiversity</i>
<i>Provide for differentiated protection of the territory</i>
<i>Strengthen in-situ protection</i>
<i>Provide for ex-situ protection of the Tarta generic resources</i>
<i>Apply unified concept for protection and use of abiotic resources</i>
<i>Set up an integrated monitoring system</i>
<i>Establish an effective system for conservation of cultural and historical values of the territory</i>
<i>Raise public awareness on natural and cultural values of the territory that create a basis for sustainable development</i>
<i>Promotion of natural and cultural values of the territory</i>
<i>Introduce the principles of the strategy into local management and development programs</i>
<i>Mobilize funds</i>

Table 5. Sustainable management objectives of Tatra biosphere reserve

One of the most significant aspects of the strategy however, is the emphasis on both the in-situ as well as ex-situ protection of the reserve. Across the two countries strict protection covers over 11.5 thousand hectares, and includes summits and zones like the Alpine Meadows, Zone of Dwarf Pine, and also forests such as the upper and lower forest belts. This indicates that the issue of *geographical equity* takes into account the resources that are critical to the biosphere reserve as well as the resources that surround the reserve. In addition another important feature of the strategy is that of the integrated monitoring scheme of the reserves' territory as well as ensuring that the strategy does not coincide with other local environmental policies.

In an era where sustainability in tourism is claimed to be extremely tourism centric (Hunter, 1995a, b, 1997) this biosphere reserve seems to approach its management issues from a general sectorial perspective devising strategies which are free from tourism development stances.

An assessment of ecotourism and sustainable practices in the biosphere reserves

The sustainable and ecotourism practices in the examined biosphere reserves have been demonstrated by a plethora of actions. As such, these initiatives are different from reserve to reserve reflecting the variety of perspectives and paradigms. Theoretically speaking, ecotourism has been claimed to be practiced in a continuum from an active pole (actions of protecting the environment) to a passive pole (ecotourism development actions which do not create negative impacts) (Orams, 1995). In addition, it was claimed that ecotourism contains three common components (Diamantis, 1999): the natural-based component; the sustainability component; and the educational component. By using the latter three elements as indicators to assess ecotourism practices in the examined reserves as well as the stages of the different crisis mentioned in the introduction, it can be seen that these biosphere reserves exercised a rather passive stance towards ecotourism, therefore all are situated the prodrominal crisis stage. With the exception of the Tatra biosphere reserve where a management program was formulated (chronic crisis stage), the remaining two reserves did not implement any programs to support the sustainability and educational elements of ecotourism (acute crisis stage) [see table 6].

<i>Indicators</i>	<i>Tarta</i>	<i>TREBONSKO</i>	<i>aGGTELEC</i>
<i>Active/Passive application of ecotourism</i>	<i>Passive</i>	<i>Passive</i>	<i>Passive</i>
<i>PRODOMINAL CRISIS</i>	<i>yes</i>	<i>yes</i>	<i>yes</i>
<i>Natural-based element of ecotourism</i>	<i>yes</i>	<i>yes</i>	<i>yes</i>
<i>Sustainability element of ecotourism</i>	<i>yes</i>	<i>no</i>	<i>no</i>
<i>Educational element of ecotourism</i>	<i>yes</i>	<i>no</i>	<i>pARTIAL</i>
<i>ACUTE CRISIS</i>	<i>No</i>	<i>YES</i>	<i>YES</i>
<i>CRONIC CRISIS</i>	<i>YES</i>	<i>No</i>	<i>NO</i>
<i>CRISIS RESOLUTION</i>	<i>NO</i>	<i>NO</i>	<i>NO</i>

Table 6. Sustainable and ecotourism performance matrix of biosphere reserves

This suggests that when it comes to implementing certain strategies at a local level all the examined reserves have a rather passive role towards an ongoing sustainable management development plan. If one considers that biosphere reserves are areas where ecotourism and sustainable practices could flourish, the current situation is not encouraging.

When it comes in overcoming these kind of crisis as well as in implementing the crisis resolution stage, ecotourism destinations as well as the examined biosphere reserves should devise strategies which reflect the grounds of strategic forecasting and scenario analysis. The strategic forecasting should be part of the ecotourism destination planning and should espouses methods that predict and

assess the impact of major and broad changes in the economic, social and environmental agenda of the area rather than to predict specific changes that may be overridden by the broader trends.

Situation analysis could also assist ecotourism destinations in avoiding the different crisis. Here the following steps can be seen:

- Select certain scenarios for sustainability and/or ecotourism purposes (best and worse case);
- Select certain indicators to fit that scenario (i.e. economic, social, environmental);
- Conduct research in the destination or on the product to see the applicability of the selected indicators;
- Consult a number of stakeholders to obtain their views and develop a list of new indicators;
- Summarize the key concept of the crisis scenarios;
- Compare results for each of the critical indicators analysed;
- Consult a number of stakeholders to obtain their views on that program;
- Consult an independent verifier to acknowledge the scenario effectiveness; and
- Develop a feedback process.

Overall, crisis management strategies should involve the wide participation of the local community as well as should include research that acknowledge a proactive rather than a reactive stance towards ecotourism. Only under such circumstances, different crisis can be predicted and eventually resolved in the setting that they are examined.

Conclusion

Implicit in the evolution of sustainability in CEE are the efforts made to transform the negative environmental images to policies which are embodied with sustainable principles, through declarations of co-operation and the development of sustainable committees. Although sustainable tourism and ecotourism are emerging as important products, there still remain a number of key challenges at the local level (Hanrahan, 2012). In adopting the concept of biosphere reserves to explore the awareness and to identify the challenges faced at a local level, three case studies were presented. It is evident from these cases that there is a level of awareness towards sustainability as well as strategies that provide a backbone to the daily management of these reserves. Although all the reserves are at their initial planning stages with regards to tourism, a trend shared by most of the reserves is that they do not approach sustainability from a solid tourism perspective. For instance in the Tatra biosphere reserve the sustainable and ecotourism practices are not applied to enhance the tourism industry needs and wants, not creating the so-called 'tourism-centric' situation. Even then, the profound inequalities that exist in the Central and Eastern Europe require the adoption of a very carefully planned crisis strategy and overall policy for sustainable development (Hall, 1998; Slee, 1998). The process of harmonization of environmental regulations and agendas is a priority task. In

addition, it must be accompanied by mechanisms that guarantee openness, adequate information and public participation, crisis scenario planning, community support as well as administrative and control procedures for its enforcement and application.

WAYS OF IMPROVEMENT OF INNOVATIVE ACTIVITY OF THE INDUSTRIAL ENTERPRISES IN THE REPUBLIC OF KAZAKHSTAN

Dosmanbetova, Aliya¹

¹ Candidate of Sciences in economics, International Academy of Business, Kazakhstan, Almaty. E-mail: adosmanbetova@mail.ru

Abstract

In article models of innovative activity and use of innovative administrative technologies in the industrial enterprises of the Republic of Kazakhstan are considered. Research it is executed on the basis of the monthly reporting of the largest industrial companies of the Republic of Kazakhstan. It is in summary presented that management of innovative development assumes development of the strategic direction of innovative activity and realization of innovative capacity of the organizations.

Keywords: innovation, innovative activity, innovative model.

Introduction

One of the main areas of Kazakhstan development is scientific and technical activity and practical development of its results for the benefit of economic growth of the country in the conditions of market relations formation. By the decree of the President of the Republic of Kazakhstan from March, 19th, 2010 № 958 it is accepted the Government program on the forced industrially-innovative development of the Republic of Kazakhstan for 2010-2014[1-4]. In the Program following priorities have been allocated:

- Higher productivity of factors of production as major condition of growth of national economy competitiveness;
- Emphasis on attraction of principally direct foreign investments, in creation of new export-oriented hi-tech manufactures;
- Development and strengthening of national innovative system;
- Sag of economy concentration and increase of a SME role in the course of industrialization;
- The rational spatial organization of economic potential.

Search of acceleration of scientific and technical progress and fast implementations into economical activity in the developed countries of the world resulted in understanding of necessity of radical perfection in the first place the management of this progress. A strategic target of modern Kazakhstan is achievement of the social and economic development level corresponding to the status of the country as world power of the XXI century with an attractive way of life, taking the advanced positions in the conditions of strengthening of a competition and reliably providing national safety and realization of constitutional laws of citizens.

The only real alternative to such events is strategy of innovative development of the country, based on the main advantages – realization of potential of highly skilled scientific manpower, in the most effective application of knowledge and abilities of people with a view of increasing technological-economic, social innovations in the national economy, providing improvement of the population's life quality and advancement of a society by the way of social and economic progress.

In the world economic literature "innovation" is interpreted as transformation of potential scientific and technical progress in real, implementing in new products and technologies [5]. The issues of innovations in our country over the many years was developed within the limits of economic researches of Scientific and technological advance.

In the model first of all two strategic lines are noticeable: development of social needs and development of a science and techniques. Both of these a little separate directions closely co-operate among themselves through three integrated blocks:

- Development of the conceptual decision (with a glance of unsatisfied needs of the market, new ideas and the financial and other possibilities providing realization).
- Development of the technical decision (on the basis of carrying out of researches, technical workings out and experiments).
- Launching of new production in the market (on the basis of carrying out of marketing researches of the market and the organization of manufacture of new production in necessary scales).

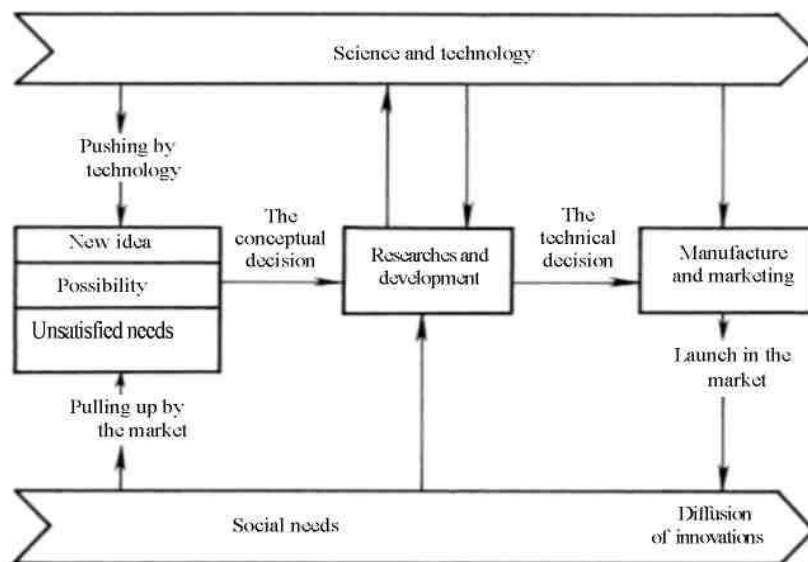

Figure 1 - The generalized innovative model.

Innovative activity of the enterprise is the activity directed on use of results of scientific researches and workings out for updating of the nomenclature and improvement of quality released production, technological development of its manufacturing [6].

Innovative activity of the enterprise includes:

- Carrying out of research and design works on concept formation of an innovation, carrying out of laboratory researches and manufacturing of laboratory samples of new production;
- Selection of necessary kinds of materials for manufacturing of new kinds of production;
- Designing, manufacturing, test and development of new techniques' samples;
- Working out and implementation of the new organizational-administrative decisions directed on realization of innovations;
- Preparation, training, a personnel training for a new profession;
- Work or acquisition of the necessary documentation on patenting, licensing.

Innovations ensue of creative enterprise activity in which various divisions of the enterprise usually participate and on which external factors have strong influence (the state influence, ecological requirements, cooperation with other institutes and etc.). Innovations have the life cycle which is beginning with occurrence of a new idea and coming to the end with implementation and the statement of a new product in the market. In this cycle it is possible to allocate six typical phases with specific character for each type of activity, situations of decision-making and results [7].

Phases, as a rule, follow one another; however cases of some parallelism of separate phases are not excluded. So, estimations and economic efficiency calculations are necessary to carry out not only in a phase of ideas search, but also in the subsequent phases.

1st phase: enterprise strategy and innovations. Strategic decisions on innovative activity can and should be accepted only in connection with decisions in the field of the general strategy of the enterprise and the strategic program of manufacture. Following strategic decisions serve for defining innovative process: a choice of the market or a market segment; the statement of applied technology; a choice of the goods and services which should be made at the enterprise; the decision concerning cooperation in workings out, manufacture and sale; an establishment of volume and speed of process of updating goods and services.

2nd phase: searches of ideas and their assessment. It's allocated three ways of search: working out of new ideas (generating ideas); critical revision and updating of known problem decisions or certain variants of decisions; search of already working general decisions or partial solutions (use of known scientific and technical experience and knowledge, acquisition of licenses). The found ideas are exposed to estimations: at first improper ones are rejected, and then the most perspective are checked with simultaneous revealing of their potential market chances. Result of the best ideas selection is the offer on manufacture of a new product where bases of the further actions are stated.

3rd phase: the grocery decision. In this phase the enterprise should be convinced that owing to grocery idea it will be developed the real product which can be included in the strategic program of the enterprise and will be promoted in the market. All it demands all-round planning which covers: goal-settings and problems on the given product; drawing up of the time schedule of resources use; planning of manufacture for the enterprise as a whole; planning of sale with economic efficiency calculation.

4th phase: scientific researches and workings out, a technological transfer. This problem should be solved taking into account following moments: definitive specification of a problem and working out of the basic decision on the new goods or new service; constructive working out of a product up to prototype creation; designing and preparation of manufacture for a new product with manufacturing and test of a pre-production model, the industrial equipment and a zero series.

5th phase: plant development. In this phase the following is important: adaptation of a prototype to technological requirements; acquaintance of the involved personnel with technological processes, with methods and new areas of problems; start of cars and the equipment to the established limits of capacity; searches of new channels of supply.

6th phase: launching in the market.

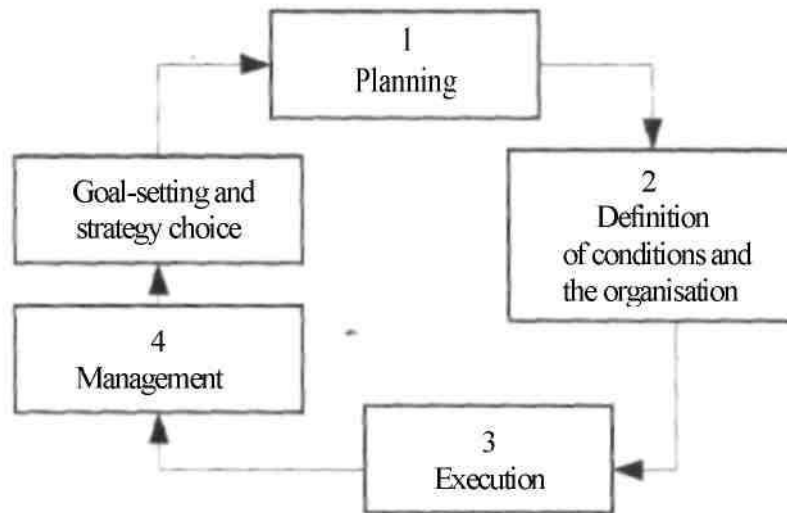

Innovative management represents a set of principles, methods and the forms of innovative processes control, the innovative activity, the organized structures and their personnel occupied by these activity[8].

For this phase, as well as for any other area of management, are characteristic:

- Goal-setting and strategy choice;
- Four cycles;

The told is visually presented in figure 2.

- Planning: scheduling of strategy realization.
- Definition of conditions and the organization: definition of resources requirement for realization of various phases of an innovative cycle, statement of problems before employees, the work organization.
- Realization of researches and workings out, plan realization.
- Management: control and the analysis, updating of actions, experience accumulation. An estimation of efficiency of innovative projects; innovative administrative decisions; applications of innovations.

Drawing 2 – Goals and cycles of innovations management

Transition to an innovative way of development of the country and efficiency of innovative development of economy of Kazakhstan in many respects depends on collective system of creation and spread of knowledge and use of technologies. Formation of national innovative system should be developed at the state, regional levels, and also at level of the organizations. Representing itself as primary links of regional and national innovative systems, innovative systems of the organizations is pledge of innovative development both the organizations, and regions of Kazakhstan where they are localized. Orientation of innovative activity of the organizations to the purposes of social and economic development of a society and well-being of citizens testifies that the innovative system of the managing subject becomes the important factor of economic growth and social well-being of the population in the region and the indicator of aiming of a society on social and economic growth in which basis acts technical and technological progress.

Necessity of a combination of strategic and operational and tactical management is the reason for that management of the organization is considered as a management combination by its innovative development and managements of innovative activity. Management of innovative development assumes working out of a strategic direction of innovative activity and realization of innovative potential of the organizations while management of innovative activity of the organization is directed on realization of problems of a certain stage. An indispensable condition of efficient control of the organization's innovative activity is use of innovative administrative technologies to which it is carried: outsourcing, reengineering, CALS-designing can be considered as a management method of innovative development of the organization.

CRITICAL SUCCESS FACTORS AS DRIVERS TO QUALITY AND SUSTAINABLE IN HIGHER EDUCATION INSTITUTIONS

dos Santos Martins, Harley¹; Correia Loureiro, Sandra Maria²;
Castro Amorim, Marlene Paula³

Abstract

In a turbulent and competitive world where building new business models for success through innovation, competitiveness and sustainability is on the agenda, it is important to develop a framework to help institutions of higher education to improve their performance without neglecting quality and sustainability issues. As far as we know, this study is the first attempt to develop a framework using critical success factors (CFS) and integrating quality and sustainability in higher education institutions. Previous studies regard quality and sustainability as separated issues and those who deal with the sustainability tend to be restricted to environmental aspects. The extensive and systematic literature review on sustainability, quality, and higher education themes lead us to identify seven critical success factors (CFS) and examine fifteen articles published in top scientific journals. The proposed framework can be a starting point to help top managers and course directors in higher education institutions, to create and manage their courses and respective institutions toward high standards of quality and sustainability.

Keywords: Critical Success Factors; Higher Education, Service Quality, Sustainability.

Introduction

In the current economic scenario of crisis, in which many countries are immersed, jobs are threatened and higher standards of qualifications are demanded. A good higher education has a growing importance in the market because it improves the possibilities to get and keep good jobs. It is not rare to read, listen or to find articles in press, stating that companies around the world need and search for qualified personnel, mostly engineers, which are trained to solve crisis in the companies they work. Such professional solid formation is a critical point to any Higher Education Institution (HEI), since only few are able to do it in an appropriate way.

The formation and qualification of good professionals, especially in engineering, high technology and even hospitality tourism fields, involves high investment for the students themselves but also for the institutions where the formation is provided. However, an appropriate and constant evaluation is the most efficient way to achieve quality in every activity (e.g., Bruno and Leidecker, 1984; Boynton and Zmud, 1986). So, to understand which are the critical success factors in learning process is crucial

to improve the service offered by an institution, hence creating a mechanism able to perceive quality from people interested in the efficiency of this process. Therefore, the main goal of this research is to develop a conceptual framework to the Critical Success Factors (CSF) in the higher education courses (especially in engineering courses but could be extended to other courses), taking into consideration quality standards and sustainability issues.

In this vein, a systematic review of the relevant current literature is made concerning to quality and sustainability aspects, building support to the framework development which, in a later moment, will be tested and may lead to adjustments according to the natural foundation of new knowledge able to contribute to the theoretical and practical in teaching and management in higher education. The improvement of the course practices and quality will lead to a better formation and qualification of the students, which, in turn, will perform a better role in their profession and in society.

This article is organized as follows. Next section presents the literature gap and the main concepts about the topic in analysis and about the systematic literature review. Section 3 comprises the methodology adopted, the quality assessment and the data extraction process. Section 4 regards to the conceptual framework which works as a basis to facilitate understanding and support to HEI decision-making in sustainability and quality of services issues inside the operations they perform. The section refers to limitations and conclusions, as well as further research.

Conceptualization

In order to achieve the goal of this research, i.e., to develop a conceptual framework to the Critical Success Factors (CSF) in the higher education courses (especially in engineering courses but could be extended to other courses), integrating quality standards and sustainability issues, in this section we present and discuss the concepts of CFS, sustainability, higher education and sustainability, and quality management.

Critical Success Factors (CSF)

The identification of Critical Success Factors (CSF) is a method initially developed in strategic planning, which gradually gained importance. The CSF emerged as a methodology to develop organizational strategies and proved to be applicable in several other business and industrial areas, such as quality, logistics, health care, or automotive industry.

The whole method idea is proposed for the first time by Daniel (1961) in an article approaching the crisis in information management. In his article Daniel (1961) highlights the need for a strategic management of the resource. Years later, Rockart (1979), establishes the concept itself by proposing and spreading a new methodological approach in order to define the needs of information with top management of companies. Following this line, others authors, such as Leidecker and Bruno (1984), present new applications of the method, specifically in the area of Planning and Business Strategic Development.

CSF is an empirical method based on interviews and surveys, and provides structured techniques able to be used by researchers in the identification of management priorities. The outcomes can be used in planning and framing mechanisms, in a top-down outspread system company, department and individuals. Managers can use the CSF concept, in an implicitly way, but if they use CSF explicitly in a methodologically way, the allocation of resources may be defined in a more correct way (Rockart, 1978).

CSF are those aspects or core elements that must occur in a correct way in order to ensure success to a manager or to an organization. Therefore, the method allows highlighting the areas or sectors inside the company that must receive a continuous and special care to generate high performance. CSF are key questions to the success of current operational activities of the organizations and for their future success as well (Boynton and Zmud, 1984).

Since CSF are “the limited number of areas in which satisfactory results will ensure successful competitive performance for the individual, department or organization” (Bullen and Rockart, 1981, p. 7), it is important to analyze which are the core factors in the context of higher education and assure that they are correctly well handled. A first step towards that objective is presented by Rovai and Downey (2010), who points seven items as CSF to higher educational courses, such as:

- **Planning:** it must contemplate a deep internal HEI knowledge, pointing out its strengths and weaknesses, its goals, its relevancy and the relevancy of its courses, its brand strategies, efficiency and quality.
- **Marketing and Recruitment:** The way the Institution’s positioning will be done towards the market and its competitors; the image, model, and representation that will be presented to the society and the brand development and refinement are key points to be regarded by the Institution in such a way to do a good work in recruiting more students, business and professionals (professors, lectures, and other staff).
- **Financial Management:** The Institution should analyze what will be better: manage the financial resources in an integrated way or divide the financial resources through the rectorate, departments, and courses. Which will be the best work dynamics to obtain better results? Institutions should rethink actions in order to cultivate the institution financial health as a whole.
- **Quality Assurance:** The Institution should analyze what they are doing to comply with existing regulatory standards towards a course operation and users' satisfaction. So, efficiency measurements to support provided services must be taken, as well as continuous improvement of installations and infrastructure, staff development and optimization of administrative processes.
- **Student Retention:** HEI should put away the idea of the ex-student and regard students as partners in order to establish a relationship. The institution should demonstrate to actual

students that keeping in contact with the Institution could bring advantage (lifelong training). So, the Institution could offer discounts in other courses and activities, classes and/or exclusive vacancies to graduate courses.

- **Faculty Development:** Incentives to academic production and university extension must be considered in order to develop professors, assistants, and researchers. A clear methodology to attract good professors should also be implemented and an appropriate organizational culture which allow the personal and collective development and the accomplishment of strategic goals.
- **Course Design and Pedagogy:** The importance of a course program, the syllabus and the philosophy of teaching process and how to operationalize what is planned. The courses should be constantly reviewed in order to be updated given the evolving market demands.

Sustainability in Higher Education

Universities have the potential to be leaders in research and technology, in teaching and learning, and in community engagement; they tend to be spaces where ideas are freely expressed, new paradigms are proposed, creativity is produced and new knowledge is created. Based on what academics know about the current environmental condition of the planet, it is mandatory that universities become leaders in movements to prevent global environmental collapse (Moore, 2005).

Sustainability has been a matter of interest not only to governments, but also to industries, NGOs (Non-governmental organizations), and companies. Therefore, Higher Education Institutions, the ones who create decision-makers professionals for big corporations, should have an active role in aspects of sustainability inside their own premises, along with its collaborators, professors, directors, and students. The sense of sustainability should be addressed in broad terms, beyond the aspects related to environment. For example: for private institutions, regulatory organisms (regulations, norms and laws) and market points, must be considered, as well as those concerned to the own institution structure itself.

Sustainability has been addressed with a focus on environmental issues (e.g., Moore, 2005; Davis, O'Callaghan and Knox, 2009; Clugston and Calder, 1999). However, the World Commission on Environment and Development (WCED) (1987, p. 8), defines sustainability as a search to "satisfy the needs of the current generation without compromise next generation's ability to satisfy their own needs". Therefore, WCED highlights the need to plan and be conscious and responsible in the use of all kinds of resources.

Davis, O'Callaghan and Knox (2009) argue that a sustainable university holds four levels of commitment. At level 1 it is essential to consider and optimize university operations, as energy and installations; at level 2 sustainability is integrated in research and education; Level 3 involves engagement of university management in formulation of new policies and collaboration with external organizations, and, finally, level 4 involves formulation of a mission declaration which should reflect

fundamental values, act as a motivator and as mechanism to support and be highly visible to the interested parts, both internal and external to the organization.

Activities towards sustainability would help HEI to implement, step by step, the four levels proposed by Davis, O'Callaghan and Knox (2009) in order to reach sustainability inside the organization. Tuncer (2008) highlights the importance of identifying and recognizing current contributions of courses, programs, and professors in education to sustainability, as well as, all integrated efforts to make progresses in education reorientation to deal with sustainability, and the effect of different factors in students' perceptions about sustainable development.

For Clugston and Calder (1999), the institutions committed to sustainability will find a way to define the concept in a form that better fits their own reality. The process is complex, therefore, only a small number of institutions has been able to reach the adequate transformation in all the critical dimensions towards sustainability, although many of them have achieved it in some areas. Even if all the critical conditions to success in sustainability programs were present, sustainability initiatives would not necessarily be well conducted.

In this study, the proposed framework, in section four, goes further and considers other important point to be regarded in addition to environment approach: regulators and normative aspects, market and financial questions, and structural points.

Environmental Approach

In order to be environment responsible and assure a better future to the world, the key word is commitment. Wright (2010) states that stakeholders (e.g., top managers, directors, students, staff and professors) must be involved in initiatives of sustainability and in decision process, in order to ensure long term success in high education sustainability programs. The leadership is fundamental to the institutional changes towards sustainability. Top management holds responsibility to define, promote, facilitate, and follow up the activities inside their organizations in order to reduce the environmental footprint.

An academic institution committed to sustainability must help students to understand the roots of environment degradation and motivate them to search for educational practices which are environmental sustainable (Clugston and Calder, 1999). Furthermore, Moore (2005) points out seven recommendations to help universities to be more environmental sustainable:

1. The inclusion of the idea of sustainability in all decisions: By updating the politics of institutional sustainable development; by promoting sustainability at all decision-making levels; by ensuring sustainability in the institution vision and its main goal; by achieving the excellence and trying to be "the best". Thereby, the university campus becomes a life and learning laboratory.
2. Incentive, involve, and actively practice collaboration among all employees of the institution: by discussing values at all levels in educational institution; by creating incentives to collaboration; by promoting synergies in research; by discussing the current system classification for higher education

and considering new options; by creating support teams to lecture courses; by promoting collaborative team works.

3. Incentive and actively practice the flexibility in courses programs: by creating flexibility to students in graduation programs; by redrawing courses syllabus and programs.

4. Focus on individual and social sustainability: by creating conditions (promoting the long term contract) in order to have a more engaged university community (professors and other staff).

5. Planning, decision-making and evaluation integrated: by integrating evaluation to politics, priorities, and institutional plans; by establishing priorities to the company evaluation structures; by changing faculty incentives and rewards staff in a way to incorporate and valorize sustainability activities; by promoting transparency in decision-making; by creating criteria and indicators along with society to evaluate the institution purposes.

6. Integration of research, service and, teaching: by promoting and integrating scholarships; by evaluating undergraduate, Master, and Doctorate programs, as well, as curricula; by promoting continuous formation to instructors and professors; by promoting and improving university/community relationship; by rethinking external relations with community, governments, and industries.

7. Create space for pedagogical transformation: by promoting, valorizing and rewarding educational communitarian services, participation in educative-transforming groups, critical/reflexive thought learning, student-centered and problem-solving based learning and, experiential learning; by removing barriers and creating a space to pedagogic transformation; by improving student-instructor interaction.

Regulators and Normative Aspects

In order to deal with courses, norms and regulations from different entities, HEI should be aware of directories demanded by the Government and/or Ministry of Education, Professional Councils, Unions, and all entities directly and indirectly related to the courses programs. In each country, the regulator organs define courses operation, as well as, graduated professional activities. So, they hold the authority to deliberate if each course has the conditions to have permission to be open and continue to operate or not. The regulator organs also perform periodic inspections to evaluate, accredit and close courses according to several criteria, reports, and considerations from the evaluation commissions.

Market and Financial Questions

Ferns et al. (2007) suggest that in higher education sustainability should be focused on three main aspects (see equation 1): quality of the course, its relevancy, and its viability.

$$\text{Course Sustainability} = \text{Relevancy} + \text{Quality} + \text{Financial Viability} \text{ (equation 1)}$$

Where, as Ferns et al. (2007) mention:

- **Quality:** may be judged based on different criteria, although it is suggested that these criteria may be a mix of internal and external students feedback measurements, undergraduate/graduate level, entrance criteria and approval and disapproval rates;
- **Relevancy:** it is defined as a composition of the course potential in generating strategic advantages to the university, such as partnership with other organizations opportunities, to promote an institution potential market, to increase low-cost marketing opportunities, to approach ways to use existing resources, to respond demands of the society they are inserted to, to satisfy needs, and fulfill industry and market companies requirements;
- **Viability:** financial viability is closely related to indicators which determine costs. Measurements to this criterion analyze market trends, course demands, and financial indicators. This point is crucial to institutions. Managers and educational teams need a coherent set of rules to determine financial viability of the courses.

Structural Points

Not all higher education Institutions hold the conditions to create engineering courses, technological courses, tourism (hospitality) courses, or other courses which need a set of requirements that overtaxes its implementation and sustainability costs. A minimum structure is required for their function and operationalization. These courses need specific facilities, such as physics and chemistry laboratories, informatics laboratory, or professional kitchen and other equipments and places in tourism courses.

Sustainability and Quality Management

The sustainability and quality management can be regarded as inter-related. Several common aspects can be noted, such as: integrated perspective, multifunctional approach, long-term economic and social focus, full value chain participation, continuous improvement, training and involvement, top management commitment, and participation and capabilities of all employees (Rusinko, 2005). Figure 1 shows a diagram that intends to expose the inter-relationships between sustainability and quality management in higher education. Sustainability and quality management can be regarded complementary.

Methodology

This study applies a systematic literature review process, using an automated search, to collect information and increase knowledge about CSF, sustainability, quality and higher education concepts. The goal is an identification, documentation, and conceptualization for all key analyses in those themes. The B-On System accessed through University of Aveiro, containing electronic databases, such as Elsevier, Emerald, Science Direct, EBSCO, Springer, and ISI web knowledge is used to search

for information. The main search terms are “Sustainability”, “service quality”, and “Higher Education”, however, the combination of different terms, sequences, and strategies were used to include as much as possible relevant literature. The period considered was from 2006 to 2011. After a broad screen of titles and abstracts and a strict screen of the remaining articles, 15 of them were selected as the most appropriate and relevant to our research topic: the sustainability and quality in higher education. The articles analyzed are written in English, Portuguese, or Spanish and we included articles with qualitative and quantitative methodology.

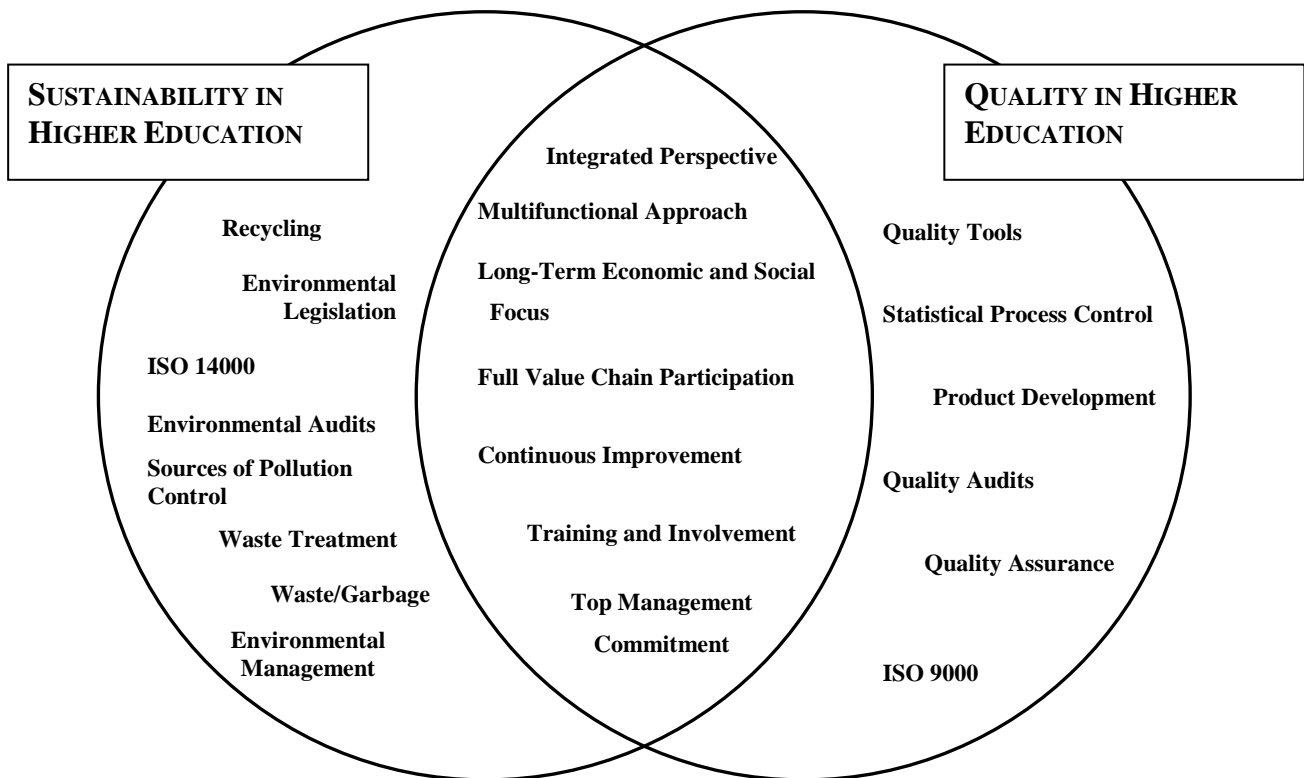

Figure 1: Inter-relationship between Sustainability and Quality

Quality Selection Criteria and Data Extraction

The quality selection criteria include: validity (how accurate is the study and information presented in articles at measuring what we intend to investigate); reliability (the consistency and the degree of replication of the results and the possibility to generalize); credibility (regards the article published in well reputed journals worldwide); integrity (which can be regarded as how robust the research is and if adopts, or not, rigor in the selected research process) (Collis and Hussey, 2003).

Based on such criteria, the next step was data extraction: a systemic review of articles collected by electronic search engines (see figure 2), which followed elements defined in selection criteria and went

through phases of general reading of articles titles and abstract, identification of credibility and relevancy of authors and journals, methodology employed, and inter-relation to the theme of this study.

The development of this process culminated with a selection of 15 articles, which were analyzed and tabulated (see table 1) giving a visualization of the general publications scenario about the developed theme inside education context, according to sustainability and quality.

Table 1 shows a synthesis of the 15 articles, presenting the authors, country of origin, publication journal and core approaches developed in the papers. This allows us to have an idea of what has been done in quality and sustainability research in higher education.

The studies presented in table 1 reveal that environmental and ethics or citizenship issues are the most frequent components of sustainability analyzed, and it is believed that for most of the authors the purpose of sustainability in higher education must be a search to highlight the importance, and even the duty, to qualify good professionals and also good citizens who will have an appropriate environmental and social consciousness. Indeed, it is clear by reading these papers that priority points are environmental and citizenship aspects, and rare are those who combine these two aspects to economic sustainability in HEI.

The social concerns are less regarded, especially those devoted to engineering courses and programs. However, authors such as Segalàs, Ferrer-Balas and Mulder (2010) allude that engineering students begin to see the sustainable issue in a different way. Engineering students seems to be more conscience of their capability to deal with social questions in the same way they are prepared to solve environmental problems by technological solutions. Thereby, the education for sustainability must integrate science, technology, society, environment and ethics issues (e.g., Segalàs et al., 2009 and Correia et al., 2010).

Holden et al. (2008) sustains that the integration of science, technology, human, and environmental aspects should be the right direction to follow. In figure 3 we can see that a sustainable initiative considering the human beings and the environment needs an intelligent implementation technique, that is, when science and technology can fulfill the human beings demands without harm environment, then sustainable activities appear.

	Nesbit, Robinson, Yen and Moore (2008)		Economics	Environmental Education Planning. Green constructions.	Approach	if they had the chance to think more about how to learn. There are needs of additional research to connect research on how people learn with researches in pedagogy, or the way to teach people to learn.
12	Juárez-Nájera, Dieleman and Turpin-Marion (2006)	Mexico and Netherlands	Journal of Cleaner Production	Studies disciplinary curriculum, questions of sustainable development education, civility and environmental education.	Qualitative Approach	Many of what college students learn in their previous formation does not fit in sustainable paradigm. Education to sustainability in high educational institutions must include the partial "re-education" and "re-programming". Students must learn new and sustainable ways to look at the world, to themselves and to their professions.
13	Haigh (2006)	United Kingdom	Journal of Geography in Higher Education	Environmental education and the importance of NGOs as partners to supply a place where to practice what was learned in class as well as to form a citizen.	Qualitative Approach	Higher education must update its former graduates comprehension and spread environmental sustainable ideas through community.
14	Velazquez, Munguía, Platt and Taddei (2006)	Mexico	Journal of Cleaner Production	Environmental Management, evaluation and strategic planning to sustainability in academic media.	Qualitative Approach	Cultural consciousness seems to be one of the best strategies to catalyze the implementation of sustainability initiatives.

						<i>Each time more students, professors and other academia community members are committed to help society to make a transition to sustainable ways of life.</i>
15	<i>Reid and Petocz (2006)</i>	<i>Australia</i>	<i>Higher Education</i>	<i>Rises questions about curriculum, teaching and environmental education in professors' point of view.</i>	<i>Qualitative Approach</i>	<p><i>More integrated and sophisticated ideas involve an emphasis in students' learning, which allows the teacher to see the implications and integrations among several key-ideas and how to make them accessible to students.</i></p> <p><i>Development of scientific thought towards more integrated levels must be a target in research and curriculum development.</i></p>

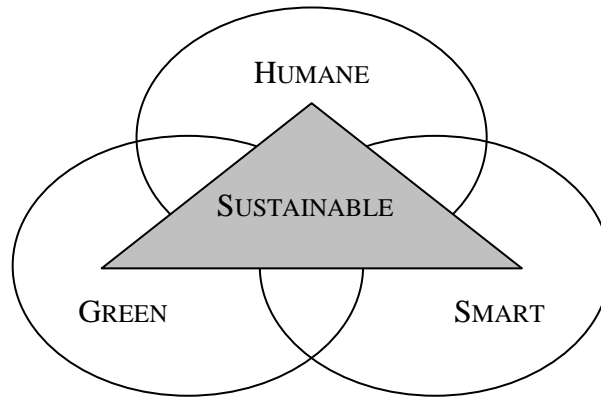

Figure 3: Conceptual Model of Sustainable Building.
 Source: Adapted from Holden et al. (2008).

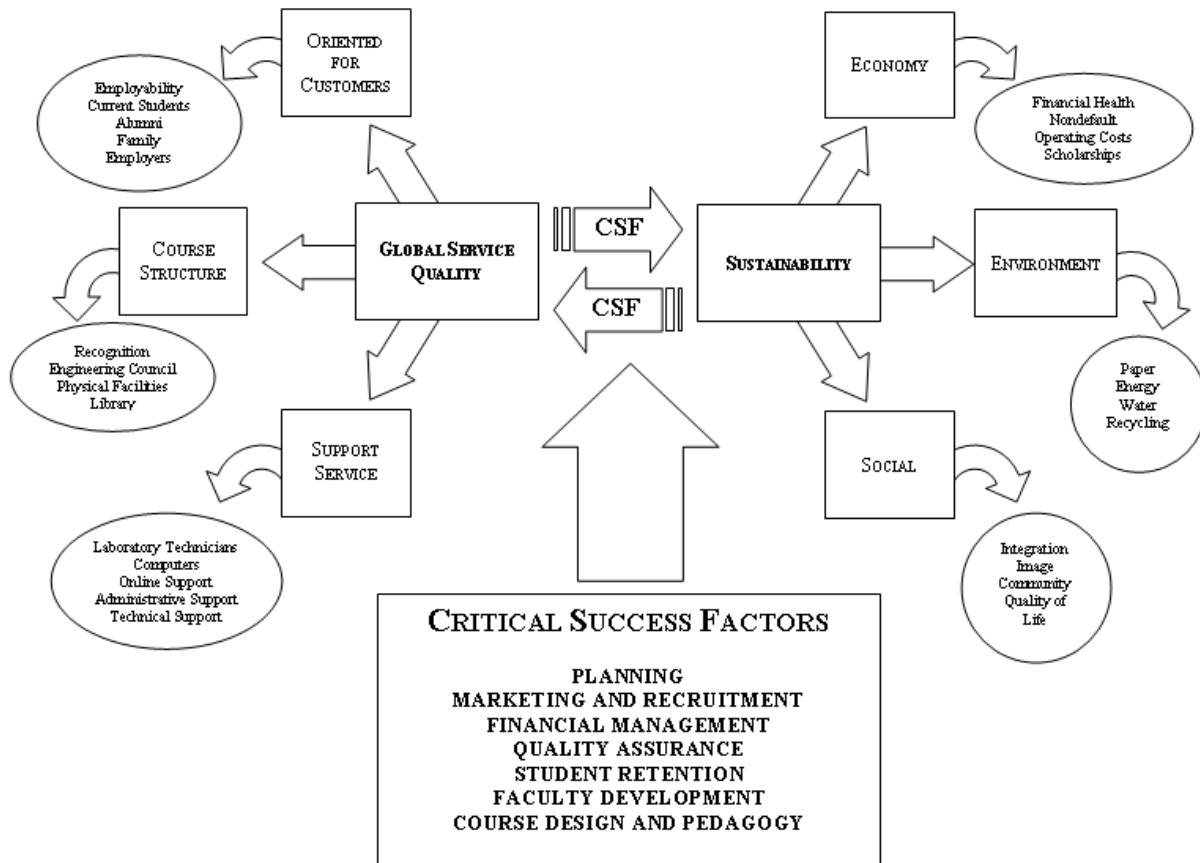

Figure 4: Framework Conceptual.
 Source: Authors' elaboration

Sustainable engineering takes into practice concepts of environmental, social, and economic sustainability, applying engineering technological knowledge in such issues (Carew and Mitchell,

2008). It is imperative to make clear in students formation that sustainability must be more than an environmental issue, actually a combination of environmental, social, and economic aspects. Therefore, this study seems to reveal the importance of these three components to be considered with equal importance.

Conclusions and Study Relevancy

Quality and sustainability combined could be a better way to manage materials and resources, offering a better service, promoting the satisfaction of stakeholders, a better qualification and professionalism of the students, and more committed professors and assistants.

The literature and the framework proposed seem to demonstrate the potential bound between service quality and sustainability. The current study identified seven core factors which could contribute to the success of engineering courses. This specificity of CSF is an important limitation of our study. However, the way the framework is organized (the quality and sustainability branches) could be extended to other courses and the CSF can be adapted.

This research also highlights that previous studies concerning services in higher education tend to focus environmental issues, and sometimes the social issues. Therefore, our study demonstrates a gap in literature: the economic perspective (e.g., employability) is missed.

Further research should test the proposed model through study cases and provide practical implications. This article gives to professionals in HEI a guide to follow in order to provide a quality service (customer orientation, support services, and course structures) with sustainability (economic, environmental and social concerns).

Acknowledgments

DEVELOPING INTERCULTURAL COMPETENCE – THE CASE OF CYPRUS COLLEGE LECTURERS

Englezou, Maria¹

¹ Nicosia, Cyprus. Email: maria.englezou@hotmail.com

Abstract

Demographic shifts highlight how important it is for an organization to develop a multicultural perspective (Tsui, 2007) and success of the organization depends on how well these demographic shifts could be managed (Wentling & Palma-Rivas, 2000). The particular organization that is of our interest for the purposes of this study is Cyprus College (Limassol Campus). This organization started to attract foreign students while the lecturers up to now have only experience with Greek students. As a result, they need to be trained on intercultural competence in order to work effectively both between the staff and also with the students.

Three different research approaches are being suggested to be suitable for the particular case of the college. These are: action research, in-depth interviews and questionnaires. Action research it is said to be the most suitable although in real-life settings can be time-consuming and not easily being developed.

The true challenge for educators is actually the know-how of orchestrating intercultural communication both logistically and pedagogically and be able to ensure that those experiences will actually lead to learning.

Introduction

Globalization have led 21st century's educators to exhibit sophisticated capacities related with intercultural communication skills in order to be able to educate students in becoming self- and also globally- aware participants in global societies (McCloskey, 2010).

It has been noticed that the language describing the needed competencies varies but whether they are framed for example as "global awareness" or "communication and cross-cultural skills" there has been a consensus on the fact that the ability to function productively in a cultural setting outside of your own is increasingly important for economic, civic and social encounters.

Growing cultural diversity led business people to expect greater understanding, sensitivity and competency in the workplace and also within educational settings (King and Buxter-Magolda, 2005). Increases in immigration and globalization create additional cultural concerns and most professionals agree on the importance of multicultural competence (Dunn et. Al., 2006). Demographic shifts highlight how important it is for an organization to develop a multicultural perspective (Tsui, 2007) and success of the organization depends on how well these demographic shifts could be managed (Wentling & Palma-Rivas, 2000). The particular organization that is of our interest for the purposes of this study is Cyprus College (Limassol Campus). This organization started to attract foreign students

while the lecturers up to now have only experience with Greek students. As a result, they need to be trained on intercultural competence in order to work effectively both between the staff and also with the students.

Becoming Intercultural Competent

As it has been reported by Ashkanasy et. Al. (2002), effective diversity management is of crucial importance in the business sector. Inclusion has been also proposed as a particularly positive way in achieving the goals of diversity (Chen & Eastman, 1997; Ferdman & Broody, 1996; Miller & Katz, 2002; O' Mara & Richter, 2009; Pless & Maak, 2004; Stevens, Plaut & Sanchez-Burks, 2008). In order to achieve a truly inclusive school environment, requires facing many challenges (Wasserman, Gallegos & Ferdman, 2008).

A lot has been also written pointing out the need to prepare educators to be able to work with culturally diverse student populations (Cohran et. Al., 2005; Darling-Hammond, 2006; Grant & Gillette, 2006).

For example, in USA the majority of the teachers are white, European-American and these teachers' ethnocentric worldviews negatively impact the educational experiences of culturally diverse students (Sleeter, 2001). It is of crucial importance to provide educators with the right skills and opportunities in order to become competent enough and be able to work with culturally diverse students (Cushner & Brennan, 2007). As it is explained by Wright and Taylor (2003), in relation to cultural diversity, in-group attitudes provide realizations on how we interact with out-group members. These attitudes of the in-group are determined by their stereotypes and prejudices.

Regarding educational settings, in order to reach the benefits that come along with having a diverse group of students, institutional bodies should also develop the right climate being capable of fostering the types of cross-cultural interactions (Chang, 2007). It has been stated that students express a strong desire to learn about others and this could be due to the fact that they lack the experience of being exposed to individuals dissimilar to them and as a result they find social interactions difficult to initiate and being maintained (Harper & Antonio, 2008).

The role of the student affairs practitioner has been pointed out since is the person that could foster the educational setting's environment. He/she can promote meaningful interactions among students and try to help students to become intercultural competent. They can only do this by developing their own understanding and competencies in interacting with diverse groups of students (Harper & Antonio, 2008; King and Howard-Hamilton, 2002).

How the Researcher's own World-View Influence Selected Research Approach

For a researcher, it is of crucial importance to understand that in science, ontology, methodology, and theory are interdependent. Philosophers of science have been arguing for long time that both our values and world views influence the way we do research, irrespectively if we recognize it or not. As such, every researcher should make conscious choices on what world view should adopt i.e. ontology

in a study. It should be mentioned here that this influence also applies the other way around. Each theory or framework it is being used in a research has been informed by its developers' ontology, whether or not the ontology is made clear or otherwise. And of course our own choice of theories and frameworks will itself be informed, explicitly or otherwise by how we view reality.

Based on my own philosophical view – being a critical realist both quantitative and qualitative research methods are being appreciated and taken into account. With the growing use of Critical Realism, it is being acknowledged that is not an easy ontology to be applied. The language and concepts it uses are opaque in nature (Danermark, 1997).

One might wonder what critical realism is, and how it can contribute to organization and management studies. In fact, a significant intellectual movement is going on in the field of organization and management studies (O & M). Particularly, in this movement critical realism has been appreciated more widely and in effect being used. Critical Realism is emerging as a philosophical position of choice for the study of business relationships as evidenced by the growing number of papers which purport to take this position (Mouzas 2001; Morais 2003, 2008; Ryan and O'Malley 2006; Sousa and de Castro 2008). Business relationship development therefore refers to changes at different levels, including learning between changes, whereby the structure emerges. The concept then takes on another dimension, which can be captured by the term learning. This process of changing, learning, reproducing and transforming, is considered to emerge throughout the life time of the entity.

It is hardly surprising that some contemporary critical realist writing is preoccupied with the criticism of relativist writing and its implications. An attempt has been made though to avoid the sterile process of critique being met with counter critique in favor of showing that critical realism has direct relevance to practice in O&M in a variety of dimensions (Fleetwood and Ackroyd, 2004).

One might wonder, how critical realism can help in a business relationship?

Critical realism sees social structures as ontologically real entities (Bhaskar, 1978). This makes it possible to also contemplate business relationships as ontologically real entities, which can have emergent powers to cause events under certain conditions. Thus, in this sense we view business relationships as social structures, which like other social structures change over time. A central point of critical realism, which underpins the above conceptualization is that reality is stratified and non-linear "consisting not only of events but objects, including structures, which have powers and liabilities capable of generating events" (Sayer 1992).

It has to be pointed out that critical realism suggests the appropriateness of changes in emphasis and practice in research methodology from what it has been done in the past. Critical realism does not show any preference for either quantitative or qualitative methods, holding that neither is inherently superior (Fleetwood and Ackroyd, 2004).

Critical realism researchers see the relevance of both kinds of data and point to the need for a creative combination of both kinds of data in illuminating causal mechanisms.

Suggesting Research Approaches for the Case of the College's Lecturers

Referring to the approaches that could be used in order to test intercultural competence level of the college's lecturers, 3 different approaches are being suggested. As a qualitative approach, interviews can take place in order to gain an in-depth understanding of the situation. A questionnaire measuring intercultural competence is another method that could be suggested belonging in the quantitative type of research. Lastly, participatory action research will be suggested as the approach being selected by the researcher for the particular case of interest.

Action research

In respect to an action research approach which is the one being suggested for the purposes of this study, from the critical realist point of view one might adopt Sayer's (1992) model which identifies the key aspects of a critical realist explanation of relationships. For the purposes of the action research method the object is understood as the business relationship itself, who's structure, is made up, but not reducible, to the two bodies that make up the dyad. This relationship is then understood to have certain causal powers and liabilities accruing by its nature. By powers in this case we mean the ability of the relationship to affect the behaviors of both parties. For example, one party makes adaptations for the sake of the relationship. While the relationship can exert influence on both parties behavior, it is also liable to be changed over time; to continually transform in response to the dynamic needs of both parties and changing external conditions. However, these powers and liabilities remain, theoretically speaking, mere potentialities until triggered under specific conditions, thereby becoming activated. As such change will in effect come through real life activation of what has been learnt.

As a critical realist, the explanation given referring to the action research approach involves a gradual transition "from actions through reasons through rules and hence to structure" (Sayer 1992, 112). The actions undertaken by "actors" within the college - organization involved in the "business relationship" will therefore become an important unit of analysis. Researcher can therefore search out the actions, and related perceptions and decisions concerning the future of the relationship, as well as the consequences of these actions, perceptions, and decisions with regard to the relationship. Individuals having experienced the phenomenon under study are seen to be able to tell about the reality by describing the events and their experiences of them. The need to ask several people for descriptions is likely to lead to contrasting views of what has happened there. Moreover, the tendency for interviewees, for reasons of narrative, to conflate the past and present by merging time and events together, has also being acknowledged.

Action research in this particular case will take the form of a reflective process which will allow for inquiry and discussion as components of the "research". Rather than dealing with the theoretical,

action research will allow the lecturers to address their concerns that are closest to them. The selected type of action research will take the form of a collaborative activity among colleagues searching for solutions to the issue of becoming intercultural competent and be able to effectively communicate with people from different cultures (Ferrance, 2000).

Action research is being suggested by the researcher because of its suitability for the particular case. Specifically, it is being suggested because of what is actually being able to offer to lecturers. It is important to point out here what is really an action research. It is not what usually comes to our minds when we hear the word research. We have to understand that action research is not a library project from which we can learn more about a topic that is of our interest.

Specifically what it is suggested to be done at the college is to follow three basic themes: empowerment of participants, collaboration through participation, acquisition of knowledge and social change. The group of lecturers which will be formed shall follow five different faces of inquiry.

The first one is identifying the problem area which in this case will be intercultural competence. Usually there are questions from participants that they wish to investigate. At this first stage careful planning is of crucial importance because it will limit false starts and frustrations. Try to be clear on the issue of intercultural competence and fully explained it.

The second step is the collection of data which is an important step in deciding what action needs to be taken. Multiple sources of data should be used in order to better understand the scope of happenings in the classrooms. In this particular case, where a focus group will be formed, data will be gathered through discussions of participants.

The third step refers to the interpretation of data. Analysis and identification of major themes takes place here. Since the data will be collected through discussions, a table form should be developed in order for a review of important elements.

The fourth step is acting on evidence. With the use of the information given from the data collection a plan should be developed with the help of all participants which will allow them to make a change.

At the last step evaluation of the intervention given will take place in order to determine whether improvement was evident. If there is indeed improvement, do the data clearly provide the supporting evidence or if no improvement took place what changes can there be made in order to elicit better results?

I believe I have selected action research approach as the most suitable for the particular case of the college because I believe that can be a valuable method to be used with lecturers for a number of reasons. Research which is done with the lecturers in their own familiar setting helps to confer relevance and validity in a study designed to be disciplined.

It is also important the fact that a lecturer is not “blindly” following what a latest study suggests but instead he/she is transforming the knowledge into something meaningful. We should realize that

research and reflection could allow the lecturers to grow and also gain confidence in their work on the contrary of just filling up a questionnaire or reporting on an interview.

Learning comes through participation and action research is enabling thinking skills, sense of efficacy, willingness to share and communicate and above all attitudes toward the process of change. Learning is essential because lectures reflect on themselves, learn about their students, their colleagues and will be able to determine different ways for continuous improvement.

Another benefit from action research is the fact that it allows for collegial interaction. Because isolation is one of the downsides of teaching and lecturers have little or no time at all for professional conversations with others this type of research method is the most suitable in allowing time to talk with others about teaching and teaching strategies. It has been said that team work within the college settings bring individuals together for a shared purpose and in fact lecturers involved in action research could become more flexible in their thinking and open to new ideas (Pine,1981). There is also the potential of impacting college change. As the lecturers will get into action research they could be more apt to look at questions that involve college concerns rather than questions that involve only the individual.

One of the main reasons that led me to suggest action research as a “solution” for the college case is the fact that through this specific approach the lecturers-participants will be able to develop critical cultural awareness and would be able to evaluate critically and most importantly from a “rational and explicit standpoint” the practices being suggested and also be able to recognize and explain how one’s own ideologies do in fact inform that evaluation (Byram, 1997). As it has been argued in a research study learning comes through active reflection on what has been experienced in order to learn from it (Talbert & Stewart, 1999). Action research offers fundamental opportunities for reflection, discussion with colleagues and shall be able to negotiate cultural meanings and also revisiting prior conceptions (Levy, 2007; Carr 1999). Although this facilitation of learning constitutes a solid foundation for the development of intercultural competence one should have in mind the challenges that might face as well. The process of action research is time-consuming and many times colleges/ foundations/ businesses do not have the time to be spent on such a time consuming procedure. Challenging could also be the fact that many people do not see themselves as cultural beings and because we are so deep in our culture we might remain unconscious of it. People could easily project their own cultural frame of reference onto other cultures and this fact could generate misperceptions and as a result impede the productive intercultural learning outcomes that the researcher expects to see.

Qualitative method

The next approach that could be used for the particular case of the college as it was mentioned above is the qualitative method of using in-depth interviews. Qualitative research is based on its ability to provide complex textual descriptions on how people experience a given research issue. Through the use of open ended questions the researcher is able to get information about the “human”

side of an issue. In other words qualitative research enables the researcher to get an insight about peoples' behaviors, beliefs, values, opinions, emotions and relationships (Denzin, 2000).

Qualitative data can be analyzed with the use of INVIVO program which will provide us with answers concerning the research question of the study, and gain insight on the case of intercultural competence at the college. Through the use of the information that the interviews will provide it will enable the research to realize how the current situation is at the college and what is actually needed to be done in the area of Intercultural Competence. The steps that will be followed in getting the gist from the interviews are: data reduction through changing the mass of data into manageable chunks and also interpretation by bringing meaning and insight to the words and acts of the participants.

Through this analysis the researcher will be able to develop a revised understanding of what has been already understood through the studying of the literature.

The main advantage of qualitative research is the "role" of exploration. That is giving participants the opportunity to respond in their own words rather than forcing them to choose among fixed questions and as such evoking responses that are meaningful and culturally salient to respondents and unanticipated by the researcher (Denzin, 2000).

Having the above benefits of qualitative research in mind, it has been decided to suggest interviews as a qualitative method in this study in order to get an insight on how people feel when interacting with other people from different cultures and how do they respond to changes in their business environment. Attempt to understand the issue of intercultural competence and possible needs in this particular area. This particular approach although is providing the researcher as well as the college with feedback on the level of intercultural competence among the lecturers it might not be enough in order to initiate change and provide an instant solution. Nonetheless, it will trigger a starting point of guidance on how to improve particular skills needed in order to become intercultural competent. As a researcher I appreciate the findings coming through qualitative research because it gives you fruitful information that could not be otherwise found through pre-determined questions being part of a questionnaire. How far a researcher could go depends on the time being available as well. In a dream-world all three approaches could be applied and through comparison of the results be able to make the best suggestions possible. As it is well-known though this can only be happened in minimum cases. As time became so precious nowadays everyone tries to find the quickest possible solution. What one should wonder though is that whether saving time in the search for a solution will that actually save time as the solution might not last long-term?

Nonetheless, each case should be treated according to the situation by comparing the advantages and disadvantages given all possibilities.

Quantitative method

The third approach that could be used for the case of the college is the quantitative research method and we refer to the use of a questionnaire. Quantitative research is based on the measurement

of quantity or amount in numerical values and involves an objective way of studying a phenomenon. With this type we are able to use statistics and as such, the measures given will give an objective result in an attempt to form the study's conclusion.

Correlational research (analysis of the data will include correlations) goes beyond mere description to an examination of the correlates of behavior. Therefore, it investigates the relationship among different variables. It is important to understand though, that establishing whether there is a relationship between two or more variables does not tell us whether one variable is causing the other. In order to find causation, one has to deal with experimental research (Brace, Kemp & Snelgar, 2003).

The data for this quantitative approach that we suggest for the current study will be analyzed by using SPSS. It has been decided according to what type of data will be used how to insert these data on SPSS in order to make sense. The next step is the actual analysis through SPSS. At first, descriptive statistics will take place and subsequently, Reliability statistics will be done in order to test the measure of Cronbach's Alpha examining the data's reliability.

Pearson's Correlations will be also given to check for correlations between different pairs among the sections of data being gathered and then other subcategories will also be formed. Pearson Correlation is a parametric test used when the data are not nominal or categorical and with this test we look for positive or negative linear relationship between two variables. (Brace, Kemp & Snelgar, 2003).

In order to add to the significance of the possible correlations that will be found, the next step is that a general Regression Analysis will take place testing for R square. This statistical measure indicates the proportion of the variance in the criterion variable which is accounted by the model being proposed. This will be followed by a careful cross-tabulation in order to remove items that might buffer the results of the data.

Then several Regressions will take place by sub-grouping the data, using the stepwise method which is the most sophisticated one, among the ones available. This method ensures that you end up with the smallest possible set of predictor variables included in your model (Brace, Kemp & Snelgar, 2003).

Through careful consideration of what can a quantitative research offer is that a cautious researcher should never disregard the assurance that is given from the power of numbers. Of course a thoughtful researcher should keep in mind that the selection of a particular questionnaire should be of crucial importance because we should include in a study the most reliable and valid questions in order to expect for correct results to be found. Provided that in a research study a reliable questionnaire has been used, then the researcher will be more confident in providing analysis of the results and make suggestion on the particular case of interest.

The outcome from the questionnaire for the particular case of the college will provide us with reliable suggestions on what could be done in making amends on particular communication issues

and provide awareness on what is really intercultural competence and how one can become competent in this area.

As being a cautious researcher research considerations will not be disregarded. Reliability, Validity, Acceptance and Ethics should be taken into consideration in all approaches being suggested.

Conclusion

After analyzing the above approaches being suggested for the case of the college the researcher came to the conclusion of appreciating once again the combination of research methods in order to reach a meaningful and important outcome. As being a critical realist I appreciate the value of each individual approach and no matter what the outcome of each approach is at the end, that will not affect my opinion about the approaches. On the contrary, any deficiencies that could be found will help me in improving what has been used and attempt to provide a better future suggestion as my contribution to both theory and practice.

As it was mentioned above time is always an issue besides the researcher preferences on particular research methods. We have to be objective and understand that each real-life situation depends on the time given according to the circumstances and also to the budget given for a particular case to be analyzed/ solved.

The true challenge for educators is actually the know-how of orchestrating intercultural communication both logistically and pedagogically and be able to ensure that those experiences will actually lead to learning. Although one might feel competent enough in behaving and communicating accordingly in different cultural settings help is usually needed in being able to know how to guide intercultural inquiry.

TAX EVASION AND ACCOUNTING REGULATION IN ITALIAN FISCAL SYSTEM

Esposito, Paolo¹

¹ (PhD, Adjunct Professor of Business Administration - University of Sannio - pesposito@unisannio.it and Department of Economic, Legal and Social System Analysis (SEGIS) University of Sannio – Benevento (BN) - Italy

Abstract

The present research is based on inductive/deductive method that implies a in depth study of the relevant literature concerning the application of different models of corporate social responsibility and accounting regulation of public sector, and allows an empirical analysis with regard to planning implementation and control systems in the Public Administrations in order to improve efficiency measures, social accountability, transparency, financial sustainability and ethic culture. The work aims to point the critical area of the current government system out and it proposes a fair way to implement a participative financial sustainability model fighting tax evasion and the anonymity tax shelter in the Italian Fiscal System.

Keywords: fiscal federalism, legality, transparency, tax evasion, corporate social responsibility

Introduction

The political science and economics literatures have extensively discussed the role of political accountability in generating good governance practices and, particularly, in reducing corruption and fighting tax evasion; see, for example, Fackler and Lin (1995), Linz and Stepan (1996), Nas et al. (1986), Bailey and Valenzuela (1997), Persson et al. (1997), Rose-Ackerman (1999), Djankov et al. (2001), and Laffont and Meleu (2001). The central argument is that accountability allows for the punishment of politicians that adopt “bad policies”, thus aligning politicians’ preferences with those of their citizens. The degree of accountability in the system is determined, in turn, by the specific features of the political system. Three main characteristics can be identified in this respect: the degree of competition in the political system, the existence of checks-and-balances (Lederman, Loyaza, Soares, 2005) mechanisms across different branches of government, and the transparency of the system.

Asocial budget

Public Administrations were called to a change of role for which, in many cases, were not equipped. The administrative criticality and managerial thickenings found, concern:

- The static models of organizational and personnel policies toward the new demands of flexibility of administrative machinery;
- The consequent difficulty of declination of the managing levers available for the business;
- The tendency to emergency-management through the increase of interventions for individual acts;

- The blend of political and managerial responsibilities;
- The absorption of the leadership in operational activities;
- The sclerotherapy for vicious circles congenital to bureaucratic model;
- The increasing gap between social purposes and operating results;
- The gradual reduction of the social effectiveness of administrative action and consequent loss of legitimacy;
- The difficulty of the administrative machinery to address to renewed strategic objectives.

The renewal process that followed has developed along two lines: the reform of normative system and the requalification of managerial skills. At this stage, against the spread of a less referential organizational culture, a considerable difficulty in translating the new general theoretical models into concrete assistance applications has been recorded. It was a phenomenon mainly due to the fragility of organizational skills of those who should make the change - elected representatives, managers and supervisors – and to the permanence of strong regulatory constraints.

The development of this intervention model has integrated with traditional management of public administration as concerns the detection and organization systems, creating a sort of vicious circle that has fueled the growth of debt and low productivity of it.

Asynchronous Paradoxes and social imbalances.

Situations of normative isomorphism, of overcrowding of programming tools, management and budgeting, and dissonance, inconsistencies, and asynchronous paradoxes on times of approval of balances, have a particular importance as *causae causarum* of corruption phenomena in PA. Normative inflation allows administrators to be able to choose the rule to be applied interpreting it to their liking and moving around the constraints to the point of turning the discretionary choice into an arbitrary choice; however the normative disorder generates failures, delays and potential conflicts to overcome which the individual is induced to pay the administration unduly. The sclerotic hyper-production of programming tools, management and balance budgeting, has about 11 documents and 56 compulsory reports that make difficult the citizens' understanding of the achievements of local public government. To generate bigger uncertainty on the terms of approval of budgets, there are the deadlines set by TUEL, usually postponed by the several governments. Terms are not even respected by RGS, through the issuing of circulars explaining the achievement of residual payment of public finance and of containment of public expense in dates subsequent to the deadline set for the approval of balances (see the RGS attachment on the respect of Internal Stability Pact-Circular No. 15 of 2010).

Source : P.Esposito - *Asynchronous Paradoxes: the time of approval of the budget in the Local Italian Bodies before the fiscal federalism adoption*

These situations were accompanied by a lack of transparency in political and managerial direction and by a weak culture of social reporting. The development of "social accountability" tool in public administration should be ascribed to the progressive consolidation of a new culture of public services, reducing the phenomenon of tax evasion and to the adoption of an approach closer to the citizen, which puts the center of activity, of modalities of performance of services, of internal and external organization of the body, the satisfaction of his needs.

Tax Shield: New Public Management or Old Public Management?

Unfortunately, in the recent Italian legislation can be recognized measures which show a political will to tolerate, if not to contribute to new opportunities for malpractice, such as "amnesty building", the "short trial", the "legal impediment" and "tax shelter" tax amnesties (dl 350/2001 converted into Law 409/2001, l.73/2002 and l. 78/2009) consisting of amnesties to behaviour antithetical anticorruptive and strategies, thus weakening the infrastructure of the ethical companies should ask themselves on a higher moral probity. Stocks government that enabled the capital illegally exported to the rest of the world to return to Italy, on payment of a penalty, and done deliberately allowing the laundering of the proceeds from illegal activities (including corruption) and its use (Mauro, 1995). Some of these measures as "tax shelter", or rather, the tax shields can be considered as an instrument capable of performing to a plurality of functions to achieve different purposes.

Undoubtedly, the purpose lies in the most obvious possibility for the Legislature, to heal irregular fiscal positions. The cure in question, he discovers how important a diverse reality of concealment of assets abroad by encouraging the return capital in Italy "grace" the beneficiaries ("tax shield") and help to avoid future fears of sanctions at a cost all minimum is, above all, avoid being prosecuted justice. The l. 73/2002 and Decree 238 of 02.10.2009, have also expanded the types of crimes is the "tax shield" and have also extended the deadline for joining the order to enable citizens of "infidels" the repatriation of funds illegally held abroad. It is also necessary to emphasize a key feature of return process and the

regularization of the activities under review, namely, anonymity: in fact, with regard to the repatriation of assets abroad, their confidential statements, which exclude the criminal liability that is the result of tax assessments on those goods are not fed back to public authority. With regard, however, the mere adjustment of capital abroad, the taxpayer must notify the tax authorities the detention of themselves outside the borders of national (completely anonymous) by completing the appropriate forms attached to the declaration returns, prepared by the Ministry of Economy of Finance, through the Agency of Entree. The amnesty is an order issued by the government, usually by way of exception, by which the tax authorities to renounce unilaterally demand payment of taxes and penalties already assessed or in the case of taxpayers who still have not received an inspection, waiving that right? to ascertain. We can then define the *amnesty*, as *that measure sound illegal conduct or made illegal by the taxpayer and concerned, above all, false tax returns, infidels or absent*. Sometimes it may refer only to certain types of crime, when, in fact, sound in full and a final position of the taxpayer before the tax authorities, changes its name to "amnesty". Main motivation that pushes the Minister of Economy and Finance to act, it is hoped the extra money to collect revenue in state coffers. At the same time the instrument of waiver also allows a widening of tax base for income tax return even next to it, as the amnesty from the day they decide to heal all their irregularities have to declare the same income level, as in case of declaration of the lower levels they are likely to be subject to tax audits and investigations.

The largest ever implemented tax amnesty in the history of the Old Continent has taken place during the Roman Empire. In 118, Emperor Hadrian, a few months in power as the new Caesar, he decided as soon as possible to win the sympathy and consent of all the citizens of the Empire, those who lived in Rome until the residents of small villages in more distant provinces. To achieve this goal, launched what is now considered the greatest of all time tax amnesty: with one impetuous act of generosity and accounting, Adriano canceled all debts / fees taxpayers Roman for the last sixteen years. The amount of this magnanimous gesture was more than 900 million sesterces, which were comparable to the entry of an entire fiscal year in Rome. Even today the cancellation of Hadrian, the step takes more 'high in the history of European accounting for all acts in tax shield matters.

The tax shelter and schizophrenia regulations in Italy

The tax shield, therefore, is a "penalty" as the last chance to remedy the violations of fiscal monitoring, but at the same time involves objective (and perhaps inevitable) fact 'condonistici. "It sound some possible misconduct or made irregular by the taxpayer in respect of production and possession of funds held abroad from taxable income not reported and presumably and purchase of property with these funds through the payment of a flat-rate tax, one-off, a value below the normal tax rates. They are due in part to the media-political difficulties of proposing different requirements for those who want the "amnesty" (which at that point should have been called by his name), and the material difficulties of tracking the movements of money hidden.

In the tax amnesties over the past years in France, the United Kingdom and the United States had never been guaranteed anonymity of tax evasion, as a principle with the concept of forgiveness. A crucial point of the shield in Italy is a particular procedure that is based, where the submission of the reserved area (wing required tax payment of 5%) prepared on a model of the Revenue that specifies the amount and the nature of financial assets to be finalized is entrusted to a third party shall not communicate the AF, for the purposes of tax assessments, data and information relating to confidential statements, thereby ensuring the anonymity of the evaders. In addition, the membership of the tax shield can not be used as an argument against the taxpayer (for example, to assume higher incomes starting from the existence of undeclared foreign assets). Incidentally, given the confidential nature of declarations, the offices do not have information on taxpayers members, unless they provide it to them to oppose such an investigation. The secrecy also applies in case of request for access to bank accounts.

This aspect of anonymity declarations of the emergence differs significantly from the 2009 Italian tax amnesty provisions concerning the return of capital in Britain and the United States, countries in which those who want to stabilize the capital exported must pay in full the taxes evaded in previous years.

In fact, the measure clearly differs from that Italian and American is precisely the identification of tax evaders that use of the initiative. While in Italy the taxpayer may act in anonymity, the United States, just depending on the item to the bottom of the measure, the Offshore Voluntary Disclosure Program, and is instead forced to "reveal" (disclosure). And so, in the U.S. the disclosure of the names of taxpayers was also intended to acquire useful information to know better the phenomenon of tax havens and the export of capital abroad, in Italy, following the rules of confidentiality guaranteed to the taxpayer, the Inland Revenue is logically in the impossibility of acquiring information on the 'mode 'with which the person has escaped. The Offshore Voluntary Disclosure Program differs taxpayers who want to regularize their position according to the severity of the acts committed, avoiding in this way to cause unfair discrimination. From the IRS website (Internal Revenue Service) that in order to join the amnesty is necessary that the taxpayer has not only failed to state the activities held abroad FBAR form, but he has omitted, or shown unfaithful the statement of its income. It is clear that the objective requirement of the measure see the American aspect of the tax position of substantial contribute formulating the framework of the FBAR mere failure to fill a necessary but not sufficient. Access to the Voluntary Disclosure therefore is barred for those who failed to complete the form FBAR but have consistently stated income held abroad. Thus, the U.S. measure, just in virtue of the objective of the program, which is to allow the taxpayer for purposes of tax evasion has used offshore accounts to remedy them, is addressed only to those who have evaded taxes and not to a multitude of indistinct taxpayers who, for the most varied reasons, have failed to fill out the form on the foreign financial activities.

Conclusion

While the IRS and then plays a central role in the operation, the Inland Revenue will be replaced by the financial intermediary that, in a relationship, more shall be presumed confidential, has the task of following the taxpayer in the process of emergence. Another element that confirms this as the philosophy behind the Italian measure, unlike the U.S., is inspired by anything but the direct collaboration between the taxpayer and the authority tax.

In Italy, that the tax shelter also provides non-criminal offense (offenses) tax, which prescribe penalties of up to six years of imprisonment:

- non-declaration of income and unfaithful;
- a declaration by fraudulent use of invoices for nonexistent transactions;
- false representation of records required;
- concealment or destruction of documents;
- false company (accounting fraud).

You can not use the shield to taxpayers already subject to tax assessment or criminal proceedings already initiated.

If the money returned is used for the purchase of equity capital, it retains the character of anonymity. But if it is reinvested in the business, this involves the waiver of confidentiality. Such a rule penalizes the use for business and economic capital and encourages the use of shields to increase revenues.

Among the most 'authoritative reviews on the shield Italian, Mario Draghi, governor of the Bank of Italy, in its report of October 29, 2009 at the World Savings Day, stressed that "an intervention that is appropriate under the tax shield to reiterate the regular application of money laundering legislation.

As the President of the FATF, the OECD Anti-money laundering Financial Action Task Force, according to Der Spiegel he would write to the Minister Giulio Tremonti pointing out the potential negative effects of Italian tax amnesty.

By circular dated 16 February 2010, the Ministry of Economy and Finance announced that "banks and other intermediaries are required to implement the obligations of customer due diligence in accordance with Articles 15 and 16 of Legislative Decree 231/2007 (AML) and in particular to:

- Identify and verify the identity of the customer including any beneficial owner (particular care should be made to avoid the use of nominees or interposed entities);

- To collect detailed information about the customer and its economic capabilities;

Always the same circular states that the MEF operations tax shelter are among those which require proper verification Enhanced (according to art. 28 of Legislative Decree 231/07) for which banks and other intermediaries are required to acquire information and any documentary evidence on the formation of capital covered by the return from abroad, aimed at reconstructing the source of the same.

The risk, is that the tax shield can be used by organized crime (mafia) to launder the proceeds of their illicit frequently held abroad. Therefore, banks (so the same intermediaries evaders to the tax shield) will have a constant control over the ongoing relationship, even after the emergence of the operation, in order to detect any evidence which might lead to identify profiles of problem worthy of study also for the reporting of suspicious transactions.

Still according to the OECD, the tax shelter will be seen by taxpayers as an extraordinary measure, part of the general transparency of information on trade taxes recently agreed at international level, otherwise the taxpayers would have to conclude that probable other tax amnesties.

THE ROAD TO AUDIT REFORM IN EUROPE: EVIDENCE FROM THE PAST CHALLENGES FOR THE FUTURE

Evripidou, Loukia¹

¹ Head of Department of Accounting, Economics and Finance, Assistant Professor, Banking/ Finance, School of Business Administration, European University Cyprus. Email: L.Evripidou@euc.ac.cy

Abstract

Differences in accounting and auditing standards together with recent accounting scandals across the globe have indicated the importance for cleverly design and widely understood auditing standards to assist in the growth of a positive economic feeling not only for the capital markets but for the society in general. In European Union the idea of accounting and audit harmonization emerge in the 1970s but still there are no uniform procedures of performing an audit in regulatory format. Currently, EU has three Directives that deal with accounting and audit standards. However, in the aftermath of the Financial Crisis European Commission indicated that there was little or no acknowledgment of the responsibility of auditors in regards to the financial crisis since auditors. The Commission also highlighted the disadvantages from increasing market concentration in the audit industry and addressed the issue adoption of IAS. Based on the notion that the financial crisis highlighted a number of shortcomings in the audit system the Commission issued certain proposals suggesting mandatory rotation of audit firms, open offer in the selection of a new audit firms, ban on non-audit services to audit clients and the creation of a European passport for audit. The primary conclusion of our analysis indicates a need for both regulators and market participants to examine more cautiously the interrelationship among audit regulation, auditors' judgment and audit quality prior initiating any regulatory reform. The new proposal of the Commission, the industry concerns and the forthcoming new regulatory framework are expected to convey a new era in the auditing industry in the future.

Keywords: Statutory Audit Directive, IAS, Audit Quality, European Union, Audit Form

Introduction

The purpose of audit standards is to provide the guiding principles for defining audit and audit behavior, endorsing consistency, act as mean for audit performance evaluation and aid education (Burns and Fogarty, 2010). In accordance with the revised ISA700 (IAASB 2009) the auditor in an audit report has the responsibility to express an opinion on the financial statements and that those statements provided sufficient evidence in forming such an opinion. Additionally the auditor should state its unqualified opinion that the financial statements present the true and fair view of all the subject matters always in accordance with the relevant financial reporting framework where auditors' opinion should be based on the conclusion drawn by the audit evidence.

Nevertheless, national auditing practices vary across countries and this diminishes the comparability of financial statements. Uniform auditing practices enhance comparability of

information available to investors and thus increase their willingness to invest across borders. This in turn generates a more efficient allocation of capital and promotes economic growth (Fraser, 2010).

In the European Union, the idea of accounting and audit harmonization emerged in the 1970s but still there are no uniform procedures of performing an audit in regulatory format. The harmonization process is set on four Directives:

- The Fourth Council Directive of (78/660/EEC) on the annual accounts of public limited liability companies
- The Seventh Council Directive (83/349/EEC) on national laws on consolidated (i.e. group) accounts
- Eighth Directive (84/253/EEC) on Qualifications of persons responsible for carrying out the statutory audits of accounting documents

In the aftermath of the Financial Crisis, the EU addressed the issue of adoption of International Audit Standards in a Green Paper (European Commission, 2010). The Commission noted that IASs have been already adopted by a number of Member States and that it is considering the time and the way of fully adopting the Standards within the Union. As the European Commission suggested, the establishment of robust audit standards is central to the well-functioning of the financial system as well as to investors' confidence (European Commission, 2011a).

This article examines the audit reform process in the European Union through identification of changes in policies and standards over the years together with the driving forces for their evolution. Additionally, it addresses the issue of adoption of IAS and the challenges that lie in the future of the audit industry in the EU.

The timeline of the audit regulatory framework in Europe

The idea of financial and audit harmonization in Europe came forth in 1972 with the preparation of an *avant projet* of a directive for audit. The objective was to set the minimum qualifications with regard to the educational and training for statutory auditors (Evans and Nobes, 1998). The driving force was based on the notion that harmonized audit could facilitate the operations of European firms in the global and to restore stakeholders' confidence about the reliability of those firms (Jeppesen and Loft 2011).

Nevertheless, prior to the establishment of an audit directive, the Commission introduced the Fourth Directive in 1978 (78/660/EEC), the first step towards harmonization of financial statements in the European Union. The EU's timeline of the Regulatory Reform in Auditing is depicted in Figure 1 together with the major event that drove to this reform.

The Fourth Directive obliges public companies to present 'a true and fair view' of their performance in their financial statements. Accordingly, the auditors' report can be considered as a means of communication with the user of financial statements, where they can state their opinion in regards to

the accomplishment of the 'true and fair view' representation of the firms' financial position (Gangolly et al., 2002).

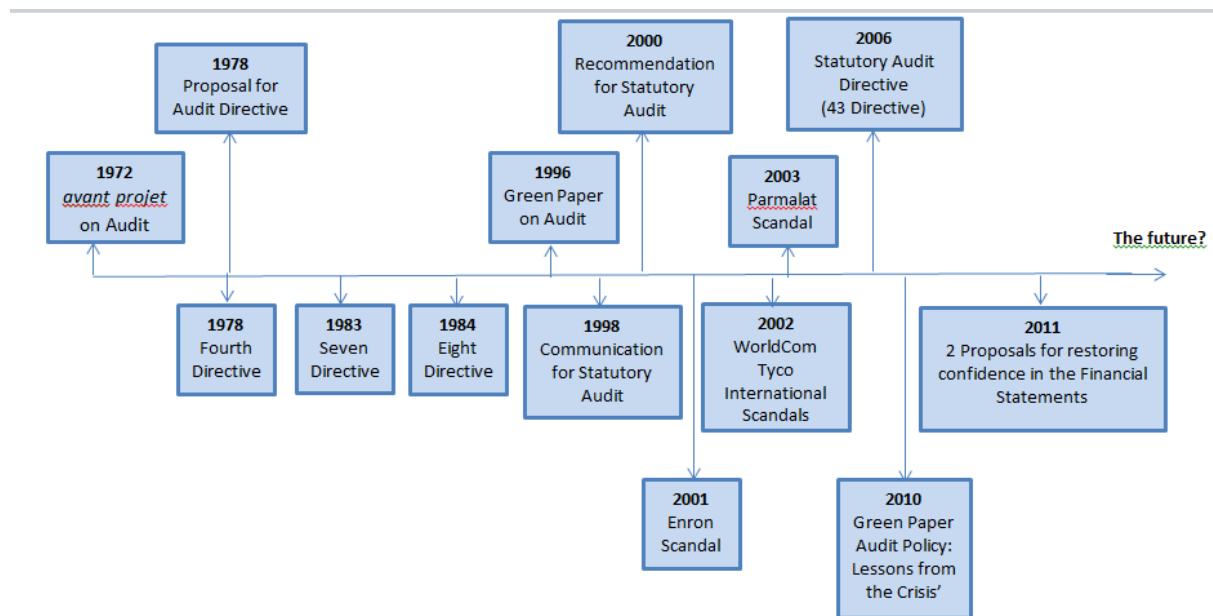

Figure 1: Timeline of EU's Regulatory Reform in Auditing

Van Hulle (1991) suggested that the Directive is both strict and adaptable at the same time. The first emerge from the compulsory layouts and the minimum context requirement of the financial statements together. The requirements are also rigid in regards to the audit report and the disclosure. On the other hand the flexibility comes forth form the minimum requirements for the true and fair view which gives numerous options for both member states and companies. Further, it is has been suggested that the Fourth Directive has '*introduce an Anglo-Saxon dimension into a directive which would otherwise have had a strong 'continental European' orientation*' (Blake et al, 1998, pp5).

Whereas the Fourth Directive introduced the obligation to firms' to have their annual accounts audited by authorized auditors, the Seven Directive protracted this obligation to consolidated accounts (Humphrey et al, 2011). The Seven Directive was the first regulation to provide a definition of a group and make provision for group accounts (Saccon, 2008) and came forth in 1983. Again this directive provided a number of compulsory and optional points. In terms of exclusion, a subsidiary must be omitted from the consolidated financial statements when the nature of activities its activity will distort the 'true and fair view' obligations. On the other hand optional exclusion emerges when the activities of the subsidiary are immaterial or it cannot be control by the parent company.

Following the Seven Directive the next year the Eight Directive come forth. The Eight Directive (84/253/EEC) aimed to harmonize the settings for the approval of the auditors. The official proposal of the Directive came forth in 1978 and the Amended Proposal in 1979 and eventually the Directive was

adopted in 1984. The delay in the adoption primarily emerged due to the disagreement between member states concerning the rule on auditors' independence (Evans and Nobes, 1998). The provisions included in the Directive were far more general than what have been stated in the initial drafts and the requirements were left to the regulatory regime of each individual nation. In summary the directive set out the required qualifications for auditors, the steps and process of performing audit, the list of scope of audit and provisions to auditors' professional integrity and independence.

Based on the aforementioned, the Directive faced numerous criticisms from the literature. Van Hulle (1992) stated that the important principle of independence of the auditor was not particularized whereas Luck (1979) claimed that individual countries interest overcome at the expensed of audit harmonization in Europe. Despite of the criticism the company law in many European countries had changed in order to comply with the new Directive (Cooper et al., 1996). In essence the directive focalized in promoting trade in audit services between different Member states. For that reason succeeding directive was issue four years later, in 1988, stating the profession training requirements for auditors and provided the joint accreditation of accounting diplomas obtain within the European nations (Baker et al. 2001).

As Jaspen and Loft pointed out (2011) the Eight Directive, together with the Fourth and Seven Directives, mirror the European Strategy at that time of 'minimum harmonization'. This strategy provided the flexibility of regulatory differentiation between European countries and provided the easiness in the agreement on harmonizing regulations.

Given the number a number of financial failure on a global level there were concerns regarding the function of audit and the independence of auditor. For that reason, European Union has revisited the Audit Directive in 1996 with the issue of the Green Paper 'The Role, the Position and the Liability of the Statutory Auditor within the European Union' (European Commission, 1996a). The Green Paper suggested that the statutory audit regulatory framework was insufficient and the uniform views between the Member States affected adversely the quality of audit.

The European Commission indicated that there are three important reasons to reevaluate the existing audit directive. Firstly, users of financial statements presume a given level of affirmation from those statements and an assured analysis from the auditors. Even though on national level there was a certain standardization of those issues, it was not the case on European level. Secondly, because of the diversity in the national laws there was not up to that time a European market in audit services (European Commission, 1996). Finally, the lack of uniformity regarding the role and liability of audit risk by member states became a significant problem for European companies in their efforts to access international capital markets.

During the same year for a discussion of the issues stated in the Green Paper a conference with held in Brussels. The conference concluded that steps should be done to enhance confidence in the financial reports by recognizing the importance of statutory audit function and by strengthening audit quality. Those steps should take the form a harmonize European Framework for auditing in

preference based on the International Standards of Audit (European Commission, 1996 b). The conclusions drawn from responses to the Green Paper from all interested parties as well as the findings of the conference were included in the Commission's 1998 Communication *'The Statutory Audit in the European Union, the way forward'*. In the Communication the European Commission recommended the foundation of an EU Committee on Auditing, aiming in close cooperation with Member States and professionals the enhancement of audit.

Based on the recommendation of the Committee in 2000 European Commission published a Recommendation *'on quality assurance for the statutory audit in the European Union: minimum requirements'* (European Commission, 2000). The recommendation pointed out quality assurance is integral with superior audit quality. Assurance was describe as a mean of ascertaining the users of financial statements that audit reports are prepared based on established auditing standards and ethical rules. Additionally, in 2002 another Recommendation has been issued by the Commission, *'Statutory Auditors' Independence in the EU: A Set of Fundamental Principles'* (European Commission, 2002). Based on the Recommendation when an auditor performs an audit should be independent from its client. No audit should be performed if there are any kind of relationship, such as financial and employment, which would compromise auditor's interdependence. Both of these recommendations have been implemented by Member States. Nevertheless despite of these accomplishments, European Commission felt that there were more to be done so as to strengthen investors and other stakeholders' confidence in the audit function in the European Union.

A step towards harmonization occurred in March 2002 where the European Parliament approved a resolution for the enforcement of International Accounting Standards (IAS) in Europe. Specifically it required that all public companies listed in a security exchange from the member states must prepare statements that comply with the international accounting standards from January 1, 2005 (Baker and Barbu, 2007). This regulation aimed to promote efficiency in the capital market and reduce the cost of financing for the firms, through transparency and uniformity in the financial statements of listed companies.

Statutory Audit Directive

Due to the increase in the European capital markets as well as the numerous scandals such as the Enron and WorldCom in US and Parmalat and following the Sarbanes–Oxley Act (2002), European Union has revisited once more the Audit Directive. During 2003 European Commission issued a Communication, *'Reinforcing the statutory audit in the EU'* (European Commission, 2003). In this Communication the Commission addressed the deficiencies of the 8th Directive. It was suggested that the Directive was outdated, did not include any guidelines for a proper audit framework such as quality assurance systems and auditors' independence, and there were no reference for the application of audit standards. Modernization of the Directive should address all this issue in more comprehensive a clear manner.

Following the above stated, a new directive on audit has adopted on 25 of April, 2006 under the name 'Reinforcing the Statutory Audit in the European Union' (2006/43/EC). This new directive expands the range of function of existing regulation in an attempt to harmonize the quality audit so as to increase its credibility. This was done by clearly indicating the duties and competence of auditors as well as their independence and ethics. The directive goes one step further in the harmonization process by suggesting the possible adoption of International Auditing Standards (IAS). During 2010 the Scoreboard on the transposition of the Statutory Audit Directive (2006/43/EC) showed that all member states had transposed the Statutory Audit Directive.

The Green Paper 'Audit Policy: Lessons from the Crisis'

In the aftermath of the Financial Crisis in 2010 European Commission issued another Green Paper, '*Audit Policy: Lessons from the Crisis*' (European Commission, 2010). Based on the recent events in the financial and capital market European Commission pointed out that auditors have a responsibility to their society to state their opinion in regards to the fairness and truth of financial reports, with cornerstone being the auditors' independence. As the Commission indicated that there was little or no acknowledgment of the responsibility of auditors in regards to the financial crisis since auditors have not given any warning in their audit reports about on or off balance sheet activities of many banks that at the burst of the crisis have reported huge losses. Hence it is central to the well-functioning of the financial system as well as to investors' confidence the establishment of robust audit standards (European Commission, 2011a).

Another important issue highlighted in the Paper is the increasing market shares of the few large firms emerge from consolidation and the risk inherent with this. With a collapse of one of those firms there would be a serious disruption in the market by harming investors' confidence and the stability of the system in general. The Paper addressed several areas of improvements, such as better communication with the relevant stakeholders, and the independence of audit firms. In regards to the latter, European commission aimed to reinforce firstly the ban of non-audit service by audit firms and secondly the mandatory rotation of audit firms. The Paper also discussed the issue of adoption of International Audit Standards (IAS). It is noted that the Standards have been already adopted by a number of Member States and that the Commission is considering the time and the way of fully adoption of the Standards within the Union. Even without formal regulation at EU level around two-thirds of the member states have adopted the IAS at national level.

The aim of IAS is to enhance the creditability of financial statement and to boost investors' confidence in financial reporting. IASs clarify auditors' obligations when administrating an audit of financial statements. The standards outline the objectives of the independent auditor and describe the nature and scope of an audit design so as to fulfill those objectives. On the other hand, IAS does not deal with auditor's responsibilities nor it provides any guidelines for the absorption of those international standards into national regulation, as these are expected to be address by an ample national regulatory framework.

Finally, in November 2011 the European Commission issued another two Proposals with the objective of restoring confidence in the Financial Statements (European Commission, 2011a,b). Based on the notion that the financial crisis highlighted a number of shortcomings in the audit system the Commission certain proposals:

- Mandatory rotation of audit firms with a maximum appointment period of six years whereas companies that agree for a willing joint audit could increase the time frame to nine years.
- Public firm will be required to have an open offer when selecting a new audit firm.
- Audit firms will be forbidden from offering non-audit services to their audit clients and large accounting firms must separate their audit from non-audit activities
- The creation of a European passport for audit to allow local firms to provide audit services all across the Union.

Significant attention has been given to the separation of audit from non-audit services. It is important firstly to identify what constitute non-audit service. Non audit services fall under three broad categories (ICAEW, 2012). Firstly, are those services that are required either by regulation or by contract offered to listed companies, such as reports on share issues for non-cash considerations, secondly services offered due to prior awareness for the business of a given company such as tax compliance, and third services that can be offered by a number of firms such as management consulting.

The Commission feels that the concentration of auditing into the Big-4 firms compromise the competition within the audit industry. The basic idea behind the ban of non-audit activities from audit firms emerges from the need to boost investors' confidence based on the notion that such regulation would promote audit independence and together with joint audit would augment audit quality. Opposing view came forth from the industry side where it is suggested that independence and quality derives from written ethical codes (ICAEW, 2012).

Future Challenges

Literature suggests that for efficient allocation of capital resources and economic growth, investors must encompass confidence on the credibility of the information obtain by the financial statements. Additionally, increasing the credibility of financial statements has as a result in a reduction on the firm's cost of capital and thus lower cost of financing (Kueppers and Sullivan, 2010).

Audited financial statements aim to remove market information asymmetries and the agency problem. Information or "lemons" problems emerge due to the information dissimilarities and contradictory motives between firms and investors. Asymmetric information may lead investors to make an adverse selection, which is to finance in bad investment projects as opposed to choose the good ones. This problem lead to irregularities in terms of valuation in the capital market, because

some good investment will be undervalued whereas some bad ones will be overvalued (Healy and Palepu, 2001).

Based on the aforementioned it is evidence that European audit industry faces a number challenges. Following the financial crisis it is evidence that markets as well as investors has lost confidence in the audit functions. The Commission's aim with the proposed reform is to re-establish trust and market confidence in auditing and enhance investors' protection. The efforts towards the proposed changes are twofold: firstly the adoption of IAS, and secondly to enhance audit quality, strengthen the independence of the auditor, and foster competition.

In terms of adoption of international standards, the Commission argues that this would generate a recurring benefit of more than €2 billion for the European economy through a reduction of firms' cost of capital with a Net Present Value amounting to €40 billion (Kohler, 2009). Additionally, the results of the study in regards to the adoption of IAS in Europe indicated that the standards would contribute in general to the credibility and quality of financial statements and to audit quality (Kohler, 2009).

However IAS does not handle the issue of auditor's obligations, since these should be address by national regulations. Additionally, IAS does not provide any guidelines in the absorption of those international standards into national regulation since they assumed the existence of adequate legislative regime (Hegarty et al, 2004). For that reason, the expected forthcoming new Directive on Audit should not only introduce the implementation of IASs in the EU but also should provide clear guidelines in regards to auditors' responsibilities as well as its enforcement.

The success of supervisory bodies in the implementation and enforcement of IAS is a significant factor in the quality of adoption of those standards. The legislation should cover different aspects of audit profession, and should encompass rules concerning ethics and audit quality assurance. Also different regulatory bodies should coordinate their activities towards a comprehensible and articulate regulatory framework (Hegarty et al, 2004). Further to the above for the implementation as well as enforcement process the challenge also rest on the issue that there might exists lack of financial and human resources in certain member states. The Union should address this issue since for the success this process human and financial capital is of imminent importance.

In terms of augmenting audit quality and independence as well as promoting competition, the Commission stated that currently there are certain weaknesses in the EU audit market. Firstly it is argued that there exists an expectation gap audit stakeholders auditors. Secondly, the most important credential that an audit must possess, that is independence, is neither assured nor demonstrable. And thirdly, the high market concentration and lack of choice increases systemic risk if one of "the Big Four" (Deloitte, Ernst & Young, KPMG and PwC) collapses and further creates an oligopoly in the market (European Commission, 2011a). An important point of notice is that currently the market share of the Big Four for audits of listed companies exceeds 85% in the vast majority of EU countries.

The proposed benefits from audit reform are primarily to boost investors' confidence in financial information, lower the firms' cost of capital and in essence promote economic stability through better quality audits and harmonize audit standards. Further, with the reduction in barrier to entry smaller audit firms would be benefit with an increase in their clientele both on national level and cross border. Last but not least it is expected that more rigid audit regulation would act as deterrent in possible future crisis (European Commission, 2011a,b).

The result of the Commission the split of the audit industry in two opponents. In essence the Big Four lobbying towards stopping many of the main proposals from being approved, such as firm rotation and separation of audit and non-audit services, whereas smaller auditors are campaigning in favor of those proposals since they would augment market competition.

It is important to note that all relevant parties, agree on the issue of improved quality audits but both market participants as well as researchers bear some skepticism in regards to certain issues of the propose reform. The primal point of conflicting views is the mandatory audit firm rotation. Specifically, it is argued that audit, especially for financial institutions which are the core of the problem, requires highly skilled and experienced specialists with a profound understanding of the audited entity. Hence, firm rotation would jeopardize and not improve audit quality since it would limit the auditors' understanding of the entity being audited. Additionally, this would lead to needless disruption and thus upsurge risks and cost but also is tapering motivation for developing industry expertise. On the other hand it is suggested that would increase competition but still would not elevate the problem of concentration.

An additional point of dispute is the separation of audit from non-audit firms. Many industry participants argue that provision of both types of services increase the efficiency of audits due to a more holistic view of the clients' business with the provision of non-audit services. The limitation of providing those services would decrease auditing firms' capability to acquire expertise and knowledge in a multiple areas, a credential quite essential for audit quality for the complex global business environment.

Knechel (2010) suggested that is the characteristics of audit practices that define the quality of audit, and the irony being the attempt of regulators to standardize those practices might eventually diminish the audit quality. Humphrey et al. (2011) pointed out that audit reform should be based on better audit quality and not on better control audits. But they further stated that if auditors believe that new regulations are needless because audit quality is already at high standards they have the obligation to make this quality noticeable and evidently understood.

Both of the aforementioned issues raise another important problem, the matter of job losses. Since highly experts and skilled employees are not going to be required and the separation of audit and non-audit provision would lead to job losses. Taking into account the increasing levels of unemployment in a pan-European level, job creation should be fostered.

The road to audit reform is lengthy and thorough. To accommodate all of the stakeholders needs as well as having a more holistic view as what constitute as a barrier to quality audit as well as to investors' confidence all the relevant parties should take part in the reform process. The views of all critical stakeholders, from regulators to investors and business communities, as well as auditors and governments, should be cautiously study before any regulation is being completed.

Conclusion

It is generally accepted that independent audit plays a significant role in increasing the credibility of financial statements by offering an independent guarantee about their quality. Nowadays the improvement of audit quality is a global issue since auditing profession has become international because of globalization of business and financing but also because of the hardships in the worldwide economic scene. Kueppers and Sullivan (2010) pointed out that with the dynamic changes and the altering needs of the financial markets, auditors should continue on improving their performance, a credential vital for more timely quality audits with more beneficial information.

The purpose of audit standards is the provision of guidelines for defining audit and audit behaviour, endorsing consistency, act as mean for audit performance evaluation and aid education (Burns and Fogarty, 2010). Currently, EU has three Directives that deal with accounting and audit standards. The Fourth Company Law Directive established the principle of 'True and Fair View', the Seven Company Law Directive set the requirement and procedures for the preparation of individual and group financial statements whereas The Eight Directive concentrates on audit. Due to the growth of the European capital markets as well as the numerous corporate scandals and following the Sarbanes–Oxley Act (2002), European Union has revisited the Audit Directive. This new directive expands the range of function of existing regulation in an attempt to harmonize the quality audit so as to increase its credibility.

In the aftermath of the Financial Crisis European Commission indicated that there was little or no acknowledgment of the responsibility of auditors in regards to the financial crisis since auditors. The Commission also highlighted the disadvantages from increasing market concentration in the audit industry and once more addressed the issue adoption of IAS. Based on the notion that the financial crisis highlighted a number of shortcomings in the audit system the Commission issued certain proposals suggesting mandatory rotation of audit firms, open offer in the selection of a new audit firms, ban on non-audit services to audit clients and the creation of a European passport for audit.

However, certain issues should be taken into consideration prior to the formulation of the new regulatory regime. In regards to the adoption of the IAS, the challenges toward this objective are threefold; legislation, implementation, and enforcement. In terms of legislation is important the expected forthcoming new audit Directive should articulate rules concerning auditors' responsibilities, ethics and audit quality assurance. For the implementation and enforcement process the direction should be towards the coordination of the different relevant so as to establish a coherent and comprehensive regulatory framework.

Concerning the issue of audit quality, the proposals for mandatory audit firm rotation and separation of audit and not-audit services should be revisited. Criticisms indicates that those proposals might harm rather than augment audit quality since they decrease auditing firms' capability to acquire expertise and knowledge in a multiple areas and also increases costs. Additionally they reduce motivation for developing industry expertise.

The primary conclusion of our analysis is a need for both regulators and market participants to examine more cautiously the interrelationship among audit regulation, auditors' judgment and audit quality prior initiating any regulatory reform. The new proposal of the Commission, the industry concerns and the forthcoming new regulatory framework are expected to convey a new era in the auditing industry in the future.

Introduction

The implementation of the principles of New Public Management (NPM) for the healthcare sector in general and for hospitals in particular is controversial, to say the least. The objectives of NPM reform are essentially economic, with a greater presence of management professionals in hospitals and the adjustment of the limits of clinical efficiency to those of economic efficiency (Doolin, 2010; Simonet, 2008).

Some critics of traditional hospital organisation assert that hospitals, which have a culture primarily centred on clinical issues, are dominated by health professionals who are often unaware of the financial and economic dimensions of their actions (Edwards et al., 2003; Vlastarakos, 2008). Other studies support the idea that these new models of management are awakening conflicts in doctor-manager relationships and, in some cases, exacerbating existing ones because whilst the former promote clinical criteria, the latter give priority to economic criteria (Lapsley, 2001; Garelick, 2005).

This potential dichotomy of views on the way in which a public hospital must be managed can create difficulties for the mid-level hierarchy, mainly clinical service directors who have to move between managers and physicians, two different, almost always potentially contradictory, visions (Forbes, 2004).

The adoption of NPM principles has brought great pressure to bear on physicians to both reduce costs and improve the medical quality of their services (Pettersen, 2010). We consider that governmental agencies and hospital administrators are responsible for actively involving physicians in managing the economic tools needed to deal with this pressure. Introducing management control systems based on more active use of accounting information may be an important element in this trend. However, according to Abernethy and Stoelwinder (1995), if doctors have the power to override the organisation goals, there is evidence that this would lead to a strong resistance against the use of the Accounting Information System (AIS) implemented by top management to control and influence physicians' behaviour.

Under NPM, the AIS in hospitals has moved from an accounting system mainly focused on the formal aspects of accountability to one concerned with the need for information for decision-making

and management control. Previous research is not conclusive. On the one hand, Aidemark (2001) and Robbins (2004)¹ report situations where accounting was introduced and readily accepted into the routine of health professionals, in terms of budget planning, management control and even on a decision-making level. On the other hand, Robbins (2004) and Arai (2006) emphasise situations where accounting is seen as a foreign language by health care professionals and, in some cases, as a tool inappropriately manipulated by managers. Furthermore, depending on its use and role, AIS can be seen as an instrument of rapprochement or distancing between doctors and managers (Hunter, 2007).

Generally, the organisational structure of public hospitals gives important management functions to the directors of the different services, but it is the physicians of each of these services actually making the decisions on patient treatments who determine how economic resources are used. In such cases, if economic and clinical criteria are not aligned, hospital management can suffer from a lack of economic and clinical efficiency.

The aim of the present study is to further understand how physicians deal with financial and economic factors in their clinical decisions, and the influence that information provided by the AIS exerts on their clinical decision-making process. In other words, we want to know more about the accounting information available, the type of decisions in which the accounting information is directly or indirectly used, and the role of that information in the formal and informal relationships that are established, both horizontally and vertically, within the hospital.

Methods

This study was conducted in the Otolaryngology Service (OS) of Hospital São João (HSJ), in Porto (Portugal), and reinforces our conviction that it is in hospital services where, potentially, AIS offers a higher level of utility. Currently, HSJ has more than 1,100 beds, employs 4,832 people (including 1,118 doctors and 1,696 nurses), provides healthcare in 33 medical and surgical specialties and has 9 additional diagnostic and therapeutic services as a means of support.

There were several reasons for studying this particular hospital. Firstly, we chose the OS because of the interest shown by its director in relation to the information provided by the department of AIS. A second reason was the fact that it has its own operating block and, thus, regularly faces clinical decisions involving high direct costs within the service. Thirdly, this service has good clinical performance recognised both within and outside HSJ, attested to by the study conducted by ENSP between November 2006 and 2007, in which the service was ranked as the best in the country in terms of effectiveness/quality.

For the inference construction, we used the content analysis technique due to the adequacy of its qualitative character for dealing with the director's and physicians' views. We used this technique "to listen to what people have to say"; and because "we should explore the ideas and concerns which the subjects themselves come up with" (Greenhalgh, 2007). Besides, this technique is widely recognised as applicable in the medical area (Nilsson, 2009; Saboor, 2009).

We began with a general analysis of the hospital AIS. For that we held several interviews with different managers, to collect general information on hospital management, organisation and functioning, and to clarify technical issues of the AIS. The main items of this general analysis are summarised as follows.

Initially, besides the three meetings with the hospital financial manager, two meetings were held with the head of the Management Analysis Service, in charge of the AIS, and three meetings with the Otorhinolaryngology Department manager. These meetings served mainly to gather the accounting information handled internally and collect general information on the management, organization and functioning of HSJ. Since the purpose was mainly to collect data and clarify technical issues on the accounting information system, none of the meetings were recorded. However, notes were taken when any personal opinion or perception about the functioning of the accounting information of HJS was expressed. The analysis of the notes taken emphasise the following ideas:

- The use of the AIS has to be fully implemented throughout the hospital as an important factor in the achievement of institutional objectives;
- Registration and data processing in the computer system is reliable;
- The demand for accounting information by service directors is very inconsistent;
- The majority of service directors essentially value: 1) information on the direct costs of their service (for which they have decision-making power) and 2) information on production levels.

Throughout this process we collected and analyzed various documents:

- The Business Plan
- The contract program where production under contract from the Ministry of Health is stated
- The economic budget
- The analytical accounting plan
- The accounting maps where financial information is checked against "statistical data" on production
- Accounting documents - Balance Sheet, Statement of Results, Appendix to the Balance Sheet and the Profit and Loss Account Management Report.

The AIS provides common information to all services in order to monitor the service budget and the objectives under contract by hospital administration, and personalised data for each service, if requested. AIS information permits the historical development of the service to be analysed for each indicator, by comparing the current year and the degree of achievement of the objectives with that of the previous year, through a comparison of the values that were agreed upon and those achieved.

After analysing all the aforementioned institutional documentation, we interviewed 15 of the 17 physicians of the OS, including the director. The aim was to interview all the medical staff, but one of

the doctors was absent for health reasons and another was unavailable due to the reduced amount of time (4 hours per week) he worked in the OS. The general characterisation of the physicians interviewed can be summed up as follows: most doctors (78.6%) are male; the prevalent age group is from 25-30 (29%), immediately followed by those from 35-40 (21%); and, in terms of professional category, 50% of the interviewees are hospital assistants.

With most of the interviewees (13 of 15), the data was registered by audio recording with the explicit permission of each interviewee. The recording option was to preserve data reliability, given that the alternative was to simply take written notes. The interviews that we carried out can be considered targeted and semi-structured. The topics discussed are summarised as follows:

- Type of information - formal or informal - involved in a clinical decision
- Economic and financial consequences of clinical decisions
- Information available in terms of production, costs and revenues associated with individual work and the service
- Type of decision for which that information is used
- Influence of the service director in the dissemination and use of information
- Information wanted/needed - type, regularity, format
- Suggestions to improve the information system

The interview guide was put together in an effort to promote free and spontaneous speech on the issues mentioned above. At the time of the interview, it was very briefly explained that its purpose was to collect data for research. Given that one of the objectives was to verify whether doctors spontaneously mentioned economic and financial issues as one of the factors considered in the clinical decision-making process, and to ensure that the interviewees were not directed towards that specific question, the interview began with an open question. Basically, the interviewees were asked to explain how doctors make their clinical decisions and to explain, openly, what type of information and which factors they take into account when they have to make a decision as to the use of diagnostic tests or prescriptions. The depth of the interviews varied, depending on the personality of the interviewees.

The data collected in the interviews was transcribed and then analysed with a computer program for qualitative data analysis (NUD.IST) using content analysis procedures. The procedure is summarised as follows:

- . Listen to all interviews twice to familiarise with the language and discourse in its raw state.
- . Read the interviews in order to isolate units of text with relevant meaning.
- . Choose the units to be analysed, according to topics, ideas and concepts identified as the reading progressed.

- . Import the text to the NUD.IST program and to begin the coding process.
- . Reread and recode several times until mutual exclusion, uniformity, relevance, objectivity and loyalty, productivity were achieved.

Results

The results of the content analysis, the inference construction, are presented for each one of the questionnaire topics.

Evidence-based medicine versus patient-focused medicine

The central issue in spontaneous, individual clinical decision-making process taking place at the HSJ is the physician's orientation towards "evidence-based medicine" as opposed to "patient-focused medicine". Defensive medicine, medical intuition/experience and economic cost of the means of diagnosis and/or therapy are factors which carry greater or lesser weight depending on the job experience, focus, and personality, with traits such as (Levinson, 1993; Roter *et al.*, 1995). Hence, economic efficiency was considered together with clinical efficiency in clinical decision-making processes.

Consideration of economic and financial parameters

Physicians do not ignore the economic limitations that their medical practice is subject to argue that their freedom in terms of therapy should be preserved. Therapeutic protocol and hospital forms are seen as two cost controlling tools that create ambivalent feelings in doctors. On the one hand, the physicians consider their freedom is reduced, but on the other hand, they recognise their economic, organisational and professional advantages of these tools. Therapeutic protocol is the result of team consensus while hospital forms are defined by high-level hierarchy. The former has greater acceptance than the latter because, in some way, physicians participate in developing the protocol. All the negative effects of economic restrictions, such as a feeling of reduced freedom or of being constantly controlled, are mainly associated with hospital forms. Hence, the involvement of physicians in designing economic controls facilitates their ex-post acceptance when their clinical activity is limited by economic restrictions (Cardinaels, 2004).

Ethics and resources

In general, physicians hold the belief that their own medical ethics do not allow resources to be wasted, however they acknowledge the need to standardise professional behaviour patterns and to establish a system to monitor and control costs that introduces uniformity to professional conduct. Therapeutic protocol is understood to be a tool of consensus and of the medical staff's commitment to scientific criteria and economic and financial restrictions. Pondering the economic cost in the decision-making process only occurs when the patient's clinical situation is safeguarded. This means economic efficiency is subordinate to clinical criteria, i.e., in case of a conflict between economic and clinical criteria, the physicians' priority is applying clinical criteria.

Economic restrictions

Economic restrictions are seen by physicians as an imposition coming from further up the hierarchy than the service director, who is seen as a messenger of “undesirable news”. The doctors’ awareness of the costs involved in their clinical decisions is advanced internally and actively within the service, primarily at meetings, and institutionally, particularly through the computer system, which is seen as a controller. Hence, a negative atmosphere may be created in the service if the director does not take physicians’ concerns into account. Economic and financial information, particularly referring to budget and performance indicators, is used when communicating with the doctors in an effort to promote cooperation and participation in cost control and increased productivity. Doctors are the best source of information on the expenses necessary to guarantee the most efficient clinical services. Again, the service director plays an important role because he/she has to motivate the physicians and gain their collaboration in a matter which is very controversial for them.

Attitude towards AIS information

Physicians have an approximate idea of costs for the means of diagnosis and treatments that they prescribe. In most situations, this idea is limited to direct and explicit costs: number of follow-up visits, medicine, etc. Information sources are varied: consultation of official price lists; benchmarks may be provided by some private clinics; information provided by patients; previous clinical academic training, medical information delegates. Although many of these sources are external, the price of medication used in the hospital is provided internally by the AIS. Hence, they have increased economic awareness. However, hospital, and even service, costs and revenues, and their accounting assignation, are frequently ignored by doctors because of their perceived irrelevance when compared to medical information. This perception of irrelevance is a failure of AIS as it is unable to create value from the financial accounting information supplied. Nonetheless, the service’s clinical performance indicators (average duration of hospital stay, first/second consultation ratio) are acknowledged by doctors and their actual or potential influence on clinical practice is recognised (Hoyt, 1995).

Implications of the results

Our results suggest that physicians are, in some way, prepared to assume economic criteria as an additional criterion in their clinical decision making process. Medical, professional or ethical criteria will always be on a higher level than economic ones. On the one hand, institutional factors have shown their capacity to affect physicians’ perception and use of the AIS information. So, hospital managers should stimulate the physicians’ receptivity to draw on economic information through the aforementioned institutional factors: corporate culture, working environment, organizational support or control system, among others (Chilingerian, 1990). Hospital managers have the authority to make decisions on these institutional aspects, and should focus their decisions on encouraging medical staff to use of AIS information (Madorrán, 2004). On the other hand, procedural elements (most already

implemented and assumed by physicians) can be employed as tools for medical staff consensus and commitment in dealing with economic and financial restrictions.

Discussion

Data analysis reveals that, although it is not possible to talk about complete, general integration of accounting information into clinical decisions, we can state that it is steadily becoming additional information that physicians consider in the decision-making process (Brunetti et al., 2011). As Cardinaels (2004) assesses, the interest of physicians in the AIS design must not underestimate. However, physicians clearly discriminate between clinical and financial information, and value the former more highly in making their clinical decisions (Mason et al., 1999). Financial information is seen as a shortcoming that acts in detriment of their clinical activity.

Through this exploratory study, we were able to obtain a deeper understanding about the physicians' perception and use of the AIS information in the clinical decision-making process. Doctors' receptivity and interest in economic and financial information depends on a variety of personal, professional and institutional factors. Therefore, we can assess that there are three sets of factors that determine information use. Firstly, deriving from individual personalities, there are personal factors including personal motives and work expectations. Physicians are people with their own personalities and specific personal conditions. As in any other profession, factors such as age or family situation are not unimportant.

Secondly, there are professional factors, where work experience and professional and personal perspectives on ethical rules are clearly recognised. Physicians are, above all, physicians and have a low-level of economic and financial training but high ethical values and principles (Kurunmaki, 2000; Peterson, 2007), deriving from their specific profession. It is more than sufficient to remember that it is the profession with the first public commitment to an ethical attitude in the medical practice, the Hippocratic Oath, from the fifth century BC. This is fundamental in understanding that they will never risk the patient's clinical situation in their decision-making process. Yet they know the importance of economic and financial limitations. In fact, they are aware of the service's clinical performance indicators, which can be considered pre-economic indicators (Gattnar, 2011).

Finally, there are institutional factors, such as corporate culture, management control system and interaction with supervisors (Moars, 2006). It is precisely the institution and its hierarchy which is observed to be the imposer of economic and financial restrictions. This observation, which in some way means the depersonalisation of whoever is responsible for constraints, is positive in that it facilitates relationships among different levels of the hierarchy and helps avoid personal conflicts.

In addition to having provided us with a deeper, more systematic knowledge regarding the use of accounting information employed in hospital services, this study allowed us to develop, mainly on a methodological level, our research ability, which could be useful in the future.

There are several possible lines for future research that emerge from this exploratory study. The logical continuation would be its extension to other hospital services in order to improve external validity of our findings. Another alternative would be to replicate this study in services of other hospitals. The identification of factors which determine the use of accounting information at middle management level by clinical service directors could be of interest as well. Given the lack of studies on this issue, the "methodological triangulation" approach appears to give us more possibilities for extending, completing and summarising knowledge.

COMPETITIVENESS, GROWTH AND CHANGE PROCESS IN THE PERSPECTIVE OF THE ORGANIZATIONAL CULTURE

Flores, Alejandro¹

¹ Universidad del Pacífico – Lima, PERU. Email: Flores_ja@up.edu.pe

Abstract

The purpose of this paper is to identify the organizational culture influence on the relations among competitiveness, growth and the change process. Competitiveness can be achieved based on different production factors, various assets, both tangible and intangible, as well as dominant positions generated naturally or artificially. An asset to be taken into account that generates competitiveness is organizational culture, whose own intangibility gives the company an inimitable factor, able to mutate, change and give the internal process of any organization a high degree of dynamics. We address the issue of organizational culture to be aware of its scope from the perspective of its evolution and the competitiveness it generates.

The launching of any business initiative demands from the owners an interpretation of their vision of the future of the project they wish to implement. Years later, this interpretation may be articulated explicitly detailing, in a tacit form, the set of values and beliefs that underpin the company. Thus, organizational culture has, as its main goal, to bring together the people's main intentions, while it generates its own dynamics, evolves and develops; it becomes enriched, but also questioned, especially when the answers provided by the company are ineffective in meeting the requirements of the environment and his possibility to adapt and grow.

Keywords: Culture, resources and capabilities, cultural response, competitive advantage, learns and knowledge.

Introduction

In a global, complex and competitive world, companies achieve their international expansion processes based on growth, however, growth processes are faster through the mergers and acquisitions. In either case, this growth creates a new organization, as a result of integration and cohesion of resources and capabilities of two or more business. Companies have always worked on competitive environments. However, the theoretical framework employed to try to explain the origin of the difference in their performance, that is to say, why some companies achieve a profit rate higher than the competition has not always been the same. The thing is that when we talk about a competitive position we have to refer necessarily to business strategy. The organizations must be adopting a conduct that makes a difference, about the performance of its competitors, and this difference is the basis for competitive advantage. However, the basis for achieving this advantage may originate from two different sources, although both intend to reach the same goal: achieves higher performance than the competition, or achieve it attains the potential to do so (Grant, 1966).

Competitive Advantage based on the analysis of industry environment

To summarize, from a traditional perspective, we can say that competitive advantage based on analysis of current industry environment is a strategic thinking approach, whose original ideas go back to the sixties and reached its highest development and dissemination in the eighties. Based on the principles of industrial economics, it argues that sustainable competitive advantage of a company in the long run depends on the position of the products in the markets. That is, the competitiveness of a company depends on: a) the degree of adjustment between their resources and the conditions of its environment and b) its position (strengths and weaknesses) for competition. The logic of the industrial economy is: *structure-conduct-results*, according to Bain (1959) who focuses his study on the imperfections of product market competition, trying to find significant differences associated with representative variables of market structure (concentration of supply and demand, barriers to entry, economies of scale, etc.), as evidence of profitability in each sector. This analysis, on the attractiveness of different sectors in terms of potential for future benefits is based on industry structure as a determinant of competitiveness. Under this line of thinking, the corporate strategy guides the business decisions to select the best areas in which to invest, as long as the company develops one of two basic competitive advantages: *low cost or differentiation*; a situation that will have beforehand an influence in the organizational-cultural context, in the coordination mechanism, in the work processes, in information systems and organizational control, all from the concept of the *value chain*, developed as a fundamental tool in the diagnosis of corporate competitive advantage to find out how to reduce costs or how to differentiate the products of the company from the competition.

Competitive Advantage based on the analysis of resources and capabilities

Another approach to reach a position of competitive advantage is developed since the nineties, the so-called 'Theory of resources and capabilities', which shifts the attention and interest from the study of the competition imperfections in product markets (traditional approach grounded in the paradigm *structure – conduct - results*) to the study of the imperfections in the resource market, based on a new paradigm, which can be called distinctive *capabilities – performance - results*. The primary bases of this new theory can be traced back to the work of Wernerfelt (1984), from which the company is considered as a set of resources, as distinct from the traditional view of an organization as a mere provider of products in the markets it competes. According to the idea of the theory of resources and capabilities, the competitiveness of companies is determined by the characteristics that certain resources and capabilities have, that is, the heterogeneity of resources and capabilities available to a company, the difficulty of mobility in the factor market and the limited ability of competition to imitate or copy these resources.

Resources and Capabilities to Competitive Position

This approach has two key elements: resources and capabilities.

Resources: any factor of production available to the company, even if the company does not have clear property rights over it, whether tangible or intangible. For example, a useful starting point for

classification is to distinguish between tangible resources, intangible resources and human resources. Among them, it is the corporate culture.

Capabilities: they represent the body of knowledge and skills to perform some task or activity supported by a number of resources.

In both cases, an heterogeneous nature is assumed, that is to say, that: *i*) companies are fundamentally different depending on the assets they own and the variability of skills that can develop (by the training programs for example) and *ii*) the assets –which are a dynamic combination of resources and capabilities-- determine competitiveness, since it is through them that the different options of product-market strategies plausible to be implemented become a reality.

However, a further step in the analysis and study of the competitive advantage is, at present, the *dynamic capabilities approach*, in an attempt to analyze and explain the causes of permanent heterogeneity of business resources from a dynamic context which has not been covered so far (Teece *et al.*, 1997). Thus, with competitive advantage based on the analysis of dynamic capabilities, the analysis focuses on the processes of change (caused both by the heterogeneity of resources and by the environmental conditions) that have a place in the company. The principle of the heterogeneity of resources and capabilities is still an explanatory variable of the differences in yields, but additionally other elements are taken into account, such as the ability of the organization to renew and increase its capacity when a response to changes in the business environment is needed.

Throughout this dynamic process of change, the organization, simultaneously, is able to:

- Record the knowledge produced as a result of the synergy between resource capacity and condition of the environment through a process of individual and organizational learning (exploration) and
- Make use of all previously developed routines (exploitation), which ensure a minimum level of stability, in the process of change.

In this vein, the theoretical framework that supports a position of competitive advantage based on resources --including contributions from the approach of dynamic capabilities and knowledge in the organization— hands over to us, in our view, a new business and management vision, much broader, enriching and creative, that the paradigm offered by *the structure-conduct-performance*, admitting that now business activity can be conceived as a process of deliberate and continuous change, driven by the need to maintain economic rents over time based on the creation, accumulation, application and distribution of knowledge, skills and resources, as a plausible means to create a distinctive performance that supports the company's competitive advantage.

Organizational Culture in Context

All entrepreneurship requires, previously, from its promoters¹⁹, an interpretation and concept about the future vision of the project that they want to conduct as well as the environment and the conditions under which it is expected to unfold. In the vast majority of cases, and especially in the early years of business life, this is an intellectual effort of reflection that appears implicit in the promoters' and their associates' daily life. Over the course of the years, this endeavor can be expressed explicitly in order to become a key element of commitment and to let society know about the ideas that will guide all actions of the organization, in the present and future.

The company culture's main aim is to bring together the main intentions of people; it generates its own dynamic, evolves and develops, and it becomes enriched, but also questioned, especially when cultural events are ineffective before the environmental requirements. This state of affairs tenders an opportunity for changes in the cultural constitution of the organization, initiating a process of continuous improvement.

The cultural process in the company

The intellectual effort of reflection and interpretation that takes place at the beginning of all entrepreneurship depends on the set of basic assumptions and beliefs held by the promoters at a given time, which have been developed over links and previous experiences (Schein, 1988), both of everyday life, and business. They make possible that their actions may be understood, in principle, depending on how they approach and interpret a particular situation.

From the first moments of life of a business project promoters share the results of their interpretations and ways of looking at life with other members (not promoters) participating in the project, helping to further strengthen the link "individual-group" or "individual-company" arising from the contractual relationship that linked them from the start. These signals or messages from the "top down", about the expected results, on how to do things or how to act at any given time, are accepted to some extent by the members of the organization as dogmas that guide their actions and determine their performance. One of the main reasons for this level of acceptance is that, in general and at this stage, the members (not the promoters) feel unable to question and contradict the basic assumptions and beliefs of the founders or leaders, because they:

- Do not have enough power to support their own assumptions, and
- Require much more of guides and work elements to strengthen their sense of belonging to the group, than to prepare and present judgments that contradict these aspects.

Therefore, members of the organization accept them as such, incorporate their own assumptions and beliefs, reinforce every day from their relationships with other members as well as from the

¹⁹ We understand as promoters of an enterprise, both the founder, or founders, that with efforts set a company in motion, as well as the leader or leaders who, at a later stage, organize and manage resources to ensure continuity in the organization.

results obtained from the interaction of elements or cultural components²⁰ and the realization²¹ of these predictions in the external environment.

Cultural structure dynamics

It is of capital importance in this scheme to highlight the necessary participation of those people who take on these aspects, whether or not they are participating as promoters in an entrepreneurship. Undoubtedly, these three components only have sense in the context of the business culture to the extent that members of an organization are actively involved in the planning, configuration and development. This last stage is understood as the group's efforts to achieve reinforcement, maintenance, enrichment and subsequent growth of the culture. Additionally, along with the components and the main actors --promoters and non promoter's members of an enterprise-- a culture, something that must be taken into account is the process by which their performance is enhanced or its effectiveness questioned, both internally and externally.

From these three elements, components, actors and process, we can sketch the cultural fabric of an organization. Its main feature is its dynamic nature, whose origin lies in the incremental accumulation of interactions; the human group, involved in its final configuration, and the assessment processes that are exercised by the various social partners.

For practical purposes, the *cultural structure* can be defined simply as the set of interrelated and interdependent components of the culture of an organization that promotes its realization in a series of events that support its use, effectiveness and validity, and which includes the existence of a dominant culture and other less influential subcultures (Ruiz-Olabuenaga, 1995). For Schein (1988:65) culture is "... a dynamic process ..." of individuals, groups and their beliefs, and its genesis has a particular resemblance to the process of group formation. Thus, culture has its natural place of conception and development in basic and primitive relations of all human groups pursuing specific objectives.

The formation of a culture is part of the development process of a group, although some of its members --the promoters-- play a decisive role in the design and initial configuration of the organizational culture (Schein, 1988), and therefore, have a determining role in its subsequent evolution.

To explain the dynamics of the cultural structure, we will rely on the graphic in Figure 1, which aims to provide a broad and comprehensive vision of how the business culture materializes through certain elements and processes departing from the ideas and beliefs postulated by their promoters.

²⁰ Such as a corporate image, symbols, colors, logos and designs that identify an organization, traditions, social routines, employees' uniforms, and any implicit or explicit distinguishing feature that allows an organization to identify and differentiate from any other of the same industry and business.

²¹ This materialization becomes evident through links and relationships with new customers, new suppliers and new social participants, also in work routines, management processes, in products, services, management results, income account evolution, and so on.

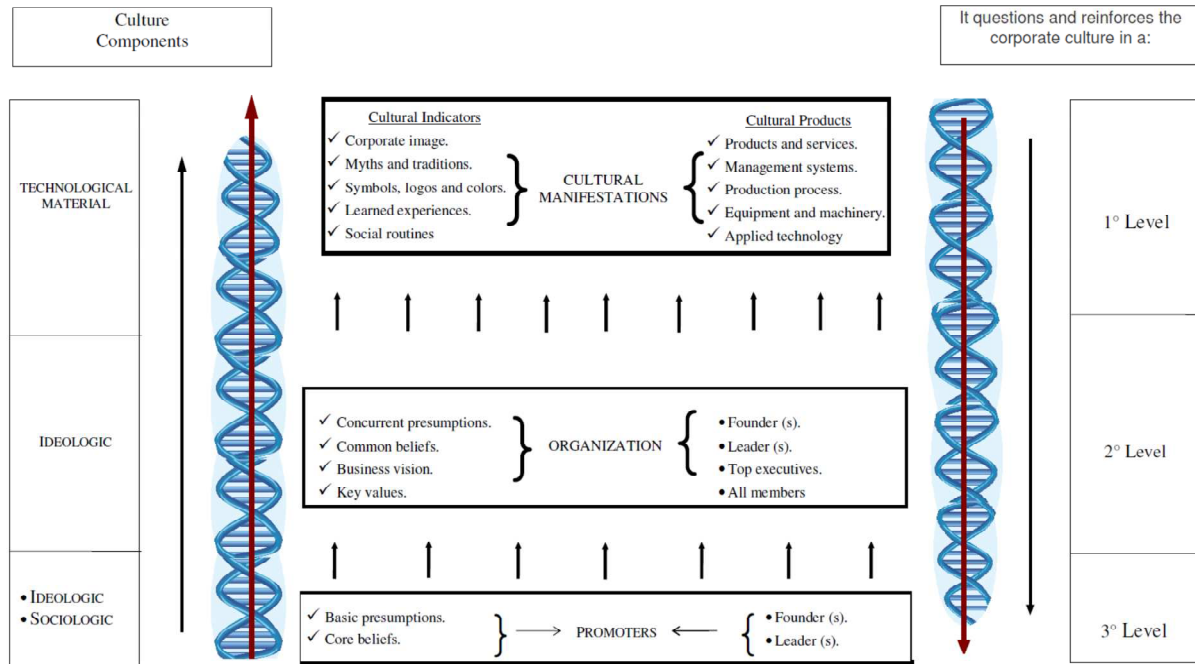

Figure 1 "Cultural structure of the company, component elements and levels in which the culture is questioned and reinforced"

Source: Own elaboration

In this regard, we believe that every organization has a particular cultural framework, a system of hierarchy and levels of definition; although in each case they have a very singular form and function. However, its dynamics can be observed, such as proposed below. According to the scheme presented in Figure 1, the culture of an organization structure consists of three closely interrelated parts, which are shown separately, in order to identify their functions.

Hierarchical levels of the cultural structure

In the case of a company's organizational structure, dynamics arises from the information that flows along it, as well as orders that are given, from the upper levels to the lower ones. The certainty about full acceptance of the principle of authority and responsibility, grants meaning and order, especially when it is about coordinating the work. However, in the case of the cultural structure, its dynamic nature is determined additionally by the process that hierarchically enhances or questions the usefulness, effectiveness and validity of the various components of corporate culture. This process is generated from the information that flows along the cultural structure of the company and has two main characteristics:

- It originates from the internal environment (members of the organization and their relationships) and the external environment (social participants of the company).

- Information flows through the cultural structure in a hierarchical manner, contrary to the process of cultural concretion²², providing relevant information.

At each level above, the organizational culture is likely to be reinforced or challenged. This process, which reinforces or challenges the organizational culture, is represented graphically (see Figure 1) by an "endless spiral of double orientation." On the one hand, of "downward" orientation, this represents the information received by the organization with regard to the aspects that are questionable (solid lines, downward orientation). The flow of information will continue to decline in the level as they continue questioning the corporate culture. In this regard, Hall (1995:6) argues, in the case of strategic alliances, cultural differences trigger a downward spiral of relationships, which eventually eliminate all positive synergic effect in partnerships. Misunderstandings, mistrust of the intentions, increased tension and conflicts generate a break in relations and the dissolution of all cooperative work.

Thus, the direction "upwards" represents a timely response that reinforces culture. The spiral "downward" originates from the information provided by the social participants regarding the efficacy, effectiveness and validity of cultural events, and it can reach the substrate itself in corporate culture. It is also an *ongoing* process, but the organization has the opportunity to reverse its direction and trend, to the extent that it can respond correctly and accomplish to mitigate the impact caused by inefficiency of the culture.

The cultural response or the learning process of culture in the firm

In the firm, which really should matter about the organizational culture is that it encourages, within the organization, the construction of a response pattern to the external environment when the market calls into question the usefulness of the material-technological aspect, the soundness of the ideosociologic aspect, or the validity of the assumptions and beliefs of the promoters (Kotter and Heskett, 1995:4). The importance of this process is not about questioning or not the cultural fabric of an organization, but that it is possible to establish a relationship of mutual dependence between the company and its environment, through which the required information should flow:

- Towards the company, so that it interprets the messages of change and adaptation that the market is requiring, and
- Towards the environment, to take into account the improvements that are made and incorporated into the disputed items, and submits them, once again, to a new process of evaluation and control.

From this point of view, we understand as business culture:

"... that process for generating answers that formalizes, conditions and predetermines the behavior of the members of a company ..."

²² In our opinion, the organizational culture comes true when the organization as a whole makes a practical and consistent use of its assumptions and common beliefs --"lives them" literally-- in each of the company activities, and of everyday life, which requires, in general, to have to realize these assumptions and beliefs in certain cultural manifestations.

Here what matters the most is not that a culture can be challenged or that the effectiveness and usefulness of its material-technological aspect is called into question; what is really important is the *ability of the organization to respond correctly and effectively* to what the external environment challenges. We should note that the elements of culture being questioned may be modified in accordance to the real needs of consumers, but also according to the real capabilities of the company; that is the reason why the answers given by the organization correspond, in general, to an *adaptation* mechanism to certain optimum conditions. Those conditions, according to Schein (1988), are:

To achieve a level of internal "integration" in the organization, and

To attain a level of stability and "subsistence" in the external environment.

The organization, every time that manages to adapt to these optimal conditions, generates a wealth of experiences that prepare it to face two situations: *routine* and *key*.

The learned cultural response (L.C.R.)

A situation is called *routine* to the extent that in order to successfully overcome it or resolve it is necessary to use a regular pattern of settlement. It is, therefore, a situation that requires a pre-established response, previously learned knowledge and whose application is dominated by the members of a company. This situation is characterized in that the organization "knows" how to address and solve this problem. It requires that the organization and its members offer a *learned cultural response* based on the assumptions and common beliefs, in the command of a certain knowledge and skill, and in a set of experiences previously acquired as a result of having successfully resolved, earlier, similar situations.

To the extent that an organization can solve a series of routine situations with learned cultural responses, it strengthens and confirms the validity of its culture, since there is no reason to doubt its effectiveness. Only otherwise, that is to say that learned cultural responses fail to solve routine situations, then a process of disbelief starts about the usefulness of this response, whereby the demonstrations and cultural elements that have greater contact with the external environment are questioned first.

The cultural response to be learned (C.R.B.L.)

On the other hand, a company faces a *key* situation when there is no routine solution or a previous solution and, therefore, the organization requires that its members:

- Create new answers, share knowledge and experience gained in developing the new solution, and
- All new responses and new knowledge and lessons learned, are incorporated into the set of assumptions and common beliefs, not only as individuals but mainly as groups. (Wilkins, and Patterson, 1986:264).

In this case, the organization *must learn* a new cultural response, enabling it to solve a new problem or new situation, which affects considerably the normal course of business activities. That is, a *key* situation can only be resolved by a *cultural response to be learned*. In this case, the content of organizational culture is derived from the combination of concurrent assumptions and common beliefs and new learning experiences as a result of solving a key situation (Sathe, 1986). It is considered that a situation is *key* because the response provided *allows new learning* and encourages further enrichment of today's organizational culture, considering that you get to incorporate new elements that strengthen the existing cultural structure, or manage to change it. However, it is also considered that a situation is *key* because if the organization fails to resolve the situation successfully and with a high degree of satisfaction, the aspects composing the culture will be questioned hierarchically.

It is in these situations labeled as *key* where a company attains to enrich its culture. This action is perceived, as "that process by which an organization manages the development, evolution, growth or change of its cultural component towards a substantial improvement in any of its three aspects."

As a result of this process, the organization adds new cultural elements, thanks to which it is prepared to overcome the present difficulties and future problems of survival and integration. Only when the new cultural elements successfully solve a key position and the effectiveness of the proposed solution is recognized, the *cultural response to be learned* becomes part of the set of learned cultural responses of an organization. In this case, the members of the organization should definitely incorporate the new criteria and elements that represent the cultural response to be learned and set aside and, in a sense, *unlearn* those processes and elements that are contrary to the new solution situation. It is as if it were the process of "two-way learning" or "double loop" (Argyris and Schon, 1974).

Generative model of cultural responses or learning model to new cultural responses

According to the above, every organization facing a:

- Routine situation, will require a learned cultural response (LCR), or
- Key situation will need a cultural response to be learned (CRBL).

As such, they are two different stages, mutually dependent, which have constituted a "generating circle" (Morin, 1981) of responses and behaviors that encourage incremental knowledge in the organization, to the extent that adapts and meets the situations that come about. A culture is more sensitive to the demands of adaptation to the external environment to the extent that the organization carries out processes of innovation and values entrepreneurship in the company. To this end, the culture demands a strong bond and close relationship with consumers / clients and other social participants, in order to have the necessary information on the effectiveness of the material-technological component and the different cultural manifestations of the organization (Kotter and Heskett, 1995).

In this sense, according to the cyclic phase model developed by Jansen (1982) to explain the reactions of people to change, or the three-stage model proposed by Lewin (1947) to incorporate and consolidate the change in organizations, in each of which both authors assume a growth-generating process, taking into account that the situation that develops in the end is totally different from the point of departure (Morin 1981) we can set up a generative model of cultural responses that, departing from a position of certainty in regard to the usefulness of a *learned cultural response* (LCR), an organization is forced to generate an alternative solution; in this case, a cultural response to be learned (CRBL), due to the greater uncertainty and complexity of the situations they have to face and intend to solve (Kotter and Heskett, 1995:46).

This way, we can see in Figure 2 that, from a *learned cultural response* (LCR_{t1}), the organization can generate new cultural responses (LCR_{s1}, LCR_{s2}, LCR_{s3} ... LCR_{sn}), as it offers solutions to every key situation, whether it comes to issues of internal integration or external subsistence.

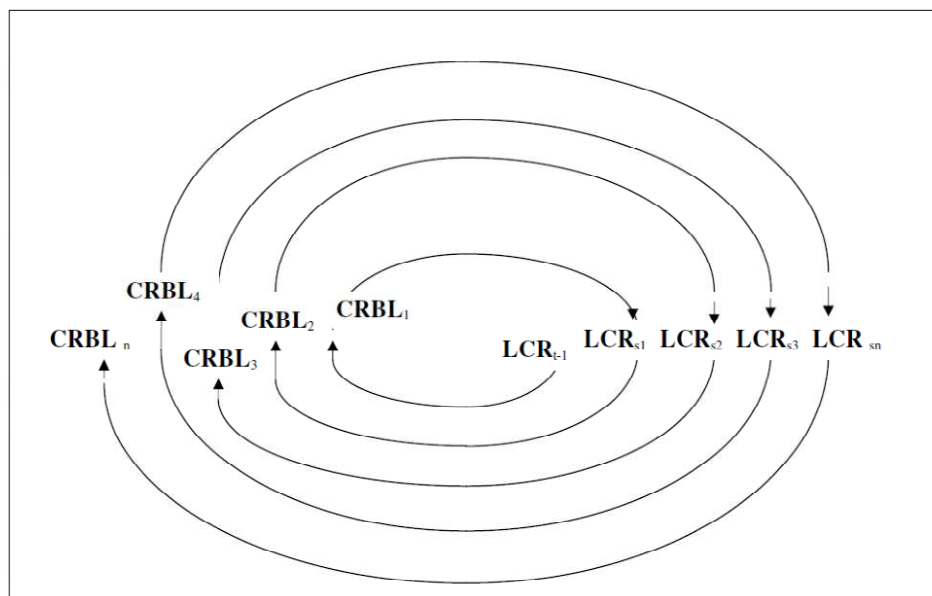

Figure 2 “Generative model of cultural responses culturales”

Source: Own elaboration

As mentioned above, each situation requires a new key cultural response, but soon acquires the category of "learned" when the response has been fully incorporated into the set of assumptions and common beliefs shared by the members of the organization, and they have learned to work with it. The solutions capable of solving problems tend to become part of organizational culture only to the extent that the process of acquiring knowledge of the organization incorporates such responses as valid. And this only happens once the response has demonstrated the capacity to successfully resolve a *key* situation, that is, the answer supplied allows the organization to return to a state of relative certainty and stability.

Now, to reach a new stage of certainty and relative stability, the organization must change some of their assumptions and common beliefs, either by improving, removing or creating new elements of its culture in any of its three aspects, which implies a learning process, that ends --partially-- when members of the organization make them their own and feel safe with the new aspects of culture.

The dynamics of business life makes the "generating circle" expand, so the *learning process never ends* and generates an enrichment of culture, taking into account that each learned cultural response means having successfully resolved a *key* situation. Hence, in principle $LCR_{t-1} < LCR_{s1} < LCR_{s2} < LCR_{s3}, \dots < LCR_{sn}$.

For a cultural response to be learned (CRBL) to get to establish itself as a learned cultural response (LCR), that is, for the organization to formalize the new pattern of cultural response will require:

- To confirm the effectiveness of the response given in a key situation.
- To identify those concurring assumptions and common beliefs, but incompatible with the new cultural response.
- To prepare the organization to learn by training programs.
- To definitely incorporate into the cultural structure those elements that create certainty and stability back to the company.
- Set the new position reached by the organization as an attitude and behavior pattern (LCR) to address and resolve routine situations.

Therefore, the learned cultural responses (LCR) act, in routine situations, as a reinforcement of the current culture, because every opportunity that they successfully resolve a situation of this type; they confirm and validate the relevance of the assumptions and beliefs, as well as cultural elements and *material-technological* aspects.

Conclusions

- The organizational culture defined and understood as "*... a response generating process that formalizes and predetermines the behavior of the members of an organization ...*" represents a means to achieve an advantage competitive position well as stability and certainty of the activities developed in the company.
- There are two fundamental aspects for organizational culture to incorporate change processes in their structure and evolution to the competitive position:
 - The first is a process by which culture is likely to be questioned -hierarchically- by the social participants and the own members of the organization who question its effectiveness when the organization as a whole, or a part of it, does not succeed with their responses to background demands.

- The second aspect relates to the learning process developed by the organization as a result of the need to incorporate new elements and build a new learned cultural response (LCR) that allows it to successfully solve a *key* situation.
- The company and workers learn about the experience when the cultural structure is questioned but also when will try obtaining new answers to respond new problems.
- The learning processes based on experiences in organizations allow heterogeneous cultural responses difficult to imitate and favors the development of intangible assets and ultimately the sustainability of competitive advantage in the firm.
- Organizations could design and implement training programs to help in change process and creation of intangible assets that support the position of competitive advantage. Organizational culture is a clear example of an intangible asset to must be developing.

Abstract

Guimarães is a world heritage site (UNESCO) since December 2001, and is hosting the European Capital of Culture (ECOC) in 2012. This paper examines the profile, destination image and motivations of tourists' visiting Guimarães before the cultural event. Based on survey responses from 276 tourists, this study found that tourists arrived to Guimarães came from the two most important cities in the northern part of Portugal (Porto and Braga). They are relatively young and well educated compared with the average tourists that visited Portugal. The results suggest that many tourists are aware of the city status as a world heritage site encompassing a historic centre, monuments, and architectural buildings. Further, these perceptions shape the image of Guimarães, as the factor analysis indicates that "historical background and functionality" is the most reliable and valid factor behind the choice of visiting the city. Finally, the main tourists' motivation to choose Guimarães as their destination is educational, rather than recreational as they want to live a learning experience.

Keywords: Tourism motivations; tourists' perceptions; tourist destination image; cultural tourism; Guimarães - Portugal.

Introduction

Tourism is seen as one of the main drivers of socio-economic progress in both developed and developing regions. Although the evolution of tourism over recent years has been somewhat irregular, domestic and international tourism industries continue to expand in response to growing markets, stimulated by consumers' increased leisure time and relative wealth (UNWTO, 2011).

The competition among tourist destinations is fierce due to the increasing number of cities that envisage attracting international travelers. Cultural tourism is one of the most growing segments of the tourism industry. Many tourists that visit heritage sites consider a value-added and authentic experience, when compared with traditional products (sea, sun, sand) or mass destinations

(Yankholmes and Akyeampong, 2010). In this context, destination images are important as they influence people's perceptions of place and can affect their choices and behaviors (Chen and Chen, 2010).

The city of Guimarães, in the northwest of Portugal, is a world heritage site (UNESCO) since December 2001, and will host the European Capital of Culture (ECOC) in 2012. One of the main outcomes of this event could be reshaping the image of the city, both by attenuating the most perceived negative attributes or by repositioning the city image according to the objectives and goals of the strategic communication plan tailored by the Portuguese organisers of ECOC.

Until now, few studies have been undertaken in Portugal dealing with the destination image (Lopes, 2011; Agapito, Mendes and Valle, 2010), but none, to our best knowledge, has focused on heritage tourism destinations. The present study examines the tourists' perceptions of Guimarães as a world heritage tourism destination and the motivations underlying the selection of the city by tourists. The understanding of tourist's perceptions of a heritage destination is important for developing successful marketing strategies in promoting and positioning a destination. In the case of Guimarães the results are even more important, due to the organization of the ECOC 2012, as they could suggest actions and tools to reshape some weak and/or negative dimensions of Guimarães image or to reinforce/reinvent a positive one.

This paper addresses motivations and destination image in the context of a heritage city. Section 1 of the paper clarifies the concepts of cultural and heritage tourism and presents some tourists typologies. Section 2 describes the motivations to visit a heritage destination. Section 3 provides a brief overview of destination image literature relevant to the study. The following section, describes the general characteristics of the municipality of Guimarães. Section 5 sets out the methodology used. Section 6 presents the results and discussion. Final section provides study's managerial implications and conclusions.

Cultural and heritage tourism

Cultural tourism refers to a segment of the tourism industry that places special emphasis on heritage and cultural attractions. At present, is one of the most growing segments of the tourism industry (Ritchie and Inkari, 2006; Sharma and Dyer, 2009; Chen and Chen, 2010; Shin, 2010). The changes in time and working conditions, as well as expectations about the holidays and leisure, are factors pointed to it. The demand for more active holidays and with more cultural elements, instead of passive and regenerative elements, has attracted more and more sectors of the population (Ritchie and Inkari, 2006; Ritchie and Hudson, 2009; Yankholmes and Akyeampong, 2010). The new middle class, with higher education levels and income, has been responsible for the increase of this segment of tourism (Richards, 1996).

According to Besculides, Lee and McCormick (2002: 303-304) cultural tourism includes visiting historic or archaeological sites, being involved in community festivals, watching traditional dances

and ceremonies, or merely shopping for handcrafted art. In less developed regions, heritage and cultural attractions may include archaeological or historic sites, museums, traditional religious practices, handicrafts, gastronomy or cultural performances.

The World Tourism Organization defines cultural tourism as movements of persons for cultural motivations such as study tours, performing arts, travel to festivals and other cultural events, visit to sites and monuments, travel to study nature, folklore or art or pilgrimages (WTO, 1985). According to Richards (1997), cultural tourism includes all movements of persons to specific cultural attractions such as heritage sites, artistically and cultural manifestations, arts and drama outside their normal place of residence. Silberberg (1995) states that cultural tourism is a form of tourism motivated by interest in historical, artistic, scientific or heritage offering of a region. Stebbins (1996) defines cultural tourism as a genre of special interest tourism based on the search for and participation in new and deep cultural experiences, whether aesthetic, intellectual, emotional or, psychological. Several authors (Henriques, 2007; Ritchie and Hudson, 2009; Yankholmes and Akyeampong, 2010; Cadima Ribeiro, Vareiro e Remoaldo, 2012) emphasize the wish to experience another culture, in multiple forms and doing it in a unique cultural experience making it authentic and memorable. More recently, creative activities and intangible heritage were added to enlarge the definition of cultural tourism (OECD, 2009). However, as the time passes and the tourism products diversify, it is increasingly difficult to incorporate all the activities offered by a community, region, group or institution within a well establish definition of cultural tourism. The economic impact of cultural tourism is overwhelming, according to the OECD (2009), cultural tourism accounted for around 40% of all international tourism, or 360 million arrivals in 2007. A study from the European Commission states that 60% of the European tourists are interested in cultural discovery and around 30% of tourist destinations are chosen based on the presence of heritage sites which can be visited (EICR, 2004).

Narrowing the concept of cultural tourism, we can find a subgroup -heritage tourism-, in which the main motivation for visiting a site is based on the place's heritage characteristics according to the tourists' perception of their own heritage. That is, a phenomenon based on tourists' motivations and perceptions rather than on specific site attributes (Poria, Butler and Airey, 2001: 1048; Poria, Reichel and Biran, 2006; Chen and Chen, 2010). The concept frequently includes built (such as historic buildings), cultural (such as traditional cultural events) and natural arenas (such as national parks). It derives from past images of history translated into reality that is constructed into costume dramas and re-enactments of past historic events (Goh, 2010). Many tourists that visit heritage sites consider their experiences as value-added and this can be viewed as a factor of differentiation between destinations and, at the same time, a chance to increase the number of returning visitors. Most of these tourists are disenchanted with traditional tourism products and mass destinations, seeking more authentic experiences provided by heritage attractions (Yankholmes and Akyeampong, 2010). One of the reasons that could explain the interest for heritage sites is the profile of heritage tourists which is very different from the average tourist. Silberberg (1995), in a pioneering work, concluded that the heritage tourist earns more money and spends it more frequently while he/she is on vacation.

The same author also identified that this kind of tourist is more educated, older and spends more time in the destination. In Hong Kong, McKercher (2002) identified five segments of cultural tourists based on the importance of cultural motives (centrality) and depth of experience: the purposeful (high centrality/deep experience); the sightseeing (high centrality/shallow experience); the casual (modest centrality/shallow experience); the incidental (low centrality/shallow experience); and the serendipitous (low centrality/deep experience). Nyaupana, White and Budruk (2006) found three distinct segments among tourists visiting three Native American cultural heritage sites in Arizona, United States: culture focused (one third), culture attentive (one-half) and culture appreciative (less than one fifth). According to the authors' conclusions the first segment (culture focused) is similar to McKercher's (2002) purposeful cultural tourists and Silberberg's (1995) greatly motivated tourists (Nyaupana, White and Budruk, 2006).

In the European case, according to Pérez (2009: 125), following Bywater, they found three profiles of cultural tourists: "a) the culturally motivated – are a small market segment that is attracted to a destination due to cultural reasons or causes, which leads them to spend several nights at the place of destination; b) the culturally inspired – are inspired by cultural sites and heritage such as the Alhambra in Granada and Venice. All they want to see the same places, which imply problems of asset management. These tourists spend short periods of time in culture destinations and are not motivated to return to the same place; c) the "culturally attracted" – are those who carry out a day visit to cultural sites and heritage, but are not strictly motivated by cultural reasons".

According to Perez (2009:126), following Richards (2004), the profile of cultural tourists has not varied much over time: more women than men; younger people; higher educational attainment, which is associated with higher consumption of culture.

Travel motivations to heritage sites

In the literature, travel motivations have been assessed in relation to the push and pull forces or demand stimulation. Crompton (1979) identified seven push motives and two pull motives. The push motives were escape from perceived mundane environment, exploring and evaluation of self, relaxation, prestige, regression, enhancement of kinship relationship and facilitation of social interaction. The pull motives were novelty and education. Gnoth (1997) suggests that motivation formation could be expressed in terms of inner-directed values (emotional drives) and outer-directed values (cognitive). However, besides push and pull factors, a hedonic factor could be added showing that emotional and experiential needs are relevant in pleasure-seeking and choice behaviour (Goossens, 2000). In general, the motivations to travel could be related to physical motivators (physical rest, participation in sports, need for recreation at a beach, and person's bodily health); cultural motivators (desire to gain knowledge about other countries); interpersonal motivators (desire to meet new people, visit friends or relatives, get away from routine or to make new friendships); and status and prestige motivators (self-esteem and personal development) (Jang and Cai, 2002).

According to Poria, Butler and Airey (2004) the two most common reasons to visit a heritage site reported in the literature are education (i.e. the tourists' willingness to learn) and entertainment (i.e. the tourists' desire to be entertained). In the same way, to Pérez (2009), among the main travel motivations stand out the atmosphere and environment of the destination, to see interesting things and the desire to learn more about the local culture. Based on a sample of English-speaking international tourists leaving Israel through Ben-Gurion airport, they found three groups of reasons for visiting heritage sites: heritage experience, learning experience, and recreational experience. These reasons were linked to the tourists' perceptions of the site in relation to their own heritage and their willingness to be exposed to an emotional experience (Poria, Butler and Airey, 2004). In a study of potential visitors to Anne Frank House in Amsterdam, Poria and Reichel (2006) reveal the existence of emotional involvement and bequeathal of the site's narrative. The findings also indicate a distinct relationship between tourists' perceptions of a site relative to their own heritage and the motivations for visiting the site.

A more recent study by Yankholmes and Akyeampong (2010) shows that tourists' perceptions of Danish-Osu (Ghana) reflect their knowledge of the site in relation to its cultural heritage attributes. They also found that tourists have dual experiences of the site: those that relate to recreational pursuits of heritage sites; and those that ascribe meanings based on their background. Results in Australia suggest that tourists are motivated differently when deciding to visit heritage destinations. According to Goh (2010) educational value was the most frequently stated reason for visiting heritage destination followed by positive feedback from previous tourists and famous reputation of the site. In Taiwan, Chen and Chen (2010) suggest that the total experience the tourists seek to get from the heritage site can be made of leisure, culture, education, and social interaction.

Tourism destination and image

The World Tourism Organization defined a tourism destination as "a physical space in which a visitor spends at least one overnight. It includes tourism products such as support services and attractions, and tourism resources within one day's return travel time. It has physical and administrative boundaries defining its management, and images and perceptions defining its market competitiveness. Local destinations incorporate various stakeholders often including a host community, and can nest and network to form larger destinations" (WTO, 2007:1). The other side of the mirror is destination image which could be considered a subjective interpretation of the destination made by tourists. This image is based on the perceptions each tourist has of all destinations they have been to or have heard of (San Martin and Rodriguez, 2008). Thus, the destination image is "formed through interpretations of rational and emotional context, which comprise two interrelated components: cognitive or perceptual (attributes) and affective or evaluative (feelings)" (Agapito, Mendes and Valle, 2010: 92/93).

One of the big challenges in the management of a destination image is the differentiation that needs to be done in order to gain sustainable competitive advantages regarding other places' image. This

differentiation strategy is based on attributes (tangible or intangible) but also involves the sum of all beliefs, ideas and impressions that people associate with a destination (Crompton, 1979; Kotler, Haider and Rein, 1993). Therefore, the role played by destination image surpasses the reality of the destination, as tourists based their decisions mostly on image. From the marketers point of view the management of destination personality is also important. According to Ekinici and Hosany (2006) destination personality could be described by sincerity (reliable, sincere, intelligent, successful, wholesome), excitement (exciting, daring, original, spirited), and conviviality (friendly, family oriented, charming). Pike and Ryan (2004) approach destination image from the positioning point of view describing Auckland (New Zealand) as having good life/infrastructure, getting away from it all, outdoor play and weather.

The empirical research available shows that destination image positively influences consumer perceptions and ultimately the demand for a place. In Lagos (Portugal) the attributes that explain the tourists' recommendations to friends and family are, in descending order, "interesting cultural heritage, good value for money, interesting cultural events, calm sea, and good sports facilities" (Agapito, Mendes and Valle, 2010: 105). In the case of Amasra region (Turkey) the visitors are affected by history and cultural heritage, shopping and food, peaceful and clean environment, architecture and infrastructure of the region (Aksoy and Kiyici, 2011). In the case of Ios (Greece) the findings revealed that visitors enjoy the relaxing atmosphere and the party mood of the island (Stylidis, Terzidou and Terzidis, 2008). Tapachai and Waryszak (2000) studied the image of Thailand and United States using five dimensions (functional, social, emotional, epistemic and conditional). The results show that Thailand was perceived as a country of cheap purchases, exotic food, historical places, virgin tropical rural regions, gorgeous sights (functional dimension), providing a culture experience and climate (epistemic dimension) with proximity, cheap travel and accessibility to other close destinations (conditional dimension). Similarly, the attributes found for United States include a functional dimension characterized by a fascination for purchases, famous theme parks, well-known landmarks, big cities, gorgeous sights and scenery; an epistemic dimension which includes the experience of the destination, a lot of things to be seen and done, and a conditional dimension supported in the lack of linguistic barriers, cheap and quality transport, and special sports events (Tapachai and Waryszak, 2000).

Therefore, in the process of decision making, destinations with stronger positive images are more likely to be chosen. However, the destination choice should be based not only on the perceived destination images, but also in attitudes formed from the available sources of information, the position of destination compared to other competitors and the ability to satisfy the perceived needs (Truong and King, 2009).

In conclusion, a tourism destination to be successful must project an image that convey specific benefits desired by tourists (both tangible and intangible) and, at the same time, search for differentiation in a meaningful way to visitors.

Guimarães as a heritage city

Guimarães is located in the northern part of Portugal and is, at present, after Porto, Vila Nova de Gaia and Braga, one of the most important towns in Portugal (Cadima Ribeiro, Vareiro and Remoaldo, 2012). The city was declared by UNESCO, a World Heritage Site, in 2001. The main reasons were the historical centre and the role in the “cradle of the nation” (place of birth of D. Afonso Henriques, first king of Portugal) with the castle being a symbol of the independence of the country against Spain.

In the present year of 2012, the municipality is hosting one of the 2012 European Capitals of Culture (ECOC), after Lisbon (the capital) in 1994 and Porto (the second more important city) in 2001. It is the first time that a Portuguese medium city hosts such a mega-event and several challenges could be pointed out. In the last decade the city experienced a slightly decrease in the population (0.9%), and the mega-event is an opportunity to reinforce the pride of residents and attract new ones to the city. A second challenge refers to tourism viewed by local authorities as a major driver for regional growth. However, the statistics revealed mixed results - in 2009, Guimarães attained a record number of 70.075 visitors, according to the figures collected at the city tourism offices; but in 2010, similarly to what happened in 2003 and 2005, experienced a decrease in the number of visitors. The organization of the ECOC 2012 in Guimarães is therefore an opportunity to reinforce the image of the city as a cultural destination both within the country and internationally. In a previous study Vareiro et al. (2011) concluded that residents' perceptions towards tourism in Guimarães is very positive due to job creation expectations, and the association between tourism development, economic opportunities of tourism and the preservation of historical buildings, traditional events and culture. If 'heritage is not simply the past, but the modern-day use of elements of the past' (Timothy and Boyd, 2006: 4, cited by Yankholmes and Akyeampong, 2010: 603), then Guimarães municipality can be seen as an example of modern view and use of its past.

Methodology

The methodology was quantitative in nature and used a survey research design as a common method to investigate motivations to travel and perceptions of destination image. Before the design of the questionnaire, we conducted an in depth interview with the responsible for the office of tourism of the city to obtain information on attributes and motivations of tourists. Also, secondary data (statistics) and previous surveys related with tourists' behavior were considered. After the design of the questionnaire (both in Portuguese and English) a pre-test was performed to assure internal and external consistency of the questions. The final self-administered structured questionnaire was applied in the two tourist offices in the city of Guimarães, both located in the classified area of the city (cultural heritage), between December 2010 and August 2011.

After the design of the questionnaire (both in Portuguese and English), a pre-test was performed in order to assure internal and external consistency of the questions. The final questionnaire includes three parts. The first part of the questionnaire dealt with cities visited before or after the tourists

arrived to Guimarães. The other is a closed multiple response question about tourists' motivations and asking why tourists had chosen this specific heritage destination (such as touring, business, culture, sports). The second part explored tourists' perceptions of destination image using 21 attributes (such as monuments, gastronomy, historical centre, accessibility), measured by a five point Likert scale. Another question tries to ascertain whether the city could be recommended by tourists to relatives and friends with a multiple response question (yes, no, perhaps). The third part covered the demographic characteristics of the respondents (such as gender, age, education).

The final self-administered structured questionnaire was applied in the two tourist offices located in the classified area of the city of Guimarães. Given the seasonality of tourism in the city, which also occurs elsewhere in the country, it was decided to apply the questionnaire in three different periods: December 2010 (corresponding to the low season - 90 questionnaires); April 2011 (corresponding to the mid season - 90 questionnaires); and, July and August (corresponding to the high season - 96 questionnaires). A total of 300 questionnaires were filled in, of which 276 were properly completed and provided usable data.

<i>Characteristics</i>	<i>N</i>	<i>%</i>
<i>Gender</i>		
<i>Male</i>	102	37
<i>Female</i>	174	63
<i>Age</i>		
<i>0 – 25 years</i>	40	14,5
<i>26-45 years</i>	133	48,2
<i>46-65 years</i>	89	32,2
<i>More than 65 years</i>	14	5,1
<i>Education</i>		
<i>Basic/Secondary</i>	36	13,3

<i>Season</i>		
<i>High</i>	90	32,6
<i>Middle</i>	90	32,6
<i>Low</i>	96	34,8

Table 1 - Sample characteristics

Results and discussion

Table 1 presents the profile of the survey respondents. The low, medium and high seasons are equivalent in number to avoid bias in the analysis of the data. The characteristics of tourists that visited Guimarães are relatively young, with more than half of the sample under 45 years old. They are well educated (above 86.7 percent possess a university degree) and mostly are married. The level of education is one of the characteristics that Silberberg (1995) identified has been part of the heritage tourist. On the contrary, significant differences were found between the age cohort of tourists visiting

Guimarães (mostly under 45 years old) and the Silberberg (1995) study (relatively older). However, Perez (2009:126, citing Richards, 1996 and 1997) refers that the profile of cultural tourists is increasingly younger. These different age profiles could be explained by the context (country, region, heritage site type) and time (year, seasonality) where these studies have been taken. Given the nature of our sample (composition and size), no further considerations will be made regarding a definitive and specific typology of heritage tourists.

The results presented in Table 2 suggest that touring around the region is very important for cities such as Guimarães which depends on the capacity of attraction of other middle cities located in the region. When considered as a set of cities (Guimarães, Braga, Viana do Castelo) its total attraction capacity improves more than seven times. However, Porto still is the main “entry door” (71 percent) to the northern part of Portugal. First, because it is endowed with an international airport, a network of public transports (railways, buses, underground) and it is the place of departure for boats that travel to Douro. Second, Porto metropolitan area has a critical dimension that enhances accommodation supply, both, in terms of quality (different star hotels) and quantity (number of beds). Finally, a wider range of attractions and experiences is available to different typologies of tourists in the metropolitan area, such as beaches, museums, Porto wine caves, and shopping. Besides the importance of Porto as a tourism destination, it is very important that all the cities belonging to the northern region could benefit from tourism. The creation of thematic itineraries (such as religious and wines routes), linking different towns and rural communities outside the Porto metropolitan area, is one strategy to increasing the potential contribution of those places to regional development. However, a major constrain persists which is the tourism seasonality. Different strategies have been implemented to attenuate this phenomenon which includes attracting selected typologies of tourists (such as seniors), organization of special events, academic conferences, professional seminars, among others.

<i>Destination</i>	<i>N</i>	<i>%</i>
<i>Guimarães only</i>	<i>32</i>	<i>11,6</i>
<i>Braga</i>	<i>145</i>	<i>52,5</i>
<i>Porto</i>	<i>196</i>	<i>71,0</i>
<i>Viana do Castelo</i>	<i>76</i>	<i>27,5</i>
<i>Douro</i>	<i>63</i>	<i>22,8</i>
<i>Others</i>	<i>52</i>	<i>18,8</i>

Table 2 – Destinations visited by tourists

Table 3 shows the main motivations of tourists for visiting Guimarães. As we can see, a particular attribute of the city (world heritage site) seem to shape the image of Guimarães and has a significant effect on tourists’ choices. This particular reason could be associated with the “tourists’ willingness to learn” (Poria, Butler and Airey, 2004) or “educational value” (Goh, 2010) that motivates tourists to live a learning experience. On the opposite side of the motivations spectrum we had tourism related activities such as touring (57.2%), cultural activities (19.2%) and other minor motivations. These

motivations could be associated to the “tourists’ desire to be entertained” (Poria, Butler and Airey, 2004) that motivates tourists to live a recreational experience.

<i>Motivations</i>	<i>N</i>	<i>%</i>
<i>World heritage site</i>	<i>221</i>	<i>80,1</i>
<i>Touring, visiting cities in the region</i>	<i>158</i>	<i>57,2</i>
<i>Business</i>	<i>10</i>	<i>3,6</i>
<i>Religious</i>	<i>7</i>	<i>2,5</i>
<i>Gastronomy and wines</i>	<i>47</i>	<i>17</i>
<i>Conference and seminars</i>	<i>4</i>	<i>1,4</i>
<i>Cultural activities</i>	<i>53</i>	<i>19,2</i>
<i>Sport events</i>	<i>4</i>	<i>1,4</i>
<i>Visit to family and friends</i>	<i>14</i>	<i>5,2</i>

Table 3 – Tourist’s motivations

The results show that Guimarães is perceived by visitors as a heritage and cultural city encompassing monuments (castle), a historic centre, architectural buildings and artistic jewels. Respondents completely agree or agree with this assertion (80.4% and 72.8%, respectively), accounting each item with mean values higher than 4. This is in line with the declaration of Guimarães as a UNESCO world heritage site in 2001. The item “welcoming city” was also pointed out by most of the tourists (67%) visiting Guimarães, which considered it a friendly city, where the residents are helpful and sympathetic. Another attribute saliency of Guimarães was the linkages to the birth of Portugal as a nation and king Afonso Henriques. The least relevant perceived attributes of the city were “health services” and “business dynamism” (mean values around 3) probably because they did not experience the health services and the business environment was difficult to envisage.

Table 4 presents the perceptions of all respondents regarding the different attributes of Guimarães as a heritage destination.

Table 5 presents the results of the factor analysis. The Kaiser-Meyer-Olkin (KMO) test and Bartlett’s test of sphericity were computed to assess the appropriateness of factor analysis to the data. The KMO value was 0.859, and Bartlett’s test was significant at the 0.00 level. Both results demonstrate the factorability of the matrices being considered (Hair et al., 1995). Principal component factor analysis with varimax rotation was used to identify the underlying dimensions. After inspection of item content for destination image, two items were deleted corresponding to a fifth factor with a Cronbach’s alfa less than 0.6. A final four factor model was estimated with 19 items. The factor solution accounted for approximately 52.7% of the total variance explained, with all communalities ranging from 0.316 to 0.697.

The factors represent the overall perception of all respondents regarding the destination image of Guimarães and were labeled: “historical background and functionality”, “shopping and entertainment”, “convenience”, and “efficiency”. Factor 1 is related with the basic characteristics of the city, and it is responsible for explaining 31.33% of the total variance found, with a reliability coefficient of 0.798. It is followed by Factor 2 (9.82% of total variance and Cronbach’s alpha level of

0.730), which comprises items related to shopping and entertainment, as expressed by good range of entertainment in terms of quality and quantity and good shopping opportunities. Complementary to Factor 2 is the youth population and regional centrality. Factor 3, labeled “Convenience”, contains accommodation, gastronomy and sympathy of the host population (6.22% of total variance explained with the alpha level of 0.663). The final factor “Efficiency”, represents 5.39% of the statistical variance and had a reliability alpha of 0.662. This factor is associated with the good promotion of cultural events and of the city and with the professionalism and prices of services.

<i>Attribute</i>	<i>CD</i>	<i>D</i>	<i>N</i>	<i>A</i>	<i>CA</i>	<i>Mean (a)</i>	<i>SD</i>

Notes: CD – Completely disagree, D – Disagree, N – Neutral, A – Agree, CA – Completely agree. SD – Standard deviation. (a) Items measured on a 5-point Likert-type scale.

Table 4 – Attribute Perceptions of Guimarães as a heritage destination

Considering the internal consistency of the items within each dimension measured by examining the Cronbach reliability alphas, these show a high level for factors 1 and 2 but lower for factor 3 and 4, suggesting lower reliability. In fact Nunnally (1978) suggests that reliability alphas close to 0.70 indicate a high level of internal consistency between the individual scale items and the related factors.

The results of Table 5 indicate that tourists' perceptions can be described in four dimensions: “historical background and functionality”, “shopping and entertainment”, “convenience”, and

“efficiency”. The dimensions were found to be reliable and valid, with “historical background and functionality” and “shopping and entertainment” as the two main factors.

The dimension “historical background and functionality” aggregates the main attributes that tourists perceived as unique and clearly distinct regarding other cities in the region. Each tourist has an image of all destinations where he/she has been to, but only remembers some of them if that image is truly remarkable. From the tourists’ perspective, Guimarães is an accessible and safe city, place of birth of Portugal, with a historic centre and monumental and artistic heritage, easily visited by people. This factor should support a differentiation strategy aimed to position the city as a set of historical attributes (tangible and intangible), beliefs, ideas and impressions that people associated with the birth of Portugal (Crompton, 1079; Kotler, Haider and Rein, 1993). The European Capital of Culture that takes place during 2012 is an excellent opportunity to reinforce this niche positioning and shape the image of Guimarães.

The dimension “shopping and entertainment” contains less potential for differentiation. These attributes are more deeply rooted in cities that compete directly with Guimarães, such as Braga, Viana do Castelo or Porto.

The last two dimensions (convenience and efficiency) are an integral part of a large set of attributes that need to be fulfilled in order to attract tourism. Good food, sympathetic people and quality hotels are only pre-conditions not differentiators of a welcoming city. Also, a high level of professionalism in services and communication-mix are needed to maintain tourists’ satisfaction.

In brief, the four factor solution offered by the analysis includes a major intangible factor of differentiation that surpasses all the other three, that is, the historical heritage of the city and all the imagery around characters (king Afonso Henriques), places (castle) and stories. These attributes should be the central element of the city image, positioning and communication-mix, rather than entertainment and shopping, convenience or efficiency.

Table 5 - Principal Component Analysis with Varimax rotation (n= 276)

Conclusions

Tourists who arrived to Guimarães seem to come, mostly, from Porto and Braga. This shows that the city keeps being an emergent destination and is part of tourists' tours which incorporate the visit to more than one site.

The tourists that visited Guimarães are relatively young and well educated compared with the average tourists that visit Portugal and relatively different from the cultural tourist profile reported by the empirical literature. The perceptions they have towards the city as being a heritage city (UNESCO destination site), with a historic centre, architectural buildings and monuments (castle) shapes the image of Guimarães and have a significant effect on tourists' choices. The main motivation of tourists for visiting Guimarães was educational, rather than recreational as they want to live a learning experience. The results indicate that many tourists are aware of the city status as a world heritage site.

The factor analysis indicates that "historical background and functionality" and "shopping and entertainment" are the most reliable and valid factors behind the choice of visiting Guimarães. The city was considered by tourists as an accessible and safe city, place of birth of Portugal, with a historic centre and monumental and artistic heritage, easily visited by tourists. The dimension "shopping and entertainment" is more deeply rooted in cities that compete directly with Guimarães, such as Braga, Viana do Castelo or Porto. Therefore, a differentiated image must be based on the historical background of the city, rather than on the other three dimensions (shopping and entertainment, convenience and efficiency). The positioning and communication-mix should be designed around characters, places and stories in order to detach the historical background of the city.

The present study is a snapshot, assessing tourist perceptions in a particular time (December 2010, April 2011, July/August 2011) and location (Guimarães). More studies are needed to cover more points in time and other locations around the country in order to compare for differences and similarities between the perceptions of heritage destinations sites (such as Douro).

The increasing number of flights of low cost companies to/from Porto and the significant growth in tourists that came to Porto to stay for a weekend (short breaks) denote the potential of the northern Portugal as a tourism destination. In this context, more in-depth analysis is needed in order to study the characteristics of visitors and the type of holiday activity. Of particular importance is the knowledge of tourists' typologies (country of origin, demographics, social and economic status), visit patterns (itineraries, duration, information sources, etc.), motivations to visit different cities and image perceptions. The results of these studies are critical for local tourism organizations (such as hotels, travel operators, politicians) to design consistent strategies to improve the movements of tourists around the entire region. Otherwise, even culturally motivated tourists interested in exploring new places and diversify experiences will tend to remain in Porto.

Acknowledgements are deserved to Vítor Marques who collect the data.

THE ROLE OF ORGANISATIONAL CULTURE ON THE OCCURRENCE OF WORKPLACE BULLYING: EFFECTS ON ORGANISATIONAL COMMITMENT AND JOB SATISFACTION

Galanak, Eleanna¹

¹ Lecturer in Behaviour of Organisations, Athens University of Economics and Business, Department of Marketing and Communication

Abstract

This paper focuses on workplace bullying and the relation of its occurrence with the organisational culture and values. Although a significant amount and level of research has been realised on workplace bullying, it mostly focuses on the incidence and implications of the phenomenon for the individual experiencing it (victim), or the one exercising it (bully). Based on a 364- respondents survey, we explore the relation of the incidence of workplace bullying with the 9 dimensions of organisational culture, as developed for the Globe research project (Dorfman and House, 2003, House and Javidan, 2003), which, along with the Hofstede one, is one of the most renowned studies on organisational culture. Concurrently, the relation of the 9 organisational culture dimensions with organisational commitment and job satisfaction are explored. This work furthers the study of organisational culture on dispositional and attitudinal measures, while it is one of the first to examine the relation of the incidence of workplace bullying based on organizational culture.

Keywords: Workplace bullying, organisational culture, commitment, job satisfaction, Greece, negative acts questionnaire, GLOBE

Introduction

The term “workplace bullying” was introduced in the early 1990’s, to represent a rather common, with very serious repercussions, yet overlooked phenomenon. At the time, it was noticed that severe stress is caused to employees by constant and repeated intimidating and demoting actions occurring in their everyday life, and to which they have difficulty to stand up to. At the time, sexual harassment was a much debated issue and the early researchers of workplace bullying noticed the similarity among the two phenomena, especially in terms of frequency and severity of impact on well-being (Einarsen, 1999).

To give a definition, “Bullying takes place when one or more persons systematically and over time feel that they have been subjected to negative treatment on the part of one or more persons, in a situation which the person(s) exposed to the treatment have difficulty in defending themselves against them. It is not bullying when two equally strong opponents are in conflict with each other” (Einarsen et al., 1994, Nielsen et al., 2009). As Einarsen put it, workplace bullying has two main features: repeated and enduring aggressive behaviours (a) that are intended to be hostile and/or perceived as hostile (b) by the recipient (Einarsen, 1999).

The aim of the current research is to explore whether organisational traits, such as organisational culture- practiced and desired value system- is related to specific levels of workplace bullying.

Literature Review

The literature on workplace bullying could be divided in two broad sets of studies:

Studies focusing on the measurement and assessment of the bullying phenomenon

Despite the many years since workplace bullying first started to be discussed, a major issue in the workplace literature still remains the assessment of bullying occurrence. Many recent papers deal and focus on the issue of how we should measure workplace bullying (see for example Einarsen et al. (2009) and Notelaers et al. (2006). In a recent work, Nielsen et al (2009) have performed a review on international studies reporting prevalence of workplace bullying and found that the percentage of bullying occurrence ranges from 1 to 55%, depending on the type of measurement used and the country in which the study was realised. A recently presented study in Greece has indicated that workplace bullying in 800 white-collar workers occurs at 13% of the sample, with the use of a very conservative measurement technique of the phenomenon (Galanaki and Papalexandris, 2011). Therefore, despite the differences observed in the exact occurrence level, depending on the specific study and research setting, workplace bullying is a reality and its incidence has been repeatedly documented in the past.

Studies focusing on the measurement and assessment of the bullying phenomenon

Some of the reported effects of workplace bullying are anxiety, irritability, feelings of depression, paranoia, mood swings, feelings of helplessness, lowered self-esteem, physical symptoms, social isolation and maladjustment, psychosomatic illnesses, depression, helplessness, anger, anxiety, despair, burnout, lowered job satisfaction and wellbeing (Matthiesen and Einarsen, 2004, Lutgen-Sandvik, 2008, Lutgen-Sandvik et al., 2007). Many researchers have focused on the long-term effects of bullying at work, notably post-traumatic stress disorder (PTSD) (Matthiesen and Einarsen, 2004, Mikkelsen and Einarsen, 2002). Apart from its direct effects, bullying also has indirect implications on long-term behaviours. One of the most characteristic, for the depth of the outcomes of bullying, is counter-aggression by the victim (Lee and Brotheridge, 2006).

A somewhat different way to approach workplace bullying is from the organizational standpoint. The effects of bullying don't only restrict to the victim(s) of bullying. Much has been written about organizational or group effects, such as the quality of the working environment (Einarsen et al., 1994), or the intention to leave (Djurkovic et al., 2008). On the other hand, organizations are seen as both responsible for the incidence of bullying (Coleman Gallagher et al., 2008, Hauge et al., 2007, Hoel and Cooper, 2000, Salin, 2003) and the key to reducing the frequency of the phenomenon or the severity of its impact (Health and Safety Authority, 2007, Hodson et al., 2006, Bulutlar and Oz, 2009, Coyne et al., 2003, Namie, 2007, Rayner, 1999, Salin, 2009, Sheehan and Barker, 1999, Tehrani, 2005).

The role of organisational culture

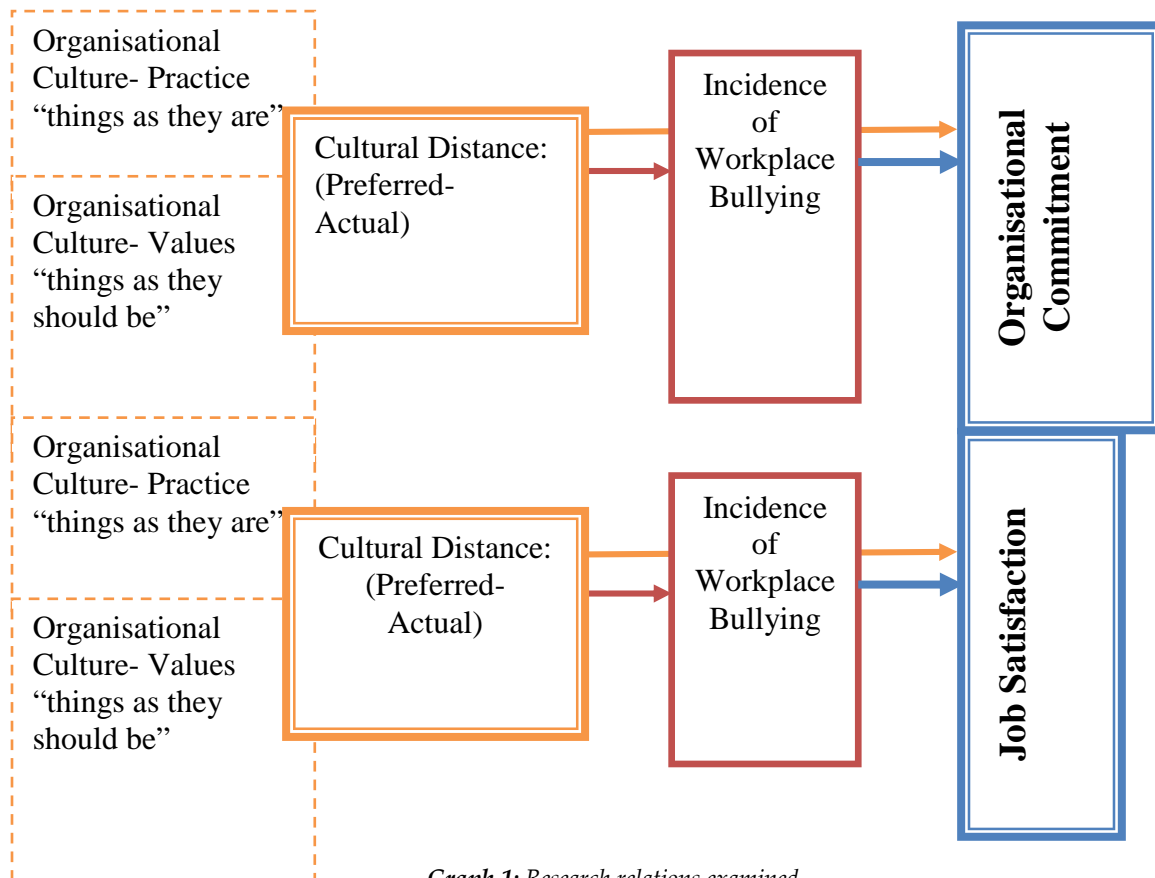

Organisational culture is seen by business and organization scientists as both the key in changing things to the best and an impediment when attempting to alter negative behaviours. To put it in simple terms, culture is “the way we do things around here”, so it both makes members of a group identify with each other and allows them to make apart from non-members. organizational culture may either support or obstruct workplace bullying. For example, one of the early studies on workplace bullying focused on the military culture, as fostering the occurrence of the phenomenon (Archer, 1999). On the other hand, a “culture of respect” is proposed as a way to diminish the probability of workplace bullying occurrence (Tehrani, 2005). However, there has not been any significant research relating recognized organizational culture dimensions with workplace bullying occurrence.

One of the most recognised studies on organisational culture globally is the Globe project, under the direction of the late Robert House. This methodology is based largely on Hofstede’s work and is one of the most well-known global initiatives to study organisational culture (Chhokar et al., 2007, House et al., 2004). The nine cultural dimensions measured under the Globe methodology are:

- Uncertainty Avoidance: Practices adopted to avoid the uncertainty existing among societal members
- Future Orientation: the degree to which individuals in organizations or societies engage in future-oriented behaviours (e.g. planning, investing in the future, delaying gratification).
- Power Distance: Centralization and the gap in power between different hierarchical levels of society
- Institutional Collectivism: The extent to which society favours cooperative, vs individualistic behaviour
- Humane Orientation: Support of human beings including generosity, concern and friendliness
- Performance Orientation: the extent to which an organization or society encourages and rewards group members for performance improvement and excellence.
- Family Collectivism: Family/ internal group emphasis. Strength of the family/friends bond.
- Gender Egalitarianism: The extent to which society tries to minimize the different roles of the two sexes
- Assertiveness: The degree to which individuals are encouraged to be dominant and aggressive.

The role of organisational commitment and job satisfaction

Two focal employee attitudes that have been traditionally studied in conjunction with personal and organizational effectiveness and results are organizational commitment and job satisfaction. However, these two attitudinal traits, though studied in-depth and in relation with multiple effectiveness indicators (Dimitriades, 2011), have not been studied in relation with workplace bullying. In fact, the study of workplace bullying effects mostly focuses on effects on behaviors (such as for example, depression, productivity or counter-aggression), rather than on attitudes. The sole such research that we identified is one focusing on the “intention to leave” (Djurkovic et al., 2008), which again is not purely an attitude, but rather an intention for a specific behavior.

Graph 1: Research relations examined

Aims and Objectives

The current paper tackles with three major questions:

- Does organisational culture and values have an impact on the frequency of occurrence or intensity of workplace bullying? Which culture dimensions are mostly related with the incidence of workplace bullying and how should organisations with a culture “friendly” to bullying phenomena could shield themselves from its occurrence?
- How does workplace bullying affect the overall organisational commitment?
- How does workplace bullying affect job satisfaction?

The above questions and relations that we attempt to test are graphically depicted in Graph 1 that follows:

As Graph 1 shows, we are going to examine whether cultural distance (the dissonance between actual and desired culture of the firm) is connected with the incidence of workplace bullying on the one hand and with job satisfaction and organizational commitment on the other. The connection of workplace bullying and job satisfaction and organizational commitment are also going to be examined.

Research Methodology

Sample and data

A survey to 364 white-collar workers from different companies of diverse sectors was conducted in spring and autumn 2011. Convenience sampling was used: we gathered 4-10 employees with at least 2-years working experience from each organisation that we visited and we asked each of them to complete a questionnaire.

Measurement and scales

- Organisational Culture

Organisational culture was measured and assessed with the use of the Globe questionnaire on Organisational culture. This instrument has been used extensively as a way to evaluate 9 major cultural dimensions of an organisation and is considered as one of the most reliable scales for the measurement of organisational culture, globally (Chhokar et al., 2007, House et al., 2003). It measures, through a 7-point Likert-type scale, 9 cultural dimensions through 34 questions on the organisational culture “as it is” and 41 questions on organisational culture “as it should be”, therefore identifying two organisational cultures/ value systems: the actual and the ideal.

The nine cultural dimensions measured through the questionnaire were explained above and are the following:

- Uncertainty Avoidance
- Future Orientation
- Power Distance
- Institutional Collectivism
- Humane Orientation
- Performance Orientation
- Family Collectivism
- Gender Egalitarianism
- Assertiveness

- Workplace bullying

The authors of the present paper measured the occurrence of bullying with the operational method. The Negative Acts Questionnaire (NAQ) was used, with 21 types of Negative Acts, which may arise within the working environment, such as intimidation, constant critique of work and efforts, rumours, false allegations and others. This instrument is one of the most widely recognised and accepted ways of measuring workplace bullying (Einarsen et al., 2009). The statements describing the different negative acts were followed by a scale from 1= never, 2= yes, occasionally, 3=yes, at least once a month, 4=yes, at least once a week, 5=yes, every day.

If a respondent answered receiving at least 3 Negative Acts from the list every week or more frequently, we treated this person as a bullying victim. Therefore, the variable of workplace bullying was treated as a dichotomous one of yes/no.

- Organisational Commitment

Organisational Commitment was measured with the Meyer and Allen commitment questionnaire (Allen and Meyer, 1990). This questionnaire measures, through a 5-point Likert-type scale, 3 dimensions of organisational commitment, i.e. affective, normative and continuance commitment through 27 questions (9 for each dimension) and is most probably the most well-known and widely accepted instrument for the measurement of organisational commitment (Dimitriades, 2011).

- Job Satisfaction

Job Satisfaction was measured with the overall job satisfaction questionnaire (Fields, 2002:5). This questionnaire measures job satisfaction with 3 questions, at a 5-point Likert-type scale, and has been widely used in organisational research, with alpha coefficients ranging from 0.67 to .95.

Findings

Profile of the 364 respondents

Table 1, below, gives a rough image of the sample collected.

Description of the answers that were given

As a way to present the findings on each of the major variables examined here, Table 2 presents the Descriptives for each of the 9 Organisational Culture dimensions while Table 3 presents the Descriptives for workplace bullying occurrence, organizational commitment and job satisfaction.

	<i>Mean</i>	<i>Minimum</i>	<i>Maximum</i>	<i>Std. Deviation</i>
<i>Age</i>	38.70	20	65	9.489

***Being a bullying victim or not is a dichotomous variable, therefore, for only for this variable, the correlations depicted are Spearman's Rho*

Table 4: Correlations (Only statistically significant, at the 0.05 level, Correlations are depicted)

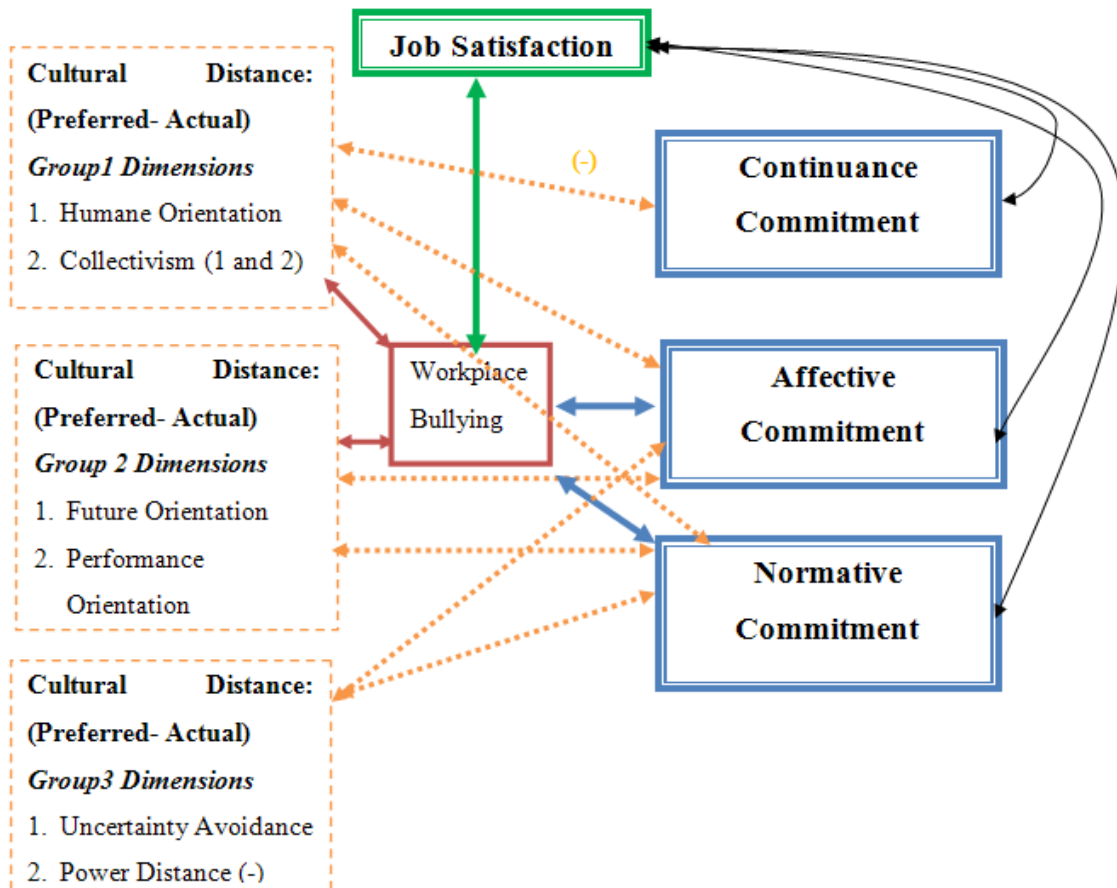

Having observed the existence of significant correlations between specific cultural dimensions, commitment, satisfaction and the occurrence of workplace bullying, it was deemed necessary to run a test of difference of means between victims and non-victims of workplace bullying, for all the culture dimensions of cultural dissonance (difference of culture as is and as should be), for organizational commitment (affective, continuance and normative) and for job satisfaction. This analysis is depicted in Table 5 that follows.

		<i>F</i>	<i>Sig.</i>	<i>Mean</i>	<i>Std. Deviation</i>

Table 5: Analysis of Variance (ANOVA) for victims and non victims of workplace bullying.

Discussion

Graph 2, below, depicts the main relations found through our analyses. Each arrow represents a significant and meaningful relation between the two variables that it connects.

Graph 2: Confirmation of Research relations that were tested

It should be underlined that, as expected, all the 3 dimensions of commitment are positively and significantly correlated with each other. Graph 2 does not show these correlations for reasons of presentation cleanness.

Effects on Job Satisfaction

From the relations depicted in Graph 2, the first that asks for attention is the fact that organisational cultural distance (desired – practiced values), although significantly correlated with specific dimensions of commitment, is not related with job satisfaction. So, it seems that respondents are not affected by organisational culture and value dissonance, when they express how much their job satisfies them. However, as one would expect, the victims of workplace bullying reported significantly lower job satisfaction than non-victims.

Effects on different facets of organisational commitment: three groups of cultural dimensions

Another important finding was that continuance commitment appears to relate with organisational culture, in a much differentiated way, if compared to the other two organisational commitment dimensions (affective and normative). For example, people who find that humane orientation should be higher in their firm are more committed to the firm from concern on what their employment alternatives are (continuance commitment), while they are less affectively or normatively committed.

The same is true for in-group (1) and out-group (2) collectivism, so we named these three cultural dimensions (humane orientation and the two collectivisms) "Group 1 Cultural Dimensions". All these dimensions are related with the occurrence of workplace bullying in a positive way, so people reporting being bullied would also wish for a higher value practice of the specific culture dimension (more humane orientation, more collectivism). This is a very meaningful and useful result, as it shows that companies with higher collectivism and humane orientation values are less nurturing for bullying behaviours.

We also identified a second group of cultural dimensions, which also had a significant correlation with the occurrence of workplace bullying, as was also confirmed through ANOVA. These two cultural dimensions are Future Orientation and Performance Orientation. Bullying victims wished for a higher practice of these cultural dimensions, than non-bullying victims did. It makes sense that none of these dimensions showed any relation with the level of continuance commitment, but they were significantly correlated with affective and normative commitment. Therefore, in organisations with less dissonance (values-practice) in future orientation and performance orientation culture, commitment (affective and normative) is higher and bullying more scarce.

The third group of cultural dimensions gathers two dimensions, i.e. uncertainty avoidance and power distance. Both of them are related with affective and normative commitment, as the people wishing for higher future orientation and lower power distance are prone to be less affectively and normatively committed to the organisation. This discrepancy, however, is not related with the occurrence of workplace bullying. So, bullying victims do not wish for a different practice of these cultural dimensions than non-victims. This is very important and actually striking. One would expect that power distance is something that people who receive bullying would like to be diminished. It should be kept in mind that the most common bully for employees still proves to be the supervisor. A lower power distance might allow for the bullying victims to stand up against their persecutor, but this is not expressed through our research findings.

Conclusions

This study confirmed previous studies' findings on the occurrence of workplace bullying in Greece (Galanaki and Papalexandris, 2011), positioning it at 13% of the sample. This underlines the critical importance of studying and taking measures against this quite common phenomenon within organisations.

Bullying was also found to correlate highly with organisational culture dissonance, therefore underlying from another perspective the need for organisations to monitor cultural dissonance and the conflict in personal and organisational values.

On this, we should stress that organisations, being responsible for a safe working environment for their employees, have a particular interest to help reduce to the minimum the incidence of bullying phenomena. This does not simply emanate from a social responsibility and ethical stance of the

employer. It is a pragmatic and realistic requirement, in order to provide the necessary conditions for good performance and excellence to occur.

In relation with the three research questions that this paper sought to answer:

- “Does organisational culture and values have an impact on the frequency of occurrence or intensity of workplace bullying? Which culture dimensions are most related with the incidence of workplace bullying and how should organisations with a culture “friendly” to bullying phenomena could shield themselves from its occurrence?”

Our findings depicted that indeed organisational culture and specifically the difference between desired and manifest organisational culture is significantly related with the occurrence of workplace bullying. This is true for the “Humane Orientation”, “Collectivism”, “Future Orientation” and “Performance Orientation” cultural dimensions. Therefore, organisations in which individuals feel that humane orientation, collectivism, future and performance orientation are lower than they should are most probable to experience workplace bullying of their members. So, these organisations should focus on adopting practices that diminish this gap between expected values and actions. This also underlines the importance for organisations to align their values and practices to the values of the society in which they operate, as a way to diminish cultural distance.

- How does workplace bullying affect organisational commitment?

Our data revealed that bullying is related in a negative way with organisational commitment. Although we are not able to check for the direction of this relation, it is rational to expect that where there is bullying, the commitment is lower (in other words, that the independent variable should be bullying and the dependent, commitment). So, workplace bullying victims are less committed to their organisation, which proves unable to protect them from a very negative experience. On the other hand, continuance commitment, or commitment from concern for the employment alternatives was not found to relate in any way with workplace bullying, as this should be dependent more on the external employment market circumstances, than on experiences with the current employer.

- How does workplace bullying affect job satisfaction?

Our findings reveal, as one would expect, that indeed job satisfaction is lower where bullying occurs. Again, the direction of this relation is not known, but it is rather rational to expect that bullying makes people less satisfied with their work.

Limitations and suggestions for future research

This study was exploratory in nature, therefore suffers from the most common weaknesses of exploratory works. Results mostly focus on the existence of relations, and causality is hard, if not impossible to sustain. Another obvious limitation has to do with the sample size (n=364), which is quite small for a study with a large number of studied variables. Another limitation has to do with the level of analysis, which here was the employee/person. For more meaningful results, it would be

useful to focus on the organisational level, with more individuals answering from each organisation, so that comparisons are done at the organisational level.

A suggestion for future research, therefore, has to do with a more large-scale research that would allow both for comparisons within the organisation and across organisations with different organisational culture. If, in addition, this were realised at the international level, it would also allow to better control the effect of national culture on the difference between desired and manifest organisational culture, which would be of most value especially to multinationals, where the discrepancy between desired and actual culture is most pronounced due to different national backgrounds of the individuals involved.

PPP LAW AND RISK MANAGEMENT

Galiotou, V.¹; Maniatis, A.²

¹ Project Manager, M. Sc., Hellenic Open University, Greece and Mechanical Engineer, National Technical University of Athens, Greece. E-mail: galiotou@gmail.com

² Adjunct Assistant Professor of the Business Administration Department of the Higher Technological Educational Institute of Patras, Lawyer, Greece. E-mail: maniatis@dikaio.gr

Abstract

The PPP is a new trend in Europe, where more and more countries award public works or services to private partnership, in order to obtain several benefits. This paper tries to present the Greek legislative content, as well as the different aspects of a PPP. Law 3389, which is in force from 2005, regulates the award procedure, establishes the rights of the contractor and includes deviations from special clauses, in order to facilitate and accelerate the implementation of a project. Before the legislative ratification of the above mentioned law, almost all public projects were implemented through concession agreements, thus the differences of the two partnerships are described. In Greece, several companies, where the state is involved, are covered neither by the classic law on public works, nor by the one on PPP. So, there is a specific legal regime ruling the way these companies operate. Such partnerships could be called institutional PPPs.

Although, PPPs are preferred in Europe for the implementation of infrastructures, due to the obvious opportunities they offer, there are also several risks that should be examined. Risk management of the PPP should be performed during the early stages of the project. Although through the right planning lots of risks could be avoided, several opportunities may emerge. The economic crisis in Europe, especially in Greece, has affected the construction and design sector. The PPP, through the development of a stable legislative framework, could reveal an excellent opportunity not only for the Greek state, but also for enterprises.

Keywords: Public Private Partnership (PPP) Contracts, Greek legislation, Risks & Opportunities, Management, Concession contract, Institutional PPP

Introduction

The acronym PPP stands for the Public Private Partnerships, which consist of the partnerships contracts that are signed between a public carrier, such as the State, the local government organizations, the legal entities under public law and the (public) companies, whose their capital share is held by the above mentioned public sectors, with a private partner (Maniatis, 2008). This joint operation mainly refers to the execution of projects (construction of technical works) or the provision of services to the society. The private entity, meaning the private partner, concludes the Partnership Contracts or Ancillary Agreements through a special purpose company, established solely and exclusively by the above mentioned entity for the implementation of the Partnership. These companies should have their registered headquarters in Greece and the only parties eligible to hold

shares are the private partners and third parties, excluding the public entities. So, a mixed economy society, belonging not only to private, but also to public carriers, is legally excluded as the contractor of the public partner.

PPPs are generally considered as a new trend worldwide. The first country that dealt with the PPP model was the United Kingdom, where the implementation of the project in the traditional way led to several budget overruns and delays. Nowadays, 88% of the projects in the UK are procured through PPPs. The benefits of such a decision consist in the delivery of the project in time, within the initial budget, with a reduced cost. Subsequently, other European countries followed the successful model of the PPPs. Such countries are Portugal, Spain, Italy, Netherlands, and France. PPPs have been introduced into the Greek legal order by law No. 3389/2005. As subsets of the PPP model could be considered the concession agreements and the "institutional" PPPs.

In PPP, amortization and remuneration are made viable because the cost of providing the service is either jointly borne by the users of the services and the government through a capital subsidy (sponsored PPP) or wholly borne by the Public Administration (administrative PPP), although the payment to the private partner merely by the users is not excluded, at least legally. According to scientific literature (Marques and Berg, 2010), the impact of private sector participation and PPP contracts in infrastructure, has been often positive. Most PPP contracts have provided value for money and have helped to solve serious problems of coverage and quality of service both in the developed and developing world. However, some outcomes have been problematic, with failures in many PPP contracts, including breakdowns and early termination of contracts. In fact, many PPP contracts are re-negotiated.

The PPP Contracts

The legislation content and the application of law No. 3389/2005

In Greece the applicable legislative regime consists in law No. 3389/2005 (Gazette of Government 232/A, 22.09.2005), as slightly modified by law No. 3483/2006 (Gazette of Government 169/A, 07.08.2006). In order to submit a work or a service to the PPP model, the conditions to meet are the scope of the contract, which, as previously mentioned, is either a technical work or a service, the undertaking of an essential part of the risks by the private partner in the frame of the allocation of risks between the contracting partners, the financing model having to do with financing the contractual scope with assets coming from the private partner and the fact that the upper cap of the budgeted cost is two hundred million Euros (200.000.000,00 €).

The aforementioned principal law has previewed the Joint Ministers' PPP Committee and the Special Secretariat for the PPP. These two authorities have several competencies, including the selection procedure, the evaluation of the proposal and, in general, the administration of the process, and take several decisions and actions, which are mentioned in article 3 and 4 of the law respectively. It is to pay special attention that the law authorizes the Committee to decide unanimously the

submission of an object to the PPP model, even if one of the last three aforementioned conditions is not met. This has been the case of the Pediatric Hospital in Thessaloniki, whose budgeted cost is approximately the double of the legally previewed. According to the provisions of Articles 5, 6 and 7 of the Privatization Law 3049/2002 (Gazette of Government 212/A, 10.09.2002) any reference to the Joint Ministers' Privatization Committee or TO the Special Secretariat for the Privatization is understood as a reference to Joint Ministers' PPP Committee and to the Special Secretariat for the PPP respectively (Maniatis, 2008).

The major part of the law regards to the award of the contract, where the contracting authority, meaning the public party, is responsible for the invitation to tender, the bid evaluation, as well as the award of the contract to the most advantageous offer or the lowest price, according to what has been declared within the tender.

This procedure has to be in accordance with several fundamental principles, related to the general principle of rule of law. Analytically, the equal treatment principle means that the contracting authority should avoid any discrimination. According to the transparency principle, the public sector should announce and declare the intention of partnership, in order to give the chance to any party to participate. The proportionality principle requires that the measures that should be taken by the contracting authority for the resolution of any problem during the implementation of the financial activity should not be excessive, against the fundamental rights of any involved person. The qualifications, the titles, the certifications, as well as the technical specifications of each tender should be evaluated and accepted by the public entity. In other words, if the participant is a foreigner, he is supposed to justify that the above mentioned characteristics are equal to the national ones, according to the mutual recognition principle. The protection of the public interest principle implicates respect for the fortune of the state and suggests the necessity of the public control of the services offered to the users. In PPPs the public partner financing should be minimized, as possible. During the bid evaluation, the public party should justify any relevant decision, according to the protection of the rights of the private individuals principle. Besides, the free competition principle ensures the participation of a large amount of bidders, wages a competition with equal rights and criteria and disinclines the development of monopolies. Last but not least, the protection of the environment principle and the sustainable development one focus on the protection of the natural and cultural environment.

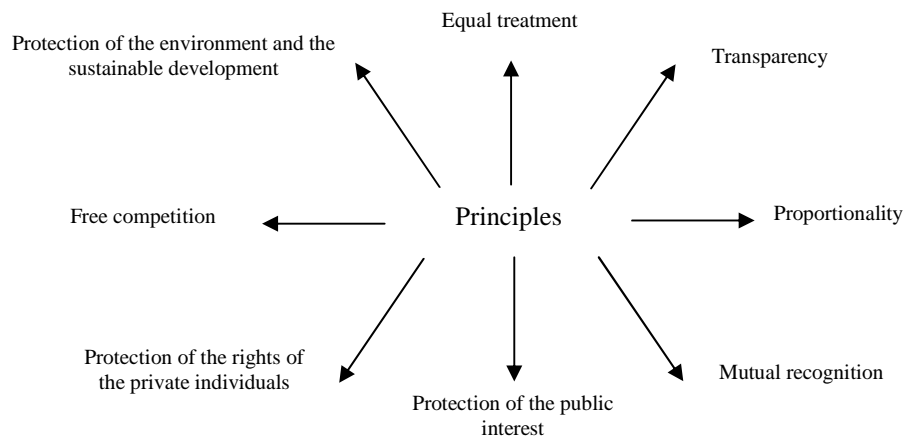

Figure 2: Main principles to take under consideration during the bid selection

Contracts are awarded by the Public Entity acting as the Contracting Authority either on the criterion of the most economically advantageous bid or on the criterion of the lowest price. The main difference of the two criteria is that in the first case, apart from the price, other parameters are examined and evaluated by the contracting entity. Such parameters could be the quality, the technical completeness, the operation characteristics, the environment, the operational cost, the efficiency, the completion date etc. The minimum qualifications and abilities of the participants are clearly defined by the Invitation to Tender.

There are four procedures for the selection of the candidates, the open procedure, the closed one, the competitive dialogue procedure and the negotiated procedure. The procurement procedure is completed with the selection of the private partner and the signing of the PPP contract (Patrikios, 2009). In the first procedure any interested person may submit an offer, while the closed procedure is restricted, as the companies that may submit their offer are preselected by the contracting authority. The minimum number of candidates that must participate in this type is five. In the competitive dialogue procedure the participants should also be invited by the public sector, but the number of applicants is more limited. Soon after the completion of the evaluation, the public partner should invite, minimum, three participants, in order to conclude, which candidate is the most suitable. In the last procedure the public sector negotiates the contractual terms before the selection. In the case of complex contracts, the process of the competitive dialogue or the negotiated procedure may be adopted. In Greece, PPPs already assigned have followed the closed procedure.

During the bid evaluation the contracting authority examines three points. The first one has to do with the reasons, for which a candidate should be excluded from the evaluation procedure. The unique reason of obligatory exclusion consists in an irrevocable condemnation of the candidate by a criminal court to a penalty, at least of imprisonment of three months. There are various other reasons, such as the fact that the candidate is under insolvency, which implicate a potential exclusion.

The second point under examination is the financial competence of the bidders. The candidate may be requested to prove his financial standing through the existence of bank funding, the demonstration

of balance sheets and overall turnover, the formal commitment of third parties of their support during the execution of the contract. In cases that the candidate is a joint venture, the nature and extent of the commitment to financial participation of the various parties and the ability to secure credit must be presented. Finally, technical skills and qualifications of the private organizations should be evaluated. Specifically, each candidate should provide all necessary documentation that can prove the technical abilities of the tenderer, registration to the appropriate professional or commercial chamber, certification of certain quality assurance standards and environmental management standards.

Due to the fact that the legislative framework applicable to a PPP is the contract or the agreement and in a subsidiary way the Greek Civil Code, a comprehensive reference to their content exists within the law. The contract or the agreement contains clear and detailed descriptions of the rights and obligations of each party. The Greek law for PPPs incorporates the directive 2004/17/EC, which refers to the coordination of the procurement procedures of entities operating in the water, energy, transport and postal services sectors, and the directive 2004/18/EC, which refers to the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts.

On the one hand, the Special Purpose Company is supposed to have undertaken all responsibilities and risks, related to the required financing for the performance of the services. On the other hand, the public entity may participate in the economic model by supporting financially or in-kind the above mentioned services. The concession of the use or the right of the exploitation of the property may be considered as a type of support of the finance by the public partner. Nevertheless, the public entity holds the right of participation in the operation and/or exploitation of the scope of services.

Finally, a significant reference is made within the law to the fees that should be charged, in each case for the use of the infrastructure or the service. The procedure may consist either of the payment of the fees by the end users directly to the Special Purpose Company, which should be determined through a Joint Ministers' Committee for the PPP administrative act, or of the exploitation of the support facilities of the main project.

Risk management on PPPs

The number of projects is growing at an exponential pace, worldwide. In the past thirty years project management has been a discipline which has developed tremendously and increased in visibility (Caupin *et al.*, 2006). A project risk can be defined as the possibility of a negative or positive deviation from a project objective (Gareis, 2005). Deviations regarding the project scope, the project schedule, the project costs and the projects income are considered (Gareis, 2005). The management of a PPP case could give several opportunities, but the risks that should be resolved are more than those of a common project. Project risk management is a project management task. It includes the identification and the evaluation of risks, the planning and performing of risk management measures and the risk controlling (Gareis, 2005).

Figure 0. Content of the contract or of the agreement

Risks

The main problem that a PPP faces is the fact that a public partner and a private one should collaborate for the achievement of the execution plan. In many occasions the objectives of each sector are differentiated and therefore delays and declinations may be caused. The interested parties should agree on the objectives and the organizational structure that should be followed before the assignment of the contract. A communication plan should also be performed, in order to avoid any misunderstanding among the parties. The exchange of the information plays a vital role during the execution of a project that is why the planning that should be followed has to be preselected, in order to transmit accurate and consistent information to all levels within the organization structure.

Besides, the private and the public sector should organize the project team. The allocation of the resources, mostly on the people that will evolve with the project, is of high importance. The team members should be accurately selected, according to their skills and qualifications. In other words, the definition of the organization chart should be clear and accurate, so that anyone knows which his responsibilities on the performed project are. Due to the fact that people, who are brought together,

have different interests, cultures etc., they may have dissimilar expectations from the project. For that reason, the right motivation should be given to the project members. The competent person for the organization of the project team should make the members of the team feel engaged in the project, and inspire the same vision and a common goal for the project.

The time schedule is included within the contractual terms and should be followed by both parties. Taking into consideration that the private entity is responsible for the execution of the services, while the public party is responsible for the control and evaluation of the deliverables, a tidy but realistic schedule is to be planned and followed. Although the applicable legislation does not define any time prerequisite on the implementation of the project, the State sets as a “rule” that the repayment of the PPP project will begin once the project is completed and ready for operation. Thus, the State avoids possible budget overruns and delays during the construction phase and the private entity is motivated to deliver in time with no delays of the project. Moreover, the cost, the budget and the financial model are also presented within the contract. A PPP project is a value-for-money investment, not only for the public partner, but also for the private one. On the one hand, the private entities gain their profit through the collection of fees or through the direct reimbursement by the public sector. On the other hand, the public entity benefits from the use of the infrastructure by the end-users.

In most cases, the public partner requests from the private one the execution of a project or the provision of a service that the contracting authority cannot perform. In other words, it is quite difficult to control the results and the deliverables of the project. Monitoring of the performance of the services may be done either by an independent company or by the competent state authorities, while the definition of the monitoring technique should be previewed in the contract. Besides, due to the fact that the acceptance of the performed technical work has to be done by the public sector, the appointment of a project manager is very important.

As for the leadership, the two parties should decide who will be competent for making the decisions to be taken during the project.

Law 3389/2005 introduces for the first time the legal framework of the PPP model, since it covers a wide range of issues, regarding the PPPs. Nevertheless, due to the complexity of each PPP project and the specific infrastructure or service that should be delivered, law presents the general principles of the PPP contracts, without giving specific aspects of the PPP framework that could be changed from project to project. Furthermore, there are a few failures of the law in regard with the applicable European legislation. Firstly, there is no possibility of using the negotiated procedure without publication of notice, in spite of the fact that in directive 2004/18/EC this term is clearly and in detail defined. Secondly, another failure consists in the non-transcription of certain articles of the same directive in the national legislative framework, regarding the publication of the notice and the opportunity to participate in tendering process through electronic media (Internet) (Patrikios, 2009).

The applicable framework on the PPP project is quite strict, regarding environment protection. For that reason, there is a separate reference on the environmental impact studies within the applicable law, in order to minimize the risks on the protection of the environment. The required environmental impact studies must be approved before the award of the PPP Contract. Moreover, within the contract there should be specific references on the measures leading to the increased protection of the natural and cultural environment.

As for the co-financing, through the earlier model of concession contracts the private entities were obliged to finance a part or the whole of the infrastructure and the end-users had to pay a fee directly to the private partner. Today, through the PPP alternative model the state may pay an amount for the implementation of the project by including the project in various European or Public Investment Programs but extra attention should be paid to the relevant terms of the PPP contracts.

Opportunities

The main benefit from the PPP model consists in the project itself. The private entities are able to implement projects and services, in which the end-users may pay a fee or not be charged at all. By using public and private funds, the implementation of the infrastructure is performed in a faster way.

Through the applicable legislative framework the project is completed in the most economical, quick and well-performed way. The contracting authority awards a contract to a private partner, who must implement the mentioned infrastructure, according to the contractual terms. In most cases, the private entity regains its revenues, when the project is completed. Thus, the public partner avoids possible budget declinations and delays and the private partner tries to deliver the project as soon as possible. During the construction, the private partner ensures the efficient maintenance and the quality through his relevant know-how.

To implement the project, a project team, including members from both partners, is recommended. Taking into consideration that the private entity holds the know-how of the construction, the members of the contracting authority may be trained, on the specific scope of services, to evaluate and avoid possible risks in future relevant implementations.

Taking into consideration the current financial crisis in Europe, the PPP model may offer a great opportunity of collaboration with foreign partners, not only for the Greek state, but also for the Greek companies.

Informal Versions Of PPP

Concession agreement

Concession agreements are considered, nowadays, as a subset of the PPP contracts. In these agreements, the private entity undertakes the risk of exploitation of the infrastructure or the service, in expectance of a profit coming from the end-users. Through the official PPP, the public partner is supposed to pay a part or the total of the private partner's budget reward. In case of the so-called

“sponsored PPP”, the rest amount of money comes from the public and, as a result, the state takes on some of the risks of the project (Venieris, 2007).

Besides, the concession agreement constitutes a public contract and, for that reason, the traditional legislation framework of design and construction is applied. On the other hand, Law 3389/2005 presents the legislative content, which should be considered when a PPP contract is signed. As already indicated, this law mentions that each contract itself, as well as the Greek Civil Code in a subsidiary way, regulates the PPP (Venieris, 2007).

For the concession agreements, the execution of technical works and the provision of services are two dissimilar terms. The European directives define the legislative content only for the works, not the services. On the contrary, the PPPs are related to both the works and the services (Venieris, 2007).

Another difference is that through the concession agreements a private company is one of the contracting parties, while the other one is the public entity. In PPPs the contracting authority signs a contract with a special purpose company (SPC), which has the legal form of anonymous society (Venieris, 2007).

<i>Main Opportunities</i>	<i>Main Risks</i>
<i>Use of the infrastructure</i> <i>Completion of project</i> <i>Training and Know-how</i> <i>European or world-wide projects</i>	<i>Objectives definition</i> <i>Organization structure</i> <i>Communication plan</i> <i>Resources allocation</i> <i>Team collaboration</i> <i>Engagement and motivation</i> <i>Time schedule</i> <i>Cost, budget and finance</i> <i>Results and deliverables control</i> <i>Work acceptance</i> <i>Leadership</i> <i>Applicable legislation</i> <i>Environment, health and safety</i> <i>Co-financing, European programs</i>

Table 1 : PPP main opportunities and risks

The public entity is competent for monitoring the procedure of selection, the performance of the services, as well as the submission of the deliverables in the concession agreements, while the PPP law previews two specialized state organs (Venieris, 2007).

The process of collaboration between public and private entities through concessions agreements for the implementation of public works and public services, in many cases, is accompanied by tax reliefs for the private partner. Besides the concession agreements, the PPP contracts provide significant tax incentives and exemptions. Moreover, the PPP model provides incentives to private

investors and ensures the effectiveness of their participation through the description of the incentives in the legislation (Venieris, 2007).

Institutional PPP

In Greece, there are companies that are entitled to act neither as public partners nor as private partners in an official PPP because they are enterprises of mixed economy, including public and private investors. So, the legal framework on PPP contracts has introduced an absolute distinction of this operational innovation against the institutional structure of the enterprises which themselves constitute an autonomous type of partnership between the public sector and the private one. Therefore, even if national legal orders do not recognize them officially as PPPs, they do constitute a type of PPP, legally complementary of the official type.

These enterprises are legal persons of private law through which a public entity establishes a partnership with a private one, to implement a project of public utility, which budget may be higher than the one described in Law 3389/2005. Such companies are the Public Power Corporation (PPC), which was established, in order to generate and supply electricity in Greece, or the Public Gas Corporation (DEPA), which was established to implement the major project to introduce natural gas in the energy balance of Greece, etc.

Conclusions

Taking into account the above analysis, the reason, for which PPPs have developed so much in recent years, is clearly understood. However, special attention should be paid during the management of such projects, to the risks, which should be avoided or minimized. The greatest opportunity, today, on account of the current economic crisis, is given by potential partnerships, aiming at the implementation of international projects.

The adoption of the law introducing the PPP methodology has been an important development in the Greek legal order. However, the aforementioned case of the budgeted cost of the Pediatric Hospital in Thessaloniki exemplifies the dysfunctions of the PPP legislative framework, which is, not only in Greece but also in other countries, such as France at least before the modification of the initial relevant legislation, too conservative for a new tool needing flexibility. It is to underline that there is severe lack in flexibility in Greece, not only legal but also operational.

The greatest advantages that could be earned by the execution of a PPP contract are quick completion, lower costs and the guaranteed quality in the infrastructure itself. Although important strides have been made as for the legal regime in Greece, there are prospects for improving the PPP framework, in law as well as in practice. Moreover, it is strongly recommended to adopt, on international scale, a global legislation on PPP methodology, by introducing a unique code at least on PPP contracts and on the complementary mechanism of the so-called "institutional PPPs".

**IMPACT OF RELATIONAL PARADIGM AND EMPLOYEE DEMOGRAPHICS ON STAFF
COMMITMENT: EVIDENCE FROM INDIAN CALL CENTRES**

Gaur, Sanjaya S.¹; Quazi, Ali²; Goswami, Manish³

¹ Auckland University of Technology, New Zealand,

³ Jet Airways (India) Ltd.

Abstract

This paper empirically investigates if relational elements and employee demographics have any effect on commitment of employees to their organizations. The data consisted of responses of a sample of 169 customer service representatives within the call centers in Mumbai, India. The results reveal a positive impact of relational drivers on employees' commitment to call centers. However, age and level of education of employees have negative effects on employee commitment to their organizations. These results confirm relational elements to be the strongest predictors of employee commitment to call centers. The implications of these findings are that Indian call centers should strive to building relationship with employees as a strategy to secure their commitment to call centers. These findings and their implications for employee retention strategies of Indian call centres are highlighted in the paper. The paper also identifies its limits as well as the areas of further research.

Keywords: Relational paradigm, call centers, India, employee commitment, employee retention

Introduction

Staff commitment is considered instrumental for organizational success because committed staff is better motivated to make positive contribution to organizational growth and development. In order to survive in an increasingly competitive environment a service organization such as a call centre needs to maintain a sustainable customer base through attracting and retaining clients in the long term. To achieve this objective, organizations must focus their efforts on developing and sustaining an organizational culture that emphasizes internal customer (employee) wellbeing as a means to attract and retain external customer patronage. A growing body of empirical evidence suggests that there is a direct relationship between a firm's financial success and its commitment to internal marketing practices that treat employees as assets. Well treated employees are likely to be committed and loyal to their organizations and happy employees in turn are motivated to serve customers well. So, customer retention and employee retention are strategically linked. Research shows the economic value of both customer retention and employee retention (Christopher Lovelock, 2003). A combination of these economic values can contribute to development of a viable organization.

Quality customer service representatives provide quality service and as such it is imperative to maintain a contingent of motivated customer service representative to ensure service quality at call centers. Attraction and retention of experienced and committed customer service representatives is increasingly becoming challenging because of their growing demand resulting from the unprecedented growth of the industry in recent times (Franklin, 2000). Franklin (2000) further noted the growth aspirations of the workforce as another critical issue. A study found that 40 percent of call centres surveyed are experiencing problems in staff turnover (Whitehead, 1999). The direct cost to the call center industry of recruiting and training replacement staff, based on a conservative estimate of £2,000 per head, exceeds £100 million a year according to Whitehead (1999). Chad (1999) found that retaining call center staff requires determining an appropriate mix of fixed and variable pay, as well as giving them other incentives like contests with cash prizes, recognition programs, award programs, and training programs. Though money is an obvious motivator, it is not the only criterion. This empirical study is intended to develop an understanding of the process that could be used by most call center management in attracting and retaining committed employees in the long term. Another potential contribution of this study is its place in the relationship marketing literature. The relationship paradigm has been applied and found useful for developing strong working relationships that lead to customer satisfaction and loyalty across numerous industries and settings (Crosby and Stephens, 1987, Webber, 2000, Westfall 2002), Anderson and Narus, 1990). Since there have been hardly any comprehensive study involving call centers in India, this study may help in filling the gap in the area of call center management and its working relationship with internal customers i.e. employees and the factors affecting these relationships.

Antecedents of Relationship Marketing and Research Hypotheses

Integration of key relationship antecedents are at the core of the relationship building model. Berry (1983) identified three conditions that should exist in order for the concept of relationship marketing to be useful. These are (a) the customer must have an ongoing desire for the service; (b) the service customer must control the selection of the supplier; and (c) there must be alternate suppliers. As a result, these conditions appear to preclude the definition of relationship marketing as “locking-in” the customer. Other authors mentioned about trust, commitment, satisfaction, and the sharing of secrets as characteristics of relationships (Crosby et al., 1990; Morgan and Hunt, 1994). Some of the more prominent relationship building dimensions that have constantly emerged in the literature include relationship quality, trust, and commitment (Boles et al., 2000; Crosby et al., 1990; Kennedy et al., 2001; Morgan and Hunt, 1994). These antecedents include the degree of communications between the exchange partners, the level of mutual commitment between the partners, the degree of cooperation between the partners, and the degree of shared values between the partners (Weinstein and Johnson, 1999; Westfall, 2002). These concepts are fundamental to the relationship-building model (Ganesan, 1994; Anderson and Weitz, 1992; Anderson and Narus, 1990; Mohr and Nevin, 1990). These studies examined five key enabling factors of relationships: communication, trust in management,

cooperation, satisfaction, and interdependence symmetry. These studies provided operational definitions and measures for these relational antecedents.

Relational Factors and Commitment

There have been numerous studies examining the relational factors. Anderson and Narus (1990) elaborated the crucial role of communication in partnerships for the formation of cooperation and trust. Selves (1996) found communication to increase satisfaction with the supplier. Thus, it is theorized that communication is a major component of relationship marketing which influences commitment. Parasuraman et al. (1985) initiated the notion of trust as a critical success factor in service relationships and suggested that customers should be able to trust their service providers and feel safe in their dealings with them. Morgan and Hunt (1994) identified trust as a key construct in their relationship marketing model. Whitener (2001) found employees' trust and commitment to be stronger if they perceive that the organization is committed to and supportive of them. Based on prior studies Arne et al. (2002), have argued that employees trusting their managers are more likely to engage in cooperative behaviors (e.g., Jones and George, 1998; Kramer and Tyler, 1996). Cooperation is of Latin origin, meaning "together," and operari, "to work," which refers to situations where parties work together to achieve mutual goals (Anderson and Narus 1990). Arne (1975) found that cooperation is vital for organizations facing the challenges of turbulent environments. Other contributors to this area include Morgan and Hunt (1994), Scott, Bishop and Chen (2003), and Dwyer, Schurr and Oh (1987). Job satisfaction has also been recognized as a component of organizational commitment (Kovach, 1977). Spector (1997) related job satisfaction to "...constellation of attitudes about various aspects or facets of the job." Scott et al. (2003) argued that job satisfaction is positively related to increased willingness of employees to cooperate and stay in the job. Anderson and Weitz (1989), Kumar et al., (1995) found that dependence in relationships has a negative impact on affective commitment, and a positive influence on calculative commitment. It was found that dependence in relationships has a negative impact on affective commitment (Anderson and Weitz, 1989; Kumar et al., 1995) and a positive influence on calculative commitment (Ganesan, 1994; Geyskens and Steenkamp, 1995). The above literature review prompted us to test the following hypotheses:

H_{1A}: There is a positive relationship between communication and commitment

H_{1B}: There is a positive relationship between trust in management and commitment

H_{1C}: There is a positive relationship between cooperation and commitment

H_{1D}: There is a positive relationship between satisfaction and commitment.

H_{1E}: There is a positive relationship between interdependence symmetry and commitment

Demographic Variables and Commitment

Prior research has linked a variety of demographic characteristics of employees with commitment to their organizations. Colarelli et al. (1990) identified three factors concerning age of employees influencing their career commitment. First; career commitment increases as occupational identity solidifies. Employees become more career focused with the increase of their age. Second; as people grow older, they become invested in their careers. Third; as an individual ages and settles into a career, he or she tends to close off other career options. One of the myths in organisations is that women are less committed and loyal to their jobs and organisations (Chusmir and Durand, 1987). Sex-role conflict has a negative influence on job commitment. In the Indian context, feminine gender is considered as secondary bread earner for the family and it is expected that feminine gender will be less committed to work and would shift or give up jobs more frequently. Marital status is also expected to affect the commitment of the employees. Married employees are more exposed to work-family and family-work conflict. Further, in the traditional societal role, a woman enters the dual world of wife and mother through the marriage. Years of education reflect socialization (Colarelli et al., 1990) and socialization experiences shape an individual's career identity, goals and values (Frese, 1982). Employees' level of education has been found to influence their job commitment (Colarelli et al., 1990). Therefore, the above literature provides impetus for testing the following hypotheses:

H_{2A}: There is a positive relationship between age of the individual and commitment

H_{2B}: There is a direct relationship between gender of the individual and commitment.

H_{2c}: There is a direct relationship between marital status of the individual and commitment

H_{2D}: There is a positive relationship between level of education of the individual and commitment.

Research Methodology

Research Design

The research was conducted using a non-experimental quantitative design (descriptive). It included a comprehensive literature review, focus group input during instrument design, empirical descriptive research, and a content analysis of survey.

The Questionnaire

The questionnaire was designed using a-priori and not post hoc approach for establishing the dimensions and approach. Questions for the survey were adapted from previous scales. Items for communication were adopted from Penley and Hawkins (1985). Questions operationalizing the concept of trust were adapted from the Cook & Wall's measures of trust (1980). Questions operationalising the concept of cooperation were adapted from the Scott, Bishop, and Chen (2003). Questions operationalising the concept of satisfaction were adapted from the job satisfaction scale of Wood, Chonko, and Hunt (1986). For the purpose of this study, the Customer Service

Representative's perception of its own dependence and its management's dependence were each measured using the parallel items adapted from Heide and John's (1988) replaceability scale. Both Role Conflict (RC) and Role Ambiguity (RA) were measured by adapting the Rizzo, House, and Lirtzman (1970) scale. The construct of inter role conflict is measured using the scale of Netemeyer, Boles, and Mc Murrian (1996). The construct of organizational commitment is measured using the 15-item scale adopted from Mowday, Steers, and Porter (1979). Overall a five point Likert format was used for all scales used in the study instrument.

Data collection and sample frame

Customer service representatives of various international call centers located in Mumbai, India constituted the population of the study. Hard copies of the instrument were prepared and a total of 1500 customer service representatives were approached to complete the questionnaire explaining the significance of the study. After several follow ups a total of 169 usable responses were received, out of which 78 were from male and 91 from female respondents. 20 respondents were married and 149 unmarried. The age of respondents varied from 18 years to 34 years and they had been working in their current organizations for 1 to 54 months. The respondents were educated at good schools and colleges of India. Working in international call centers implies odd working hours including night shifts, higher level of skills and comparatively higher pay scale as compared to the domestic call centers in India.

Statistical Techniques

A variety of statistical methods were used in this research which included summary statistics, factor analyses and regression analyses. Factor analyses and Cronbach alpha tests were used to establish the construct validity and reliability for the survey data.

<i>Independent variable</i>	<i>Dependent variable</i>	<i>Beta</i>	<i>t</i>	<i>Sig</i>	<i>Hypothesis supported?</i>
<i>Communication</i>	<i>Commitment</i>	.129	1.686	.094	Yes
<i>Trust in management</i>	<i>Commitment</i>	.331	4.539	.000	Yes
<i>Cooperation</i>	<i>Commitment</i>	.314	4.274	.000	Yes
<i>Satisfaction</i>	<i>Commitment</i>	.344	4.374	.000	Yes
<i>Interdependence symmetry</i>	<i>Commitment</i>	.134	1.746	.083	Yes
<i>Age</i>	<i>Commitment</i>	-.221	-2.928	.004	No
<i>Gender</i>	<i>Commitment</i>	-.074	-.961	.338	Yes
<i>Marital status</i>	<i>Commitment</i>	.076	.985	.326	Yes
<i>No. of years of education</i>	<i>Commitment</i>	-.087	-1.127	.261	No

Table 1: Regression Results

Analysis and Results

All hypotheses were tested using multiple regressions. The results are presented in Table 1.

Discussions and Implications

In general the research revealed positive relationship between relationship marketing antecedents and organizational commitment of employees implying that managers need to address the career structure in the industry and also to develop a personalized approach in dealing with their staff. Faith and confidence in management are other important attributes that constitute trust and are important in developing commitment. Cooperation between team members is also valid and necessary antecedent in call center administration. Similarly, job satisfaction and interdependence symmetry are found to have positive effect on the commitment of the employees. Our research found no relationship between age and commitment which may result from the harsh working conditions in the industry. The implication of this finding is that management needs to take appropriate steps towards improving the working conditions to relate employees' progression in life with their job commitment. The research found a direct effect of gender on employees' commitment. Sex-role conflict, marital issues and the working conditions of the industry are not favorable to the women. So, these findings are understandable. The research found a relationship between marital status of the employees and commitment. This is expected in the working conditions of the industry and also supports the previously discussed relationship between gender and commitment. Interestingly, the research revealed negative relationship between level of education i.e. socialization of the employees and commitment. Socialisation experiences are important in developing and sustaining career commitment because they shape an individual's career identity, goals and values (Frese, 1982). The working conditions in a call center are probably unfavorable to the extent that the staff views it only as a job to be accepted with low levels of education and they have not much alternatives to explore to get a better job. This is, however, a typical scenario in modern India where job opportunities for relatively less educated workers in growing rapidly especially in the service sector. This growth of employment is driven by current pace of economic development in India demanding service of diverse group of people with lower to higher level of educational qualification.

Limitations and Future Research

This paper has a number of limitations that are to be noted. First, the sample size is relatively small which is drawn from one of several cities in India. Future research can draw a national sample to increase the generalizability of the findings across Indian call centres and beyond. Second, the research findings are constrained by the study's basic research design involving descriptive research. Future research can develop a more robust model and test it using SEM technique. Third, there may be a non-response bias outside the collected data that could affect the results. Finally, the face, content, construct, and predictive validities are restricted to the extent that these limitations are not met.

Abstract

This paper provides a conceptual platform of reflection upon abundant research work, which has been recorded over the past thirty years on the topic of executive succession in family firms. Secondary research through systematic literature review serves as a starting point. Many of various influential studies have looked at the key factors that are believed to foster succession effectiveness. Fourteen defined factors provide insight to this direction. These are, a. incumbent characteristics and qualities, b. incumbent tenure, c. successor skills and attributes, d. successor training and development, e. successor origin, f. incumbent-successor expectations, g. succession ground rules, h. family dynamics, i. board of directors, j. organizational performance, k. organizational size, l. organizational age, m. transfer of capital, and n. succession monitoring and reflective feedback. Our synthesizing effort proposes an encompassing conceptual framework that joins aforementioned factors together and gives prospects to succession effectiveness in a specific form of business organization-the family owned wineries. In addition, our paper highlights gaps in the conceptual understanding and knowledge as well as areas of additional research. The theoretical limitations and practical implications of the framework are also discussed.

Keywords: Family owned wineries; executive succession; succession factors; succession effectiveness; conceptual framework

Introduction

For more than thirty years, abundant research work from several scholars has been recorded on the topic of executive succession in family firms (Boeker and Goodstein, 1993; Canella and Lubatkin, 1993; Dalton and Kesner, 1985; Hambrick and Fukutomi, 1991; Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Pfeffer, 1981 and Zald, 1965, as cited in Boeker and Goodstein, 1993, p.184; Poutziouris, 2001; Schwartz and Menon, 1985). Many of these influential studies have looked at the key factors that are believed to foster succession effectiveness.

Several scholars considered significant that specific factors-named as process factors, appear core to succession such as an on-going (Le Breton-Miller *et al.*, 2004), multidimensional (Poutziouris, 2001), socio-political process (Canella and Lubatkin, 1993) in which the power and influence exercised by the incumbent and other [family] executives determines the outcome of success or failure (Klein and

Bell, 2007; Le Breton-Miller *et al.*, 2004; Pfeffer, 1981 and Zald, 1965, as cited in Boeker and Goodstein, 1993, p.184). Similarly other factors, which are identified at the side environment of succession-defined as context factors, might have a higher or lower degree of peripheral influence. These have been connected to the managerial or social-political aspects of the family business by focusing on a variety of related issues, and are assumed again to determine succession effectiveness (Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Poutziouris, 2001).

By adopting a deductive approach (Saunders *et al.*, 2009) our paper proposes a conceptual framework that draws heavily from Le Breton-Miller's *et al.* (2004) succession model. At this period of time, however, the conceptual framework proposed is generic and descriptive, not thoroughly specific and explanatory. This is in relation to the fact that there have been no academic or empirical attempts to frame the enablers and complexities of succession in family wineries which is indeed a particular form of business organization. Virtually, theory constructed has not been accustomed to the specific needs of the wine business industry. In other words, a vital "wine factor" is currently missing from abstract conceptualization due to the fact that raw data were generated either from large market research firms or simply from larger firms of diverse industries other than wine.

Another fundamental argument is that theoretical orientation of past research is again limited in its potential to provide authentic insights into the socio-political aspects of succession in family wineries such as the beliefs, thoughts, feelings, behaviours and practices of research participants within their specific organizational contexts. We believe likewise because there is major literature around succession that positions methodological challenges of researching this area on strictly quantitative methods (Boeker and Goodstein, 1993; Dalton and Kesner, 1985; Schwartz and Menon, 1985) and oddly, that is in contradiction with the socio-political roots of succession (Canella and Lubatkin, 1993). Thus, the concepts we discuss now encompasses a number of factors resulted from theory that may be restricted to a general business leadership succession, and not to a specific succession in family wineries. Hence, we believe fundamental that further thoughtful research will be helpful in analyzing and interpreting quantitatively various relationships, qualitatively different trends and other organizational mechanisms towards succession effectiveness in family wineries.

Moreover, in the second section of this paper we highlight our secondary research aim and objectives and give special emphasis on the research methodology we have chosen to follow. In the third section, we explore and present various secondary evidence, which we believe they are fundamental to define succession and succession effectiveness factors. Among others, the following "process" and "context" factors have a paramount importance for the concept of succession: a. incumbent characteristics and qualities, b. incumbent tenure, c. successor skills and attributes, d. successor training and development, e. successor origin, f. incumbent-successor expectations, g. succession ground rules, h. family dynamics, i. board of directors, j. organizational performance, k. organizational size, l. organizational age, m. transfer of capital, and n. succession monitoring and reflective feedback.

In the fourth section, we integrate these factors located in the literature and develop a conceptual framework that particularly draws upon existing theory describing vital aspects that generally evolve before, during, and after the process of succession. We then provide a set of specific propositions for further research, and finally discuss research limitations, practical implications with a brief conclusion.

Literature Review-Aim, Objectives and Methodology

Literature review aim and objectives

As the 1980's has been theoretically and empirically assumed the era of foundational research in the family business arena (Bird *et al.*, 2002, as cited in Klein and Bell, 2007, p.21), systematic review of previous research work that has been effected over the last thirty years, is intended to provide insight into the nature and various aspects of effective succession. Hence, the aim of this secondary research is the identification, screening and selection of various research works on family owned business succession for a systematic review in order to achieve three main objectives outlined as follows:

- to explore and reflect on key factors and variables of effective succession;
- to make of reflective and reasonable associations among the reviewed studies, to synthesize and interpret the findings in order to develop a Preliminary Conceptual Framework towards Succession Effectiveness, with broad exploitation and value; and
- to indicate theoretical gaps and potential areas for further empirical research in the wine sector.

In the light of the above aim and objectives, systematic literature review has been assumed as an integral and on-going part of our general research experience and thus this stretched out at different time horizon depending on the stage of research activity which expands accordingly our theoretical background.

Methodology

As illustrated in figure 1, our search strategy schematically encompassed three consecutive action stages. Firstly, through a parallel exploratory scoping stage of electronic databases such as Business Source Complete (EBSCO), Electronic Journal of Family Business Studies (EJFBS), Emerald Insight and International Journal of Wine Business Research (IJWBR), under the use of specific searched terms such as *family owned business* and *succession*, and *succession* and the *wine industry*, a yield of 367 citations was considered to be the main body of the literature related to the topic area.

Figure 1: Secondary research process-a three stage search strategy

Secondly, a careful title reading and abstracting process aimed to narrow the broad spectrum of this literature into a more manageable number of academic articles. Consequently, a number of 284 studies were then rejected as they diverged from the field of family businesses or were not focused on the topic of executive succession or even they provided ambiguous information on their research methodology. Titles and abstracts of the remaining eighty-three citations were vigilantly read for a second time and forty-eight of these were rejected for similar reasons. Thirty-five citations were potentially selected; however, some titles and abstracts still did not have enough information relevant to the topic or the methodology. According to the guidelines of the literature review method, thirty-five selected studies from all aforementioned databases were consequently scrutinized using the inclusion and exclusion criteria. These are purposively set of criteria that we were judged critical in order to select the most credible, reliable and valid studies for a systematic review,

Moreover, studies from recent researchers were principally able to show the direction towards new interesting paths for further primary research as it is for instance, the materialization of incumbent-successor expectations through selection of a non-family successor (Klein and Bell, 2007) or the need to go towards the succession process itself on a more specialized manner of research (Le Breton-Miller *et al.*, 2004). The latter, as a research option for the future, clearly reflects our primary research intentions for a specialized research in the wine sector on the basis of the general objectives outlined as follows:

- Examine peoples' individual perceptions related to succession thinking and preparing for it in the family owned wineries.
- Advance an action research on particular succession process and context factors and their contribution mechanism towards succession effectiveness.
- Re-conceptualize and adapt the framework to the real needs of the family owned wineries in order to provide change and improve future succession processing.

At the end of the inclusion/exclusion process, a yield of twenty-five studies was finally filtered for a full text reading, evaluation and interpretation. The cited references of each selected study were in addition used as a connection to other potentially related literature on the research subject including chapters from edited books, research notes, archival reports, and thus added a more topic specificity to the review.

Conceptual Knowledge on Succession and its Factors of Effectiveness in Family Firms

Succession in family firms

Over the past years, family business has been a vital force in the UK and other market economies (Kirby and Lee, 1996; Poutziouris, 2001). According to Poutziouris (2001) estimates suggest that about two thirds of all enterprises are family operated, managed, owned or controlled, and that family firms range in size from traditional small firms to large conglomerates. In relation to the development of the literature, the pattern of a family owned business was basically seen as a dual system encompassing the business and the family (Klein and Bell, 2007; Le Breton-Miller, *et al.*, 2004; Poutziouris, 2001). The system has in fact a parallel functioning in which all involved family members are engaged in a both task and emotional state of affairs: (a) the business-managerial task and its development (Le Breton-Miller *et al.*, 2004; Poutziouris, 2001), and (b) the socio-political state of relationships and interactions (Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Poutziouris, 2001).

However, the existing literature on this form of business organization supports that one of the most essential problems facing family firms is the capability to guarantee proficient family management across generations (Le Breton-Miller *et al.*, 2004). Evidently, a series of characteristics sourced from the family business idiosyncrasy and organizational environment (Lee *et al.*, 2003) can affect managerial succession, and eventually the succession of ownership (Le Breton-Miller *et al.*, 2004). To this regard, among the most constructive characteristics that are mentioned in the literature entrepreneurial talent, long-term commitment, loyalty to business success, pride in the family, tradition, solidarity (Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Poutziouris, 2001), and the degree of idiosyncratic knowledge (Lee *et al.*, 2003; Poutziouris, 2001) might be easily accessible in family firms and supportive to succession effectiveness.

On the other hand, negative distinctiveness of family firms might turn them in a vulnerable situation over time (Le Breton-Miller *et al.*, 2004; Poutziouris, 2001). Among others, anachronistic nepotism, de-formalized procedures, inexistent organizational structures, rigidity to adapt in new challenges, weakness to make strategic decisions, and family feuding might be catastrophic for the future of the business (Poutziouris, 2001). Hence, a number of researchers (Birley, 1986; Kets de Vries, 1993) emphasized that only a third of family firms survived into the second generation, and from that fraction, a further ninety per cent failed the transition process to the third generation (Birley, 1986; Le Breton-Miller *et al.*, 2004; Morris *et al.*, 1997; Ward, 1987).

It is moreover supported from the literature that the typical life duration of family owned business is estimated to be twenty-four years, which is also comparable to the typical tenure of their founders (Beckhard and Dyer, 1983). According to Barack *et al.* (1988) and Beckhard and Dyer (1983, as cited in Lee *et al.*, 2003, p.657) "nepotism is generally perceived to be the reason why families hand over their businesses to their offspring or close family members". Therefore, poor successions (Kirby and Lee, 1996) and performance inadequacies (Kets de Vries, 1993) were often the source of this phenomenon

due to the inability to ensure competent family leadership across generations (Dalton and Kesner 1985; Le Breton-Miller *et al.*, 2004; Poutziouris, 2001; Schwartz and Menon, 1985).

Further reflective challenges have been identified in the current literature assuring succession effectiveness (Finkelstein and Hambrick, 1996; Le Breton-Miller *et al.*, 2004) although the situation is far more difficult in the case of family firms where there are frequently complicating emotional factors and interactions among all involved parties, and multifaceted social bonds with the family (Dyer, 1996; Lansberg, 1999; Le Breton-Miller *et al.*, 2004; Poutziouris, 2001). What is more supported from the relevant literature is that the level of a business idiosyncrasy (Klein, 1988; Williamson, 1979, 1981) which "is often individual specific rather than firm specific" (Castanias and Helfart, 1991, 1992, as cited in Lee *et al.*, 2003, p.658), nepotism (Barack *et al.*, 1988; Beckhard and Dyer, 1983) and the usual absence of a prescribed succession planning (Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Poutziouris, 2001) explain more expressly the reasons behind the aforesaid family business failures. Accordingly, a preannounced planning for succession is seen to be foremost vital to the success and continuity of the family business across generations, and thus a crucial mean to the effectiveness of succession (Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Miller, 1993; Ocasio, 1999; Pitcher *et al.*, 2000; Poutziouris, 2001).

Defining succession effectiveness

From the recorded research knowledge it was revealed that executive succession is a multidimensional process that encompasses the transfer of leadership, and eventually the transfer of ownership by the means of actions, events and organizational mechanisms (Le Breton-Miller *et al.*, 2004; Poutziouris, 2001). Le Breton-Miller *et al.* (2004) in their argumentation, considered the aforesaid fundamental to plan for both structures in order to empower the new leader and strengthen his or her professional status. In addition, executive succession was defined as a long, ongoing and dynamic process that may be depended from a series of interacted process and context factors (Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Poutziouris, 2001).

It was moreover believed that such factors can synergistically predict succession effectiveness while succession, itself, is about an opened and systemic process needing a continual monitoring and adjusting (Le Breton-Miller *et al.*, 2004). Thus, in a simplistic way, figure 2 illustrates that in the broader business environment, succession effectiveness is dynamically influenced by process and context facilitators which evolve and interact each other adjusting the process in the light of feedback.

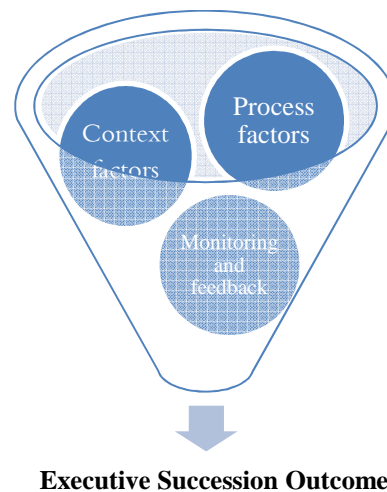

Figure 2: Conceptualization on effective succession: an interactive process of factors

The systematic literature review indicates that various tangible or abstract metrics can distinguish succession effectiveness within family firms. For Boeker and Goodstein (1993), Dalton and Kesner (1985), Le Breton-Miller *et al.* (2004) and Schwartz and Menon (1985) the most regular explanation of effective succession was recorded to be the result of an outstanding organizational performance. Klein and Bell (2007), however, have taken a broader scope on the subject and seen effectiveness as the incumbent-successor satisfaction based on a set of pre-contractual expectations.

Le Breton-Miller *et al.* (2004) and Poutziouris (2001) in relation to their theoretical development expressed the issue of succession effectiveness as the family business viability and continuity over time. It was further extremely interesting to note that succession effectiveness was even articulated as the pathway of avoiding conflicts among family members and keeping the family in unity (Poutziouris, 2001). In this regard, Poutziouris (2001) further assumed that in case of inappropriate design, implementation and administration of a succession process, all involved may exercise internal politics and games of influence that will jeopardize succession effectiveness. In a more general way, we would suppose that recorded definition of succession effectiveness has been also seen through the lenses of ontological and epistemological assumptions of every researcher, in other words, it is based on how researchers face and interpret the world through their life philosophy.

Frequent process factors of succession effectiveness

What it was notably promising to identify from the review was to get in touch with some common enablers of effective succession. All things considered, it was possible to classify them in two thematic groups: a. the process factors and b. the context factors. Primarily, the process group of factors comprises frequent cited processing oriented categories and competency related variables that seemed to be core to succession such as a socio-political process (Canella and Lubatkin; 1993, Le Breton-Miller *et al.*, 2004; Pfeffer, 1981 and Zald, 1965, as cited in Boeker and Goodstein, 1993, p.184).

These process factors are subject of manipulation and are hierarchically summing up according to their citation frequency in the literature as follows: 1. incumbent characteristics and qualities, 2. successor skills and attributes, 3. succession ground rules, 4. successor training and development, 5. successor origin, and 6. incumbent tenure. The aforementioned six process factors are explained and discussed below in more detail. The context factors are also examined below in section 3.4.

Incumbent characteristics and qualities

Le Breton-Miller *et al.* (2004) and Ward (1987) classified business incumbent as the most important factor of a successful succession at the same time where Le Breton-Miller *et al.* (2004) placed incumbent [and successor] in the central of an integrative model of effective succession.

Castanias and Helfart (1991, 1992, as cited in Lee *et al.*, 2003, p.658), Klein (1988), and Williamson (1979, 1981) all suggested the importance of a business “idiosyncratic knowledge” (Lee *et al.*, 2003) which is regularly part of the incumbent’s personality rather than firm specific. Bruderl and Preisendorfer (1998), and Nooteboom (1993b) asserted that idiosyncratic knowledge habitually embraces considerable personal relations and networks. Nooteboom (1993a) claimed further that this kind of knowledge is all about the skill of incumbent to gain the cooperation of the firm employees, whereas Pollack (1985) associates the same suggestion with knowledge and understanding in relation to the internal operations of the family business and responsiveness to the organizational context milieu.

Cabrera-Suárez *et al.* (2001), Dyer (1986), Goldberg (1996), Handler (1990, 1992), Klein and Bell, (2007), Lansberg (1988), Le Breton-Miller *et al.* (2004), and Ward (1987) all emphasized the significance of a “quality professional and social relationship” between the incumbent-successor to the process of effective transfer of leadership and knowledge. A relationship based on mutual respect and considerations, agreed goals and cooperation, is discussed to make all involved feel supported and to create a setting of trust and understanding (Klein and Bell, 2007; Ward, 1987) where learning can afterward surface through an evolutionary process (Cabrera-Suárez *et al.*, 2001; Klein and Bell, 2007; Ward, 1987).

Dyer (1986), Goldberg (1996), Handler (1990), Klein and Bell, (2007), Lansberg (1988), and Le Breton-Miller *et al.* (2004) pointed out the paramount importance of incumbent overcoming concern on the subject of succession and failure to “let control go”, and therefore moving away from the refutation step finally being “willing to move ahead and progress”. Klein and Bell (2007) conversely, emphasized that mistrust, controlling and aggressive behaviours were shown to be inhibitors of succession process resulted in high costs. It is not surprising that Cabrera-Suárez *et al.* (2001), Dyer (1986), Handler (1990), and Le Breton-Miller *et al.* (2004) affirmed that incumbent aptitude to “delegate”, to “let successor expand his or her own critical thinking” and learn from mistakes, it is fundamental for the required transfer of knowledge to successor and further development as a leader.

Successor skills and attributes

Evidently, the successor is the other key performer in any succession process. The quintessential importance of a “quality relationship” between incumbent-successor has been previously discussed. However, the literature review acknowledged other key variables such as successor “motivation”. From Barack and Gantisky (1995), Chrisman *et al.* (1998), Le Breton-Miller *et al.* (2004), Potts *et al.* (2001b), and Sharma *et al.* (2001) theorizations, successor “willingness to join and serve with commitment the family firm” appeared to be of the essence.

Moreover, from Handler’s (1992) and Le Breton-Miller’s *et al.* (2004) assumptions it was clear that the more the opportunities for “career advancement and personal professional development” the more likely the succession process will be effective. Without a doubt, satisfied successors tend to be more interested and personally involved, more excited and fulfilled and more apt to be effective successors (Barach and Gantisky, 1995; Handler, 1990).

The successor’s demonstrated “academic, professional and social skills” were found to be helpful to earn credibility and respect within the family organization and therefore is associated to effective succession (Barach *et al.* 1998, 1995; Chrisman *et al.*, 1998; Le Breton-Miller *et al.*, 2004; Potts, 2001b). Among others skills and attributes, “decision-making ability” and “experience”, and “advanced interpersonal skills” were found to be the most important (Chrisman *et al.*, 1998).

Succession ground rules

Le Breton-Miller *et al.* (2004) theorized that a judiciously established set of ground rules that covers different courses of action that have to be “set early on to direct the process”, could be a key determinant of succession effectiveness. However, some authors highlighted that deteriorating successions have shown that conflicts take place in family businesses because of misunderstanding about those ground rules. They furthermore asserted (Le Breton-Miller *et al.*, 2004) that at least; it might need to include a “planning for succession”, a “transition period of working together” and development of “shared vision for the future” which is evidently some of the most significant researched variables in the literature. Landsberg (1988) asserted that specifically succession planning means making the required arrangements according to the future needs of the family business in order to guarantee the harmony of the family and the continuity of the business through the next generation.

Le Breton-Miller *et al.* (2004) and Ward (1987) claimed that the “gradual transfer of power and control” takes five to seven years on average whilst Dyck *et al.* (2002) and Handler (1990) believed that a “mentoring connection” between incumbent and successor collaborating for a transition period is found to be critical for the succession effectiveness. Moreover, a “smooth phase-out/transition/phase-in” period is facilitated when the incumbent established plans to do so (Klein and Bell, 2007) and thus to develop new challenging activities, even a “new career”, outside the family business (Dyer, 1986; Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004) in order to satisfy his or her individual desires and needs (McGivern, 1978). Similarly, if the incumbent is favorable to accept

related opinions and recommendations of an “internal selection committee” (Le Breton-Miller *et al.*, 2004) or from a committee within the board of directors acting according to criteria, then succession launching and reflective monitoring is substantially facilitated (Boeker and Goodstein, 1993; Le Breton-Miller *et al.*, 2004).

Barach and Gantisky (1995), Chrisman *et al.* (1998), Dyer (1986), Lansberg (1999), Le Breton-Miller *et al.* (2004), Potts (2001b), Poutziouris (2001), Sharma *et al.* (1998) all believed that a communicated shared vision for the future is an outstanding family business tool necessary for achieving the goals and objectives, and the passage of the business to the next generation. In this regard, Dyer (1986, p.133, as cited in Le Breton-Miller *et al.*, 2004, p.310) stressed that “the individual dreams of different generations [must] be woven together into a shared collective dream”. It will then compose an essential and trustworthy variable for succession effectiveness and business future decisions (Le Breton-Miller *et al.*, 2004; Poutziouris, 2001).

Dyck *et al.* (2002) stressed the importance of “sequence timing” and “communication” in executive succession. In the same direction, Klein and Bell (2007), Le Breton-Miller *et al.* (2004), Poutziouris (2001) and Ward (1987) emphasized that succession must be seen as an early established, clearly communicated and appropriately adjusted with [reflective] feedback planned process. Time frame and timing variables “in a slow and subtle process of role adjustment between the incumbent and successor is key” (Handler, 1990, as cited in Le Breton-Miller *et al.*, 2004, p.314).

However, Dyck *et al.* (2002) emphasized the role of the competitive environment to the timing variable. As such, a steady organizational context may allow freedom for a continuing and secure transition, while an unstable one may demand a far speedier process “as an incumbent may become obsolete very quickly” (Dyck *et al.*, 2002, as cited in Le Breton-Miller *et al.*, 2004, p.314). Of course, timing variables such as the incumbent health and successor educational, personal training and professional development have a quintessential importance for the succession effectiveness (Le Breton-Miller *et al.*, 2004, p.314).

Successor training and development

As previously discussed, the training and development of successors is of principal importance to acquire “new knowledge” and “idiosyncratic capabilities” (Lee *et al.*, 2003) as well as to gather credibility and admiration within the family business (Barach *et al.* 1998, 1995; Chrisman *et al.*, 1998; Le Breton-Miller *et al.*, 2004; Potts, 2001b). In fact, successor training and development for a family firm leadership role was found to be one of the most important factors among successful successions (Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Ward, 1987). Dalton and Kesner (1985), Kets de Vries (1993), Kirby and Lee (1996), Le Breton-Miller *et al.* (2004), Poutziouris (2001), Schwartz and Menon (1985) all reported that poor successions and performance inadequacies were often resulted from incompetent family leadership across generations. Indeed, McGiven (1978) similarly supported that half of all businesses failures in the United States were due to successor incompetency.

In reality, it seemed clear that successor “prior introduction” to the family organization allows to get in contact with the culture, value system, operations and workforce and provides the opportunity to develop distinctive capabilities out of the firm’s idiosyncratic knowledge (Cabrera-Suárez *et al.*, 2001; Barach and Gantisky, 1995; Barach *et al.*, 1988; Dyer, 1986, Klein and Bell, 2007, Le Breton-Miller *et al.* 2004). In the view of Goldberg (1996) successful successors were linked to significantly more years of “appropriate work experience” than less effective ones. Barach and Gantisky (1995), Le Breton-Miller *et al.* (2004) and Ward (1987) claimed that former “work experience in an external enriched environment” can provide positive outcomes such as knowledge, reliability, self esteem and reliance.

Dyer (1987) and Le Breton-Miller *et al.* (2004) proposed the “apprenticeship” of successor as a key family business tool. Thus, family mentors use their idiosyncratic knowledge to educate the apprentice all the distinctive aspects related with being a manager [of change] in a family business. In that case, Cabrera-Suárez *et al.* (2001) and Le Breton-Miller *et al.* (2004) emphasized that greatest apprenticeships often begin at home environment, increase during summer job activities inside the family business and maintain through an officially established career. However, Klein and Bell (2007) highlighted that apprenticeship is facilitated when a close and quality relationship exists between the incumbent and the successor.

Morris *et al.* (1997) and Le-Breton-Miller *et al.* (2004) further pointed out that the most effective successions were positively correlated with successor “education” whereas Klein and Bell (2007) and Le-Breton-Miller *et al.* (2004) moreover highlighted that a “formal leadership training plan” benefits family owned businesses. Dyer (1986) and Le-Breton-Miller *et al.* (2004) expressed that an assortment of experiences and everyday jobs are vital to any well structured training plan that may include administrative duties, wide-ranging management tasks, operational issues and organizational performance responsibilities (Churchill and Hatten, 1987; Le-Breton-Miller *et al.*, 2004; Ward, 1987).

Successor origin

Klein and Bell (2007) and Le Breton-Miller *et al.* (2004) all claimed that successor origin is a core dimension of succession process and its long term dynamic nature. In addition, this literature review faces succession as an “inside” (internal), when the successor is coming from firm’s managerial ranks, or “outside” when the top leader is approaching from firm’s external span (Boeker and Goodstein, 1993; Dalton and Kesner, 1985; Klein and Bell, 2007; Schwartz and Menon, 1985). Presumably, and according to Brady and Helmich (1984, as cited in Boeker and Goodstein, 1993, p.174), outside succession can impose greater change in every organizational level and a sense of uncertainty to actual incumbents in the top management.

In their turn, inside managers could resist an outsiders’ selection to create job security and decrease uncertainty. Moreover, Helmich and Brown (1972, as cited in Boeker and Goodstein, 1993, p.175) argued that uncertainties for the present executives may be reduced by the selection of an insider successor since a new outside leader is more likely to dismiss subordinates in the executive ranks. As

such insider's resistance to change might affect the successor's choice and moderate the overall succession process.

Incumbent tenure

A rather less researched but still central factor of the process of succession is that of the seasons of incumbents' tenure. Hambrick and Fukutomi (1991) empirical findings confirmed that there are noticeable phases, or seasons, within an incumbent's lengthy executive leadership, and that these seasons influence particular structures and patterns of executive interest, organizational performance and behaviour, and, ultimately the selection of a successor. Evidently, Canella and Lubatkin (1993) emphasized that those business socio-political forces, such as the incumbent's aptitude to influence the selection decision, can impact the successor choice and consequently determine effectiveness or collapse of succession process in the future. Lastly, Beckhard and Dyer (1983) empirically supported that the typical tenure of a founder-incumbent is twenty-four years which coincide with the average life cycle of family firms.

Frequent context factors of succession effectiveness

The recorded literature on the topic of succession effectiveness in family firms involves not only processing and competency oriented factors but fundamentals related to the business-managerial and industry specifics (Churchill and Hatten, 1987; Mc. Givern, 1978, in Le-Breton-Miller *et al.*, 2004, p.317). The way a particular business is operating in a particular evolving industry could be a critical issue to be handled prior to a selection in order to appropriately match successor and competitive challenges (Churchill and Hatten, 1987). In relation to the socio-political profile of succession, social elements such as nepotism, influence, and politics are also involved (Le-Breton-Miller *et al.*, 2004; Poutziouris, 2001), however, and inversely to process factors, these are only partly subject to manipulation.

Accordingly, Lansberg (1988) and Le-Breton-Miller *et al.* (2004) highlighted that succession as a social and family process, is more or less influenced by cultural norms that must be taken into consideration and managed according to the cultural circumstances and social context of the business. In this regard, context factors are orderly summing up according to their citation frequency in the literature, and include that of: 1. family dynamics, 2. board of directors, 3. incumbent-successor expectations, 4. organizational performance, 5. transfer of capital, 6. organizational size and age, and 7. succession monitoring and reflective feedback.

Family dynamics

Unavoidably, the succession choice involves not only competency, know-how and processing but internal socio-political fundamentals of preference and power (Boeker and Goodstein, 1993; Schwartz and Menon, 1985; Canella and Lubatkin, 1993; Le-Breton-Miller *et al.*, 2004) expressed by the owning family itself. In this regard, the literature review admitted the significance of the family in the "ownership patterns" and "governance structures", "succession process" and "selection criteria",

“managing feuding” and “developing consensus” around emerging issues, and “counseling” and “guidance” in family councils (Churchill and Hatten, 1987; Lansberg 1998; Le-Breton-Miller *et al.*, 2004; Poutziouris, 2011; Ward, 1987).

Moreover, Boeker and Goodstein (1993) characteristically addressed the role of the owning family as the vehicle to “manage capital”, a “moderating factor to control decision making” and therefore, a means to “influence successor choice” during succession process. Schwartz and Menon (1985) and Boeker and Goodstein (1993) particularly emphasized that family ownership structure and concentration can affect and moderate successor choice much more than other [context] factor. In the same track, they can help successor to meet both competency and social criteria and abilities to develop consensus on key issues (Le Breton-Miller *et al.*, 2004). Consequently, Lansberg (1988) asserted that frameworks, plans and processes towards succession effectiveness must take into consideration the social organizational context in which a family business found itself. Therefore, succession such as a socio-political and family process is heavily dependent from various cultural norms such as patriarchy, matriarchy, primogeniture, and eventually other complexities (Le-Breton-Miller *et al.*, 2004).

Board of directors

The board of directors was seen as a key factor for a successful succession as it could “facilitate commencement and monitoring” of the succession process, and “assure the establishment of the succession plan” for the benefit of the owning family (Barach and Gantisky, 1995; Churchill and Hutten, 1987; Dyer, 1986; Lansberg, 1988; Le Breton-Miller *et al.*, 2004; Malone, 1989; Potts *et al.*, 2001b; Sharma *et al.*, 2001). A dynamic and well-structured board of directors with comprehensible duties and responsibilities could act as the “watchdog of the selection process”, and thus a vehicle to succession success (Le Breton-Miller *et al.*, 2004).

Klein and Bell (2007) took a broader view on the issue and evidenced higher succession failures in case of external recruitment instead. Hence, they underpinned “selection-recruitment process” to be a task role for an entrusted and experienced “internal committee”, [we would say under the board of directors]. However, Dyck *et al.* (2002) and Le Breton-Miller *et al.* (2004) highlighted the necessity for all involved board members to be agree on who is to participate in the succession selection committee, under which criteria, with what procedures of repetitive appraisal and selection, and from what pool of candidates, much before the selection process start-up.

Incumbent-successor expectations

Klein and Bell (2007) argued that several pre-contractual expectations exist for both business incumbents and successors to join a family firm. In case where an incumbent is outward looking, switching from the internal limited pool of successors to the opened market of capable talents may generate enhanced expectations to “de-emotionalize the business”, formalize decision making and other business operations (Klein and Bell, 2007). In the opposite side, an external successor may feel a sense of being member of an informal and cozy work environment, or even feel attracted by a certain

influence a family firm may have on people, behaviours, structures and processes. An outside successor may also have expectations for “higher income”, “career advancement”, “new status” and “self esteem” (Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004). In this direction, Klein and Bell (2007) highlighted that a family firm could indeed offer to a new successor the chance to achieve “individual visions and goals”, and demonstrate “entrepreneurial passion” in a less bureaucratic and hierarchical environment.

In reality, fully satisfied incumbent-successor pre-contractual expectations are found to be helpful to the succession process as they ensure an enthusiastic and responsible activity within the family business, greater trust, mutual understanding, and knowledge among all involved (Klein and Bell, 2007). Hence, fulfilled expectations are said to contribute to the “family business harmony” (Churchill and Hatten, 1987; Dyer, 1986; Handler, 1990; Le Breton-Miller *et al.*, 2004; Malone, 1989; Potts *et al.*, 2001b). In this regard, Sharma *et al.* (2001) and Le Breton-Miller *et al.* (2004) theorized that such harmony supports again the development of a “shared vision for the future” which in its own turn provides a classic element to be encompassed in succession ground rules.

Inversely, Klein and Bell (2007) emphasized that a probable “moral hazard problem” might be in a latent situation and occur in case where an external successor becomes extremely autonomous. In such scenario, personal hidden agendas and actions may not be aligned with the best economic interests of the family owning the firm. Successor inadequacies may result in mutual unsatisfactory expectations, uncertainty, vulnerability to attack from competitive firms, loss of reputation for the involved parties, high switching costs due to dismissal that may put succession process at serious risk.

Organizational performance

This literature saw organizational performance as a key factor of succession effectiveness. Schwartz and Menon (1985) argued that corporate environmental contexts such as uncertainties and financial distress can influence top management succession, and thus affect the distribution of power. In other words, chief executive selection and recruitment can result in major organization change that drastically affects organization profile. Our literature review also revealed that a non-linear, statistically significant relationship exists between “organizational performance and succession type” (Schwartz and Menon, 1985). Consequently, failing firms may replace top executives with an outsider due to dissatisfaction with organizational performance or perceived incompetency. In fact, an appealing “formula” resulted from theory tied inside replacement with maintenance and outside replacement with change (Dalton and Kesner, 1985; Schwartz and Menon, 1985).

Basically, in the hopeless reality of poor performing firms, an outside succession was seen as an opportunity for turning around stressful business situations; therefore, it is presumably relevant to say that failing firms should go for an outside successor to make critical strategic decisions and to seek to turn around the problematic incidences. On the other hand, one could presume that firms with a reasonable performance should opt for an inside executive to maintain current successful

strategies. However, strong socio-political forces as exercised by all involved parties, the incumbent, an heir apparent, the owning family and the board of directors, can be drastic moderating factors of above theoretical “formula” (Boeker and Goodstein, 1993; Canella and Lubatkin, 1993).

Transfer of capital

Concerning the transfer of capital, Le Breton-Miller *et al.* (2004) theorized that two aspects of family owned business succession exists; a. the leadership transition and b. the ownership transfer. Barach and Gantisky (1995), Forbes (1990) and Le Breton-Miller *et al.* (2004) emphasized that both aspects should be planned and proceeded together. Churchill and Hatten (1987), Lansberg (1988), Le Breton-Miller *et al.* (2004) and Potts *et al.* (2001b) suggested that capital transfer should be happening immediately after phase-in period in order to strengthen the new successor with confidence and self-worth.

Organizational size and age

From this systematic review, it was revealed that organizational size, and possibly, age, may attenuate the logic “formula” behind linking of outside succession with change and inside succession with maintenance (Dalton and Kesner, 1985). In fact, Schwartz and Menon (1985) statistically justified that corporate size of solvent firms did not drastically affect succession type, however, size did matter for larger poor performing firms, in which outside executives are the most prevalent type of successors. This preference may be partly explained from the deterioration of internal socio-political forces, power structures and the increase of dynamics of external stakeholders (Boeker and Goodstein, 1993). In addition and according to the same authors, no empirical data supported the general argument that top executives in larger firms are more resistant to their replacement and that large failing firms, consequently, make fewer top executive changes than small firms (Dalton and Kesner, 1985; Schwartz and Menon, 1985).

Succession monitoring and reflective feedback

This literature review on the topic revealed that succession was not found to be a linear and static process (Cabrera-Suárez *et al.*, 2001; Barach and Gantisky, 1995; Barach *et al.*, 1988; Churchill and Hatten, 1987; Dyer, 1986; Handler, 1990; Klein and Bell, 2007; Le Breton-Miller *et al.*, 2004; Malone, 1989; Potts *et al.*, 2001b; Poutziouris, 2001). On the contrary, any uncertainties that may occur and changes resulted should be an effect of frequent observation, evaluation and re-adjustment at different stages on the basis of reflection (Le Breton-Miller *et al.*, 2004). They further emphasized (Le Breton-Miller *et al.*, 2004) that such re-adjustments may encompass changes in the ground rules stage, selection criteria, competitive environment and performance trends of succession candidates and incumbents.

Gaps in the Conceptual Understanding and Areas of Future Research

Further to our literature review (Georgiou, 2010; Georgiou *et al.*, 2011) it is assumed that theoretical orientation of past research, which is in the central focus of this conceptual paper, has been placed on

the basis of strict quantitative research approaches. Additionally, it was confirmed that the majority of studies on the subject-matter were mostly provided from research on large family controlled organizations of diverse industries quoted in the stock markets rather than from smaller privately owned firms (Boeker and Goodstein, 1993; Dalton and Kesner, 1985; Schwartz and Menon, 1985). That assertion coincides with Boeker and Goodstein (1993), Dalton and Kesner (1985) and Schwartz and Menon, (1985) claims, that, in several cases, data from privately owned firms were much more difficult to be gathered and treated. Hence, positivist theory is inevitably limited in its potential to provide authentic socio-political insights from the perspective of research participants and unable to explain true mechanisms behind succession effectiveness in individual organizational settings.

Additionally, even in the more encompassing studies, we cannot assume as accurate that process and context factors emerged from theory were, too, sound predictors of effective winery succession as they overlook essential dimensions related to the specificity of the wine business context. Moreover, none of the studies has been located to deal with the topic of succession effectiveness in the arena of family wineries of Cyprus, which is our empirical research base, implying that “unlike other countries, this is an industry that is difficult to research from inside” (Vrontis *et al.*, 2001, p.260). In the same track, we were even unable to locate conceptual knowledge dealing with succession effectiveness from similar works carried out in other wine countries.

Evidently a vital “wine factor” is entirely missing from abstract theory, and thus incomplete knowledge still exists in this wine specific business area. Under such situation, it appears true that theoretical considerations which are based on the literature have not been customized to the precise requirements of the wine business industry, and that signifies the need for a further thoughtful empirical research, new reflection and meaningful abstract re-conceptualization. Hence, we will try to fill the aforementioned conceptual gaps with further primary research effort in a potentially important wine sector of Europe-the wine sector of Cyprus. This enquiry is considered essential in order to create a deeper organizational, socio-political and emotional meaning from the participants’ perspective, and propose a generalized conceptual framework under the prism of wine specificity.

Conceptual Framework Development Towards Succession Effectiveness in Family Firms

This research seeks to provide the reader a fundamental direction of what literature has to say in the areas of succession and its factors of effectiveness in family firms. In going through the supportive but fragmented literature on the topic, various studies were identified, selected, searched and directed towards different but important key factors and variables of succession effectiveness. Thus, some studies were found to be more focused on factors such as the “incumbent-successor skills and attributes” as well as to their “joint expectations and relationships” during the transition period. Others were mostly centralized on the socio-political aspects of succession, which highlight the moderating “dynamics of the owning family” on ownership structures and governance patterns. Still

others stressed out on the succession outcomes linking “organizational performance” and successor choice.

This paper is therefore a merging and synthesizing effort, which proposes a conceptual framework that draws a lot from Le Breton-Miller’s *et al.* (2004) succession model. It aims to specifically be expanded on their findings in the direction of development a Conceptual Framework towards Succession Effectiveness in Family Wineries, and thus “to professionalize succession [process] as much as possible and safeguard family tradition as much as necessary” (Poutziouris, 2001, p.15). Hence, at this stage of research our conceptual framework; a Conceptual Framework towards Succession Effectiveness in Family Firms (figure 3) is a precursor of a wine specific abstract conceptualization. It is therefore preliminary, generic and descriptive, not explanatory or specific to the family wineries.

Our framework presently hypothesizes certain elements which are commonly named as process and context factors. On the other hand, constructed theory on the topic underpinned the assumption that such process and context factors might perform individually; though, they can certainly interact synergistically in determining again the succession outcome (Boeker and Goodstein, 1993; Le Breton-Miller *et al.*, 2004). However, the several relationships, and interactions that might exist among succession factors and variables, or even other factors which are specific to the wine sector, are not presently placed on the conceptual framework because they are missing from the theoretical research and normative models. As we have argued in section 4, these connections and trends, as well as the participants understanding and thinking will be empirically examined in the arena of Cyprus family wineries in a way to provide substantial and original contribution to conceptual knowledge.

Hence the concepts we discuss now encompasses a number of secondary factors resulted from theory that may be restricted to a general business leadership succession, not to a particular succession process in family wineries. In the heart of the framework, a fundamental factor-“the succession ground rules”-is related to the first stage of critical actions to take in order to gradually launch the succession process itself. At this stage, the creation of a shared vision for the future of the family business and early foundation of the succession planning has a vital importance in leading the process.

A second stage of the process include five more central factors which are tied to the key performers of succession-that of incumbent and potential successor(s). Thus, “incumbent’s characteristics”, “qualities” and accumulated idiosyncratic knowledge from “tenure experience”, and “successor’s skills”, “attributes”, “training and development”, as well as his or her “inside or outside origin”, are all subjective to both socio-political forces and business-managerial circumstances. At the summit of the conceptual framework distinct tangible factors are noticeably embedded in the business-managerial context. Evidently, the “organizational performance” and “size”, “firm age” and “ownership transfer” have all a profound importance to the succession effective outcome. In turn, at

the socio-political base of the framework, the “dynamics of the family” and the “board of directors” have again a quintessential value to the same direction.

Succession “is a long-term dynamic issue that requires an ability to constantly adapt in the light of evolving circumstances” (Le Breton-Miller *et al.*, 2004, p.324). Similarly, a good quantity of those process factors and variables are thoroughly monitored and adjusted with reflective feedback. These are factors at the heart of the framework that are all each connected by a continual monitoring from which a reflection upon and feedback lead to related adjustments and new actions as the business, the owning family and their environment often co-evolves. However, in contrast of what has been previously mentioned on the issue of monitoring and responsiveness to changes occurred during the succession process, the factors at the summit and base (context factors) exceptionally differ in the extent to which they can be controllable and manipulated by the current management to progress effectiveness. Therefore, succession monitoring and feedback factor is placed in the heart of abstract conceptualization in a way to show that core process factors are more likely technocratic than political, and certainly, are more easily to be handled and adjusted accordingly.

Limitations, Research Value and Conclusions

As a major limitation, we believe, that research ignores peoples’ symbolic world (Saunders *et al.*, 2009) and emotional expressions that otherwise would have been surfaced during the research phase. Nevertheless, current literature review findings satisfy our aim and objectives as it provides sufficient insight on the succession topic, research trends and emerged aforementioned theoretical gaps. A future [action] research direction in the wine sector will therefore be focused on investigating peoples’ thinking and preparing for succession against abstract considerations in a way to provide answers to the gaps in the research addressed in section 4. It will also test and valid the Preliminary Conceptual Framework for Succession Effectiveness in Family Firms, and the philosophy on the way to its design. Finally, it will contribute to the identification of the mechanism towards succession effectiveness and adaptation of the framework to the real needs of the family owned wineries.

Recorded studies over a thirty year period of research were identified and selected for a systematic review through a comprehensive search strategy and establishment of inclusion/exclusion criteria. Consequently, the first important conclusion is that further to our systematic literature review on the topic, crucial process and context factors, and the main performers such as incumbent(s) and successor(s), were acknowledged that can potentially show the way to succession effectiveness. In this regard, Le Breton-Miller *et al.* (2004, p.324) theorizes that “these processes and actors can play key roles in assuring the health of successions, especially in the face of uncertainties that so often derail the process”.

It is also concluded that the literature, which systematically enclosed some of the key components of the framework, did not enlighten much on how and why these factors contribute to succession success, and therefore omits research participants’ thoughts, views, psycho-synthesis and actions. This was even true in the prism of the family owned wineries which is a very specific form of

business organization where in addition, and as a third conclusion, no systematic review has been conducted to tackle the complexities, the enablers and barriers of succession in the Cyprus or other countries' wine arena.

It should be moreover noted that our preliminary conceptualization outlined in figure 3, does not fully encompass the "wine factor" which is essential to add specificity to the framework. Hence, it is suggested that future research is necessary to test this framework in the organizational context of Cyprus family owned wineries. This is of paramount importance in order to provide change and improve future succession processing in Cyprus and other wine producing regions and countries.

Regardless of significant theoretical contribution to knowledge of succession in family firms, the value of this paper stems from the fact that no prior research attention has been located and focused on the true dynamics, enablers and barriers behind succession effectiveness in family wineries of Cyprus and elsewhere. Additionally, this research provides a set of generic succession process and context factors resulted from various research works in several industries other than wine, allowing for their evolvement or particular adaptation according to individual needs of the family owned wineries in various wine regions and countries. Therefore, this work offers a firm and inclusive theoretical basis for further empirical research in the wine sector and practical application.

THE IMPACT OF POST-MERGER INTEGRATION ON COST SAVINGS: THE CASE OF GREECE

Giannopoulos, Marinos¹; Koufopoulos, Dimitrios N.²

Abstract

The cost efficiency and resource-based theories are used to propose a model of the effects of asset divestiture and resource redeployment on cost savings. The dataset comes from a detailed survey of acquiring firm managers and involves domestic and cross-border acquisitions that took place in the European Union and more specifically in Greece. The population consisted of domestic and cross-border acquisitions that took place in Greece between listed companies operating in the same or different industries. In doing so, a country level research was conducted. This paper's theory stems from the value creating theories which originates from the traditional cost efficiency theory based on the concept of economies of scale and scope and in the resource based view (RBV) which is derived from the utilisation of core capabilities and resources. The results indicate the process of divesting the acquirer's assets does not lead to systematic cost savings and can even hurt costs. They also suggest that the acquirer is more effective in rationalising its own assets than those of the target.

Keywords: cost efficiency; resource-based theory; mergers and acquisitions, asset divestiture; resource redeployment; cost savings

Introduction

Acquisition activity carries on being at the centre of debate among managers, public policy makers and academics. In particular, the debate revolves around – but is not limited to – issues concerning their purpose, motives, contributions and impact upon society as a whole. This paper examines the issue of how asset divestiture and resource redeployment contribute to cost savings on mergers and acquisitions. A large body of research focuses on the motives behind M&As. Two classes of theories exist; the value creating theories and the managerial theories (Seth, 1990). The first group concentrates on the notion of how firms can increase their performance or value through acquisitions. On the other hand, the second group examines how managers can increase their own utility through acquisitions. This paper's theory stems from the value creating theories which originates from the traditional cost efficiency theory based on the concept of economies of scale and scope and in the resource based view (RBV) which is derived from the utilisation of core capabilities and resources (Lee and Lieberman, 2010).

Asset Divestiture and Cost Savings

In recent years asset divestiture has been attracting increasing attention. According to Capron *et al.* (2001), asset divestiture:

‘is the partial or complete sale or disposal of physical and organizational assets, shut down of facilities and reduction of work forces of target and acquirer businesses’

Studies using the asset divestiture argument support that the performance of acquisitions improves following divestitures (Anand and Singh 1997; Seth 1990; Tremblay and Tremblay, 1988; Maksimovic 2011). Divestiture can be viewed therefore as a part of a consolidation process that helps firms gain scale efficiencies by selling off excess resources (Capron *et al.* 2001)

This study proposes that this previous view is embedded in a well-known phenomenon of acquisitions, the scale-efficiency. In this standpoint, companies have the opportunity to obtain scale efficiencies by selling off spare capacity (Dutz 1989; Anand and Singh 1997). Scherer and Ross (1990) argued that in an efficient enough market, firms would be disciplined into specialising their assets in one or across many activities depending on their efficiency even without the use of an acquisition. An efficient market according to Scherer and Ross (1990) and Capron (1999) is a market that would be efficient enough to regulate firms into specializing their assets in an activity(ies) according to their respective efficiency and to stimulate efficient plant investment, specialization or closure choices. Asset divestiture is therefore a reasonable end result of a procedure where companies use mergers as means of reshaping their resources. Penrose (1959) and Wernerfelt (1984) were the first ones to refer to this outcome in the resource-based view of the firm.

Literature in economics, has presented us with the view that acquisitions enable firms to realize cost savings by the means of economies of scale and scope. Production-linked scale economies are frequently used as strategy to reduce costs. Economies of scale arise if the merged firm achieves unit cost savings as it increases the scale of a given activity (Capron 1999).

According to Porter (1980) and Scherer (1980) economies of scale can appear not only in the production process, but also in various other processes such as distribution, advertising, administrative activities, research and development and sales. Economies of scale can be achieved by spreading the amount of fixed costs over more activities (Shepherd 1979). Thus, economies of scale are more likely to arise in related acquisitions than to unrelated ones (Lee and Lieberman, 2010)

There are cases where economies of scope arise and it less expensive to combine two or more product lines in a firm than to produce them separately (Panzar and Willig, 1981; Capron *et al.* 2001). Economies of scope occur when a merged business has the ability to reduce costs as the activities it carries out increases.

The first, usually referred to as cost scope economies, stem from cost efficiencies related to the joint production of an array of services. Specifically, cost economies of scope are achieved if financial conglomerates can produce a given mix of products at a lower cost than individual institutions producing the same array of products separately (Berger, Hunter and Timme, 1993). Cost scope

economies could come from a number of sources. In particular, they may be the result of a) spreading the fixed expenses of managing client relationships, such as human resources, information technology and sustaining good reputation, over a broader output mix, b) the efficient use of established distribution channels for delivering additional products at lower marginal costs and c) synergies in the use of knowledge related to the production of services (Herring and Santomero, 1990).

If the shared factor of production is imperfectly divisible, economies of scale occur, so that the manufacturing of a subset of a good leaves excess capacity in some stages of production (Baumol *et al.* 1982; Teece 1982; Capron *et al.* 2001). Also Teece (1980) asserted that if an input is reused economies of scope exist, such as the sharing of the know-how or several other indefinable assets by more than one product.

In order for the economies of scale and scope to be exploited in an acquisition process, generally it can happen so through asset divestiture (Capron, 1999; Lee and Lieberman, 2010). This divestiture is possible without the need for an acquisition to take place. This might happen with the condition that the markets were efficient enough to regulate businesses into having their assets specialized in one or several activities according to their individual efficiency and have them produce competent plant investment, specialization or closure choices (Scherer and Ross, 1990). Nevertheless, taking into consideration transaction costs, firms are prohibited from using market contracting to reduce their assets and asset divestiture using market mechanisms and can create means of mutual specialization and co-dependency among the partners (Teece, 1982; Dranove and Shanley, 1995).

The study expects to find various evidences indicating that the direction of post-acquisition actions can affect the effectiveness of the divestiture of the assets and the redeployment of resources to the target or the acquirer (Capron 1999). This study's model relies heavily on the behavioural assumptions that post-acquisition resource redeployment and asset divestiture are amalgamated and employed in order to maximize the merged efficiency and effectiveness of the merging firms. Therefore, taking into consideration these assumptions, the expectation that post-acquisition decisions are not taken without a rationale behind them is expected, depending on the relevant position of the merging firms relating to their asset efficiency and resource complementarity (Capron, 1999; Capron *et al.*, 2001; Song *et al.*, 2005; Chung *et al.*, 2002). Hence, this process can be viewed as joint decision between the two merging firm's managers.

Several authors have doubted those assumptions. Numerous studies depict a similar political process can impair post-acquisition decisions and on several occasion the dominating firms of that process tend to be the acquirers (Pablo, 1994; Jemison and Sitkin, 1986; Haspeslagh and Jemison, 1991; Vaara, 2003; Birkinshaw *et al.*, 2000). Thus, post-acquisition processes result into changes primarily within the acquired firm (Datta, 1991; Hambrick and Canella, 1993, Pablo, 1994; Capron, 1999).

The majority of mergers and acquisitions and especially related ones, entail a high probability that the acquiring firm's managers will distinguish and reduce inefficiencies in the target because of their experience supervising similar businesses (Walsh, 1988; Hambrick and Canella, 1993;

Birkinshaw *et al.*, 2000). Hence, acquiring firm's management team will frequently take over the acquired firm by providing it with their own management instruments and also by regulating the implementation of these instruments (Chatterjee *et al.*, 1992; Hambrick and Canella, 1993; Capron 1999). Often it is easier for the acquiring company to enforce divestiture measures on the target than on its own business. Overall, the asset divestiture and the taking over of the target firm by the acquiring firm usually cultivates a sense of weakened relative status of the target managers. Also, it can produce high target executive turnover after an acquisition has taken place (Walsh, 1988; Mirvis and Marks, 1992).

Consequently, a disturbance in the organization has a high probability of occurring in the process of divesting the target's assets (Capron 1999)

Hypothesis 1: Following an acquisition the divestiture of:

- The acquirer's assets (H1a)
- The target's assets (H1b)

has an effect on cost savings

Potential Cross Effects

Recent merger and acquisition literature suggests that asset divestiture and resource redeployment are viewed as pieces of a common process of reconfiguration of the target and the acquirer (Galunic and Rodan, 1998; Song *et al.*, 2005). Through asset divestiture, changes in resources such as organizational and marketing are employed in order to sell and produce goods more efficiently. Conversely, through resource redeployment redundancies and conflicts with resources already in use are created. The result of these processes is that the firm has the tendency: to sell excess physical assets, lay off surplus employees and even shut down excess facilities. This study looks for those effects and that is why an attempt to investigate whether asset divestiture and resource redeployment are correlated was made.

Asset divestiture according to McKinley (1993) can stimulate or deter market development, while the effect innovation remains controversial. In addition, downsizing enable firms to reduce unnecessary resources; thus allowing a more productive allocation of resources (Jensen, 1986).

The same argument holds for resource redeployment. The question whether resource redeployment increases or decreases cost remains a controversial one. One point view is that resource redeployment can increase costs as the merging firms need additional resources in order to implement resource redeployment. By holding on to slack resources the firm has the ability to increase the "learning capacity of the recipient firm thus increasing the transferring firm's "teaching" effectiveness (Capron *et al.*, 1999). Some researchers argue that resource redeployment has the ability to improve cost efficiency in mergers and acquisitions (Teece, 1982, Panzar and Willig, 1981). Furthermore, in mergers and acquisitions certain factors of production can be easily accessed and can

be used in order to increase production efficiency or even reduce supply costs or production. Taking Capron *et al.*, (1999) under consideration cost savings can arise from resource redeployment and constitute a “dynamic” source of efficiency, contrarily to the more static economies of scale.

This paper measures the potential direct effects of asset divestiture and resource redeployment on cost savings.

Hypothesis 2: Following an acquisition, the redeployment of:

- The acquirer’s resources to the target (H2a)
- The target’s resources to the acquirer (H2b)

has an effect on cost savings.

Effectiveness of asymmetry between target and acquirer

The study model is based on the behavioural assumptions that post-acquisition resource redeployment and asset divestiture are employed in order to maximize the efficiency and effectiveness of the cost savings. There is an expectation that post-acquisition decisions are not engaged without a rationale behind them depending on the relevant position of the merging firms relating to their asset efficiency and resource complementarity (Capron, 1999; Song *et al.*, 2005; Chung *et al.*, 2000). Hence, this process can be viewed as joint decision between the two merging firm’s managers.

Several authors have doubted those assumptions. Numerous studies depict a similar political process can impair post-acquisition decisions and on several occasion the dominating firms of that process tend to be the acquirers (Pablo, 1994; Jemison and Sitkin, 1986; Haspeslagh and Jemison, 1991; Vaara, 2003; Birkinshaw *et al.*, 2000). Thus, post-acquisition processes result into changes primarily within the acquired firm (Datta, 1991; Hambrick and Canella, 1993, Pablo, 1994; Capron, 1999).

Overall, asset divestiture and the taking over process by the acquiring firm cultivate a sense of weakened relative status of the target managers and can produce high target executive turnover after an acquisition has taken place (Walsh, 1988; Mirvis and Marks, 1992).

Consequently, a disturbance in the organization has a high probability of occurring in the process of divesting the target’s assets (Capron 1999)

Hypothesis 3: Following an acquisition the divestiture of:

- Target’s assets has a lower impact on cost savings than the divestiture of the acquirer’s assets (H3a)

Measures and Methods

Cost reduction is operationalised inquiring the respondents for their assessment of the extent to which the acquisition had a positive impact on (Capron 1999):

- Product costs
- Input prices

These indicators are reflective and will be established by a five-point scale with one depicting negative impact and five depicting positive impact.

Moving on, the degree of asset divestiture is evaluated using an adapted version of the scale developed by Datta (1991) (Capron, 1999). The degree that the acquiring and acquired firms divested their assets is measured across five main actions:

- Resource and development (R&D)
- Manufacturing
- Logistics
- Sales network
- Administrative services

Each of the five indicators is reflective and the level of divestiture for each function is measured by taking the mean value of two questions relating to the degree of capacity disposed of and the proportion of the workforce cut. They are measured on a five point scale where one will be the zero percentage of asset divested over total assets (1=0%) and five will be the 91-100% of the assets divested over total assets.

Taking under consideration the research model in question and the need to formulate several hypotheses for testing, given that sufficient evidence was made available, it was deemed appropriate that a combination of descriptive approach design and causal approach design will be adopted, given the cross-sectional character of the research and the need to manipulate all the dependent and independent variables of the model.

On the other hand, resource redeployment to acquired firms and to acquirers is measured through five types of intangible resources (Hofer and Schendel, 1978; Barney, 1986; Morck and Yeung, 1992; Amit and Schoemaker, 1993; Teece, Pisano and Shuen, 1997; Capron 1999):

- Resource and Development (R&D) capabilities
- Manufacturing know-how
- Marketing resources
- Supplier relationships
- Distribution expertise

Each of the five indicators is reflective and will evaluate the level of resource redeployment post-acquisition with a scale from one to five, with one being not transferred at all and five being transferred to a very large extent.

Population and Frame

The population consisted of domestic and cross-border acquisitions that took place in Greece between listed companies operating in the same or different industries. In doing so, a country level research was conducted. The period of 2005-2009 was chosen, in order to exclude a) recent acquisitions where post acquisition restructuring had not yet led to asset divestiture or resource redeployment and b) older acquisitions for which managerial turnover would make it difficult to gather detailed information about post-acquisition activities. In this study the population frame was chosen so as to satisfy the following criteria. First, the organisation should operate in Greece. Second, firms should have participated at least in one merger or an acquisition within the predefined timeframe. Third, the merger or acquisition should have been completed. Fourth, a member of the top management team should be easily identifiable. Finally, firms should operate in various industries for the external validity of the findings to be reinforced. After having established the objectives concerning the population of the study, a sampling frame that fulfilled the above requirements was determined. A number of prospective published materials were examined. Sources for information included the *Athens Stock Exchange*, *The National Bank of Greece*, the *Ministry of Commerce in Greece*, the *ICAP Group*, *Thomson Financials* and *Thomson Datastream*. A total number of 510 companies was drawn from these directories.

Procedures and Sample Size

The process of choosing the sample used in this study was rather straightforward. All the listed companies that were involved in a domestic or cross-border acquisition or merger that originated from Greece were chosen²³. Because of several reasons like unknown Chief executive or information about the top management team could not easily identified less than half of the companies were dropped. The resulting number of companies that were selected for this study was 310.

Structural Equation Modelling

Structural equation modelling (SEM from henceforward) is a family of statistical models that seek to explain the relationships among multiple variables (Hair et al 2010). SEM is a multivariate technique that is described as a combination of both factor analysis and path analysis (Ho 2006). In doing so it examines the structure of interrelationships expressed in a series of equations, similar to a series of multiple regression equations. These equations depict all of the relationships among constructs (the dependent and independent variables) involved in the analysis. Constructs are unobservable or latent factors represented by multiple variables (much like variables representing a factor in factor analysis). SEM can be thought of as a unique combination of both types of multivariate techniques (interdependence and dependence), because its foundation lies in two familiar multivariate techniques: factor analysis and multiple regression analysis.

²³ That involved only Greek companies that acquired Greek and foreign targets

SEM in its most general form consists of two parts: the measurement model and the structural equation model. The measurement model specifies involves the rules of how the latent variables are measured in terms of the observed variables and it describes the measurement properties of the observed variables. The structural equation model is a flexible, comprehensive model that specifies the pattern relationships among independent and dependent variables, either observed or latent. It incorporates the strengths of multiple regression analysis, factor analysis and multivariate ANOVA (MANOVA) in a single model that can be evaluated statistically.

The model's diagram is depicted on Figure 1.1. Acquirer and Target divestiture are used to create value for the post-acquisition performance through cost-savings.

The input covariance matrix generated (Appendix I) from the model's 52 measurement variables contains 253 sample moments. For the measurement model, there are 28 regression weights, 4 covariances, and 27 variances, for a total of 80 parameters to be estimated. The model, therefore, has 201 degrees of freedom (253 – 52), and the chi-square goodness-of-fit statistic was computed.

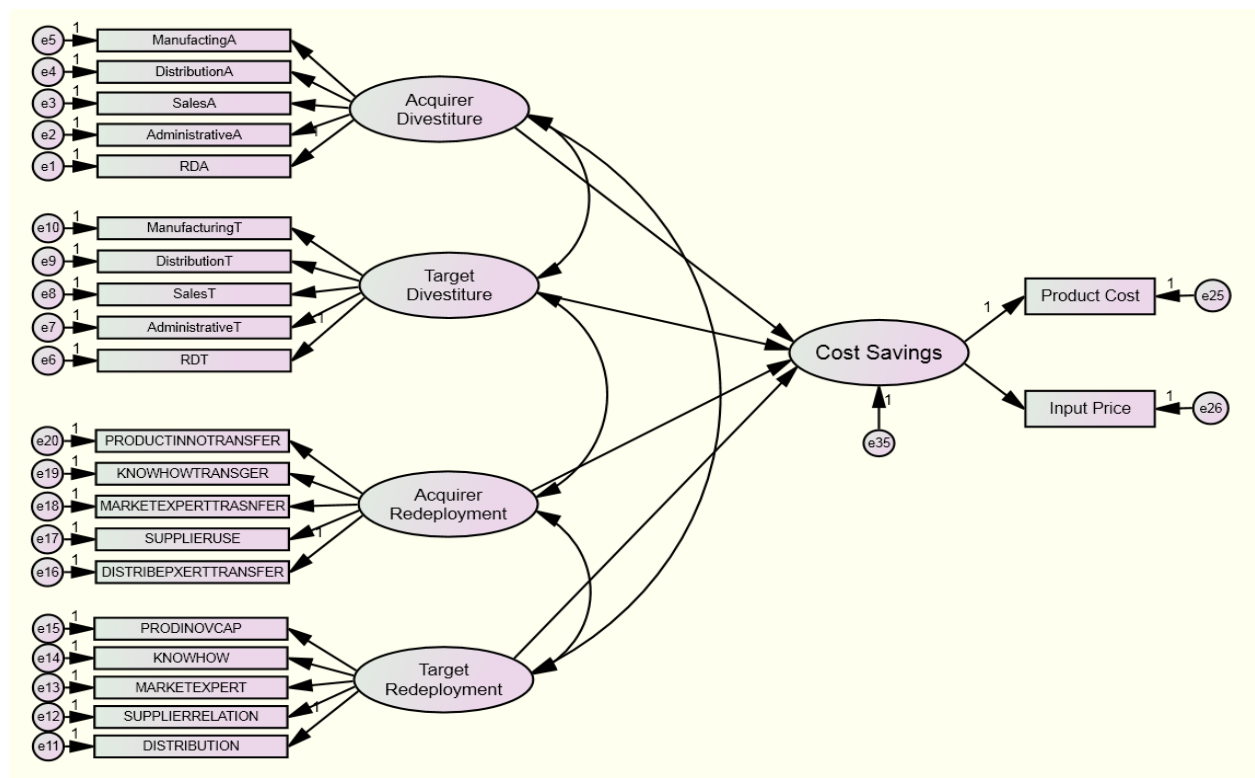

Figure 1.1

The chi-square goodness-of-fit test shows that the model did not fit the data well, χ^2 ($N = 136$ $df = 281$) = 571.064, $p < .05$. Although the model did not fit well by the chi-square test, the baseline comparisons fit indices of NFI, RFI, IFI, TLI, and CFI are close to 0.9 (range: 0.758 to 0.853) (see Table 2.2). Given the range of the computed baseline comparisons fit indices, the remaining possible improvement in fit for the hypothesized model (range: 0.018 to 0.171) appears so small as to be of little practical significance.

The unstandardized regression weights are all significant except that of the acquirer diversifications on Cost Savings (Table 2.3). The standardized regression weights range from -0.161 to 0.959. These values indicate that the 26 measurement variables are significantly represented by their respective latent constructs.

The explained variances for the 23 measurement variables are represented by their squared multiple correlations (see Table 2.5). The percentage of variance explained range from 0.26 or 26% (Cost Savings) to 0.920 or 92% (Acquirer Asset Manufacturing). The residual (unexplained) variances are calculated by subtracting each explained variance from 1 (i.e., 1 – squared multiple correlation). Thus, for the 23 measurement variables, the residual variances range from 8% to 74%

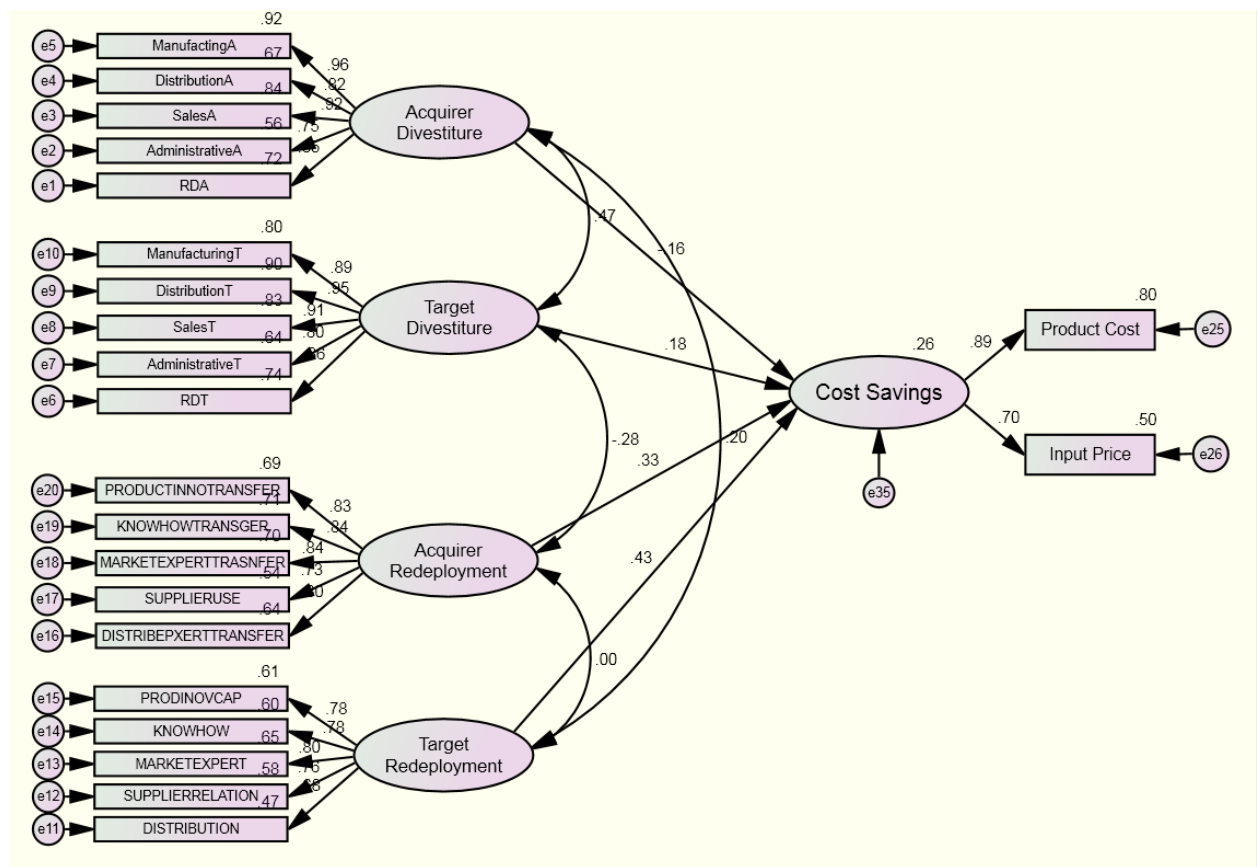

Figure 1.2

Figure 1.2 presents the results for the structural model depicted in Figure 1.1. Figure 1.2 depicts that the variance in cost savings explained by the model is 26%. That variance can be the outcome from the large number of factors that can affect post-acquisition performance in the model 26% is reasonable. Target divestiture has a positive significant effect on cost savings ($\beta=0.099$, $p<0.10$). This outcome can be the result of cost efficiency gains through cost cutting and reduced product cost, lower input prices and the reduction in slack resources. Whereas, acquirer divestiture has a negative insignificant effect on cost savings ($\beta= -0.161$, $p>0.10$). Acquirer and Target redeployment have a positive significant effect on cost savings ($\beta=0.198$, $p<0.001$) and ($\beta=0.337$, $p<0.001$) respectively.

Hypotheses 1a and 1b argued that the post-acquisition asset divestiture of the acquirer's and the target's assets enhance acquisition performance through cost savings. The results do not support Hypothesis 1a since the divestiture of the acquirer assets has an insignificant effect on cost savings ($\beta = -0.248$, $p > 0.10$). Hypotheses (H2a) and (H2b) are supported ($\beta = 0.198$, $p < 0.001$) and ($\beta = 0.337$, $p < 0.001$). Finally Hypothesis (H3a) is supported as the target's divestiture has a lower impact on cost savings.

These results indicate the process of divesting the acquirer's assets does not lead to systematic cost savings and can even hurt costs. They also suggest that the acquirer is more effective in rationalising its own assets than those of the target.

Summary and contributions

The intention of this study was to advance research on cost savings. It intended to achieve that by exploring by how post-acquisition asset divestiture and resource redeployment can increase cost savings. A structural model with latent variables was used in order to simultaneously assess the interrelations between post-acquisition actions and cost savings, while accounting for measuring error.

From a practitioner point of view, cost based-synergies are not easily achieved and may require more substantive changes in operating the business than those suggested by the dominant approach based on cost cutting and downsizing gains. Also the target tends to suffer damage and is much more likely to incur divestiture measures and face organizational disruption than the acquirer.

This study is subject to the limitations that generally apply to cross-sectional survey based research, which means that the response rate renders the conclusions subject to potential response biases.

Abstract

Logistics services quality (LSQ) is currently considered as a differentiation factor enhancing companies' competitive advantage. Nevertheless, there is neither consensus about its dimensions, or on how they affect customer satisfaction and loyalty in the business relations context. The present paper aims at identifying the main dimensions of logistics service quality and analyzing their effects on supplier's performance in terms of customer satisfaction and loyalty. The proposed structural equations model is tested empirically in a sample of 213 manufacturing companies in Greece. The results show that: 1) business customers' appraisal of their supplier's physical distribution quality is based on its technical/outcome and functional/process elements and that technical/outcome quality is further affected by functional/process quality, 2) both LSQ dimensions have a positive impact on customer satisfaction with technical/outcome quality being the main driver followed by functional/process quality, and 3) LSQ dimensions and customer satisfaction are all directly related to customer loyalty, while their indirect effects, through satisfaction, enhance their impact on customer loyalty. Finally, the theoretical and practical implications of the results within the framework of logistics management are discussed.

Keywords: Logistics service quality (LSQ) dimensions, Satisfaction, Loyalty, Hierarchical constructs modeling, Logistics management

Introduction

The importance of effective supply chain management (SCM) has become more and more evident in recent years. Businesses continue to identify the role of SCM in creating and maintaining a strategic competitive advantage through close customer relationships, increased satisfaction and improved business profitability (Mentzer, 2001; Stank et al., 2003). An essential aspect of SCM is reliable, high-quality logistics services. The main objective of logistic services is the design and implementation of inter-organizational systems operations that allows products to overcome time and space constraints (Bienstock et al., 2008).

Logistics service quality is one of the basic business operations, since it significantly affects the value that buyers receive along with product quality and price (Gil-Saura et al., 2008). LSQ has gained popularity and has become an important research topic in the last two decades, mainly due to its close relationship with customer satisfaction. It has now been realized that companies can obtain

increased business (Zeithaml et al., 2006) and market share (Daugherty et al., 1998; Innis and La Londe, 1994; Stank et al., 2003) through maintaining loyalty among customers by increased customer satisfaction, which can only be achieved by better customer service. Zeithaml et al. (2006) point out to the importance of word-of-mouth communication in new customers' acquisition. Post-experience evaluations of LSQ would significantly affect what customers tell others about the supplier's performance; this means that customers who are satisfied with the service they received can easily influence other customers to purchase from the same supplier, or avoid that particular firm if they were dissatisfied.

The literature provides several approaches regarding the measurement of LSQ. However, there is no consensus on its components, or on their role on the LSQ-Satisfaction-Loyalty chain system which is considered an appropriate tool for service evaluation (Brady et al., 2002; Huang et al., 2009).

With respect to the first issue, most previous studies adopt an aggregate measure for LSQ operationalization (Gil-Saura et al., 2008, 2010; Davis-Sramek et al., 2008) or they consider LSQ as a second-order construct with the nine constructs proposed by Mentzer et al. (1999) as subdimensions (Bienstock and Royne, 2010; Huang et al., 2009). However, Bienstock et al. (2008) pointed out that considering the outcome and process elements of LSQ separately in comprehensive models is an important step in advancing the understanding of how customer perception are formed. Following the perspective proposed by Grönroos (1984) as adopted by Mentzer et al. (1999, 2001) for the logistics context, they proposed that logistics service quality evaluation is based on two dimensions: technical/outcome quality, which addresses whether the supplier delivers the core benefit and functional/process quality, which addresses the process of service delivery.

As far as the links between LSQ and performance outcomes such customer satisfaction and loyalty are concerned, most of the previous studies follows the structure type known as "satisfaction" model (Cronin et al., 2000), where the primary and direct link is from customer satisfaction to outcome measures such as loyalty (Gil-Saura et al., 2008, 2010; Bienstock et al., 2008; Davis-Sramek et al., 2008, 2009), while the only determinant of customer satisfaction is service quality. Theoretical justification for these links can be attributed to Bagozzi's (1992) appraisal → emotional response → coping framework. However, several studies, especially in the field of B2C service marketing, proved that service quality directly affects loyalty except of being indirectly related with it through satisfaction (Cronin et al., 2000; Brady et al., 2002). The operational literature has been lacking in research that follows an integrative approach in modeling the relationships between LSQ, satisfaction and loyalty.

The current research effort proposes and tests an integrative model of service performance evaluation effects on customer satisfaction and loyalty in manufacturing supply chains. In the proposed model 213 business customers, operating in Greece, assess the technical/outcome and functional/process elements of LSQ of their supplier as well as their own satisfaction with and loyalty to these providers.

The major contributions of the paper is that it is trying to fill the gap in the literature concerning either the conceptualization of LSQ dimensions as well as their role in the LSQ – Satisfaction – Loyalty chain, since customer satisfaction is an important performance outcome in B2B industry and is considered as an important driver, among others, of loyalty, which in turn is related to increased market shares and profitability (Innis and La Londe, 1994).

The paper is organized as follows. In the sections that follow, a brief literature review, an overview of the proposed model and the relevant hypotheses are provided. Then the methodology is described, including the sample and the measurement model. Finally, the results of the structural equation model are presented, followed by discussions, implication and directions for further research.

Theoretical Background and Hypotheses Development

Logistics service quality (LSQ)

According to Perreault and Russ (1976), logistics' activities create time, place, and form utility, thereby enhancing product value. This was further proved by Coyle et al., (1992), Shapiro and Heskett, (1985), and Stock and Lambert, (1987) in describing the seven Rs of utility creation by logistics services: delivering the right amount, the right product, at the right place, in the right condition, at the right time, with the right information, and at the right price.

In this regard, further contributions have been made by several authors including Mentzer et al. (1989) who proposed that service quality deliverables comprised of "customer service quality" and "physical distribution service quality". The marketing customer service component has been researched by Mentzer et al. (1989). They proposed that understanding perceptions of physical distribution service from a customer's point of view was an essential input in marketing management decisions.

A commendable effort has been carried out by Bienstock et al. (1997) to develop a valid and reliable multidimensional scale for measuring physical distribution service quality combining the logistics and marketing service quality research streams. As part of this endeavor, they examined the marketing service quality measurement literature, particularly the development of SERVQUAL and subsequent attempt at replication of SERVQUAL's dimensions in industrial service contexts (Parasuraman et al., 1988). Bienstock et al. (1997) elaborated that the problems faced in applying this scale to an industrial service context were based on the relative importance of technical/outcome versus functional/process dimension that significantly affects the evaluation of industrial service transactions. Technical/outcome quality determines whether the service delivers the core benefit or outcome that is promised, while functional/process quality addresses the process of service delivery (Grönroos, 1984; Parasuraman et al., 1988). The SERVQUAL dimensions are heavily oriented toward the functional/process aspects of service quality and cannot address the validity of the LSQ construct (Bienstock et al., 2008).

Based on these findings and LSQ literature, Bienstock et al. (1997) developed and validated a 15-item BDSQ scale based on the value-added utilities of time, place, and form, and comprised of three technical/outcome dimensions of physical distribution service quality: timeliness, availability, and condition.

Mentzer et al. (1999) and Mentzer et al. (2001) tried to broaden LSQ concept by encompassing BDSQ's technical/outcome dimensions of timeliness, accuracy and condition, as well as additional dimensions of a functional/process nature such as personnel contact quality, order release quantities, information quality, ordering procedures, and order discrepancy handling.

In addition to the notion of a multidimensional perspective of service quality, Dabholkar et al. (1996) and Brady and Cronin (2001) proposed that perceptions of service quality are multilevel. Kang (2006) and Collier and Bienstock (2006) followed a similar approach to identify the dimensions (technical and functional) of service quality and the components thought to make up each dimension in mobile telecommunications and e-retailing respectively. The present study adopts a similar approach to represent LSQ technical/outcome and functional/process dimensions as higher-order constructs, since the separation of functional/process and technical/outcome service quality dimensions, in a comprehensive model, is a significant step in advancing the sophistication of the understanding of how customer perceptions of service quality are formed (Bienstock et al., 2008).

Customer satisfaction and loyalty

Given the increased emphasis on SCM has turned interest on understanding how business processes affect supply chain's performance. However, the performance outcomes, which are appropriate in measuring the effectiveness of such initiatives, are still under discussion. Anderson and Oliver (1987) suggested that performance is classified into dimensions of actual behavior or outcomes of that behavior. According to Stank et al. (1999, p. 433), "performance based on the behaviors of supply chain members involves determination of the effect of operational activities such as manufacturing, inventory management, and delivery on perceptual factors such as customer satisfaction".

According to McDougal and Levesque (2000), customer satisfaction is defined by the degree to which there is a match between customer expectations of the service offered and the actual usage experience. Customer satisfaction is considered by either using the transaction-specific perspective (cognitive dimension) or the cumulative perspective (affective dimension) (Söderlund, 1998). However, many studies in the field of service marketing support the affective perspective arguing that customer satisfaction is the customers' total response to the purchase and after sales experience, since this perspective is more capable of evaluating the service performance of firms and predicting customers' post-purchase activities (Parasuraman et al., 1988; Cronin et al., 2000).

Literature in service marketing management suggests the existence of a strong link between service evaluation and loyalty (Fornell, 1992; Anderson and Sullivan, 1993; Jones and Sasser, 1995, Cronin et al., 2000). Customer loyalty is defined as a long-term commitment to repurchase involving both a

favorable attitude toward the selling firm and repeated patronage. Thus, loyalty is demonstrated by the purchasing pattern over time (Dick and Basu, 1994). Although many customers' psychological processes may be associated with customer loyalty, customer satisfaction with company's capabilities has been shown to have significant and positive impact on cognitive attitudes and repurchase intentions in the supply chains context (Innis and La Londe, 1994; Daugherty et al., 1998; Hu and Jen, 2010). Customer loyalty is considered as a very significant determinant for suppliers' long-term financial prosperity (Jones and Sasser, 1995), since their profits can be improved substantially upon high customer loyalty rates maintenance (Reichheld and Sasser, 1990). Zeithaml et al. (1996) noted that increasing customer retention, or lowering the rate of customer defection, is a major key to the of service providers' ability to produce profits. The benefits of customer loyalty have been discussed in many studies and include among others increased repurchase volume (Heskett et al., 1997), better acquisition rates from positive word-of-mouth, and lower sensitivity to price increase (Zeithaml et al., 1996). The relationship between physical distribution performance and demand was validated by Innis and La Londe (1994) by investigating the impact of customer service, satisfaction, and attitudes on repurchase intentions which were considered as a proxy for market share. From the other side, both customer loyalty and positive referrals also contributes to the reduction of costs and capital investments requirements (Oliver, 1999; Crosby and Johnson, 2005).

Conceptual model and research hypotheses

The model examined in this study is presented in Fig. 1. The theoretical foundations for the relationships depicted in this figure are summarized below based on the preceding review of relevant literature.

In terms of LSQ's dimensions specification, both technical/outcome quality and functional/process quality are specified as second-order latent constructs, to model a level of abstraction higher than first-order constructs (Wetzels et al., 2009). According to MacKenzie et al. (2005), the utilization of higher-order constructs allow for more theoretical parsimony and reduce the model's complexity. Following the studies of Mentzer et al. (2001) and Bienstock et al. (2008), technical/outcome quality dimension has 4 sub-dimensions: order availability, timeliness, order accuracy, and order condition, while functional/process quality dimension has also 4 sub-dimensions: ordering procedures, personnel contact quality, information quality, and order discrepancy handling. Based on the above theoretical propositions, this study hypothesizes the following:

H1: Technical/outcome quality is a second-order construct having product availability (H1a), order accuracy (H1b), timeliness (H1c), and order condition (H1d) as its sub-dimensions.

H2: Functional/process quality is a second-order construct having ordering procedures (H2a), personnel contact quality (H2b), information quality (H2c), and order discrepancy handling (H2d) as its sub-dimensions.

Empirical studies in operations, marketing, and logistics provide considerable support for links between technical/outcome quality and functional/process quality performance and customer satisfaction (Crosby et al., 1990; Cronin and Taylor, 1992; Innis and La Londe, 1994; Youngdahl and Kellogg, 1997; Daugherty et al., 1998; Gil-Saura et al., 2008; Davis-Sramek et al., 2008, 2009).

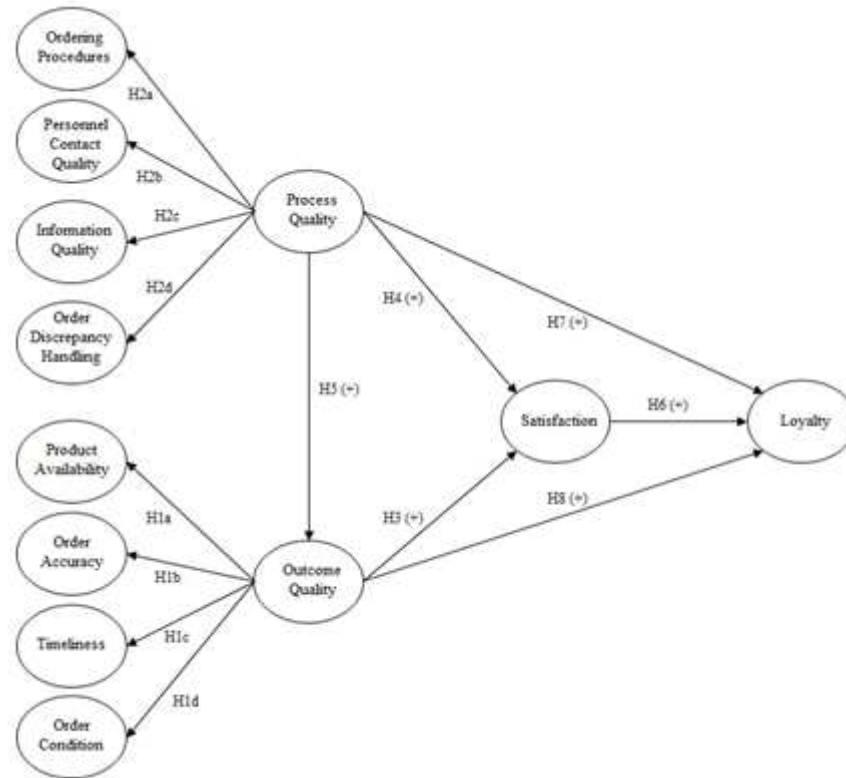

Figure 1: Conceptual Model

In marketing, Cronin and Taylor (1992) identified service quality as an antecedent of customer satisfaction. In logistics, elements of technical/outcome quality and functional/process quality performances relative to logistical services were found to positively affect customer satisfaction (Mentzer et al., 1999, 2001). A synthesis of these findings leads to the next two model hypotheses:

H3: In supply chains relationships technical/outcome quality performance positively affects customer satisfaction.

H4: In supply chains relationships functional/process quality performance positively affects customer satisfaction.

Mentzer et al. (2001) conceptualized LSQ as a process in an effort to increase the understanding of how logistics service customers form their perceptions of LSQ and satisfaction with logistics services. In their process model of LSQ, customers' perceptions of logistics process quality affect both directly and indirectly customer satisfaction. The indirect effects occur through customer perceptions of logistics outcome quality. Bienstock et al. (2008), Stank et al. (1999) and Hu and Jen (2010) confirmed this relationship in the operations management literature, finding that once a supplier learns about customer needs it can be better handle the operational means to cover them. This lead to the following hypothesis:

H5: In supply chains relationships functional/process quality performance positively affects technical/outcome quality performance

The literature reveals a strong link between customer satisfaction and loyalty in B2C and B2B contexts (Fornell, 1992; Anderson and Sullivan, 1993; Innis and La Londe, 1994; Jones and Sasser, 1995; Bienstock et al., 2008; Gil-Saura et al., 2008). Customer satisfaction with companies' performance has been shown to have a significant and positive effect on repurchase intentions, and positive referrals (Cronin and Morris, 1989; Youngdahl and Kellogg, 1997; Daugherty et al., 1998). These findings provide the theoretical basis for the following hypothesis:

H6: In supply chains relationships customer satisfaction positively affects customer loyalty.

Although there are a lot of evidence about the existence of significant, bivariate relationships between service evaluations and their outcomes such as WOM, referral and retention, the links between service quality and outcome measures is still unclear. Cronin et al.'s (2000) review reveals little uniformity on whether service quality directly or indirectly affects customer's post-purchase behavior. The majority of previous studies in the B2B relationships are categorized in the structure type known as "satisfaction" model (Cronin et al., 2000), where the primary and direct link is from customer satisfaction to outcome measures such as loyalty (Gil-Saura et al., 2008, 2010; Bienstock et al., 2008; Davis-Sramek et al., 2008, 2009). Partial examination of the simple bivariate links between the service quality dimensions and customer loyalty may either mask or overestimate the true relationship due to omitted variable bias. To address this issue Cronin et al. (2000) proposed a model where service quality and satisfaction directly lead to customer loyalty simultaneously. This leads the final two hypotheses:

H7: In supply chains relationships technical/outcome quality performance positively affects customer loyalty

H8: In supply chains relationships functional/process quality performance positively affects customer loyalty

Research Methodology

Research instrument development

In order to collect empirical data to assess the scales' properties and for testing the proposed hypotheses, a self-administrated questionnaire was prepared according to related literature and users' and experts' contribution. The items of the questionnaire were adapted from existing and well tested scales offered by the extant literature. More specifically the items used to assess LSQ dimensions were adapted from the items investigated and validated in Bienstock et al. (2008, 2010) and not from those proposed by Mentzer et al. (2001). More specifically the process dimension of order release quantities in the Mentzer et al. (2001) measurement scale has been omitted as it is concerned that there is an overlap between this dimension and the logistics outcome dimension of availability. Similarly, the outcome quality dimension of order quality found in Mentzer et al. (2001) model has been omitted as it is considered to have the same meaning with order accuracy. Customer satisfaction and loyalty measures were drawn from used and validated by Stank et al. (1999) and Gil-Saura et al. (2010). Likert scales (1–5), with anchors ranging from "strongly disagree" to "strongly agree" were used for all items to ensure statistical variability among survey responses for all items measured. Finally, a series of classification variables are included such company's size, respondent's duties, and company's yearly revenues.

In order to maintain the technical and conceptual equivalence of these instruments, a translation and back-translation strategy was applied during the development of the Greek version of the questionnaire. Finally, a factor analysis was performed on the data collected from a pilot study with 60 participants. The results were satisfactory, given that the nine expected LSQ factors, corresponding to the intended constructs, clearly emerged and all factors' Cronbach's alpha values were well above the commonly accepted threshold value of 0.70.

Data collection and sample profile

The universe consists of Greek manufacturing companies operating in the Attica region (the region around Athens, the capital of Greece), which are engaged in purchasing activities. The database of eligible companies, including 1,006 entries, was retrieved from the <http://www.icapbusiness.gr> by selecting the appropriate NACE (National Classification of Economic Activities) codes. The fieldwork was conducted during the last two months of 2011. Initially an e-mail, along with the questionnaire, was sent to operations/purchasing managers of all eligible companies, where the research objective

was described and their participation necessity was explained. The initial invitation yielded 184 usable responses (18%). After a reminder, 29 more usable responses were received for a total of 213 useable responses and an overall response rate of 21%.

Most of the respondents (54%) reported that their position is related to purchasing activities. A relatively big proportion of the respondents (18%) refused to report their duties, while the rest respondents (28%) reported their titles as senior managers, middle managers, or business owners. The majority of the respondents (88%) are industrial goods companies and the rest are consumer goods companies. The largest percentage of organizations (71%) were SME, since they reported between 10 and 250 employees, 18% of the participants reported more than 250 employees and 11% did not report the number of their employees. Finally, 49% of the participants reported that their annual revenues are less than €1.000.000, 38% are between €1.000.000 and €50.000.000, and 6% are more €50.000.000. 7% of the respondents failed to report their annual revenues.

Data Analysis and Results

The method of Partial Least Squares (PLS) analysis (Gefen et al., 2000), an implementation of Structural Equation Modeling (SEM), was applied to test the measurement model by determining the internal consistency, reliability and construct validity of the multiple-item scales used to operationalize the study variables. PLS is a component-based SEM technique that helps in testing the psychometric properties of the scales used to estimate the parameters of the structural model (Fornell, 1987). PLS-PM is preferred over covariance-based SEM techniques such as AMOS and Lisrel because (1) it has less strict requirements on sample size and residual distributions (Chin et al., 2003), and (2) it is especially capable in testing large and complex models (Bollen and Lenox, 1991), such as the proposed model, which has eleven first-order and two second-order reflective constructs.

The sample size of 213 respondents considered as adequate for PLS implementation. In general, the most complex regression in PLS implementation will involve either the indicators of the most complex formative construct or the largest number of antecedent constructs leading to an endogenous construct. Based on Barclay et al. (1995), sample size requirements should be at least ten times the number of predictors from either of the above rules, whichever is greater. In our case, since there are no formative constructs, 60 cases are adequate for PLS implementation.

The data analysis employed a two-phase approach suggested by Anderson and Gerbing (1988) in order to assess the reliability and validity of the measures before using them in the research model. The first phase includes the analysis of the measurement model, while the second phase examines the structural relationships among latent constructs.

Assessment of the measurement scales

The test of the measurement model involves the estimation of internal consistency, convergent and discriminant validity of the study constructs, which indicates the strength measures used to test the proposed model (Fornell, 1987). As shown in Table 1, all reliability measures (i.e. Cronbach's alpha

and Composite Reliability-CR) are well above the recommended level of 0.70 as an indicator for adequate internal consistency (Gefen et al., 2000).

Latent variable		Item	Mean	Std. deviation	Standardized loadings	Critical ratio	Cronbach's alpha	CR	AVE
Ordering Procedures	OP	OP1	4.202	0.823	0.906	79.246	0.741	0.885	0.794

Satisfaction	S	S1	4.047	0.749	0.928	74.509	0.910	0.943	0.847
		S2	4.028	0.731	0.928	66.216			
		S3	3.981	0.893	0.904	68.447			
Loyalty	L	L1	3.667	1.038	0.786	21.234	0.915	0.934	0.703
		L2	3.714	0.933	0.762	15.522			
		L3	3.638	1.095	0.844	39.363			
		L4	4.042	0.946	0.889	45.554			
		L5	4.000	0.914	0.877	43.778			
		L6	3.967	0.916	0.865	47.565			

Table 1: Psychometric Properties of the Constructs

As it can also be seen in Table 1, latent constructs show adequate convergent validity. Based on Fornell and Larcker (1981), convergent validity is adequate when constructs present an average variance extracted (AVE) which is greater or equal to 0.5. Convergent validity can also be verified

when items loading on their associated factors are well above 0.7, which is true in our case (Gefen et al., 2000).

Table 2 illustrates the discriminant validity of the constructs, with correlation among constructs and the square root of AVE on the diagonal. All values on the diagonal were greater than those in corresponding rows meaning that all measurement variables load more highly on their own constructs than on the other constructs (Fornell and Larcker, 1981).

Thus, it was concluded that logistics service evaluation is explained sufficiently by the revealed latent variables' structure (convergent validity), and this structure includes all unique manifest variables (discriminant validity).

Assessment of the higher-order constructs

In Table 3, the composite reliability (CR) and AVE measures of the second-order constructs are provided. These show CRs equal to or greater to 0.856 and AVE greater than 0.599, which are well above the recommended thresholds of 0.7 and 0.5 respectively, providing evidence of reliable second-order constructs (Wetzels et al., 2009). Finally all the loadings of the second-order constructs on the first-order constructs are equal to or exceed 0.704 and are significant at $\alpha=0.01$. All the above supports the validity of H1 and H2 that customer's perception of LSQ dimensions performances is based on their perception about their pre-specified sub-dimensions performances.

Table 2: Discriminant Validity Assessment

Results of hypotheses testing

The PLS method was also used to confirm the hypothesized relations between constructs in the proposed model. The significance of the paths included into the proposed model was tested using a bootstrap resample procedure with 500 replications. Smart-PLS software was used to conduct the PLS analysis (Ringle et al., 2005). In assessing the PLS model, the squared multiple correlations (R^2) for each endogenous latent variable were initially examined and the significance of the structural paths was evaluated.

The assessment of the proposed SEM is presented in Table 4 where the standardized path coefficients, representing the direct effects of the constructs, their statistical significance, and the proportion of explained variance for each endogenous constructs are given. Moreover, the significance of all possible indirect effects in the proposed structural model was also given in Table 5. The product of coefficients strategy (Preacher and Hayes, 2004) was preferred for the indirect path coefficients calculation, over Baron and Kenny's (1986) approach, because of its better statistical validity.

PROCESS QUALITY				OUTCOME QUALITY			
Sub-Dimension	CR = 0.888 AVE = 0.664			Sub-Dimension	CR = 0.856 AVE = 0.599		
	Loadings	Critical Ratio	95% Confidence Interval		Loadings	Critical Ratio	95% Confidence Interval
OD	0.801	30.778	[0.753-0.861]	OC	0.793	24.472	[0.720-0.861]
IQ	0.785	23.378	[0.697-0.839]	T	0.795	22.517	[0.711-0.852]
CQ	0.835	37.454	[0.785-0.879]	OA	0.799	25.591	[0.711-0.854]

Table 3: Assessment of the higher-order constructs of the LSQ dimensions

As can be seen, both outcome and process quality influence on customer's satisfaction from their supplier. However, outcome quality presents stronger influence on satisfaction than process quality, as indicated by model's coefficients of $\beta = 0.583$ ($t = 8.406$) for outcome quality, and $\beta = 0.227$ ($t = 3.277$). Moreover, process quality affects customer's perception about outcome quality ($\beta = 0.775$, $t = 17.838$). Therefore hypotheses H3, H4, and H5 are confirmed. Moreover, process quality not only directly affects customer satisfaction but also indirectly through outcome quality, since the relevant path coefficient ($\beta = 0.452$, $p < 0.05$) is statistically significant. As far as the direct determinants of customer's loyalty are concerned, both LSQ dimensions and customer's satisfaction affects business customer's attitudinal loyalty, confirming the validity of proposed hypotheses H6, H7, and H8. More specifically, satisfaction is the most important factor of customer loyalty ($\beta = 0.481$, $t = 7.027$), followed by outcome quality ($\beta = 0.197$, $t = 2.476$), and process quality ($\beta = 0.168$, $t = 2.383$). In terms of the indirect effects of LSQ dimensions on loyalty, both found to be statistical significant, as indicated by the relevant coefficients of $\beta = 0.480$ ($p < 0.05$) for process quality, and $\beta = 0.281$ ($p < 0.05$) for outcome quality.

The proposed model accounted for 59.7% of the variance in technical/outcome quality, 60.1% of the variance in satisfaction, and 60.5% of the variance in loyalty. The relatively high values of coefficients of determination (R^2) indicate that sizeable portions of the variances in the endogenous variables were explained by the chosen independent variables.

Discussion of findings and implications

Discussion of results

The aim of this study is to advance the understanding of the role of LSQ dimensions on business customer's satisfaction and loyalty. The major contributions of this study is the investigation of LSQ dimensions and the applicability of an integrative model investigating the relations between the concepts of the quality-satisfaction-loyalty chain in the manufacturing supply chain context (Cronin et al., 2000). A comprehensive framework was developed and PLS-PM analysis was conducted to empirically validate the propose model.

The proposed framework of this study confirmed a reliable and valid conceptualization of logistics service quality consisting of two second-order dimensions of LSQ: outcome quality and process quality. This basic dichotomy parallels technical versus functional B2C service quality proposed by Grönroos (1984) and is found as well in other studies (Bienstock et al., 2008; Stank et al., 1999).

<i>Path</i>	<i>Value</i>	<i>Std. error</i>	<i>t</i>	<i>Pr > t </i>	<i>R²</i>	<i>Hypotheses Validation</i>
<i>Outcome Quality → Satisfaction</i>	0.583	0.069	8.406	0.000	0.597	<i>H3 supported</i>
<i>Process Quality → Satisfaction</i>	0.227	0.069	3.277	0.001		<i>H4 supported</i>
<i>Process Quality → Outcome Quality</i>	0.775	0.043	17.838	0.000	0.601	<i>H5 supported</i>
<i>Satisfaction → Loyalty</i>	0.481	0.069	7.027	0.000	0.605	<i>H6 supported</i>
<i>Outcome Quality → Loyalty</i>	0.197	0.080	2.476	0.014		<i>H7 supported</i>
<i>Process Quality → Loyalty</i>	0.168	0.071	2.383	0.018		<i>H8 supported</i>

Table 5: Bootstrap results for indirect effects

Our results show that both technical/outcome and functional/process LSQ dimensions impact satisfaction, while outcome quality partially mediates the relationship between process quality and satisfaction. These results are consistent with the findings in Stank et al. (1999), Davis-Sramek et al. (2009) and Bienstock et al. (2008).

The results also revealed that the most important factor of business customers' loyalty is customer satisfaction, but in contrast with most previous studies (Bienstock et al., 2008, 2010; Stank et al., 1999; Gil-Saura et al., 2008; Stank et al. 1999), it is not the only one. Both LSQ dimensions directly affect

customer loyalty except of being indirectly related with it through satisfaction. These results are in accordance with the studies of Cronin et al. (2000) in the context of B2C service marketing, Collier and Bienstock (2006) in the e-retailing context, and Huang et al. (2009) in LSQ evaluation for online shopping, which have proved that customer loyalty is better predicted/explained by comprehensive modeling approaches. However, it should be mentioned that despite the statistical significance of LSQ dimensions' direct effects of on customer loyalty, they are much lower than their indirect ones.

Managerial Implications

There are several important implications of the results for supply chain managers. Logistics service quality is currently an important element of strategic management for companies wishing to outperform, since it could be a differentiator for manufacturers in market conditions characterized by changing supply chains, global competition, products similarity, and intense price competition (Davis-Sramek et al., 2009). This study provides a clear conceptualization of LSQ considering its process and outcome dimensions separately. This confederation is crucial for practitioners in advancing their understanding of how customer's perception of service quality is shaped.

The results of the present study show that outcome quality is the main driver of customer satisfaction followed by process quality. As manufacturing companies recognize that customer satisfaction from order delivery effectiveness represents a significant element in the buying process, they should respond appropriately by developing their technical capabilities. This will produce value to the suppliers by performing the relevant activities better than their competitors. However, these suppliers should not disregard the importance of LSQ soft elements' development, because 1) business customers' evaluation of process quality can bias future evaluations of outcome quality, and 2) its total effect on customer satisfaction (0.679) is greater than the relevant effect of technical elements (0.583). Moreover, given the fact that LSQ's technical elements could be easily copied by competitors, the consideration of functional elements of quality in suppliers strategic positioning will offer them significant opportunities in improving their customers attitudes about the services they receive (Huang et al., 2009).

In terms of business customers' loyalty, the suppliers are suggested to improve both LSQ elements and satisfaction collectively rather than improve only one variable, since the strategy considering the improvement of only one variable and ignore the effects of the others will be incomplete (Cronin et al., 2000). Suppliers need to know that gaining customer loyalty needs more than simply deliver the order. They need to be concerned with how the order is received by the customer and how the customer interacts with them. When business customers make an order to their supplier, they are expecting that their products will be delivered to the specifications denoted by them and will be able to interact effectively with supplier's available contact points. If one or both LSQ's dimensions fail to meet customers' expectations, then not only will service evaluation be affected but also satisfaction and ultimately future behavioral intention.

Limitations and future research

The current study has a number of limitations that have to be addressed in the future research. First, rigorous tests for non-response bias are necessary, although appropriate comparisons were conducted across the two wave responses. These could be achieved by contacting a random sample of non-respondents and asking them to respond to selected survey items and comparing these to those answers of actual responses. Second, the fact that the study sample includes manufacturing companies operating in the Attica region may affect the generality of the results. There are different territories in Greece exhibiting different problems which might alter the results. Third, the findings and the implications of this study were obtained using a cross-sectional study, which reduces its ability to reflect the temporal changes in the research constructs.

In future research efforts, other constructs related to relationship quality (i.e. trust, commitment) showing significant explanation power of loyalty could be incorporated into the proposed model, so as to enhance its predictive performance and provide better understanding of business customer's decision-making process. Moreover, it should be investigated whether the relationships reported here are generalizable across different industrial segments such as wholesaling, retailing, TPL etc., different companies' sizes, and companies' technology level. The understanding of the above moderators' effects in the proposed model relations will help suppliers in their efforts to improve the effectiveness of their logistics services.

Abstract

It is argued that productivity gains should be maintained during times of severe financial and economic crises so that the economy gets back on track and avoids being trapped in a state of growth recession; this was the Japanese experience in the 1990s. Innovation is an important factor in productivity improvement. We use historical data from the World Intellectual Property Organization on patents in the United States, Japan, and major European and Latin American economies going back to 1883 together with economic indicators to investigate the impact of major crises on innovation. Patents are used as a proxy for innovation. We anticipate that this work will lead into solid empirical evidence on a major policy issue that has resurfaced recently with great force in the light of the World Financial Crisis of 2008. Countries like the USA and France, have taken a firm policy on investment in research and development (R&D) as a major thrust of their efforts. The EU at large has increased its research budget by 5%, a significant increase in the light of the crisis. Others countries are still grappling with this issue, while smaller countries feel that investment in R&D will not have any impact on their economic recovery.

Keywords: Innovation, economic growth, economic and financial crises.

Introduction

It is widely accepted, going back to the work of Schumpeter (1942), that “innovation is an engine that drives growth in capitalist economies”. Innovations, be it new products, new processes, new legal and institutional environments for doing things, are the inventions that can be applied successfully. Innovations bring about a positive change in terms of higher productivity which turns out to be a fundamental source of increasing wealth in an economy. Hence, innovation is considered a major driver of economic development. On the other hand, innovations may also have a destructive effect as new developments alter or obliterate old organizational practices, routines and products. Schumpeter coined the term “creative destruction” to describe the process through which innovative companies create new markets while destroying old ones. As a consequence, organizations that do not innovate effectively may be destroyed by those that do.

Because of the double nature of the process of “creative destruction”, Schumpeter saw the process of innovation not only as a driving force for progress but also as a cause of recurring recessions and cyclical behavior of the economic development. In his work on business cycles, Schumpeter (1939)

interprets the major waves of economic growth and technological transformation as “successive industrial revolutions” and explains that these clusters of radical innovations are dependent on financial capital. Carlota Perez (2002) develops this idea further showing that the technological revolutions arrive with some degree of regularity and that economies react to them in predictable phases. Like Schumpeter she believes that creation of the new technology corresponds to the period of explosive growth, and turbulence and uncertainty usually follow the revolutionary developments, leading to the collapse of bubbles created by financial speculation. Perez argues that the financial crises are a prelude to industrial shake-up and moving to a new “paradigm”.

Each technological revolution is received as a shock and its diffusion encounters a powerful resistance both in the established institutions and in people themselves. Each technological revolution brings not only a full revamping of the productive structure but also the transformation of the institutions of governance, society and even of ideologies and culture. This process of “creative destruction” occurs every 50-60 years both in the economy and socio-political framework (Perez 2002).

In light of the current economic crisis the question of particular interest is how to stimulate a recovery? As Bruegel policy report (2009) indicates, national policies do matter in determining the recovery strategy. Comparing the examples of two countries Japan and Sweden, the report shows that policies implemented during crisis and in response to it, have major bearing on the long term growth. Thus, Sweden was able to recoup its output loss entirely by using recession as an opportunity for economic transformation and investing heavily in R&D and education.

While there are arguments that innovation drives economic growth in post-industrial societies and while policy-makers argue that investments in R&D are essential for getting out of financial crises, there is no empirical evidence that either economic growth drives innovation or that innovation spurs economic growth. In this paper we investigate the two-way link between the innovation and economic growth. Particular attention is paid to financial crises, as it is during crises that the “creative destruction” phenomenon of Schumpeter takes place and it is major crises that signal a “paradigm shift” according to Perez (2002).

This working paper is organized as follows. Firstly, we will present the basic model in the theory section. Secondly, we will describe the data we use in the analysis. Thirdly, we will describe the empirical test of the model. And finally, we will present the preliminary findings and plans for future research and discussion issues.

Theoretical model

We describe now the theoretical model that links innovation with economic growth, and on which we base our empirical work. This is not a theoretical model in the sense of explaining “how things happen” but in explaining “what happens”. In this sense it looks at the macro relations, and not the micro. It is a theoretical model nevertheless, in the sense that it can be subjected to empirical testing

for its verification or refutation. And while the arguments on which this model is developed, are drawn from the literature on innovation, it is its empirical verification we are interested in.

The relationships between the factors of the model are illustrated in Figure 1. At the top level we have link no. 1 in which we are primarily interested: Innovation feeds into economic growth. However, innovation is also fed from economic growth as highlighted in the lower part of the figure. That is, economic growth leads to increases in education (link no. 2), which leads into research and development (R&D, link no. 3) which leads in turn to innovations (link no. 4) in the sense we described above.

By education we mean here the general body of useful knowledge as articulated in Mokyr (2002) in his discussion of the historical origins of the knowledge economy. Mokyr (chapter 1) develops a Theory of Useful Knowledge, which he classifies into propositional knowledge, or beliefs about natural phenomena and regularities, and prescriptive knowledge, also called techniques. The link of economic growth to the generation of “useful knowledge” is discussed in passing in Mokyr, and is dealt with at length in Ruttan (2001). So, link no. 2 is derived from the literature we just quoted. Link 3 postulates a relation between education and R&D, where by this term we mean all the activities that go on in University research centers, government laboratories and the R&D division of enterprises. The nature of this link is rather vague for now and we do not yet pursue in which ways educational levels affect R&D. Nevertheless, this vagueness is inconsequential for our model, since we might as well go straight from education to innovation without altering the basic hypotheses we are testing later. This direct link (e.g. education – innovation) is not strenuous, as argued in Mokry (2002, chapter 6). Link no. 4 describes the process through which research and development activities lead into innovations in products and processes, a process that is well documented in the literature on entrepreneurship and incubators, knowledge regions, venture capital and the like.

We hasten to point out that there is cyclicity in our argument - the model describes a feedback loop. And hence we need to establish in our empirical investigation whether the causality is from innovation to economic growth (link no. 1) or simply economic growth feeds into innovation, in what is illustrated simply through link no. 5.

Having postulated the four-link loop for our model we can now identify proxies for each module and carry out empirical testing. For the scope of the present paper however, we are testing directly only links no. 1 and no. 5 with the objective of identifying if *financial crises have an effect* on these links. In future work we will explore the remaining links, since the conclusions of this paper drawn from the empirical work that follows do not reject the hypothesis implied in the top of the figure, and hence the bottom of the loop deserves investigation as well.

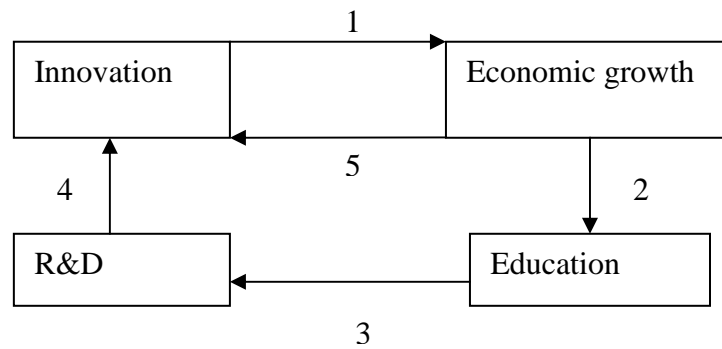

Figure 1: The feedback loop between innovation and economic growth.

From the above description we now formalize four hypotheses that will be tested empirically in the next section. The hypotheses are formulated in the form of regression equations that will be tested for significance and their coefficients examined for revealing the directionality of the relations.

The first two models investigate Link no. 1.

- **Model 1:** $GDP = f(I)$. This model tests whether innovation, as measured by a relevant proxy, has an effect on GDP.
- **Model 2:** $GDP = f(I, CRISES)$. This model tests whether innovations and crises have an effect on GDP. In a sense, this is a trivial model as crises are defined by a significant drop for three consecutive quarters in GDP, however we are interested to see, if there is a joint effect with innovation. Assuming Model 1 is significant so will be Model 2.

The remaining two models investigate Link no. 5, and they are self-explanatory.

- **Model 3:** $I = F(GDP)$.
- **Model 4:** $I = F(GDP, CRISES)$.

In the Model 4 we are interested to see if the economic crises create a special opportunity to innovate. As economies worldwide collapse and firms retrench, people look for alternatives: cheaper alternatives, faster alternatives, easier alternatives. Draper (2009) believes that recessions and crises give birth to some of the greatest, longest lasting and best-run companies of the world. For everyone it is a time of crisis, for an entrepreneur it is a time of great opportunities.

Empirical analysis

The empirical analysis focuses on testing two main hypotheses: the influence of innovation on economic growth and the influence of economic growth on innovation. We also test the impact of economic crises on innovation.

Data description

The empirical setting for testing the hypotheses is the data from the US. We use the data from WIPO (World Intellectual Property Organization) on the number of patents granted by the US patent office that cover the period from 1883 to 2008. Furthermore, we collected the US data on GDP for the same period of time from Eurostat. Both GDP and patent data are ln-transformed. Finally, we took a list of all the economic recessions and crises in the US from Wikipedia for the period of 1883 to 2008 and created two dummy variables for crises: the first variable summarizes all the American crises and recessions and is called "ACRISES" and the second variable summarizes only the 5 major crises, characterized by the longest duration and a significant drop of GDP and is called "MCRISES". For example, "MCRISES" include the Great Depression from 1929 to 1934, depression after the Second World War in 1945, oil and stock market crash of 1973-1975, early 1980 recession caused by the Iranian revolution and the energy crisis, early 2000 recession because of the dot com bubble, and finally late 2000 recession caused by the subprime mortgage crisis that led to the collapse of the United States housing bubble.

<i>GDP</i>	<i>Model 1</i>	<i>Model 2a</i>	<i>Model 2b</i>
<i>Intercept</i>	-12.936*** (0.950)	-12.347*** (0.955)	-13.118*** (0.942)
<i>Innovation</i>	1.894*** (0.088)	1.848*** (0.088)	1.913*** (0.087)

	<i>F</i> =462.669 <i>Adj.R2</i> = 0.787 <i>N</i> =125	<i>F</i> =245.637 <i>Adj.R2</i> = 0.797 <i>N</i> =125	<i>F</i> =239.612 <i>Adj.R2</i> = 0.792 <i>N</i> =125

*** $p < 0.01$; ** $p < 0.05$; * $p < 0.1$; values in parentheses are standard errors.

Table 1

Model testing and preliminary findings

To test the first hypothesis we run OLS regression with GDP as a dependent variable and innovation (measured as a number of registered patents) as independent variable. If an increase in GDP results in an increase of innovation, innovation should have a positive sign. Consequently, we test the model adding dummy variables indicating economic crises. In the Model 2a the dummy variable ACRISES summarized all American crises and recessions and in the Model 2b the dummy variable MCRISES summarizes only the five major crises. The results of the analysis are presented in the table 1.

As can be seen from the Table 1, in the Model 1 the coefficient of innovation is positive and highly significant, which proves our hypothesis that innovation drives economic growth. In the Models 2a

and 2b the coefficients of the dummy variable are negative and also significant, which indicates that crises adversely affect economic growth.

To test the model 3 we run OLS regression with innovation as a dependent variable and GDP as an independent variable. Growth of GDP should be contributing positively to innovation. To test models 4a and 4b we add crises variables to the equation. If crises create an opportunity to innovate the coefficients of the variables should be positive.

The results of the analysis are presented in the table 2:

<i>Innovation</i>	<i>Model 3</i>	<i>Model 4a</i>	<i>Model 4b</i>
<i>Intercept</i>	7.663*** (0.146)	7.587*** (0.158)	7.652*** (0.144)
<i>GDP</i>	0.416*** (0.019)	0.423*** (0.020)	0.416*** (0.019)
<i>ACRISES</i>		0.065 (0.051)	
<i>MCRISES</i>			0.228*** (0.095)
	<i>F</i> =462.669 <i>Adj.R2</i> = 0.787 <i>N</i> =125	<i>F</i> =233.228 <i>Adj.R2</i> = 0.788 <i>N</i> =125	<i>F</i> =243.081 <i>Adj.R2</i> = 0.795 <i>N</i> =125

*** $p < 0.01$; ** $p < 0.05$; * $p < 0.1$; values in parentheses are standard errors.

Table 2

Consistent with our expectations GDP positively influences innovation and the sign of the GDP is positive and highly significant. In the model 4a the coefficient of the crises variable is positive but not significant. This can be explained by the fact that small recessions, which do not seriously shake up the economy, do not create enough stimuli for innovation. The model 4b shows the opposite: as the coefficient of the crises variable is positive and highly significant, we conclude that major crises, characterized by the long duration and significant drop in productivity and industrial output create opportunities for innovation. When a crisis is prolonged, people lose jobs, companies retrench, people start thinking more creatively because the circumstances push them into it (Draper, 2009).

Conclusions and future research

The goal of this paper was to provide empirical evidence that innovation drives productivity growth and GDP. We also tested the contrary argument that GDP drives innovation. The data provided strong support for the hypotheses. We also studied the impact of economic crises on innovation. Our data provided support that major economic crises positively affect innovation. When the economic crises are characterized by long duration and significant drop in the industrial output they create opportunities to innovate. This question is of particular interest and should be investigated further.

Having tested extensively the US data we plan to carry out similar analysis for the other countries. First, while the model we test may reflect valid economic theories, our empirical analysis is not testing a theory in a laboratory setting but is testing its implementation by policy-makers in response to different crises. Hence, we want to see if the findings have universal applicability. Second, having ex post knowledge on which countries performed well in recovering after the crises we can draw further conclusions on the validity of the hypotheses that innovation drives economic growth.

GREEN ENTREPRENEURS – AN ITALIAN PERSPECTIVE

Greig, Karen ¹; Reitano, Antonella²; Sposato, Carla²; Taylor, David¹

¹Manchester Metropolitan University, Business School, UK

²Department of Business Administration, University of Calabria

Abstract

The aim of this paper is to explore the motivations of those starting green businesses or greening established businesses in Italy. Taylor and Walley's Green Entrepreneur Typology (Taylor and Walley, 2004, Walley et al, 2008) is used in the research as a framework for comparison of established businesses and start-ups.

Despite the growing perception of the role of green entrepreneurs as crucial change agents in the sustainability transformation process (Walley et al, 2008), until recently, research into the motives of and influences on green entrepreneurs has been quite limited (Walley et al, 2008, Schaper, 2005). There is evidence however that in the UK and internationally there are as many new green businesses set up with entirely economic motives as there are green start-ups established because of wider sustainability goals (Walley et al, 2008) many of these encouraged by initiatives designed specifically to encourage green entrepreneurship (Schaper, 2005).

According to Bianchi and Noci (1998), the approach of Italian SMEs to greening has been reactive rather than proactive in that they have responded positively when required to by key stakeholders. This approach is attributed to a number of factors including a lack of resources and knowledge (Bianchi and Noci, 1998). The EU and the Italian Government are actively encouraging sustainable business but their focus appears to be primarily on the "greening" of existing businesses, in particular SMEs, rather than the encouragement of green start-ups.

The focus of this research was limited to Italian SME's in the Calabria region of Italy leaving room for further research in other Italian regions. The purpose of the research was to provide insights for policy makers and educators in the UK and Italy into ways to foster green entrepreneurship. Questionnaires were sent to SME owner-managers in the Calabria region of Italy, who were listed on the website of Confindustria Cosenza, the regional branch of Confindustria, a national business association representing both manufacturing and service enterprises throughout Italy. The results indicate that whilst profit is still a key determinant of the business approach, sustainability is playing an increasingly influential role.

Keywords: Green Entrepreneurs, Italy, Sustainability, Greening

Introduction

Until recently, investigation into the motives of and influences on green entrepreneurs amongst the wealth of research on entrepreneurship has been quite limited (Walley et al, 2007, Schaper, 2005). This is a cause for concern given the growing perception of the role of green entrepreneurs as crucial change agents in the sustainability transformation process (Walley et al, 2008).

Following a detailed analysis of general entrepreneurship typologies (including Chell et al, 1991; Dana, 1995; Thompson,1998), structuration theory applied to the greening of business (Giddens 1984; Walley & Stubbs, 2000) and different conceptualisations of green businesses (Elkington, 1999; Isaak, 1998), Taylor & Walley (2004) constructed a conceptual typology representing the drivers, or inspirations of green entrepreneurs (see fig. 1 below).

Because there had been limited empirical evidence to support not only the Green Entrepreneur Typology but also much of the research on green entrepreneurs that preceded its introduction, in 2007, Walley et al embarked on primary research – in the form of interviews with green entrepreneurs - to test the appropriateness of the Green Entrepreneur Typology they had presented in 2004.

The founders of 10 SMEs (less than 250 employees) located in North West England from the Energy, recycling & pollution (1), Food and farming (2) and Toiletries & cosmetics, clothing, fashion (3) sectors were interviewed about their motives and circumstances at the time they set up their businesses. The businesses were selected from “The Green Guide” a national online database containing both self-declared and nominated ‘green’ businesses. When the interview data had been analysed, the businesses were mapped onto Taylor & Walley’s (2004) ‘Green Entrepreneur Typology’ (fig. 1). This resulted in a roughly equal distribution of the companies between the four types on the typology. Two of the three toiletries sector entrepreneurs were placed in the ethical maverick category, and similarly two of the three food/farming entrepreneurs were placed in the accidental enviropreneur category. All of the food/farming and toiletries companies identified predominantly soft structural influences and therefore appear in the bottom half of the typology. The renewable energy sector entrepreneurs were either innovative opportunists or visionary champions where hard structure is most influential. The results suggest that in the UK there are as many new green businesses set up with entirely economic motives as there are green start-ups established because of wider sustainability goals.

A review of current research revealed that there had been limited attention paid to developments in the approach to sustainability of Italian business owner/managers since the Bianchi and Nocci (1998) research. A research team was therefore established, comprising colleagues from the University of Calabria and the Manchester Metropolitan University, to identify what motivates and influences those starting up green businesses or those greening existing businesses in Italy, specifically the Calabrian region.

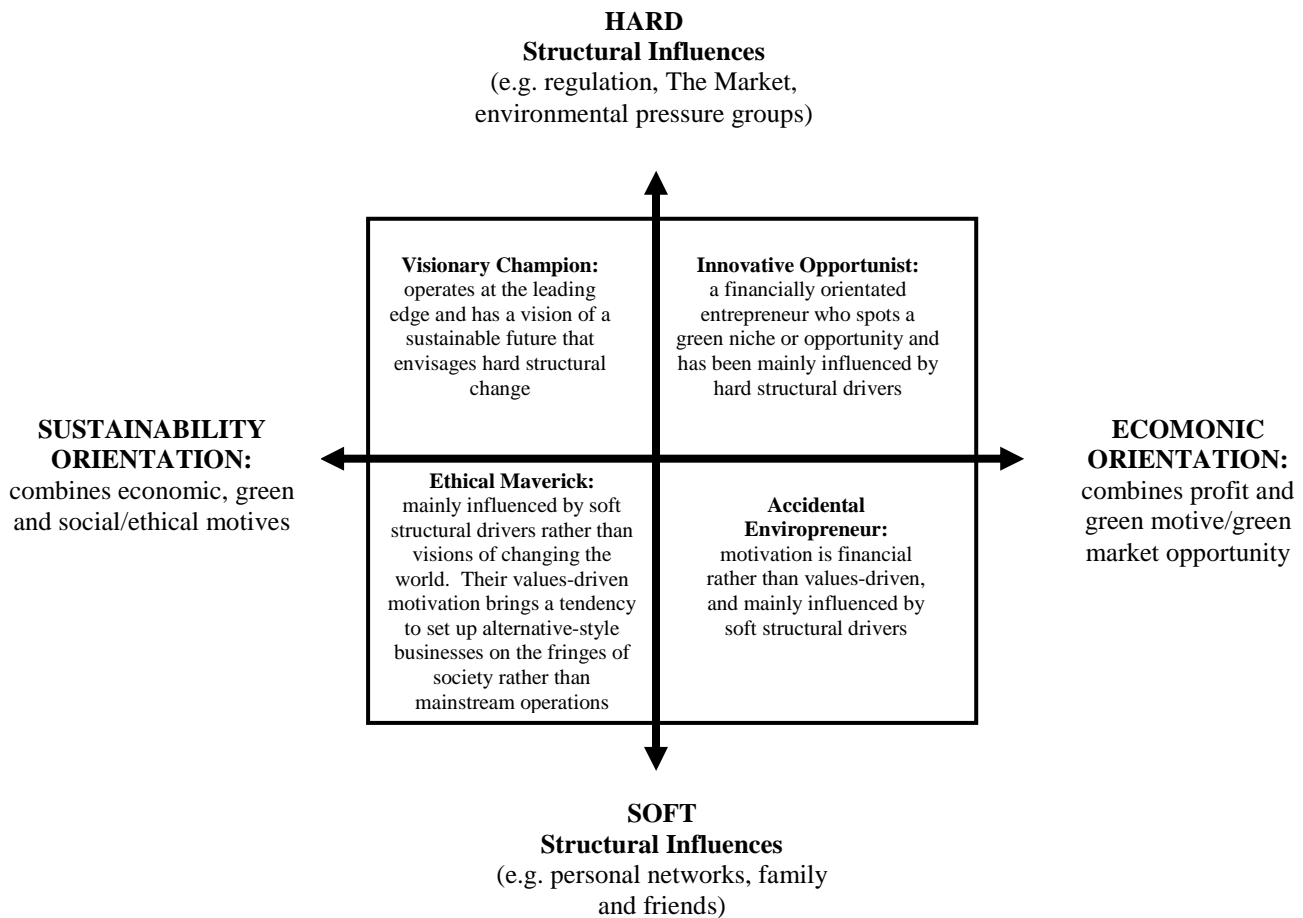

Fig. 1: Green Entrepreneur Typology (Taylor & Walley, 2004)

Background

The approach of Italian SMEs to greening has traditionally been reactive rather than proactive in that they have responded positively when required to by key stakeholders (Bianchi and Noci, 1998). This approach is attributed to a number of factors including a lack of resources and knowledge (Bianchi and Noci, 1998). More recent research (Hitchens et al, 2005) suggests that although environmental concerns amongst European SME's are voiced, there is no evidence to suggest that this has triggered more environmentally responsible behaviour. Furthermore, the lack of improvement in

environmental behaviour generally is attributed to the absence of sustained pressure on European SME's to improve their environmental performance (Hitchens et al, 2005).

In 2009, the EU and the Italian Government turned their attentions to the renewable energy sector in an effort to actively encourage more sustainable business performance. Their focus however appears to be primarily on the "greening" of existing businesses, in particular SMEs, rather than the encouragement of green start-ups.

The aim of this research therefore is to establish the level of take up of EU and national Government 'greening' initiatives by established Italian SMEs and business start-ups. It explores the motivations for and influences on the greening of businesses and start-ups using Taylor and Walley's Green Entrepreneur Typology (2004), and as well as assessing the environmental and attitudinal changes that have taken place in Italy since 1998, provides data for a UK-Italian comparison.

Although a similar approach to the UK research was taken we were unable to apply the Walley et al (2008) interpretation of the term 'green entrepreneur', that is to say, an individual founder of a new, for-profit, significantly green business ('significantly green' meaning green either by virtue of the nature of the product, e.g. renewable energy, or the significantly green /ethical policies and practices of the business) or a business which is a primarily an ethical/social business but includes some green credentials . This is because the Walley et al (2004) definition does not include within its scope existing businesses that have or are taking steps to green their products and/or processes. Our interpretation of the term green entrepreneur has therefore been broadened to include businesses that have taken steps to green their products and/or processes.

Research Methodology

Specific evidence of greening is not always identifiable from sources of secondary published data such as a company website. The authors decided therefore to embark on primary research in the form of questionnaires that would be emailed to the businesses in the sample. An introductory email was sent to the company requesting the contact details of the owner/manager. On receipt of these details, a personalised email with the questionnaire attached was sent. Questionnaires were chosen on the basis that they would provide us with the information we required within the limited timescale we had been set for the research.

The focus of the research was the Calabria region of Italy so the first challenge was to identify a listing of companies in that region from which an appropriate sample could be selected.

Confindustria Cosenza (<http://www.assindustria.cs.it>) is an association established over 60 years ago with the aim of promoting the spread of the entrepreneurial culture in the province of Cosenza in the Calabria region of Southern Italy as well as providing advice and guidance (on matters concerning, for example, safety and quality, internationalization, scientific and technological research, and economic and environmental concerns) and representing the interests of the associated enterprises.

The Confindustria Cosenza website features a list of 57 companies in a range of industrial sectors, all of which are located in Cosenza. These companies constituted our initial research sample. Preliminary screening based on a comparison between our definition of a Green Entrepreneur and the company profile published on the company website and, in line with Walley et al's (2008) research, only including SME's (< 250 employees) provided us with a sample of 25 companies in 3 industrial sectors; agriculture & food (1), manufacturing (2) and electronics (3).

It became apparent during the initial screening process that the majority of the companies were family businesses that had been passed down from a previous generation and that making contact with the original founder would be problematic. The contact was in fact more likely to be the current owner/manager. The age of the companies in the sample also suggested that those companies that could be classified as green were more likely to be established companies in the process of greening rather than green start-ups. A telephone call was made to each company in the sample during which the details of current owner/manager of the company were requested. This enabled us to email a questionnaire to a specific person/owner-manager.

The questions in the questionnaire were selected from the interview questions used in the Walley et al (2008) UK research. These questions had been designed to obtain sufficient information about the owner/manager's approach to sustainability to allow their position on the Green Entrepreneur Typology to be determined. They included questions relating to the perceived hard and soft structural influences were posed as well as questions aimed at determining their position on the horizontal economic-sustainability axis.

To enable some preliminary assessment of the relevance to the research of the information provided by the respondents, the questionnaire with a covering letter, in which the purpose and nature of the research was explained, was initially emailed to 10 companies. A single response was received which, when analysed, resulted in a number of enhancements to the questionnaire being made. These included reducing the number of questions and where appropriate (for clarity and ease/speed of completion) including a number of closed questions.

The enhanced questionnaire (see appendix 1) was emailed to 24 companies, including the 9 companies that were sent, but did not reply to the original questionnaire. 8 of the 24 companies contacted replied to the enhanced questionnaire, a response rate of 36%.

Quite clearly we did not achieve our initial aim of identifying a sample of Italian Green Entrepreneurs whose motivations and influences at start-up we could analyse in order to position them on the Green Entrepreneur Typology (Taylor and Walley, 2004). The founders of the businesses in the sample were unavailable for comment, in most cases because the business had been in the family for generations. In such cases, a profit motivation at start-up could reasonably be assumed. The apparent lack of Italian Green Entrepreneurs is not that surprising given the reactive rather than proactive approach to greening of Italian Businesses reported by Bianchi and Noci (1998). This does

however raise questions about the completeness of the Confindustria Cosenza website company listing and the need to perhaps resort to more than one source in any future research.

The questionnaires that were returned were completed to different degrees and although follow up questionnaires were sent to companies who had failed to respond to all questions, only one of these was returned. Whilst telephone interviews would have provided us with more opportunity to obtain the required information from the company owner/managers, it was logistically more efficient and financially more feasible to adopt the method we did.

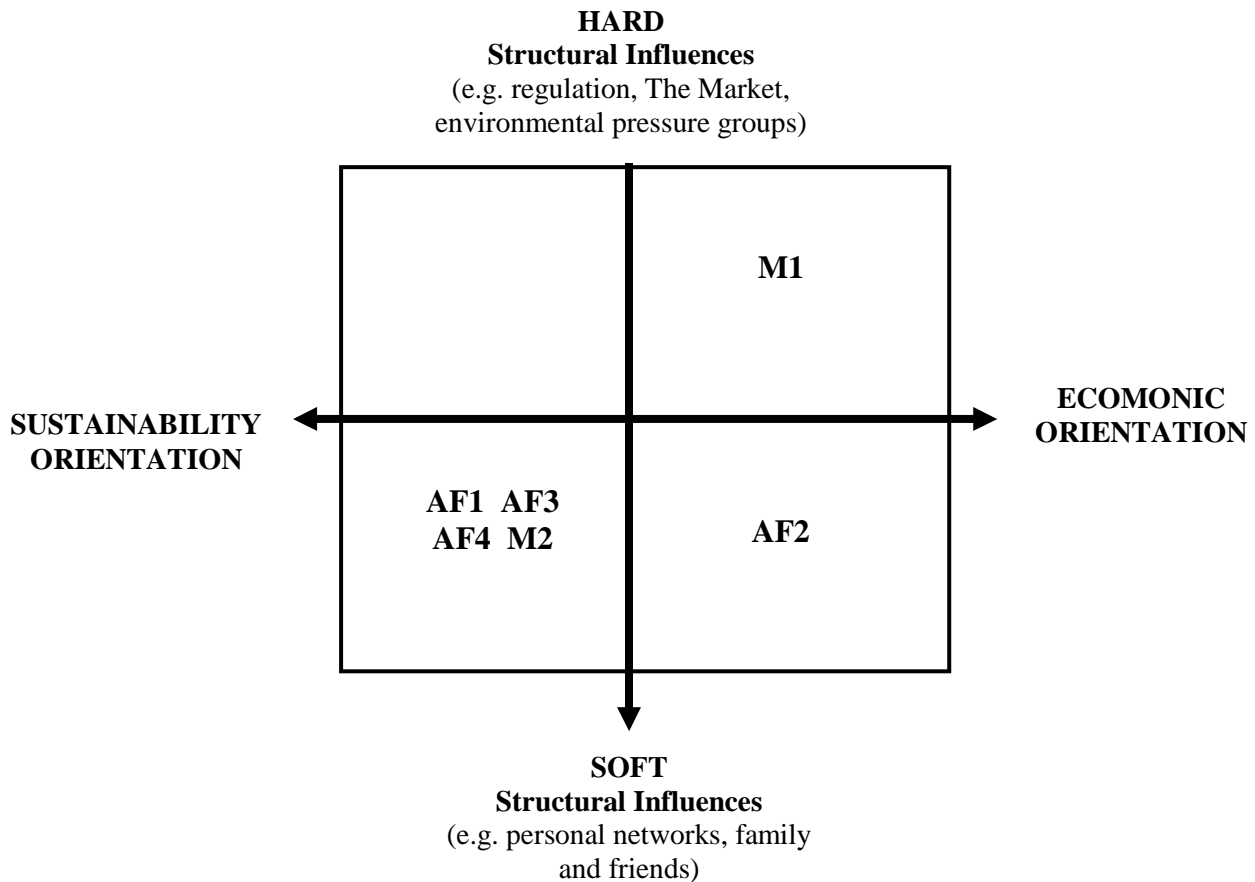

Fig. 2: Classification of Pilot Case Studies

Not unlike the Walley et al (2008) UK research, our methodology did not include any other perspectives than that of the owner/manager and our interpretation of that perspective. We have not, for example considered the role of or interviewed any support organisations. Unlike the Walley et al (2008) UK research however, we are looking at what happened next (Beveridge & Guy, 2005) rather than the influences/motivations as perceived by the individual entrepreneur at the time the business was conceived.

Results

Completed questionnaires were received from businesses in the following sectors/sub-sectors: Agriculture & Food (5 responses), Manufacturing (2 responses). One of the Agriculture & Food respondents was in fact a co-operative society so the information that they had provided was not relevant to our research.

The questionnaire data was analysed in order to identify the orientation (profit or sustainability) and to classify the influences cited as either soft or hard structure. In cases where both hard and soft structure influences were cited, it was necessary to determine which was the dominant set and where appropriate identifying the dominant set.

At the end of this exercise we were able to position the entrepreneur concerned on the Green Entrepreneur typology (see fig. 2).

Innovative Opportunists	1
Ethical Mavericks	4
Accidental Enviropreneurs	1

AF1 – AF4 are the *agriculture & food sector cases* (see table 1); M1 – M2 are in the *manufacturing sector* (see table 2). The position of the case within each box is random – in other words, there has been no attempt at this stage to finely grade each case within the respective type box.

The analysis of the questionnaire data has provided us with a mix of ‘types’ however we (one could say, predictably) have not identified amongst our sample of green entrepreneurs any Visionary Champions. This would appear to support research suggesting that Italian SME responses to the green agenda are reactive rather than proactive (Bianchi and Noci, 1998). Reactive companies are unlikely to “operate at the leading edge” or to have “a vision of a sustainable future that envisages hard structural change” as are the visionary champions envisaged in the Green Entrepreneur Typology (Taylor and Walley, 2004).

Given the high proportion of family businesses amongst the sample, the prevalence of soft structural influences was predictable. What was less predictable was the claimed sustainability orientation of four of the companies. This contradicts previous research which has suggested a reluctance amongst European and Italian SME’s to adopt a sustainable approach to business unless legislation or the market demands it. SME’s are less likely to have the resources (human and financial) and skills necessary to engage with or in more sustainable tools and behaviours (Borga et al, 2006; Hitchens et al, 2005; Castka et al, 2004).

Although the sample is too small to draw any significant more generalisable findings, there does appear to be a link with the Agriculture and Farming sector and the resulting green entrepreneurial type. Three out of the four respondents were found to be Ethical Mavericks. This was not the case however in the manufacturing sector where one of the entrepreneurs was an innovative opportunist

and the other an ethical maverick. The manufacturing innovative opportunist appeared to have finely balanced combinations of both hard and soft structural influences, but it was an economic orientation of the business that placed it in the 'innovative opportunist' rather than 'visionary champion' category.

Unsurprisingly, the companies that are inherited appear in the bottom half of the matrix. Almost by definition, these companies will be more influenced by soft structure factors such as family, personal networks and education. In the manufacturing sector however, one of the two entrepreneurs appears in the top half of the matrix where hard structures is most influential.

Finally we asked the enterprises what sources they had used to find information or guidance for improving their sustainability performance. Most of them had found the information on the Internet but all respondents agreed that the issues around green entrepreneurship needed to be put forward and that relevant and updated information should be made more easily available for everyone. They all expressed a high level of interest in finding out more about this topic through newsletters, conferences and courses because for them it is important to know what the market needs regarding "sustainability products".

Conclusions

Whilst we set out to replicate, in an Italian context, the research undertaken by Walley et al (2008), into the influences on and motivations of Green Entrepreneurs at the time they started their business, the age of the businesses in our sample (most of which are family businesses that in some cases have been passed down from generation to generation) has meant that we have not been able to speak to the founder of the company. Our research has therefore focussed on the influences on and motivations of current owner/managers to 'green' their existing businesses.

Our results have shown some positive developments in the current approaches of Italian businesses to the environment. Whilst profit is still a key determinant of the business approach, it is clear that sustainability is playing an increasingly influential role. The businesses in the sample have attributed their rather belated recognition of environmental concerns to a lack of resources (human and financial), not uncommon in the case of many SME's, and also limited availability of advice and information which is indicative of a lack of improvement since Bianchi and Nochi's research in 1998.

It is perhaps surprising that a number of the businesses involved in the research who indicated a lack of information available to them on ways to improve their environmental impact were amongst the businesses who claimed an increased sustainability orientation. This is however encouraging for the Italian Government who are currently promoting environmental performance improvements in specific industry sectors.
