<i>Green Credentials</i>	<i>According to the Managing Director, Pina Amarelli, since the business was established it has been a "green business". The Amarelli family was interested in the roots of this particular plant (liquorice) and in particular to extraction the juice of this beneficial plant.</i>	<i>The "secret" of the Falcone family's success lies in knowing how to capture the magic of Sila's mountain environment, infusing it with meat processing expertise handed down from rural traditions.</i>	<i>The company respect the Brundtland report. This report was studied in the University from the marketing manager Alberto Bua. The group follows the guidelines of this report and they are considering the Sustainable Development as the development which meets the needs of the present without compromising the ability of future generations to meet their own needs.</i>	<i>Their production philosophy is based essentially on the natural raw material, on the quality, innovation and service, which they manage to incorporate in their products. Their agronomic department runs continuous and time based controls during all the productions phases according to theirs and ICEA (Institute for the Ethic and environmental Certification) standards and practices. Since 1986 the Gabro's olive plantations have been recognised as "organic production plantations".</i>
<i>Main Influences at Start-Up</i>	<i>Personal Networks (family). Market.</i>	<i>Personal Networks (family). Knowledge.</i>	<i>Personal Networks (family). Education. Regulation.</i>	<i>Personal Networks (family). Beliefs.</i>
<i>Orientation</i>	<i>Sustainability. Economic.</i>	<i>Economic first. Sustainable through economic necessity.</i>	<i>Sustainability. Economic.</i>	<i>Sustainability. Economic.</i>

Table 2

<i>Manufacturing</i>	<i>Case M1</i>	<i>Case M2</i>
<i>Company Profile</i>	<i>Production food preservation and house cleaning items. The business was established in 1995 with purely economic (profit) motives, the company manager claims that a sustainability orientation is now evident.</i>	<i>Manufacture, service and repair of the buses, minibus, school bus and special vehicles.</i>
<i>Green Credentials</i>	<i>According to the manager, the company have now adopted the most advanced technologies that enable the production of high-quality products, with the utmost respect for the environment: this is now the business's philosophy. They only use materials showing the "non-toxic hygienic and odourless" mark, in order to produce re-usable products that are of excellent quality and that meet the new demands. Now, they want to introduce into the market a new product, a "sustainable aluminium packaging" 100% recyclable like all their products.</i>	<i>The products that are used in the paint and gluing phases are chemicals, for these reasons the company takes environmental precautions for the nature's respect. Some of these environmental precautions include: 1) Disposal of container's solvent in special collectors. 2) Use of filters inside the cab painting to purification of the air that carry out. 3) Collection.</i>
<i>Main Influences at Start-Up</i>	<i>Demands of the Market.</i>	<i>Personal Networks (family). Business Ethos.</i>
<i>Orientation</i>	<i>Economic first. Sustainability.</i>	<i>Sustainability. Economic.</i>

Table 3

It was apparent during the analysis stage of this research that the businesses questioned did not always fit exactly into the categories on the typology unless a clinical approach to the response analysis was taken. For example, a business that cites 3 hard structure influences and 2 soft structure influences is automatically positioned in the top part of the model. The significance of each influence is not assessed. In the case of the orientation axis, the business is positioned either at the sustainability end or the economic end and this does not always reflect the strength of the particular orientation. Whilst we do not believe that our approach has resulted in inaccurate outcomes, we do believe that more strategic positioning on the typology would reflect more accurately the approach of the businesses questioned.

Our analysis has not resulted in a 'complete' mix of green entrepreneur types (see fig. 1). From the analysis of the questionnaires the results were: four ethical mavericks, one accidental enviropreneur and one innovative opportunist.

The questionnaires results suggest that the stated motives for establishing the business were both economic and sustainability driven. In some cases therefore we had to make a judgement based on both the overall balance of factors to determine whether we placed them on the hard or soft end of the 'influences' axis and on which 'type' description seemed to best fit the individual.

Our research has highlighted significant developments in the greening of existing businesses in the decade since the publication of the Bianci and Nocci research (1998). There is, however, scope to

broaden the research to a larger number of cases within the Calabrian region, and across different regions in Italy.

Appendix 1

Questionnaire

1	<i>When was the business established?</i>
2	<i>Did you set up a 'green' business? If yes, what motivated you to do this? If no, would you like to improve the sustainability performance of your business and how would you do this?</i>
3	<i>How would you describe your motivations when you started the business?</i> <i>Economic (profit).</i> <i>Sustainability</i> <i>Both</i>
4	<i>What were the key influences at the time you started the business, for example, Government Legislation (taxes, subsidies that encouraged the business idea), consumer demand, family tradition, your education, past experience, your own ethical values (respect for the environment) etc.</i>
5	<i>How would you classify your business in relationship to the market/sector?</i> <i>Deep Green.</i> <i>Light Green.</i> <i>Not Green</i>
6	<i>Where would you go to find information or guidance on improving the sustainability performance of your business?</i>
7	<i>If you already have this information, where did you find it?</i>

THE RELATIONSHIP BETWEEN TECHNOLOGICAL CHANGE AND ECONOMIC GROWTH IN LESS ADVANCED EUROPEAN REGIONS

Abstract

The present paper addresses the following question: some technological change determinants are linked to the economic growth and local development in less advanced EU regions?

The underlying hypothesis is that the technological change stimulates the economic growth.

The study database consists of 324 EU regions. After identifying the less advanced regions and by considering some technological change determinants during the period 2000-2008, a statistical analysis is carried out. The correlation analysis results show that the less advanced EU regions in which the public expenditure in R&D is higher report the higher GDP growth rate.

Keywords: Regional growth, Technological change, EU less advanced regions

Introduction

The origin of interest in innovation as a tool able to achieve regional development can be dated back to mid-1990s but a great relevance was attributed to this topic only in 2000 when the European Union introduced the Lisbon Strategy. The assumption at the basis of the Lisbon Strategy was that innovation and European competitiveness were the main goals to achieve.

Despite the relevance of the established goals, the involvement and the resources spent to achieve them, in 2005 the results were not satisfactory and so several changes were introduced (Martinez and Rodriguez, 2009; Seravalli, 2009). The main change was the passage from a national to a regional context where to carry out innovation processes.

The definition of regional boundaries in which innovation processes are conducted is the straight cause of empirical evidences: regions report different growth rates and so disparities between less and more developed regions are conspicuous.

For this reason, the main aim of the present work is to focus on the less advanced EU regions and try to understand whether technological change is linked to economic growth of these Regions. To analyze this link, the research considers some determinants of technological change by main regional innovation actors over the time span 2000-2008.

To achieve this goal, the present work is divided into three parts.

In the first part, attention is paid over the “innovation-regional development” nexus in order to underline two important passages: the former is from innovation processes based on a linear model to innovation processes based on systemic approach, the latter is from a national to a regional context where innovation processes are carried out.

In the second part, the EU regions are clustered according to fifteen indicators (such as share of population; level of education; employment/unemployment rate; GDP euro per inhabitant). The result is the identification of five clusters.

In the third part, the technological change, taking place between 2000 and 2008, is measured by considering the effect of total intramural R&D expenditure rate; of patent applications rate; of R&D personnel rate and of employment high-tech sector rate on GDP rate. Very interesting results support the choice to focus on the second cluster. This cluster includes the less advanced EU regions but these regions are the ones that have grown more than the others.

Literature Review

Even if many years have passed since the mid-1990s, when the interest in innovation for regional development was born, the “innovation – regional development” nexus is still complex and difficult to understand (Broekel and Brenner, 2011; Pinto and Guerreiro, 2010). It does not depend on the concept of innovation itself [1] (Crossan and Apaydin, 2010) but on the evolution of the innovation process. As noticed by Brulin (2002), three kinds of process can be adopted to carry out innovation processes:

- The linear model;
- The innovation system approach (triple helix);
- Relationship-building and networking.

According to Langvik (2004), innovation is not the result of one of the processes but of all of them. It means that the linear model, based on R&D activities, on refinement of the results and on their exploitation by big companies, is not enough. The innovation process needs to leverage on the triple helix (universities, public authorities and business community) and on relational economies.

The passage from the linear model to the systemic model (Seravalli, 2009; Abrunhosa, 2003), based on the exchange of knowledge with other actors involved in the innovation process (Amable and Petit, 2001), requires to define the geographic boundaries in which innovation processes can take place. Even if all the innovation processes are always localized (Ferrão, 2002), the choice is of great relevance since it affects the possible results and has several consequences.

Traditionally, when talking about innovation processes, attention was focused on a national scale of analysis (Pinto and Guerreiro, 2010) since policies, tools and instruments were established and implemented by national Institutions.

As noticed by some scholars (Broekel and Brenner, 2011; Silva and Silva, 2000), the European Union, through the implementation of specific policies, started giving importance to territorial contexts that are smaller than the national one: the Regions.

The choice to carry out innovation processes at a regional level implies both strengths and weaknesses.

Strengths are connected to the presence of actors (universities, research centers and enterprises) directly involved in the local innovation process (Doloreux and Bitard, 2005) and to the existence of territorial, intangible, institutional and relational resources (Guerreiro, 2005).

On the other side, weaknesses are linked to the use of local tools and approaches that can cause stratification rather than integration across regions (Seravalli, 2009) and, above all, to disparities that can emerge across regions in reference to the achieved results (the finding and the introduction of innovation). For these reasons, some scholars started investigating the regional economic performance (Bracalante and Perugini, 2010). In particular, focus is on less advanced regions (Kallioras and Petrakos, 2010) that try to reduce the existing gap (in terms of wealth, development and welfare) with the more developed ones.

Innovation processes and results achieved by less advanced regions are the main topics of the present work that, as already anticipated, aims to investigate whether and how innovation (total intramural R&D expenditure rate by sectors performance, patent applications rate, R&D personnel rate by sectors performance and employment high-tech sector rate) has affected the development of some of the less advanced European regions over the time span 2000-2008.

Methodology

The purpose of this paper is to focus on the less advanced EU regions and try to understand whether technological change determinants are linked to economic growth in the period 2000-2008.

To answer the research question two specific sets of indicators were identified. The first is useful to classify EU regions having similar social and economic characteristics, the second is designed to measure the technological change triggers.

Data have been collected from the Eurostat website and dataset was constructed consisting of 324 regions.

The first set is composed by 15 regional indicators related to *population density, economic structure, demographic structure and training, labor market structure*.

The second set considers the Eurostat variables related to "Regional Science and Technology Statistics", calculated as the rate from 2000 to 2008 (base 2000).

The dataset is analysed through multivariate classification techniques, descriptive statistics and correlation matrix.

Results

Identifying the less advanced EU regions

To carry out the empirical research, it is necessary to cluster the 324 European regions to identify the less advanced ones that share the same social and economic development.

To cluster the 324 regions, the following fifteen indicators have been used:

- Share of population under 15 years old;
- Share of population 15-64 years old;
- Share of population over 64 years old;
- Share of population - total ISCED;
- Share of population - ISCED 0-2;
- Share of population - ISCED 3-4;
- Share of population - ISCED 5-6;
- Employment rate;
- Unemployment rate;
- Long-term unemployment rate;
- Share of employment - Agriculture;
- Share of employment - Industry;
- Share of employment - Tertiary;
- Population density;
- GDP euro per inhabitant.

Because of the missing of some data, the clustering has been focused on 166 regions belonging to 17 European Countries (Austria, Belgium, Czech Republic, Estonia, Finland, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Poland, Romania, Spain, Sweden).

Starting from the data referred to 2000 and leveraging on the fifteen indicators cited above, the cluster analysis (non-hierarchical, based on the K-means method) has identified five clusters.

In the following part of the paper, attention is going to be focused on the second cluster that is the one including the less advanced EU regions.

Variables	Cluster				
	1	2	3	4	5
Share of population under 15 years	,167	,187	,184	,162	,161
Share of population 15-64 years	,681	,681	,661	,668	,669
Share of population over 64 years	,153	,132	,155	,170	,170
Share of population - Total ISCED	,785	,751	,708	,729	,692
Share of population - ISCED 0-2	,164	,129	,220	,177	,289
Share of population - ISCED 3-4	,367	,514	,248	,342	,223
Share of population - ISCED 5-6	,223	,108	,234	,161	,153
Employment rate	74,8	66,5	66,1	69,8	62,0
Unemployment rate	4,850	9,829	7,150	5,203	11,212
Long-term unemployment rate	2,049	5,598	4,345	2,426	7,039
Share of employment - Agriculture	,007	,044	,002	,014	,048
Share of employment - Industry	,238	,387	,177	,314	,272
Share of employees - Tertiary	,755	,570	,820	,672	,680
Population density	914,699	142,143	3063,084	265,966	368,338
GDP euro per inhabitant	34890	4088	50200	24187	14190

Tab.1 – Final Cluster Centers

As noticeable in Table 1, the second cluster (including 41 regions [2]) shows a population density lower than the other groups, the worst GDP euro per inhabitant and a strong concentration of employment in the industry and a weak one in the service sector. The share of population with ISCED 5-6 level of education is very low.

Cluster 3, including two regions (Région de Bruxelles and Luxembourg), reports the best GDP euro per inhabitant value, the best levels of education and the highest share of employment in the service sector. Cluster 1, comprehending ten regions, has the highest employment rate of all the clusters and, consequently, the lowest long-term unemployment rate. Values referable to cluster 4, the most numerous one with 63 regions, are in line with the mean of all the clusters. Eventually, cluster 5, is characterized by high rates of unemployment.

Measuring the technological change determinants and GDP rate

To measure the technological change push, taking place between 2000 and 2008, a set of Eurostat indicators based on “Regional Science and Technology Statistics” is composed.

It comprehends:

- Total intramural R&D expenditure rate by sectors performance (total sectors, business enterprise, government, higher education);
- Patent applications rate;
- R&D personnel rate by sectors performance (total sectors, business enterprise, government, higher education);
- Employment High-Tech sector rate.

To understand if there are differences between cluster 2 and the other clusters, a cluster mean comparison was carried out (Table 2).

Clusters		R&D expenditure Rate - Total	R&D personnel Rate - Total	Patent applications Rate	High-Tech employment Rate	GDP Rate
1	Mean	,289	,164	-,345	-,001	,303
	Std. Deviation	,187	,111	,239	,165	,151
2	Mean	1,562	,158	3,801	,244	1,762
	Std. Deviation	1,218	,264	7,112	,349	,826
3	Mean	,614	,225	-,331	,251	,517
	Std. Deviation	,128	,012	,148	,221	,341
4	Mean	,605	,498	-,161	,185	,338
	Std. Deviation	,596	,419	,331	,268	,130
5	Mean	1,091	,600	,382	,324	,572
	Std. Deviation	,768	,382	1,791	,404	,267
Total	Mean	,973	,391	,986	,227	,760
	Std. Deviation	,947	,395	4,044	,332	,732

Tab. 2 – Cluster Mean Comparison

The mean values of the indicators related to technological change triggers and growth of GDP have been compared. It is possible to note that:

- The average of GDP rate of less advanced EU regions is higher than the one of other clusters;
- The patent applications rate of cluster 2 is higher than the other clusters (growth rate is almost four times higher compared to 2000);
- The growth of R&D expenditure rate in cluster 2 is on average higher than the others; this increase, however, does not generate a particularly significant increase in number of researchers.

- The high-tech employment rate of cluster 2 grows up more than the other clusters.

Next, with reference to the 41 regions of the cluster 2, bivariate linear correlations among the different indicators of technological change determinants, and between the latter and the rate of growth of GDP were carried out (Table 3).

The correlation matrix, about the 41 regions in cluster 2, underlines that:

- Even if there is no linkage between the total R&D expenditure rate and GDP rate ($\rho=0,273$), there is a positive and strong correlation between higher education R&D expenditure rate and GDP rate ($\rho=0,742$). Moreover, there is no correlation between GDP rate and business enterprise R&D expenditure rate ($p\text{-value}=0,274$) and there is no positive correlation between business enterprise R&D personnel rate ($\rho=-0,468$).
- There is a positive correlation between business enterprise R&D expenditure rate and business enterprise R&D personnel rate ($\rho=0,596$). Weaker correlations between R&D expenditure rate and R&D personnel rate exist in reference to government ($\rho=0,524$) and higher education ($\rho=0,424$). This result can be due to the fact that private enterprises have launched innovation programmes aiming to the education and training of skilled researchers.
- There is no correlation between the GDP rate and the patent applications rate. As a consequence, technological change in the less advanced EU regions has taken place through *soft activities* (Philpott et al., 2011), like educational programmes, consultants' training and scientific publications.
- There is a significant correlation between the patent application rate and higher education and government R&D expenditure rates. Probably, not all patents are exploited by commercial enterprises.

		R&D expenditure Rate - Total	R&D expenditure Rate - Business Enterprise	R&D expenditure Rate - Government	R&D expenditure Rate - Higher Education	Patent Applications Rate	R&D personnel Rate - Total	R&D personnel Rate - Business Enterprise	R&D personnel Rate - Government	R&D personnel Rate - Higher Education	High-Tech Employment Rate	GDP rate
R&D expenditure Rate - Total	Pearson Correlation Sig. (2-code)	1										
R&D expenditure Rate - Business Enterprise	Pearson Correlation Sig. (2-code)	,343 ,038	1

Tab.3 – Correlation Matrix

To get deeper results, cluster 2 has been sub-clustered by using a *cluster analysis* (non-hierarchical, based on the K-means method). The result is the identification of four groups (Table 4).

	Cluster			
	A	B	C	D
	Poland, Czech Republic, Hungary	Bucarest Ilfov	Baltic Countries, Romania East	Romania West
N.	30	1	7	3
GDP rate	1,322	4,643	2,588	3,273

Tab. 4 – Sub-clusters out of the second cluster

The sub-cluster A is made up of 30 regions (composed by almost all regions of Poland, Czech republic and Hungary) and reports the lowest growth rate (1,322); on the contrary, the sub-cluster B is made up of one region (Bucarest – Ilfov) and shows the highest growth rate (4,643).

To describe the differences among sub-clusters identified, with reference to the indicators of technological change determinants, a sub-cluster mean comparison is carried out (Table 5).

Sub-Clusters			R&D expenditure Rate - Business Enterprise	R&D expenditure Rate - Government	R&D expenditure Rate - Higher Education	R&D personnel Rate - Business Enterprise	R&D personnel Rate - Government	R&D personnel Rate - Higher Education	Patent applications Rate	High-Tech employment Rate	GDP rate
A	Poland, Czech Republic, Hungary	Mean	2,035	,968	1,431	3,268	1,968	2,454	2,910	,284	1,322
		Std. Deviation	1,686	1,049	,775	2,014	1,049	,879	4,036	,333	,177
B	Bucarest Ilfov	Mean	1,781	5,651	8,040	2,781	6,651	9,040	1,795	,472	4,643
		Std. Deviation
C	Baltic Countries, Romania East	Mean	2,212	4,326	9,300	2,318	5,326	10,300	2,884	,064	2,588
		Std. Deviation	3,480	2,968	7,286	1,558	2,968	7,286	2,504	,214	,307
D	Romania West	Mean	1,492	12,227	21,966	2,492	13,227	22,966	15,520	,209	3,273
		Std. Deviation	,512	3,505	7,548	,512	3,505	7,548	23,100	,715	,197
Total		Mean	2,018	2,791	4,954	3,012	3,791	5,969	3,801	,244	1,762
		Std. Deviation	2,010	3,773	7,183	1,844	3,773	7,183	7,112	,349	,826

Tab. 5 – Sub-Clusters Mean Comparison

By comparing the sub-cluster means, some interesting evidences come out:

Sub-clusters B and D show a GDP growth rate higher than the mean of all the sub-clusters;

Sub-cluster D presents a mean value about patent applications that is noticeably higher than the mean of all the sub-clusters and of cluster 2 as a whole;

Generally, sub-cluster A reveals values lower than the other sub-clusters. Only in reference to R&D expenditure rate and to business enterprise R&D personnel rate, the values are higher.

Limitations

The paper presents some limitations. First, the paper does not explain the cause-effect relationship between the indicators to measure the technological change determinants and economic growth in developing regions, because this is a work in progress.

Secondly, the dataset has some missing data for specific regions and for specific years. To solve the first problem, some regions were excluded from the analysis, while for the second issue temporally adjacent values were considered .

Conclusion

From the regional development perspective, this research has analyzed the link between technological change determinants and the economic growth in less advanced EU regions.

This study show that GDP of the regions of Poland, Czech Republic, Hungary, Romania and Baltic Countries has a growth rate higher than the other EU regions, in the period 2000-2008.

In that period, a link between technological change coming from higher education sector and economic growth of less advanced regions, has been observed. Instead, the increase of the R&D area of private enterprise seems to have no weight on the growth rate.

The specific analysis of the less advanced EU regions has shown that Romanian regions have scored the highest rates in terms of both GDP and R&D public investments.

This research offers useful insights into the planning and implementation of technology and economics policies. This study also offers the potential for useful future streams of “innovation-regional development” using the unique database created.

Endnotes

[1] Innovation is the process of making changes, large and small, radical and incremental, to products, processes, and services that results in the introduction of something new for organization that adds value to customers and contributes to the knowledge store of the organization. Various factors encourage an organization to innovate. These drivers can be summarized as follows: emerging technologies; competitor actions; new ideas from customers, strategic partners, and employees; emerging changes in the external environment.

EXAMINING THE SEGMENTATION AND POSITIONING STRATEGIES FOR HIGHER EDUCATIONAL INSTITUTIONS IN CYPRUS

Hadjiphanis, Lycourgos¹; Evripidou, Loukia Ch.²

¹ Lecturer, Marketing/Research, School of Business Administration, Department of Management & Marketing, European University Cyprus. Email: L.hadjiphanis@euc.ac.cy

² Head of Department of Accounting, Economics and Finance, Assistant Professor, Banking/Finance, School of Business Administration, European University Cyprus. Email: L.Evripidou@euc.ac.cy

Abstract

The purpose of this quantitative, correlational research study was to determine the relationship, if any, between segmentation and positioning strategies employed by universities in Cyprus to increase student enrollment. Each strategy was individually investigated in one of the study's first two null hypotheses, and then collaboratively examined in the study's third hypothesis. The findings allowed the rejection of all three null hypotheses. Relationships between segmentation and enrollment and positioning and enrollment were found to be relatively strong, with full-sample correlation coefficients of $r(334) = .83, p < .01$ and $r(334) = .86, p < .01$, respectively. A moderately strong predictive relationship ranged from $R^2 = .63, F(1, 107) = 183.23, p < .01$ to $R^2 = .80, F(1, 106) = 415.72, p < .01$ between effective implementation of market segmentation strategy and enrollment. Similar findings showed a moderately strong predictive relationship ranged from $R^2 = .48, F(1, 334) = 311.09, p < .01$ and $R^2 = .84, F(1, 106) = 558.92, p < .01$ between effective implementation of positioning strategy and enrollment.

Keywords: Segmentation, positioning, marketing strategy, marketing implementation

Background

Research studies show that academic administrators do not fully implement marketing strategies along with the concept of marketing. They put in practice promotion and price strategies, ignoring product, and distribution channel strategies. Similar to the findings of Lovelock and Rothschild (1980), Goldgehn (1991) and Helgesen (2008) indicated that U.S. colleges and universities do not implement marketing techniques properly within the context of a marketing plan. In addition, marketers in colleges and universities do not understand the different marketing concepts and hence, marketing strategies are not fully practiced or implemented by the staff (Bingham, 1993; Brown & Oplatka, 2006). These research studies showed that this problem still exists. However, the study's findings were expected to contribute to the existing body of knowledge by providing a current assessment of the segmentation and positioning strategies in the university setting in Cyprus.

Purpose of the Study

The purpose of this quantitative, correlational research study was to determine the relationship, if any, between segmentation strategies and positioning strategies currently employed by universities in Cyprus to increase their students' enrollment. Enrollment is an important factor that has a significant impact on universities' profitability and their survival. Other factors that have an impact on profitability were the increased expenses, the reduced revenues the waste and unnecessary overhead, none of which were connected to marketing. Marketing strategies were mostly associated with the marketing mix strategies, which different organizations and universities implement in their business and management operations (Kotler & Andreasen, 2008). Other marketing strategies that organizations apply to support the marketing mix strategies are the segmentation and positioning strategies. As a consequence, this research critically examined the segmentation and positioning strategies, which the universities in Cyprus implement in their business operation. The study examined the relationship between the implementation of segmentation and positioning and students' enrollment in a university setting in Cyprus. This research also examined the contribution effect of each strategy on universities' enrollment.

Research Questions

The research questions that have been formulated to examine the purpose of this study were the following:

- To what extent, if any, is there a relationship between the implementation of a
- segmentation marketing strategy and enrollment in the Cyprus universities?
- To what extent, if any, is there a relationship between the implementation of a
- positioning marketing strategy and enrollment in the Cyprus universities?
- Which, if any, of the marketing strategies of segmentation and positioning more strongly relate to enrollment in the Cyprus universities?

Hypotheses

The hypothesis questions for this quantitative research study are as follows:

H1₀: There is no correlation between the implementation of a segmentation marketing strategy and enrollment in the Cyprus universities.

H1_a: There is a correlation between the implementation of a segmentation marketing strategy and enrollment in the Cyprus universities.

H2₀: There is no correlation between the implementation of a positioning marketing strategy and enrollment in the Cyprus universities.

H2a: There is a correlation between the implementation of a positioning marketing strategy and enrollment in the Cyprus universities.

H3a: There is not a strong relationship between the marketing strategies of segmentation and positioning and enrollment in the Cyprus universities.

H3a: There is a strong relationship between the marketing strategies of segmentation and positioning and enrollment in the three private Cyprus universities.

Theoretical Framework

This brief review of the literature shows that universities do not fully practice segmentation, positioning and marketing mix strategies and hence, it can be argued that this has a significant effect on the business operations and on the students' enrollment (Anctil, 2008; Brown & Oplatka, 2006; Gabbott & Sutherland, 1993; Ghosh, Javalgi & Whipple, 2008; Goldgehn, 1991; Johnson, Jubenville & Goss, 2009; Lovelock & Rothschild, 1980; Washburn & Petroschious, 2004). These studies examined only one concept of marketing mix, which was the marketing communications, or promotion, ignoring the other concepts that were the product, the place, the price, the segmentation, the targeting, and the positioning strategies (Chimanzi, 2004; Opoku, Hultman & Esmail, 2008). Hence, it can be argued that this has a significant effect on the students' enrollment because universities do not fully practice all fundamental marketing strategies. In addition, the decrease in enrollments affects not only the image and reputation of higher institutions but also their business operations.

Many researchers point out that the philosophy of marketing and specifically the different marketing strategies can contribute to the universities' greater effectiveness (Burns & Hayes, 1991; Ghosh, Javalgi & Whipple, 2008). Hence, the marketing strategies of segmentation and positioning can contribute effectively on the profitability of the different universities. Nevertheless, this brief review of the literature shows that research studies do not have enough evidence of how colleges and universities implement the different marketing strategies. On this perspective, this brief review of the literature shows that there are no formal surveys that examine the relationship between the effective marketing strategies and enrollment in a university setting. In addition, the literature review shows that there are no formal research studies that examine the contribution effect of each strategy on students' enrollment. This relevant literature review indicates a relationship between implementation of segmentation strategy and promotion strategy and enrollment, and the contribution effect of each strategy on organization's enrollment. However, studies do not prove this relationship and the contribution effects of the segmentation, positioning and marketing mix strategies in a university setting. Hence, it can be argued that the examination of the above relationship as well as the examination of the contribution effects of these marketing strategies was a need for additional research within the area of marketing strategies in a university setting.

Selection of Participants

The research questions for this study were examined with the method of quantitative research. Questionnaire surveys were given to academic administrators or public relations officers at each of the universities to examine the implementation of the different marketing strategies in their workplace. The universities in Cyprus were studied as one unit. In addition, the analysis was broken down by individual university, then the findings were summarized to compare and contrast the different universities. The target population of this research study was 600 respondents. Specifically, the total employee target population for this study was 600 representing: 200 in the first university; 200 in the second university; and 200 in the private university. Questionnaires were given to academic administrators or public relations officers to each university, striving for as large as a sample as possible, with a hope of a 50% sample. This research did not examine the entire population because then would not be able to conduct inferential statistics. Hence, a simple random sampling was used to select the participants. This study did not include students in the target population because the purpose of this proposed quantitative research study was to determine the relationship, if any, between segmentation strategies and positioning strategies implemented by academic administrators and directors of the administrative staff to increase students' enrollment.

An a priori power analysis using GPOWER (Faul & Erdfelder, 1992) was carried out to determine an appropriate sample size. The power of a test indicates the probability of correctly rejecting a false null hypothesis (Cohen, 1989). To detect a medium effect size ($d = 0.5$), a total sample size of 176 was needed to conduct a one tailed paired sample t test on means with $\alpha = 0.05$, and power = 0.95, and a sample of 140 was required for $\alpha = 0.01$ and power = 0.99. The total employee target population for this study is 600 participants. Hence, a priori power analysis using GPOWER was carried out to determine an appropriate sample size. A pilot study was conducted to test and determine the survey's effectiveness. A pilot test of the survey instrument was conducted with 40 academic administrators at each of the universities. For this reason, the number of the pilot test participants was 120. Based upon information collected, the study was modified accordingly.

Results

Analysis of research question and hypothesis 1.

The outcome of the correlation for the full sample is presented in Table 2. This demonstrates a correlation of $r(334) = .83$, $p < .01$ at the .01 significance level between the two variables identified in the full sample (perceived effectiveness of implementation of segmentation strategies and perceived impact of segmentation strategies on enrollment). This correlation coefficient was found to be significant at the 0.01 level, exceeding the threshold of significance $p < .05$ that was set for analysis.

Thus, in terms of the full sample, hypothesis 1 (alternative hypothesis) could be said to be supported and the null hypothesis was rejected.

Table 2. Correlation Across Full Sample for Perceived Effectiveness of Implementation of Segmentation Strategies and Perceived Impact of Segmentation Strategies on Enrollment

The analysis process above was repeated using the same evaluation levels, following a process that split the original data set into three separate, smaller datasets. This split was accomplished using the SELECT CASES function in SPSS, with the selection mode indicating "IF UNIS=?" (with each individual university selected in turn). Each sorted university dataset was then saved to its own file to facilitate the analysis process. The results of each individual university correlation are identified below.

The correlation outcomes between the two variables in use for this hypothesis at University A are presented in Table 3. Using the same evaluation criteria as above, this correlation was found to be $r(107) = .80$, $p < .01$ between the two variables with significance at the 0.01 level (two-tailed), below the $p < .05$ level that was identified as the significance level required for acceptance. Thus, for University A the null hypothesis was rejected and the alternative hypothesis was once again accepted.

The results of the correlation analysis as performed above at University B are presented in Table 4. Once again, significance at the 0.01 level (two-tailed) is found between perceived effectiveness of implementation of segmentation strategies and perceived impact of segmentation strategies on enrollment at University B only for a correlation coefficient of $r(117) = .83$, $p < .01$. Thus, for University B the null hypothesis was rejected and the alternative hypothesis was once again accepted.

Table 4. Correlation Between Perceived Effectiveness of Implementation of Segmentation Strategies and Perceived Impact of Segmentation Strategies on Enrollment at University B

The same process was used to identify the correlation, if any, between perceived effectiveness of implementation of segmentation strategies and perceived impact of segmentation strategies on enrollment at University C. The results of this analysis are presented in Table 5. This analysis showed a correlation coefficient of $r(106) = .89$, $p < .01$, which was significant at the 0.01 level (below the $p < .05$ level that was identified as the significance level required for acceptance).

Thus, at University C as well, the null hypothesis for Hypothesis 1 was rejected and the alternative hypothesis was accepted.

a. Universities = University C

Table 5. Correlation Between Perceived Effectiveness of Implementation of Segmentation Strategies and Perceived Impact of Segmentation Strategies on Enrollment at University C

The analysis of hypothesis 1 indicated that the correlation coefficients were $r(334) = .83, p < .01$ (full sample), $r(107) = .80, p < .01$ (University A), $r(117) = .83, p < .01$ (University B), and $r(106) = .89, p < .01$ (University C), with significance for all correlation coefficients at the 0.01 level, which was below the $p < .05$ level that was identified as the significance level required for acceptance. At all levels of analysis, including at the sample-wide level as well as at each of the universities, the null hypothesis for H1 was rejected and the alternative hypothesis was accepted. The research demonstrated that there was a correlation between the implementation of a segmentation marketing strategy and enrollment in the universities in Cyprus.

Analysis of research question and hypothesis 2.

As with hypothesis 1, a split dataset was used to generate both full sample outcomes and individual university outcomes for consideration and to ensure that the same results were found among the various datasets. The existing split data sets were used for this analysis as well, as the same variables were available within these data sets.

The first correlation for the two variables for hypothesis 2 was performed across the full sample, which included all three universities and is presented in Table 6. This correlation analysis showed a correlation of $r(334) = .86, p < .01$ between perceived effectiveness of implementation of positioning strategies and perceived impact of positioning strategies on enrollment, at a significance level of 0.01. This is lower than $p < .05$ (the established significance level threshold) and thus, the null hypothesis $H2_0$ was rejected for the full sample and the

alternative hypothesis is accepted. This analysis was repeated on the individual university level to determine if the results are consistent across all three universities.

a. Universities = University A

Table 7. Correlation for Perceived Effectiveness of Implementation of Positioning Strategies and Perceived Impact of Positioning Strategies on Enrollment at University A

The analysis above was repeated using the same variables and statistical significance level of $p < 0.05$ at the individual university level to determine if the correlation observed in the full sample persisted across all three universities. This section presents the results of these three correlation processes, which were constructed using the split data set as indicated above. The results of the correlation analysis as performed above at University A are demonstrated in Table

7. In common with the full sample, university A showed a correlation between the two variables tested. A correlation coefficient of $r(107) = .81, p < .01$ was found to be significant at the 0.01 level, exceeding the threshold of significance $p < .05$ that was set for analysis. Thus, for University A this was found to be a significant correlation and allowed the rejection of $H2_0$ and the acceptance of $H2_a$.

The results of the correlation analysis as performed above at University B are presented in Table 8. University B demonstrated a very similar ranking to university A, with a correlation coefficient of $r(117) = .87, p < .01$ which was found to be significant at the 0.01 level (below the $p < .05$ level that was identified as the significance level required for acceptance). Thus, at the University B level as well as at the university A data level and in the full data set, $H2_0$ may be rejected and $H2_a$ may be accepted.

Table 8.

Correlation for Perceived Effectiveness of Implementation of Positioning Strategies and Perceived Impact of Positioning Strategies on Enrollment at University B

The final test that was performed during the examination of this area was for the University C dataset. The results of the correlation analysis as performed above at University C are presented in Table 9. This analysis showed an even stronger correlation than any of the other three tests that had been performed. With a correlation coefficient of $r(106) = .92, p < .01$ and a significance level of 0.01 (below the $p < .05$ level that was identified as the significance level required for acceptance), this test also demonstrated a statistically significant correlation between the two variables that were tested, leading to a rejection of the null hypothesis $H2_0$ and an acceptance of the alternative hypothesis $H2_a$.

***. Correlation is significant at the 0.01 level (2-tailed).*

a. Universities = University C

Table 9

Correlation for Perceived Effectiveness of Implementation of Positioning Strategies and Perceived Impact of Positioning Strategies on Enrollment at University C

The correlation coefficients found during the analysis of hypothesis two indicated that there were correlations of $r(334) = .86, p < .01$ (for the full data set), $r(107) = .81, p < .01$ (for University A), $r(117) = .87, p < .01$ (for University B), and $r(106) = .92, p < .01$ (for University C). All of these correlation coefficients were supported at a statistical significance level of 0.01, which was below the significance level of .05 that was set by the researcher for acceptance of the null hypothesis. This analysis showed that at every level the null hypothesis for Hypothesis 2 was to be rejected and the alternative hypothesis to be accepted. That is, the findings supported the contention that there is a correlation between the implementation of a positioning marketing strategy and enrollment in the universities in Cyprus.

Analysis of research question and hypothesis 3.

The analyses for research questions 1 through 2 focused on correlations, or identification in similarities of performance. However, this did not allow direct comparison of the results, nor did it allow direct identification of the relationships between variables that may be found in this case. Furthermore, as correlation did not imply causation, it did not say anything about the potential causal relationships between the variables. To determine if there was a relationship between these two factors and enrollment, linear regression was chosen to examine this relationship.

Two linear regression processes were used to explore the issues involved in this evaluation. This was evaluated using a significance level of $p = 0.05$. These two regression processes were

repeated four times each, as with the correlation processes. These included the full sample (all three universities combined) as well as individual runs for University A, University B, and University C. The results of this analysis are presented below, divided by the sample including full sample, University A, University B, and University C findings. The variable pairings used in three separate linear regression determinations for each of the analysis levels are identified in Table 10. These variables are consistent throughout the analysis levels.

<i>Variable</i>	<i>Description</i>
<i>X1 (Independent)</i>	<i>Perceived effectiveness of implementation of Segmentation strategies</i>
<i>Y1 (Dependent)</i>	<i>Perceived impact of segmentation strategies on enrollment</i>
<i>X2 (Independent)</i>	<i>Perceived effectiveness of implementation of positioning strategies</i>
<i>Y2 (Dependent)</i>	<i>Perceived impact of positioning strategies on enrollment</i>

Table 10.

Variable Specifications for Linear Regression Process

All regression equations were specified in the form $Y_i = \text{slope} * X_i + \text{intercept}$, in which i = the number of the variable as specified above. Each variable number corresponded to the related correlation-based hypothesis above. Each equation was specified for the variable pair using the appropriate matrix determination (Constant/B for the slope and Variable/B for the intercept). R^2 values (from 0 to 1) were used to determine the strength of the relationship described by each equation, and the ANOVA output from each was used to determine if the relationship was statistically significant.

Following the process of specification for each of the models, the R^2 values for each of the outcomes were considered to determine how strong the relationship between the two variables was. The R^2 value varies between 0 and 1, with 0 indicating no significant relationship and 1 indicating an absolute relationship.

The R , R^2 (coefficient of determination) and regression equation determined for each of the two variable pairings in the full sample are described in Table 11.

<i>Variables</i>	<i>R</i>	<i>R²</i>	<i>Regression Equation</i>	<i>F</i>	<i>ANOVA Sig.</i>
<i>X1 (Independent)</i>	.83	.70	$Y1 = .206X1 + (-.501)$	762.32	.000
<i>Y1 (Dependent)</i>					
<i>X2 (Independent)</i>	.69	.48	$Y2 = .183X2 + .016$	311.09	.000
<i>Y2 (Dependent)</i>					

Table 11.

Linear Regression Outcomes (R, R² and Regression Equation) for Each Variable Pair, Full Sample

In the case of the relationship between X_1 and Y_1 , the $R^2 = .70$, $F(1, 334) = 762.32$, $p < .01$ value indicates a moderate relationship between the two variables; colloquially, 70% of the variation in Y_1 can be explained by the corresponding value of X_1 . The ANOVA output for this test indicates a significance of .000, which is below the significance threshold of $p = 0.05$. Thus, this is

accepted as a valid and statistically significant relationship on the sample-wide level. The $R^2 = .48$, $F(1, 334) = 311.09$, $p < .01$ value in the regression analysis between X_2 and Y_2 indicates a more modest relationship. This demonstrated that 48% of the variation in outcomes in Y_2 was explained in variation in X_2 . In addition, it was a less convincing relationship and may make prediction based on X_2 considerably harder, but remained a relationship that should be considered. The ANOVA test for this linear regression shows a significance level of .000, below the established level of $p = .05$ required for assignment of statistical significance. Thus, this linear regression relationship is also accepted on the sample-wide level.

The analysis process was performed in the same way for University A as it was for the sample on the whole. The most important outcomes for the linear regression equations constructed for University A are demonstrated in Table 12. It should be noted that although the specific numbers were different in this case, the general strength of the relationships in each of the three cases was similar to the sample-wide pattern.

Variables	R	R ²	Regression Equation	F	ANOVA Sig.
X1 (Independent) Y1 (Dependent)	.795	.63	$Y1 = .203X1 + (-.459)$	183.23	.000
X2 (Independent) Y2 (Dependent)	.805	.65	$Y2 = .208X2 + (-.511)$	196.71	.000

Table 12

Linear Regression Outcomes (R, R² and Regression Equation) for Each Variable Pair, University A

Variables	R	R ²	Regression Equation	F	ANOVA Sig.
X1 (Independent) Y1 (Dependent)	.83	.70	$Y1 = .217X1 + (-.763)$	267.28	.000
X2 (Independent) Y2 (Dependent)	.87	.76	$Y2 = .216X2 + (-.669)$	372.59	.000

Table 13.

Linear Regression Outcomes (R, R² and Regression Equation) for each Variable Pair, University B

The relationship between X_1 and Y_1 demonstrated an $R^2 = .63$, $F(1, 107) = 183.23$, $p < .01$ value (indicating that 63% of the variance in Y_1 could be explained by X_1). Although not a perfect predictive measure, this is relatively strong. The ANOVA analysis for this process demonstrated a significance of .000, lower than the $p = .05$ threshold that was set. Thus, this can be seen to be a moderately strong and statistically significant relationship. The relationship between X_2 and Y_2 was a bit stronger, with an $R^2 = .65$, $F(1, 107) = 196.71$, $p < .01$ value (indicating 65% of the variation in Y_2 being explained by X_2). This was accompanied by a statistical significance level in the ANOVA of .000, indicating that again this represented a moderately strong and statistically significant predictive relationship. The same process was used to create linear regressions for University B as in the other samples. The results of this are presented in Table 13.

The relationship between X_1 and Y_1 in this case indicated an $R^2 = .70$, $F(1, 117) = 267.28$, $p < .01$ value (indicating that 70% of the variation in Y_1 is because of X_2). This was accompanied by an ANOVA significance level of .000, indicating that this was a statistically significant result. This can be described as a moderately strong relationship between these variables. The $R^2 = .76$, $F(1, 117) = 372.59$, $p < .01$ value for X_2 and Y_2 showed one of the strongest relationships (indicating that 76% of the variation in Y_2 was associated with the value of X_2). This also showed an ANOVA significance of .000, indicating that the relationship was statistically significant. This is the one of highest levels of predictive power seen in the results as a whole.

Linear regressions were prepared for University C in the same fashion as the previous results. The outcomes of this analysis are described in Table 14.

Variables	R	R ²	Regression Equation	F	ANOVA Sig.
X_1 (Independent) Y_1 (Dependent)	.89	.80	$Y_1 = .201X_1 + (-.337)$	415.72	.000
X_2 (Independent) Y_2 (Dependent)	.92	.84	$Y_2 = .211X_2 + (-.572)$	558.92	.000

Table 14.

Linear Regression Outcomes (R, R² and Regression Equation) for each Variable Pair, University C

The first relationship, X_1 and Y_1 , indicates a very strong result with an $R^2 = .80$, $F(1, 106) = 415.72$, $p < .01$ value (indicating that 80% of the variation in Y_1 can be attributed to the value of X_1). The statistical significance of this finding was indicated by the ANOVA statistical result of .000. Thus, this was accepted as a predictive model. The second relationship between X_2 and Y_2 also showed a very strong $R^2 = .84$, $F(1, 106) = 558.92$, $p < .01$ value (indicating that 84% of the variation in Y_2 at University C could be explained by X_2). The statistical significance of this result is indicated by the ANOVA significance value of .000. Thus, this was accepted as a very strong predictive relationship.

The findings for the full sample level and at individual levels were consistent, although they varied in specific level. All results that were found were statistically significant. For the relationship between X_1 and Y_1 in all sample sets, there was a moderate to strong relationship ranged from $R^2 = .63$, $F(1, 107) = 183.23$, $p < .01$ to $R^2 = .80$, $F(1, 106) = 415.72$, $p < .01$. This indicates that there is a predictive relationship between effectiveness of market segmentation performance and the impact of market segmentation on enrollment levels as indicated by the findings of this study. The relationship between X_2 and Y_2 was similar in magnitude to the relationship between X_1 and Y_1 . The R^2 value for this pairing ranged between $R^2 = .48$, $F(1, 334) = 311.09$, $p < .01$ (in the full sample) and $R^2 = .84$, $F(1, 106) = 558.92$, $p < .01$. This demonstrates a widely variable but moderate relationship between the variables, which represented the effectiveness of a positioning strategy and the impact of positioning on enrollment levels as indicated by this study.

Recommendations

This research has shown that academic administrators appear to have a moderate to strong grasp of the use of segmentation and positioning strategies to force increased enrollment. As a consequence, the implementation of marketing is becoming increasingly effective in the university environment. Nevertheless, there are still some areas for possible improvement that were highlighted by this study. The most noticeable one is the concept of the marketing mix. Currently, it can be expected that universities make use of marketing communications or promotion such as catalogues and view books, websites, and other materials strongly to remain competitive and to draw in students. Universities use these marketing communications tools to reach students and to drive up enrollment figures. However, the use of promotion tools is not enough to sustain a long-term enrollment increase, and thus does not represent sufficient use of the marketing mix. University administrators need to consider other elements of the marketing mix to improve the enrollment outcomes. For example, private universities can increase their competitive positioning in the market by implementing the pricing feature of the marketing mix.

Thus, universities could increase enrollment from students seeking relief from increasing higher education costs in the private area by pricing their product competitively in the marketplace. However, universities must also consider the fact that may even discourage enrollment if students perceive that they are receiving an inferior product because costs are substantially lower than their competitors. Examining ways in which more of the marketing mix can be used, rather than simply the marketing communications aspects, will help to increase the university's value for money put into the marketing mix. Universities must understand that sustaining or increasing enrollment is essential for maintaining competitive advantage in the market, and so should not automatically reject any marketing mix element that will allow them to maintain this advantage.

One area that this research has provided a contribution is in formal study of the relationship between segmentation and positioning strategies and enrollment in a university setting. Thus, this research filled a gap regarding the implementation of marketing strategies in the university setting; whereas the literature review noted there has been little or no formal study. However, this research was conducted in a university setting, and did not examine interaction effects between the various marketing strategy tools. Instead, it focused on identifying individual effects of the segmentation and positioning on enrollment. This does leave an ongoing gap in the research in identifying, which of the various marketing mix strategy tools or elements such as product, price, promotion and place contribute to the student decision to enroll. Furthermore, another area of study that could be a good area for further research into the subject is the examination of the additional elements of the extended marketing mix such as people, process, and physical evidence. One suggestion for future study is regarding the possible ambiguous term of marketing mix. An avenue for further research might be to break

down this term into specific terms such as price product, promotion and place to more accurately assess each variable's impact. In addition, it may be academically advantageous to expand the study to include other countries, such as those in Europe or the United States.

WHY AND HOW DO THE POLITICAL ACTIONS OF A PRODUCT'S COUNTRY OF ORIGIN AFFECT THE POLITICALLY CONCERNED CONSUMER PURCHASE DECISION?

Halimi, Tariq¹; D'Souza, Clare²

Abstract

The aim of this paper is to examine the effects of how political actions of the product's (country of origin) COO affect consumer behaviour and the impact it creates in terms of a firm's competitive advantage¹

This is a case-based qualitative study. One-to-one in-depth interviews are conducted to find answers for the aforementioned questions.

It has been found that the consumer is affected by the political actions of the COO, and these actions raise consumer's concern. Sources of concern include humanitarianism, nationalism, religion, and self.

The current research primarily helps two types of organisations: it helps companies from boycotted COO set strategies to combat the boycott calls. It also helps companies from non-boycotted COO set strategies to exploit these calls.

The topic is innovative in marketing as this is an emerging contemporary topic and little work has been undertaken in the area of marketing

Keywords: country of origin, consumer behaviour, consumer satisfaction, political consumer boycotts, qualitative research

Introduction

Country of origin (thereafter COO) is where a product is either manufactured or originates. Consumers often have certain perception about brands and products especially where they originate; for instance, products made in Japan often denote quality (Cateora et al., 2009). 'Origin' can create a good perception or in fact destroy a product. Thus, it is critical that marketers understand how consumers evaluate these products. The research first discusses the background of the country of origin and the relationship it has with the political situation in a country. The objectives of the study are then stated and the methodology is described. The data is analysed using a qualitative study and some recommendations are made.

Country of origin and the political environment

The political actions of products' country of origin (COO) and their effects on the consumer decision and behaviour in the form of boycotts are becoming a phenomenon that attracts attention. It is speculated that the political effects of a COO may be used (comparative to using the level of country's development and industrialisation) as a competitive advantage by firms from a country with favourable political actions (which can lead to boycotting (reward) these firms) or form a disadvantage for firms from a country with unfavourable political actions (which can lead to boycotting (punishment) these firms).

Johansson et al. (1985) and Ozsomer and Cavusgil (1991) define country of origin as the country where the corporate headquarters of the company marketing the product or the brand is located. Other researchers, define the product's COO as the "the country of manufacture or assembly". In addition, countries can combine to represent ownership. For instance, Sullivan-Mort and Duncan (2000) found that the country of origin construct can be decomposed into "Made in" (location of manufacture) and "owned by" (ownership of the brand), for instance, an Australian owned brand can have its product made in China. COO can lend itself to some negativity. According to Wang and Lamb (1983), the country of origin effects are intangible barriers to enter new markets in the form of negative consumer bias toward imported products. Alternatively, the development level of a product's COO may be used as a source of competitive advantage for its firms. With reference to opinion, Schooler (1965) found that products from less developed countries were not evaluated as quality products, concluding that the COO can have an effect on a consumer's opinion of the product. The problem arises when products are judged on the basis of the country perception rather than on the product perse, very often resulting in consumer boycotts due to the very nature of political animosity towards the country.

Consumer Boycotts

The use of boycotts as a coercive marketplace tactic is widespread (Klein and John, 2003). Friedman (1999) defines consumer boycotts as "an attempt by one or more parties to achieve certain objectives by urging individual consumers to refrain from making selected purchases in the market place. Examples of boycotts include Nestle for promotion of infant formula in poor countries and Disney for promotion of homosexuality. . Boycotts also extend to countries, for instance, examples of these countries are China for human rights violations and Denmark for displaying cartoon depicting the prophet Muhammad, which was perceived as an offensive act in the Muslim world. These acts unfortunately at times transcend on hostility towards the people and products of a country leading to boycotts.

A number of empirical studies have been conducted to understand the motivations of consumer boycotts and their associated consumer trade-offs. These studies include Garrett's (1987) review of the boycott literature which hypothesised six factors in boycott participation:

the awareness of consumers, the values of potential consumer participants, the consistency of boycott goals with participant attitudes, the cost of participation, social pressure, and the credibility of the boycott leadership. Mahoney (1976) also found that expectations of success were one of the variables influencing boycott participation. This can be matched with the term perceived consumer effectiveness (PCE) defined as a domain-specific belief that the efforts of an individual can make a difference in the solution to a problem (Ellen et al, 1991). PCE is related to the concept of perceived behavioural control, which has been studied by theorists in the areas of learned helplessness, locus of control, and perceived control (Rothbaun, Weisz, and Snyder, 1982). In fact, PCE refers to the extent to which individuals believe that their actions make a difference in solving a problem (Ellen, Weiner and Cobb-Walgren, 1991) and can be defined as "the evaluation of the self in the context of the issue" (Berger and Corbin, pg. 80-81; Kim and Choi, 2005). Klein, et al (2004) also found that the perceived egregiousness of the firm's actions was a powerful predictor of boycott participation. The more egregious a consumer perceived the firm's behaviour, the more likely the consumer was to boycott.

While these studies have made a considerable contribution to understanding the boycott phenomenon, they do not precisely describe the politically concerned consumer behaviour in the context of political conflicts between countries. One exception is Klein's et al (1998) test of the animosity model of foreign product purchase in the context of mainland Chinese consumers and their evaluation and purchase of Japanese products. The results of this study showed that animosity toward Japan (the perceived offensive country) and consumer ethnocentrism were distinct constructs that affect willingness to buy from the country. Chinese consumers' animosity toward Japan was related negatively to their willingness to purchase Japanese products. It is not product perceptions that lead to a reluctance to purchase goods from the target country; instead, it is hostility toward that target. Japanese goods were viewed quite positively by Chinese consumers regard- less of the consumers' level of animosity.

This study: problem and purpose

In a particular part of the world (the authors prefer not to name the political conflict) experience a political conflict, there have been calls to commercially boycott firms of a country of origin and its allies in order to pressure their governments to stop their perceived unfavourable political actions. After conducting a web search, it has been found that products of countries-to-boycott are still available in the markets where the calls are concentrated, and nationals who are directly affected by these political actions are still buying from these countries' firms. On the other hand, it has been found that boycott participants are not limited to those directly affected by the political conflict. They also include participants from different nationalities who are geographically and psychologically distant from the conflict. Boycott organisations, including participating tertiary students from different nationalities and religious affiliations, are an example.

This scenario raises a number of questions. While nationals are directly affected by the political actions of the offending country, why aren't all of them taking a purchase action (e.g. boycott) towards their perceived offender? On the other hand, why are some non nationals who are distant from the conflict and apparently not affected by these political practices, taking such an action? On another note, can firms use their country's political image as a source of market competitive advantage? This current study seeks to find answers for these questions. Due to absence of theory about motivations for politically-based boycotts, this present study is aimed at building theory about this phenomenon. The study is designed to increase an understanding of consumer's self-reported behaviour and its impact on COO. First, we examine consumers' beliefs on political actions of a product's COO. Second, we attempt to identify how consumers react to the political actions of a products' COO. Third, we examine whether favourable/unfavourable political actions of a COO influence the competitive advantage/disadvantage for their firms. Such goals require discovering new insights aimed at understanding this phenomenon.

Methodology

This is an exploratory case-based research. It is aimed to build theory, rather than test theory, about consumer behaviour in the context of political relations between nations. Since there is a need to find answers for the questions of why consumers are affected by the policies of the COO and how consumers react to such policies in the market place, an interpretive (qualitative) approach is more appropriate. The main purpose of interpretivist methodologies is to achieve substantive meaning and understanding of how and why questions in relation to the phenomena under investigation (Carson et al. 2001). Interpretivism methodologies seek to build theory as a result of empirical insights and careful attention. Qualitative research is appropriate for data collection and analysis due to its rich, explorative, and descriptive nature (Myers, 2009) which is appropriate for this study.

In-depth interviews

Such insights, for this research, were obtained through conducting in-depth interviews with individuals in order to seek explanation from them about the reasons for being (or not being) concerned about the political actions of products' COOs and how they react to them. Since the purpose is to build theory, the interviews were mostly directed by informants in order to reveal their own thoughts, feelings, experiences, and interpretations about the topic in context that cannot be observed or discovered in other ways. Prior theory was used to loosely frame the research, particularly the findings related to motivation to boycott and country of origin.

Interviews were conducted in 2011-2012 in Melbourne (Australia) face-to-face in various places, including educational institutions, places of worship, social centres, and personal home visits. Melbourne as a city inhabited by people from various cultures and being the target of tertiary international students was a big advantage, and made access to these people easy.

Interviews were also conducted over the phone when face-to-face contact was difficult, including people living overseas. Each interview took 20 to 30 minutes.

Interview guide design

The interview guide was semi-structured. The funnelling technique was used, beginning with broad open-ended questions then narrowing down. Informants were given the opportunity to freely express her/his experiences about the topic in their own words, followed by more specific questions. The recursive model of questioning is used in which previous conversation influences the structure and content of what will be asked next (Minichiello et al, 200*). Thus, the research guide was evolutionary. The findings of a discussion during an interview were carried out to the next interview, and so forth. The discussion guide consisted of three main sets of questions related to the topic in context:

1. Informant's lifestyle and concern about politics.
2. Informant's reaction toward products' COO political actions and calls for boycott.
3. Informant's decision making within this context.

Sample

Since consumers from different nationalities are reacting to the political conflict in context in different ways, as discussed previously in the research problem, informants were recruited from three groups of people:

- 10 nationals who are directly affected by the conflict.
- 10 nationals who are indirectly affected by the conflict (geographically distant).
- 10 non-nationals who are not affected by the conflict.

In all there were 18 males and 12 females were interviewed. This inequality was not intentional. It is only because males were more interested to participate than females.

The diversity of informants who came from different nationalities, cultures, and religious affiliations as well as different demographics, including ages (all informants were 18 and above), education and income levels, and lifestyles has given a rich amount of information about the topic. Their various reactions to the same political conflict helped construct a broad picture about the phenomenon in context and build theory about it.

Following the methodology, an in depth analysis and interpretation is conducted on the research results to uncover underlying themes present within the data identifying relationships present between the variables depicted within this research. The following paragraphs conclude summarizing the key findings and interpretations with a discussion of the limitations and ethical considerations of the study.

Results

The informants reported that the political actions of a product's country of origin do influence their purchase behaviour. This influence ranges from boycotting a COO with favourable (benevolent) actions to boycotting a COO with unfavourable (severe) actions, as depicted in Figure 1.

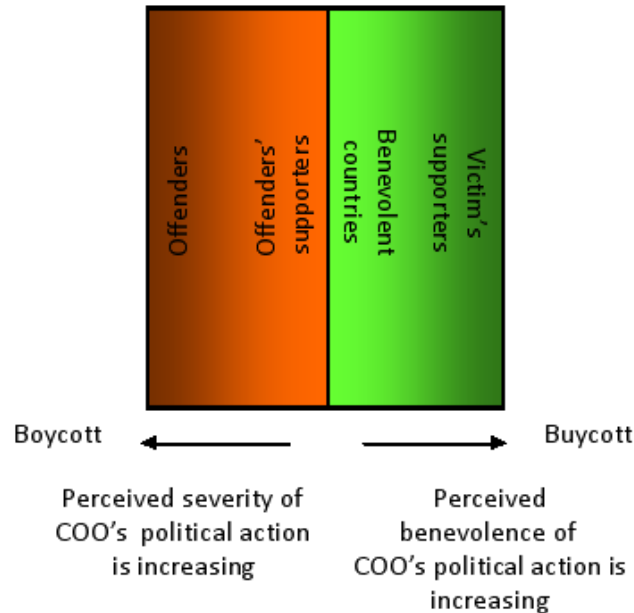

Figure 1: Product's COO's action and consumer's reaction (purchase behaviour)

Corporations are either considered a primary target if animosity sentiments are towards all the citizens of the COO, or a secondary target in order to pressure their governments (after they make financial losses in the market) and hence, to change their policies towards them. Also, corporations are boycotted because they pay taxes to their offending governments, which are then used to oppress other countries and nationals.

According to the data collected from the informants, there are five factors that influence a consumer's behaviour in the context of politics (Figure 2): relevance of the context to the consumer (concern), consumer values, product necessity, availability of satisfactory alternatives, and nature of product's country of origin's actions.

Consumer Concern

The consumer purchase decision is affected by the political actions of the country of origin if these actions raise the consumers' concern. The interviewed participants, who came from various cultural backgrounds, and had different demographics and psychographics, reported three major sources of concern: self, others, which can in turn be divided into three major groups: family, group of identification, and humanity in general, and religion.

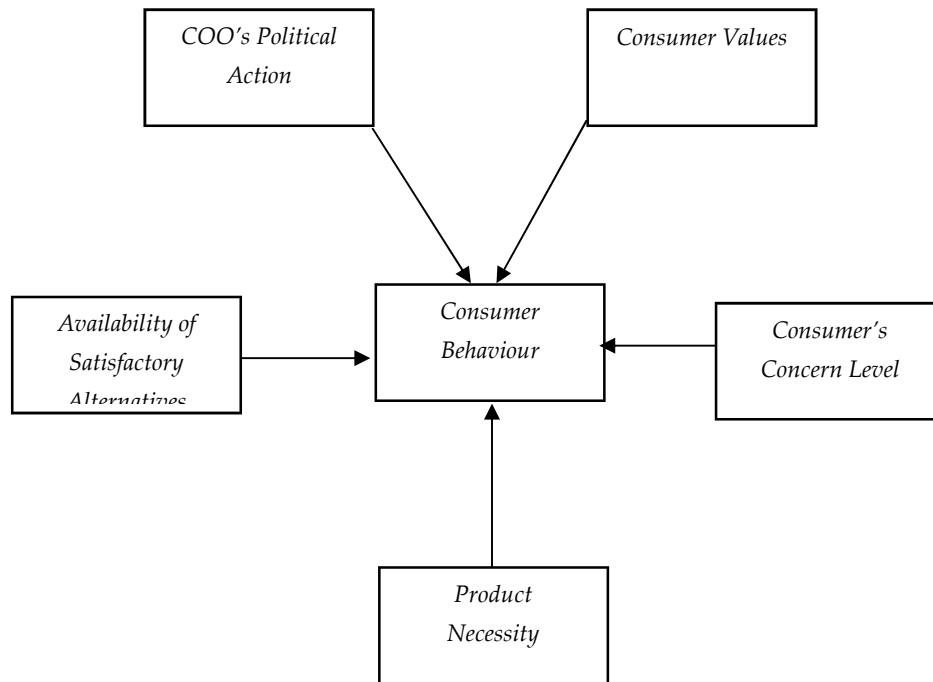

Figure 2

The Politically Concerned Consumer Behaviour Model

Concern for self

This is when the product's COO political action is directly affecting the consumer, like occupying his house. This has the strongest influence (only second to concern for children as reported by some informants) on the consumer's decision, since all participants, without any exception, reported that they will refrain from buying all sorts of products from the COO that directly offends them, unless refraining from buying the product will be life-threatening or cause a serious harm to the informant, as it is the case when the consumer needs to buy an essential medicine (for instance, a high-blood pressure medicine) from the offender in the absolute absence of satisfactory alternatives. This will be further discussed in this paper.

Concern for others

This factor is three fold. The product's COO action may be affecting individuals who directly concern the consumer through blood relations. The political action may also affect a group of people who the consumer identifies with (e.g. ethnic or religious groups). Also the consumer may be concerned about humanity in general.

Concern for family

A family member suffering from the actions of a COO is a strong factor for the consumer to punish this COO when making a purchase in the market. The consumer feels that the offense is affecting him personally as it draws near him, bearing in mind that a family member, in

addition to the blood relation, is a member of the group of identification as well as a member of humanity.

Children appeared to be the strongest concern among all in the 'Concern for Others' category. It matches the level of concern with self, according to all parents who were interviewed. Parents have a strong motivation to boycott products from a COO that offends their children. As the family relationship becomes remote, the consumer's concern for the remote relatives becomes similar to his concern for nationals, which indicates a lower level of motivation to take an action.

Concern for group of identification

The consumer may be concerned about people suffering from the political actions of a COO, who relate to them by nationalism or religious affiliation. Informants justified their boycott action against the offending COO due to its unfavourable actions towards the victim group which they identify with, as one of the informants made the comment:

"I refuse to buy their (offending COO) products because of what they have done to our people (religious group)".

The stronger the sense of nationalism and the more religious the informants are, the stronger the motivation was to boycott the offending COO. When the informants were given another scenario where a COO is acting politically unfavourably against a different national group, they did not express the same level of motivation to take a purchase action against the offending COO, they expressed their concern about humanity generally though.

Conversely, an informant who belongs to the same religion of the suffering group, but described herself as non religious, does not boycott the offending COO.

Concern for humanity

Humanitarianism is another source of concern for others that was reported by participants who are not connected to the cause through self, family, or group identification. These informants described themselves as altruistic people who have sympathy towards suffering others, leading them to take an action against the offending COO. Altruism is motivation with the ultimate goal of increasing the welfare of one or more individuals other than oneself (Batson, 1994).

Based on the responses of these altruistic informants, their motivation for an action, like boycott, is 'triggered' by factors that attract their attention to the cause. For instance, an informant who is not related to the suffering group by blood or nationality expressed her concern for this group solely for humanitarian reasons, and hence she boycotts the offending COO. When she was asked if she boycotts other countries that also have unfavourable political actions, she said that she is generally concerned about all humans, but she is particularly more concerned about this case because she has friends who are suffering from the COO. Hence, her

motivation is ostensibly triggered by friendship. Another informant reported that she does not boycott the offending country, but when she sees the footage of suffering people, she becomes motivated to take a purchase action towards the offending country; however, this feeling fades away afterwards because *'we humans tend to forget'*, she commented.

Many other informants also reported their motivation to boycott a COO when they see in the media what it is doing. This may indicate that the closer (physically or psychologically) or the more aware we are about the political actions of the country of origin, the greater motivation we have to take an action against the offending COO in the market place.

Another interesting trigger which is related to altruism is empathy. An individual who is also suffering from the political actions of a COO, whether be it the same COO or different from the one that others are suffering from, will motivate this individual to take an action. Generally, informants who are directly suffering from the COO expressed their willingness to boycott any other COOs which are violating human rights or oppressing other nations.

Religion

This is different from identification with the suffering religious group. This factor is two folds. On the one hand, informants are motivated to boycott the COO because its political actions are offending others religiously, like occupying a holy place. On the other hand, informants are motivated to take an action purely because their religion commands so. An informant reported that he does not boycott a COO despite its unfavourable practices towards the suffering religious group that he identifies with. However, he expressed his definite will to boycott it if it is a religious order.

Nature of political action

Severity (or benevolence) of action of the COO was reported as a factor when making the purchase decision. Informants were questioned about the difference between a COO which is occupying the land and another COO which is reported in the media as a supporter of that occupying COO. The reaction of all participants, without exception, was different. Concerned informants reported their definite boycott against the direct offender (occupant), while the supporter's action was perceived as less serious. One informant reported:

'it is only the government of ...(the supporter) which is doing the wrong thing, not the whole nation (of the COO) as it is the case with ... (the occupant).'

Another informant reported:

'...(the supporter) is also supporting other countries in one way or another. It is not a direct enemy'. It is just serving its interests.

Nevertheless, concerned informants expressed their intention to refrain from buying products from this COO with less severe actions if there is a satisfactory alternative, and their willingness

to pay more for an alternative. On the other hand, they displayed great willingness to buy products from countries that support those who are oppressed, and, to a less extent, countries that are benevolent with their actions.

Necessity of product

Boycotting a product is dependent on how important the product is to the consumer. Informants would boycott a non-essential product like soft drink or chocolate from an offensive COO. They would even quit the product altogether or seek a substitute in the absence of satisfactory alternative. However, if the product was essential like a medicine, informants would 'have to' buy the product from the offender irrespective of the severity of its action in the total absence of satisfactory alternatives. However, this is not applicable to all informants. Some of those who are directly affected by the COO's action reported that they would compromise on their health and wellbeing and not buy anything from the offender.

Availability of satisfactory alternatives

Concerned informants expressed willingness to boycott a COO's products with the condition of the availability of satisfactory alternatives. If the product is very essential like a medicine, informants, particularly those who are relatively distant from the case, reported that they would buy the product from the offensive COO even if the offense is very severe in the total absence of alternatives. If the product is non-essential, like soft drink, the concerned informants may quit the product or seek a substitute product, or at least significantly reduce consumption as an informant reported that she might occasionally eat a chocolate made by the offensive COO if there is no satisfactory alternative.

As the perceived severity of the COO's action decreases, the consumer becomes more lenient with the conditions for purchasing from it. An informant reported:

'I sometimes eat at ...(a fast food chain owned by a less-severe COO action) but not too often... I take the family to enjoy eating their from time to time, but you know I feel guilty when I do that, but there is no alternative'.

Another informant reported willingness to pay double for the alternative of the offending COO's medicine, while he is willing to pay only 50% more for the alternative of its supporting COO's medicine; otherwise, he will buy the medicine from the moderately offensive COO.

Consumer values

Self-enhancement is main the motivator for the politically concerned consumer behaviour to take an action when the COO's action is directly affecting the consumer, while altruism towards others is the motivator when the action is affecting others. Altruistic values that transcend family and national members to humanity in general are a very strong factor. The closer the suffering individual or group to the consumer, the more altruistically the consumer will be, which will lead to take an action against the offending COO. Altruism and sympathy towards

other are strong feelings that can overpower other feelings, including enjoyment obtained from eating chocolate and self-esteem obtained from driving a Lamborghini. However, altruism cannot overpower, according to most informants, wellbeing. Any product that is essential for wellbeing cannot be sacrificed even if it is coming from a tyrant political regime. Nevertheless, feelings of sadness, being oppressed, and animosity towards the offender, and the need to stand against the direct oppressor, which lead to the spiritual wellbeing, as stated by an informant, was stronger than physical wellbeing obtained from the offender's medicine.

Consumer demographics and psychographics

This research suggests that consumer psychographics, particularly political concern, religiosity, and altruistic personality, and consumer demographics, particularly nationality, are very strong predictors of consumer behaviour in this context. Contrarily, other consumer demographics, namely gender, age, and education level, have no significance. Income level and purchasing power, however, may moderate the politically concerned consumer behaviour (PCCB).

It has also been noticed through data analysis that informants who described themselves as concerned about fashion were less concerned about politics, and were not motivated to take an action against the offending COO unless its action is directly affecting their country or themselves.

Discussion and implications

The findings of this research raise a number of issues for discussion, which can be compared and contrasted to other theories in the literature.

The PCCB and the kin-selection theory

The findings of this research imply that all consumers may be concerned about the political actions of the country of origin, depending on how relevant this action is to them. And as the COO's action becomes more relevant to them, i.e. nears the consumer, the likelihood of taking an action towards the COO increases, as depicted in Figure 3. The increasing intensity of the red colour indicates greater motivation to boycott the COO.

Figure 3: Motivation to boycott an offensive COO

For less altruistic consumers, motivation levels to boycott will differ, as depicted in Figure 4.

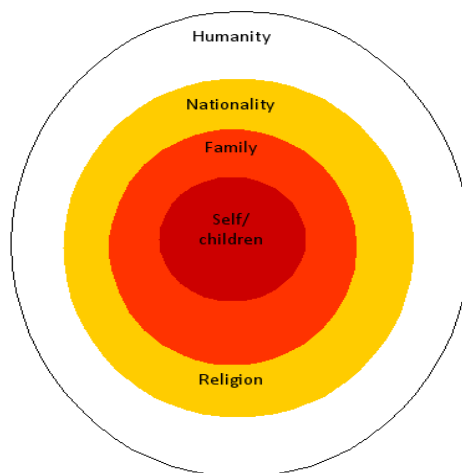

Figure 4: Motivation to boycott an offensive COO for less altruistic consumers

The degree of relevance of the action is in turn dependent on the consumer's values. For some consumers, altruistic feelings may be stimulated towards any human suffering from oppression, irrespective of her or his nationality or religious affiliation, which may lead to an action like a boycott. Others get altruistically stimulated when the oppression is affecting people who they nationally or religiously identify with. While for others, such altruistic stimulation may not start until the COO's action is directly affecting one of their nuclear family members.

This finding is comparable with Hamilton's (1964) theory of kin-selection which predicts that individuals engage in altruistic sacrifices on behalf of close relatives, such as offspring,

more than distant relatives, such as cousins, and more toward distant relatives than toward genetic strange. Similarity in attitudes or culture (as it is the case in this research), and geographical proximity could potentially all be used as kinship cues (Van Vugt and Van Lange, 2006).

If there are more than one group suffering from COOs, the resource-constrained consumer will prioritise the group of people who he should be concerned with in his purchase decision. Resources include, in addition to financial resources, mind capacity that can attend to more than one political problem that will motivate the consumer to act. Thus, it is the 'problem proximity', whether be it physical or psychological, which can be used to predict consumer motivation to take a purchase action.

This link between problem proximity (consumer concern levels) and motivation to boycott a COO may also be used to explain why consumers, in contexts of corporate social responsibility and green marketing, do not boycott socially irresponsible companies or refrain from buying products which negatively affect the environment. Some consumers may not take a purchase action towards these unfavourable practices of corporations unless these practices directly affect them.

Perceived consumer effectiveness (PCE) and social pressure

Contrary to what other researchers found in their studies of consumer boycotts like Mahoney (1976) and Sen et al (2001), PCE was not a factor for PCCB. All the concerned consumers stated that they will remain on their boycott action even if it will not make a difference. They reported that their action is driven by their self-motivation rather than by others:

'It is not just a tactic to pressure the offending COO. It is a principle'.
an informant commented.

PCE is a factor for those who described themselves as 'a bit' concerned about the cause. An informant reported that he does not boycott the COO in context because it is not effective. When he was asked if the COO is occupying his own country, then he confirmed his boycott action regardless of its effects.

Social pressure is not a factor to boycott for those who are concerned as it is their own initiative to take an action against the offending COO. Instead, some informants reported that they will advise people around them, like friends and relatives, to boycott as they are. Social pressure is a potential factor for those who are not concerned to take an action. Non-concerned informants reported that there is a possibility to take an action if they see that close people around them or the majority of the population in where they live are doing so.

The effect of Country of owned by

Producing the product (which is owned by the offensive COO) outside the offending COO did not moderate the PCCB. On the contrary, if a company from a non-offensive COO produces

the product in the offensive COO (including sourcing its raw materials from the offensive COO), the politically concerned consumer (PCC) will boycott the product. This is because the consumer perceives that in both scenarios the offending COO is benefiting, which the PCC is trying to impede through his boycott.

Time factor

The contemporaneousness of the COO's action may also be factor. The comment made by an informant that she does not boycott because 'we humans tend to forget' raises the speculation that the more current the political conflict is, the greater the motivation is to take an action in the market place. This idea was carried out to the interviews that followed. Informants reported that they do not boycott countries that used to be offensive to them or their ancestors in history; however, they prefer not to buy from them, thus these countries have less priority to take a purchase action against them.

Conclusion and further research

This research is exploratory in nature. Further studies may follow in order to confirm its findings. As the literature states that the level of development of a country of origin forms a competitive advantage for products made by this COO, this research suggests that the political actions of the COO also form a competitive advantage (for benevolent actions) as well as a disadvantage (for offensive actions) for the consumer. However, this advantage (and disadvantage) is not stand-alone. Consumers may be willing to sacrifice some of the benefits of a product in order to buy from their politically favourable COO (like paying more for its products), but to a certain extent, as reported by consumers who frequently stated:

'I will pay more as much as I could'.

Choice modelling will be used to study the significance of the COOs' political actions (at different levels, ranging from severe to benevolent), as a product attribute among the rest of the attributes like quality and price, measuring the findings against consumer psychographics (like level of concern about politics, fashion, and religiosity), and demographics (like gender, age, purchase power, and nationality). Companies from politically favourable COO may use the political dimension as a strategy to differentiate their products (through promotional activities, provided the law of the country permits such activities) from the other brands, which also needs to be empirically tested. Further research can also examine and rank countries according to their political favourableness by groups of consumers, segmented by their demographics and / or psychographics. Future research can also compare and contrast responses from consumers suffering from another political conflict in the world.

Appendix: General interview guide

- There is a political conflict in this area of the world (the area under study). Does this political conflict affect you? Why/why not?
- There have been calls to commercially boycott certain countries based on their unfavourable political actions in this area. How do you react to these calls?
- How do you link your concern and behaviour in this context to your personality and lifestyle?
 - a. Tell me about the motivations of your behaviour.
 - b. Is it initiated internally or externally?
- Do other political conflicts affect you too? Why/why not?
- How do you react to calls to boycott in this other context?
- How do you make your purchase decision in the absence of satisfactory alternatives of the boycotted product?
- Do you distinguish between boycotting a bar of chocolate and an essential medicine? How do you make your purchase decision while considering the political actions of the COO?

THE CONCEPTUAL RELATIONSHIP BETWEEN GREEN SUPPLIER DEVELOPMENT AND ORGANIZATIONAL PERFORMANCE

Abstract

Green supplier development is the key coordinate of economic and social development that will contribute to the achievement of green supply chain management and therefore improving supply chain competitive advantage and organizational performance. By reviewing and analyzing many previous supplier development programs which were collected from supplier development and green supply chain management literature, three supplier development programs related to both economic and environmental performance are summarized in this study including green knowledge transfer and communication, investment and resource transfer, and management and organizational practices. This paper aims to provide a conceptual support to future empirical investigation of the relationship between green supplier development and organizational performance.

Keywords: green supplier development; green supply chain management; organizational performance

Introduction

Nowadays, because of the lack of natural resources, environmental protection is attracting much attention (Srivastava, 2007; Brammer and Walker, 2011). The traditional extensive economic growth mode which excessively pursues economic benefits is no longer adaptable to the needs of development. The new requirement for enterprises is not just maximizing economic benefits but greening the process of purchasing, manufacturing, distribution, retailing and recycling so as to manage ecological construction and environmental protection. In order to bring supply chain into full play in economic growth and to achieve sustainable development, it is necessary to transform supply chain systems from the environmental perspective and then

suppress the harm of supply chain on the environment (Zhu and Sarkis, 2006). Therefore, many enterprises have adjusted their development strategies to include the import of green ideas to supply chain management, and to combine sustainable development into the whole life cycle of products from material purchasing, manufacturing, packaging, distribution, retailing, and the subsequent recycling of the products so as to promote the coordinated development of the economy and environment while emphasizing resource conservation and environmental protection. In the implementation of supply chain management, enterprises have gotten maximum economic benefits, and at the same time, the corresponding social responsibilities should be on them in parallel (Lee, 2008). For this reason, green supply chain management was proposed as a newly advanced management model to fit in with the needs of the development of economy, society and environment.

Under the umbrella of green supply chain, supplier development have been heralded as new requirements that call for the evaluation of suppliers based not only on traditional criteria (quality, price, delivery, technologies, production capacities, planning and service management), but also upon suppliers' environmental awareness and activities. By enhancing the environmental performance at the source of the supply chain, enterprises will improve their environmental performance, thereby meeting the environmental requirements of society and, at the same time, reducing total cost (Hu and Hsu, 2010). Thus, green supplier development is the key coordinate of economic and social development that will contribute to the achievement of green supply chain management and therefore improving supply chain competitive advantage and organizational performance (Thun and Müller, 2010).

Given the above, this paper advances a conceptual model to investigate the relationship between green supplier development and organizational performance. Generally, it hopes to shed some light on the following question:

Does green supplier development affect organizational performance, and if it does, to which extent is the effect?

Literature review of green supplier development

Green supplier development is very necessary for green supply chain development and green supplier management. It is the needs of enterprises' growth in green supply chain environment. In green supply chain management, the activities between purchasing enterprises and their suppliers no longer rely on the traditional seller-buyer relationship. They have built long-term and steady strategic cooperative partnerships that share information, resources, profits and even risks (Ting and Cho, 2008). Thus, with the ascension of suppliers, an enterprises' competitive advantage is promoted as well.

Green supply chain management has begun more intensive research and has achieved some accomplishments in the academic world. But, there is a big gap in the current research about

green supplier development. Recently, several researches have appeared that focus on supplier development with consideration given to enterprises' economic performance. Academics have divided green supplier activities into different dimensions in different empirical studies. They have tried to relate these activities to an enterprises' economic performance (Zhu and Sarkis, 2006; Zhu *et al.*, 2007; Walton *et al.*, 1998; Hervani *et al.*, 2005; Lee, 2008; Chien and Shih, 2007; Thun and Müller, 2010).

Benton and Krajewski (1990) researched the effects of supplier performance on an enterprises' inventory status and service level. They proposed delivery reliability and materials quality as the criteria for measuring supplier performance. The research finding showed that, in manufacturing systems, quality has a minimal impact on inventory and the greatest impact on stockout, while semi-finished products reduce stockout frequency and increase inventory cost so as to lead to the reduction of influence imposed by uncertain delivery and the increase of influence by raw materials quality. Supported by numerous studies, the focus has been on increasing profit through improved supplier performance. Krause and Ellram (1997) discussed how buyers enhance their suppliers' capabilities so as to improve their own competitiveness. Hahn *et al.* (1990) proposed a conceptual model that aims to develop a supplier development program and establish relevant decision-making processes which combine the purchasing strategies and total development strategies of enterprises. However, these studies focused only on the relationships between supplier development programs and the economic performance of enterprises.

A review of the above studies indicates that more and more attention is being paid to supplier management. But, most of these studies have stressed the analysis and evaluation of suppliers' current situation, and very little care given to supplier development. Especially in light of the background of green supply chain, namely green supplier development, that is an entirely new task.

Most successful enterprises have their own steady and outstanding suppliers. The profits that derive from supplier development are not only fat but also long term (Walton *et al.*, 1998). In many cases, enterprises have to spend too much time and effort promoting their suppliers' level so as to achieve long-term cost savings. Ma and Lin (2010) suggested that enterprises should uphold an open supplier development concept, establish perfect supplier development programs, shoulder the responsibility of developing suppliers and improve management capabilities so as to guarantee supplier development that in turn provides an advantage in the world of fierce business competition.

Supplier development also requires that they respond to environmental change. With the irresistible development of economic globalization, industries and enterprises have entered an increasingly fierce competitive environment (Ma and Lin, 2010). Many non-renewable resources have been severely depleted, leading to the greenhouse effect, ozone depletion and acid rain.

Suppliers have been required to deal with increasingly fierce competition and to change much more swiftly. Koh *et al.* (2007) asserted that an organization or enterprise be an open system, ready to adjust to environmental change. An increasingly intense competitive market and rapidly changing technological innovation are the critical drivers for enterprises that pursue high level suppliers and carry out supplier development programs. Especially with the development of green supply chain, suppliers must continue to develop so as to fit in with green requirements.

In the face of the change in marketing demands, suppliers have been required to develop rapidly and improve adaptability so as to nourish long-term and steady strategic partnerships with enterprises which purchase from them (Walton *et al.*, 1998). Specifically, a green supplier development program is a set of activities of buying enterprises, including supplier identification, supplier evaluation, supplier selection, supplier performance feedback, performance expectancy, supplier training, technological knowledge transfer, green knowledge transfer, supplier incentive and reward, professional supplier development team and buyer enterprises' direct capital investment to supplier.

Based on the previous studies related to supplier development and green supply chain, green supplier development is defined in this study as follows:

In order to promote supply chain competitiveness and improve economic, environmental and social performance, enterprises must build long-term and steady strategic partnerships with their suppliers. Cooperative activities include such things as knowledge transfer and capital investment, helping suppliers to improve performance (economic, environmental and social performance) and technology so as to enlarge competitive advantage, and keep and develop the capability of cooperating with the whole supply chain, sticking together, sharing information, resources, profits and even risks. It can be summed up in that green supplier development is the process which enterprises develop together with their suppliers so as to improve supplier performance and meet their own long-term demands.

An overview of the model and propositions

From the literature review, some scholars have started to pay attention to supplier development however green supplier development is an entirely brand-new task. Based on the existing researches of supplier development, this study will explore the practices or activities related to green supplier development.

Green knowledge transfer and communication

According to Wagner and Krause (2009), knowledge transfer and communication have a strong positive correlation with supplier development. Knowledge transfer is an achievement that spreads knowledge from owners to receivers in a controlled environment while knowledge sharing and communication are the fundamental guarantee of knowledge transfer. Knowledge

transfer and sharing between enterprises and their suppliers can help suppliers to accumulate valuable knowledge, and promote the diffusion and achievements of technology so as to narrow the technological gap between enterprises and suppliers.

Effective approaches of knowledge transfer between enterprise and supplier include providing training to suppliers, communicating performance information with suppliers and building feedback mechanisms (Prahinski and Benton, 2004). Through the training programs, enterprises have provided managerial and technical support to their suppliers ensuring that suppliers are close to their stakeholders, enabling them to learn more about their needs and enhancing the employees' environmental awareness and technical capabilities so as to achieve better development (Hunter *et al.*, 1996; Dyer and Nobeoka, 2000).

Communication programs include supplier assessment and feedback, and information sharing between enterprise and supplier (Monczka *et al.*, 1993; Wagner, 2006). These programs integrate various forms of communication. Some are specific, simple and interchangeable while others are nonspecific, complicated and non-interchangeable (Fulk and Boyd, 1991; Prahinski and Benton, 2004; Sako, 2004). Thus, for knowledge which is difficult to share and communicate, resource transfer should be used to complete such a complicated knowledge transfer process. In addition, suppliers' own efforts which they can actively carry out include activities such as sharing and providing feedback information to their buying enterprises, activities that also belong in a supplier development program (Hunter *et al.*, 1996; Dyer and Nobeoka, 2000).

The above discussion suggests the following proposition:

- P1: Green knowledge transfer and communication have a significant positive effect on organizational performance.

Investment and resource transfer

Investment and resource transfer have made a significant contribution to the improvement of supplier's capability and performance (Krause, 1999). Thus, Zsidisin and Ellram (2003) suggested that enterprises should actively invest in supplier development so as to improve their suppliers' performance. The investment of enterprises in their suppliers can be divided into two groups: direct investment such as, supplier capacity building and technical support (Monczka *et al.*, 1998; Krause, 1999; Narasimhan *et al.*, 2001; Liker and Choi, 2004), and indirect investment such as, incentives and rewards (Krause, 1999; Das and Narasimhan, 2000). These direct and indirect investments have been conducive to suppliers developing as requested by the buying enterprise, indirectly improving supplier performance (Liker and Choi, 2004).

Investment and resource transfer, in practice, and knowledge transfer and communication, in concept, are both components of supplier development programs which have interacted and cooperated so as to improve supplier capacity (Wagner, 2006). Enterprises have transferred

knowledge such as production knowledge and technical advice to their suppliers. On the other hand, they have transferred suppliers' employees to their own enterprises and have offered training to them (Krause *et al.*, 2000; Wagner, 2006; Wagner and Krause, 2009). Thus, enhancing employee transfer between buying enterprises and suppliers will lead to stronger ties between supplier capacity improvement and knowledge transfer activities.

The above discussion suggests the following proposition:

- P2: Investment and resource transfer have a significant positive effect on organizational performance.

Management and organizational practices

Another important component of a supplier development program is helping suppliers develop through management and organizational practices. Hartley and Jones (1997) pointed out that the attitude and decision of top managers have a significant impact on the building of long-term and steady relationships between suppliers and buying enterprises. Thus, an enterprise manager's approval and support for a long-term supplier development plan is critical to the success of supplier development programs. Sharon (2006) advised that the managers of both buying enterprises and suppliers should transform their thinking to a win-win concept which aims to build long-term and steady partnerships. And over this course of doing so, problems or the restriction of resources and the environment should be given adequate consideration. Krause *et al.* (1998) suggested that supplier development programs should simultaneously consider the aspects of both management and organizational practices, such as improving operational processes, enhancing standardization, perfecting the supply process (Watts and Hahn, 1993; Hartley and Jones, 1997), a formal process of supplier development (Krause *et al.*, 1998), supplier development standards (Narasimhan *et al.*, 2008), and supplier quality certification standards (Sharon, 2006). These organizational practices must be coupled with management objectives that will improve supplier performance and lead to a steady strategic partnership between suppliers and buying enterprises.

The above discussion suggests the following proposition:

- P3: Management and organizational practices have a significant positive effect on organizational performance.

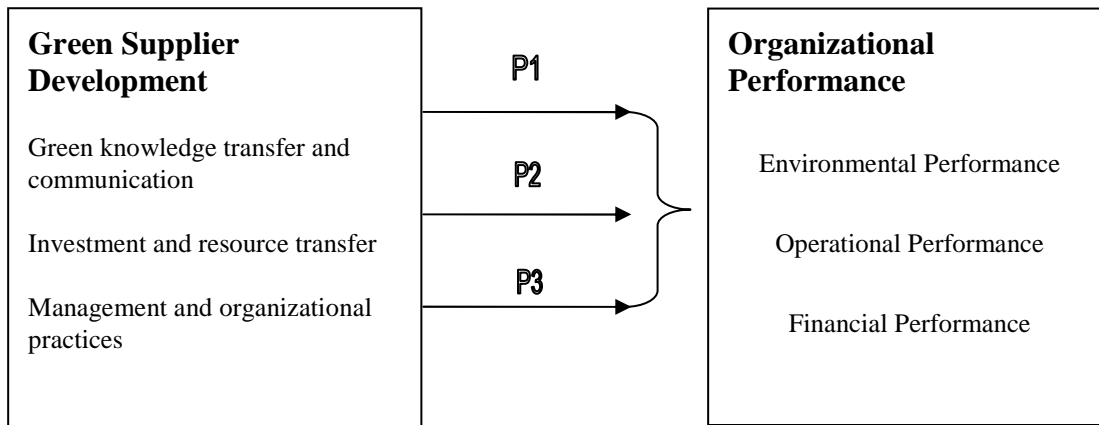

Fig. 1: Conceptual Model

Conclusion

Green supplier development programs have not only focused on the economic activities but have considered the impact of environmental factors. In other words, the implementation of green supplier development programs at the same time has made great efforts towards improving both economic and environmental performance. Thus, by reviewing and analysing many previous supplier development programs which were collected from supplier development and green supply chain management literature, three programs related to both economic and environmental performance are summarized in this study including green knowledge transfer and communication, investment and resource transfer, and management and organizational practices. Additionally, this paper plans for future empirical investigation of the relationship between green supplier development and organizational performance.

Abstract

There has been a phenomenal increase in the consumption and production of organic food world over. Scientific research has proved the health and environmental benefits of consumption and cultivation of organic food over conventional food. However, the preferences of consumers and their perceptions towards organic food are equally important to the researcher as well as the marketer as they will determine the production, promotion, distribution, purchase and consumption of organic food. This research is an attempt to understand customer preferences and perceptions towards organic food. More specifically answers to the research questions as to why do consumers prefer organic food, are they willing to pay more for organic food, what influences the willingness to pay higher price, what are the preferred categories of organic food and where are they purchased from, and what are the preferred sources of information on organic food, are sought in this research.

This research has employed a combination of exploratory and descriptive research methods. During the initial phase unstructured depth interviews of store owners/managers as well as consumers of organic food were conducted to get primary insights into the phenomenon of purchase and consumption of organic food and to develop hypotheses. In the subsequent phase a structured pretested interview schedule was administered to 251 consumers of organic food from cities of Delhi, Bangalore, Mumbai, Chennai and Ahmedabad of India. Although convenience sampling technique was employed judgment was used for inclusion of variety in terms of demographic profile of the sample units. The data have been statistically analyzed and inferences were drawn based on Rank Analysis and Kendall's tau-b

While the most widely purchased category was fruits and vegetables followed by bread and grains, organic food stores trailed behind supermarkets as preferred outlet. Word of mouth was found to be the most powerful source of information followed by news papers and internet in that order. Books were found to be the fourth source close to internet. While majority of the respondents were willing to pay considerable premium in price ranging from 1 to 22 percent over conventional food the willingness did not have relation with the income of the respondent. The major motivations for consumption of organic food were health benefits, quality taste and environmental concern in that order.

Willingness to pay premium price for organic food was related with age and gender. Contrary to expectations education was not found to lead to awareness while surprisingly availability of organic food was positively influencing the willingness to pay.

Data have been collected from urban population of major cities of India while separate study among rural population and comparisons can provide more insights which are of importance to marketers and researchers. While in this research many factors were independently considered for establishing relation with some independent variables, simultaneous consideration of multiple variables could lead to interrelations among many related variables. Also linear models with mediating and moderating effects could be hypothesized and tested. The present research has practical implications for organic food marketers as it identifies many of the consumer behavior variables and their relations.

The paper identified the importance of awareness of health benefits supported by availability as the path to purchase and consumption of organic food at premium price. It is important to note that the finding is theoretically rich and managerially actionable. The finding is also of policy implication. The study also identifies the implications of demography on consumer perceptions and preferences towards organic food. The finding is of segmenting, targeting and communicating value for marketers and researchers.

Keywords: Organic food, price premium, customer perception, customer preference, demography

Introduction

Organic Foods and Conventional foods have been studied across different countries for several years and it has been found out that Organic foods are comparatively less harmful and healthier. **Mikkola, et al. (2009)** substantiate this by saying that Organic food do not consume or release synthetic pesticides into the environment. Although the benefits of organic food are proved scientifically, consumer perceptions and awareness shape the preference towards organic food. Across the globe, in last few years extensive research has been conducted to identify consumer's preference towards food. **Lange, et al. (2006)** have cited in their paper that many people in countries like Austria, Denmark, Finland are moving towards Organic Food and are also ready to pay some premium for organic food. They also put forward that the government of these countries also have realised this and have invested a lot of their revenue in Research and implemented some plans that encourage farmers to take up Organic Farming. **ACNielsen (2006)**, in their survey of preference for functional foods revealed that India was among the top ten countries where health food, including organic food, was demanded by the consumer. It was also found that the most important reason for buying organic food was the concern for the health of children, with over 66 percent parents preferring organic food to non-

organic food. Though organic food is priced over 25 percent more than conventional food in India, many parents are willing to pay this higher premium due to the perceived health benefits of organic food. The research also states that the increase in organic food consumption in India is evident from the fact that many organic food stores are spurring up in India. Today every supermarket has an organic food store and every large city in India has numerous organic food stores and restaurants. This is a huge change considering that the first organic food store in Mumbai was started in 1997.

Consumers are buying organic food despite its generally higher price tag. Retail sales of organic food increased from \$3.6 billion in 1997 to \$18.9 billion in 2007, accounting for over 3 percent of total U.S. food sales. According to the **Harris (2007)**, organic food sales could reach an estimated \$24 billion in 2010.

Awareness of harmful effects of use of chemical fertilizers prevalent in recent days among customers (**Cooper, et al. 2008**) from the demand side and the realization of potential of the organic farming by farmers (**Brendehaug, 2005**), (**Jacobsen, 2005**) as far as the supply side is concerned have contributed to the phenomenal increase of production and consumption of organic food worldwide.

Lodorfos and Dennis (2008), says that the theory of planned behavior is indicative of the determinants of consumers' intent to purchase organic food. The theory is based on the concept that the stronger the intention to perform a given behavior, the greater the likelihood that the person will perform that behavior. In this study, intention to buy organic food was found relatively strong since it had a mean value of 3.5956 in a 1-5 Likert scale. Consumers' intent to buy organic food was predicted by attitude, subjective norm, and perceived behavioral control, which includes (social influences, salient beliefs, motivation to comply with the views. In *FMI Journal*, 2009, a research was conducted to find out why people in United States follow organic food compared to the conventional food. It shows that 81% of consumers are buying organic food for nutrition and 77% people are buying organic food for the freshness and over 67% people look into the long term perspective. **Gifford and Bernard (2005)** argues that consumers believe that conventional foods have a lot of chemicals in it and when consuming the conventional food the chemicals also get into their body and in the long run it may give some problems. To avoid it, people are purchasing organic food which has no chemical fertilizers so that they are not prone to any side effects and are safe in their older age. These beliefs and perceptions of US people brought forward in the study strengthen theory of planned behavior.

Customer perceptions about organic food are not positive alone. Many customers hold negative attitudes towards organic food. **Lodorfos and Dennis (2008)** enlightens that some consumers are also afraid of Organic foods for the fact that organic foods are not containing any preservatives hence it might lead to the formation of Bacteria in it and consuming them might cause some health hazard .It is observed that some are also not interested in organic foods for

the simple reasons of price and non availability. Organic foods are grown without making use of any fertilizers and they are prepared totally using Green methods which make them unique and also expensive, thus users feel when they get the same material at a comparatively lesser rate then why should they pay the extra premium. Consumers would be prepared to buy more organic food if it did not carry such price premium over non-organic food.

Scholderer et al.(2001) cited in Grunert, notifies that some consumers pay premiums for organic products which look and taste the same, produced without chemicals and with concern for animal welfare and the environment, products which are guaranteed GMO-free. **Cicia et al.(2009)**, brings out some facts as in Italy if the conventional tomato price is €1/kg; consumers are willing to pay an average €0.86/kg as a premium price for organic tomatoes. This premium price consisted of the health component value (€0.46/kg) and the environment component value (€0.40/kg).

Aryal et al (2009) , conducted a study in Kathmandu valley and came to a result which states that consumers are willing to pay price premium of 5-50% for organic products which can be viewed as the cost of investment in human health. Vegetables followed by fruits and beans are the most preferred and highly demanded crops at present and the price of vegetables specially the leafy ones are higher than other normal vegetables. But, quality characteristics affect consumers' preferences for organic products; with the most important including health and nutritional value, taste, and fresh and general appearance.

On the other hand, **Griffith and Nesheim (2008)** suggest that there is enormous heterogeneity in willingness to pay for organic products and that in aggregate willingness to pay for organic foods in England in 2004 was at least £ 114m and that willingness to pay for a change to a 100% organic economy was less than £ 10.9bn.

Hypotheses

Customers buy and consume organic food for different reasons. Concern about the environment is one of the major reasons cited by experts. **Macilwain (2004)** states that in earlier days farming practices involved activities that would improve the richness and stability of the soil and this was done by restoring the organic matter and they completely avoided synthetic fertilizers or pesticides.

It is not positive motivations alone that drive consumption of organic food. **Lauridsen, et al. (2005)** conducted an experiment on 36 rats and fed them with grains wherein it has been applied by a pesticide or a fertilizer. They found out that this fertilizer settles in the grain and the rats consuming the grains also consumed the pesticides that were settled in the grain. The result showed that the rats suffered deficiency in necessary nutrients and were seen to suffer with some diseases due to settlement of chemicals in the liver which was evident in their post

mortem report. Many people avoid conventional food for fear of harmful effects of fertilizers and pesticides.

Flaten, et al. (2005) points out that fertilizer contaminates the soil. Pesticides are non degradable and are also toxic in nature. Larger concerns of environmental impact also drive purchase and consumption of organic food.

Knudson (2007), has classified organic food market into two segment , consumer who buy organic food because they are healthier than conventional food and consumers who buy because of social aspects like clean environment, supporting small scale agriculture, and locally produced food.

Ojisan (2010) also says that values of consumer drives its choice for organic food. According to him people buy organic food because they believe that by doing so they are saving environment. He has classified Consumer's values who make a choice for organic food also in two parts use values which can only be enjoyed by actually consuming the product (ex.taste) and non-use values related to improved environment and animal welfare. **Scholderer et al.(2001)** say that people buy organic food because they believe that by doing so they are saving environment.

Chandrasekhar (2010) has also suggested that one can change preferences of non-organic food consumer to organic food consumer by changing their mind-set and showing them how organic food is better than conventional food in terms of taste, quality, health, environment etc. Since the study also bring factors affecting consumer's preferences.

Lipson (2004), states that organic foods are highly nutritious, healthy and environmental friendly. People are showing great interest in terms of the taste; people feel that an organic food tastes much better than that of its counterpart.

Gifford and Bernard (2005), says that some consumers also consume organic food for just the sake of trying it once and they feel they would continue if they find it suitable to them at a later stage; that is; if it suits their interest both in taste and in their financial needs.

It is possible to classify the motivations for purchase and consumption of organic food based on the nature of the motivations. They may be direct or indirect, affecting self or others and benefit or non-benefit. Human beings by nature are likely to seek direct benefit to self over and above benefits which are indirect and affect self through impacts which are common to the society. Benefits which are direct are more appealing as they can be more readily perceived. Also there are benefits which accrue to elements in the society other than self. Self interest is likely to be placed above interests of others. By consuming organic food customers are likely to enjoy direct benefits to self such as better health, better taste and better quality. It is also possible to think that customers may consume organic food for non benefit reasons such as

curiosity and appealing marketing tactics. These are likely to have only marginal impact on customers. Hence it is possible to hypothesize that:

- H1 Benefits to self will be ranked above benefit to others
- H2 Direct benefits will be ranked over indirect benefits
- H3 Benefit concerns will be ranked above non-benefit concerns

Gifford and Bernard (2005), concludes that Organic foods are gaining momentum these days and there are over 40% who are more likely to buy an Organic food compared to that of the conventional food and less than 4% who are not willing to pay for the Organic Food .

Rodriguez **et al.**, (2007) has firmly said that some consumers are also concerned about the quality of chicken as many of the chicken are formed using artificial hormones so they are afraid about the imbalance that would cause in their hormones too. According to the research it is well known that organic foods are certified by some certification institutes USDA and many consumers are concerned if the Organic Food that they are buying is certified in one of the certification units also they are ready to pay a premium to the product if their Organic food is certified by some Certification centers.

Cicia et al., (2009), informs that Self-actualization or ethics and food safety are also predictors of attitude and intention towards organic food consumption. Health and environment proved the main motivators explaining consumer willingness to pay a premium price for organic products.

Since customers perceive higher benefits associated with consumption of organic food they are likely to pay more for organic food.

- H4 Customers are willing to pay higher price for organic food

As there is evidence to state that customers are willing to pay price premium a natural further inquiry will be into the reasons for it. Customers with higher income are the first likely candidates who might be willing to pay more. Grunert, 2003, highlighted consumers' income to play a significant role in driving them to purchase organic food.

People with higher income are more likely to spend more on non essential items than by people with lower income. Also persons with higher income are likely to purchase high value items of the same product category than people with lower income. Several reasons are attributed to this behavior. Perceived higher benefit is one of the reasons while decreasing marginal utility of money is another reason.

- H5 Customers with higher income are willing to pay more for organic food

Follet (2008), argues that the choice of Organic food also depends upon the society a consumer is part of. If a consumer is in a society where all are purchasing Organic Food then

that consumer is likely to purchase organic foods compared to the conventional food. **Gifford and Bernard (2005)**, comes up with another reason that organic foods are also not available in many places. Consumers feel that once they get habituated to it switching back to conventional food in case of unavailability of Organic Food will be difficult.

Customers normally think of purchasing an item when it is available. Hence availability triggers the thought of purchase and since organic food is priced high availability is likely to partly induce the willingness to pay price premium.

- H6 Availability of organic food is positively related with willingness to pay premium price for organic food

Health concerns stem in most individuals as age advances. Health concern is one of the reasons for consuming healthier food. Also, on an average, individuals with higher age are likely to have higher income. Hence age is hypothesized to be positively related with willingness to pay price premium.

- H7 Age of the customer is positively related with willingness to pay premium price for organic food.

Sometime the intent also depends on gender. It is observed that female consumers are more inclined to buy organic food. **Rahman (2006)** in his study found that Egyptian consumers were more inclined towards purchasing organic foods primarily because they had mostly females that are member of families and are adults, thereby leading to the observation that females prefer organic foods more than males.

On the contrary, it is possible to also argue that females are more price conscious. In most households the task of balancing the budget is left to the female member. The case is true even in the female member is working. Also ladies are observed to be price conscious, deal prone, and value oriented in purchases. Hence it could be hypothesized that willingness to pay price premium is more for males compared to females.

- H8 Willingness to pay premium price for organic food is more for males than females

The theory of demand is supposed to hold good even in the case of organic food. The quantity consumed is likely to be influenced by price. The price perceptions are more relevant than actual price.

- H9 Higher the perceived price of organic food the lower the consumption of organic food

Age is considered to be one of the most important factors that influence consumer behavior. Most people start with baby food and end up with health food. **Lodorfos and Dennis (2008)** support it by stating that Intention to buy Organic food changes depending on age group.

Most individuals develop health consciousness later in their life. At this stage organic food is likely to substitute conventional food and hence the quantum of consumption of organic food increases with age.

- H10 Age of the customer and consumption of organic food are positively related

Education is supposed to have a great say in healthy habits and particularly food habits. Also education increases awareness in general and particularly on food items. Hence it is possible to hypothesize positive relation between education and awareness.

- H11 Education of the customer is positively related with awareness about organic food

FMI Journal (2009), reports a survey which was conducted to see what are the type of organic foods that are purchased and the result showed that 44% of Organic foods sold was Fruits and Vegetables, milk and Yoghurt comprised of around 30% , Cereals and breads comprised of about 29% and sauces and Soups about 15%. **Smith and Lin (2008)** says that among the organic food categories, fruit and vegetable sales were the largest (\$6.9 billion), almost 37 percent of organic sales in 2007. This leads to the hypothesis that the concept of organic food is more popular with vegetarian items than non-vegetarian items

- H12 Preferred categories of organic food are more vegetarian than non-vegetarian

The survey (FMI Journal 2009) also speaks about the places where people prefer to buy organic foods also and it points out that 53% of people buy in Grocery shop, around 7% people buy in warehouses and some buy directly in the location of farmers.

One of the major benefits which customers look forward in shopping is convenience and supermarkets and common outlets normally allows everything under one roof. Many of the super markets also have better brand image than specialty stores unless the exclusive outlet is of a major branded manufacturer.

- H13 Customers prefer common outlet to exclusive outlets

Health concerns being important to individuals source credibility has a role to play in communication. Also marketer sponsored communication is likely to be discounted in terms of source credibility. Also vicarious learning is found to influence preference for sources of information.

- H14 Personal Sources of information is more preferred than impersonal sources

Methodology

The study has been conducted in two phases. The first was an exploratory research phase which involved depth interviews of outlet managers/owners of organic food and also customers. 20 outlet managers/owners and 20 organic food customers have been selected by

using judgment in order to include variety in the demography. All the outlet managers and customers were urban and they have been interviewed with unstructured open-ended questions. The questions related to benefits, price perceptions, outlet preferences and sources of information. Each interview lasted forty minutes to fifty minutes. The collected texts were qualitatively analyzed in order to gain insights into the organic food related consumer behavior and to develop hypotheses.

The second phase involved a quantitative study in which data were collected from 251 organic food customers using a pretested interview schedule. The schedule contained questions which sought answers on categorical as well as ordinal measures. The respondents have been selected by convenience sampling method by intercepting them after purchase at organic food outlet. Care has been taken to include variety in demography of the respondents. The collected responses were analyzed using ranks, percentages and Kendall's tau-b.

Analyses and Results

<i>Reasons</i>	<i>Average Rank</i>
<i>Health Benefits</i>	1.792
<i>Quality</i>	2.510
<i>Taste</i>	3.673
<i>Environmental Concern</i>	3.936
<i>Animal Welfare</i>	5.099
<i>Curiosity</i>	5.330
<i>Product Presentation</i>	5.625

Table 1: Average Ranks of Perceived Reasons for Purchase of Organic Food

The ranking of various reasons for consumption of organic food by customers as given in table1 indicate that the first three ranks have been accorded to health benefits (1.792), quality (2.510) and taste (3.673) in that order. All the three are direct benefits to the individuals (self). Environmental concern is an indirect benefit (rank=3.936) and animal welfare (rank=5.099) is a benefit to others. Both of them are ranked below the direct benefits to self and hence hypotheses H1 and H2 are accepted. Curiosity (rank=5.330) and product presentation (rank=5.625) obtained the last two ranks confirming H3.

<i>%Premium</i>	<i>1-5</i>	<i>6-10</i>	<i>11-15</i>	<i>16-20</i>	<i>Above 20</i>
<i>% Customers</i>	28	35	22	8	7

Table 2: Percent of Customers willing to pay Premium Price

All the customers are willing to pay some price premium for organic food. The premium ranged from 1% to 20% and above. The average price premium that the customers are willing to pay is 9.55% over the conventional food. The premium the customers are willing to pay is quite substantial and the hypothesis that the customers are willing to pay a premium (H4) is accepted.

There are several factors which influence the willingness to pay price premium for organic food. Results for testing these hypothesized influences are provided in table3. Contrary to expectations income was found to be unrelated with willingness to pay price premium with a p value of 0.390 which leads to the rejection of H5. Availability ($p=0.014$), age ($p=0.000$) and gender ($p=0.011$) were found to influence willingness to pay price premium leading to the acceptance of H6, H7 and H8. While age is positively related with willingness to pay, females were found to be less willing to pay price premium.

Variables	Value	Std. Error	Approx. T ^b	Approx. Sig
Income and willingness to pay	0.046	0.053	0.860	0.390
Availability and willingness to pay	0.143	0.058	2.464	0.014
Age and willingness to pay	0.480	0.049	1.307	0.000
Gender and willingness to pay	-0.146	0.057	-2.547	0.011
Price and consumption	-0.331	0.050	-6.484	0.000
Age and consumption	0.182	0.048	3.805	0.000
Education and awareness	-0.158	0.061	-2.509	0.012

Table 3: Determinants of willingness to pay, consumption and awareness

The law of price quantity demanded relation epitomized in the classical downward sloping demand curve is reconfirmed with the negative relation with price and consumption of organic food with a p value of 0.000 which lead to the acceptance of H9. Apart from price age was also found to be positively related with consumption with a p value of 0.000. Hence H10 too stands confirmed. Surprisingly, education is negatively related with awareness ($p=0.012$) which leads to the rejection of H11.

Categories	Fruits and Vegetables	Bread and Grains	Meat, Fish and Poultry	Dairy Beverages	Spices	Prepared Food
% Customers	42	15	14	13	10	6

Table 4 : Preferred Categories of Organic Food

Fruits and vegetables scored considerably high as the preferred organic food category with 42% of the respondents. All other categories are way below fruits and vegetables with bread and grain, meat, fish and poultry, dairy beverages and spices ranging from 15% to down to 10% respondent preference. Prepared food was the least preferred category with only 6% preference score. It is interesting to note that more than 80% score for preferred category is vegetarian items.

Places of Purchase	Super Markets	Organic Food Stores	Local Market	Direct Channels
% Customers	50	25	15	10

Table 5 : Preferred Places of Purchase

The preferred outlet of purchase happens to be super market which confirms H12. Organic food stores stand way below at 25% followed by local market and direct channels.

The prominent source of information happens to be word of mouth with 26.4% share followed by news papers, internet, books and magazines, food store, product presentations and television with shares ranging from 16.6 percent to 7.8 percent.

Source	News paper	Word of Mouth	Television	Internet	Books and Magazines	Organic Food Store	Product presentations
Percent	16.6	26.4	7.8	15.7	14.3	9.6	9.6

Table 6 : Sources of Information on Organic Food

Discussion

As far as reasons for consumption are concerned, benefits are ranked over non benefits which are consistent with rational consumer behavior. Ranking of direct benefits over indirect benefits are explained in terms of ease of perception. Also the accrual of indirect benefits is dependent on others' behavior which is less certain. Self interest, the basis of free market economy, and a guiding rule in many of the individual behaviors explains the ranking of benefits to self over and above benefit to others.

Motives to pay a price premium are many. The most prominent of them is the perceived higher benefits. Price premium is also closely linked with value. The incremental price paid is compared with the incremental value to arrive at the decision. Many a time premium price payment is linked with lifestyle and status. **Griskevicius (2010)** say that there are some buyers who believe that buying Organic food is a social status and they believe they are in the elite class if they buy organic food and they consider that others will appreciate their love towards the nature and their richness also, which is fascinating. However, it is interesting that income has no relation with the willingness to pay price premium. Ability to pay is only one of the bases for pricing decisions. When there are more compelling reasons, like health, for the purchase of a product, ability takes a backseat. However the more surprising result is that still the demand is not price inelastic. This indicates that everyone is willing to pay higher price but will buy less at higher price. Age was found to influence both quantity consumed and willingness to pay premium having the dual impact. The reason for the impact of availability on willingness to pay price premium is not clear. This is against the normal economic understanding of scarcity leading to higher price. A possible explanation is the premium on prevalence. Motives for risk reduction (social, financial, and lifestyle) do possibly explain the phenomenon. Males are willing to pay higher price consistent with the abilities to take risk.

Conclusion

Categorizations of motives for organic food consumption confirm the theories of self interest and the power of perceptibility. It is also possible to conclude strong influences of age and gender on consumption and consumer needs. Even in the case of strong motivations like health the law of demand does not get exempted. Two of the findings are surprising; the lack of

relation between income and willingness to pay price premium and the lack of relation between education and awareness of benefits of organic food. The power of convenience as a strong predictor of consumer behavior and the strong influence of word of mouth in sensitive issues like health stand confirmed. The term organic is more related with plant kingdom than animal kingdom.

Managerial Implications

The benefit categorization helps the manager in segmenting, targeting and communicating. It also helps in product development. The dependence of quantity demanded on price allows the marketer to sell more at lower prices. Hence he gets many pricing options which normally encourage competition. Since availability boosts price premium marketers also have incentive for careful distribution policies. The fact that there is no relation between income and the willingness to pay premium for organic food helps the marketers to target a larger consumer base, which is presently ignored because of the assumption that only rich customers will be willing to buy more of organic food due to its high prices.

This research shows that consumers perceive organic food to be healthy and environmentally friendly but consumers are also primarily concerned with the limited availability. In order to increase the demand for organic food, considerable efforts are needed to increase its availability and improve the distribution systems. Making organic food as an essential part of the product lines of conventional supermarkets will increase its availability, thus improving distribution and reducing price differentials. Furthermore, as more organic food arrives in the marketplace, prices are likely to drop. More demand will lead to more supply and more competition, which will result in lower prices. With higher demands economies of scale can also be achieved resulting in cost-effective techniques. Again marketer role also lies in increasing the awareness about the benefits of the organic foods. Increased awareness will definitely lead to consumers preferring organic foods over the normal foods. Companies can also cash on the fact that their efforts to save the environment will lead to sustainable growth which is the need of the hour.

The fact that organic foods are consistently better than conventional food, in many aspects can be a further incentive to devote more space to organic farming. The finding that consumers have a positive impression of organic food and their perception of organic food being superior compared to conventional products can be useful for advertising strategy. As word of mouth has emerged as the most powerful information source marketers have an incentive to focus on quality and service as opposed to advertising and promotion

Directions for future research

Educated individuals scoring lower on awareness is a surprising fact and requires further research for explanations. While conceptualization and measurement issues could solve the problem to some extent, social and cultural explanations also may help in further clarifying the

reasons. The fact that income is not related with willingness to pay a price premium is also a candidate for further research as the result is counter intuitive. The driving forces behind availability leading willingness to pay price premium need to be researched further. The contextual variation in the gender difference influence on price premium willingness is also something that needs to be researched.

COSMOPOLITANISATION, LIQUID TIMES AND TRUST: A GUIDE FOR MANAGERS TO UNDERSTAND THE COSMOPOLITAN GENERATION

Illum-Engsig, Rolf¹

¹ Business School Lausanne, Rte de la Maladière 21, Chavannes, Switzerland. Email: rolf.engsig@bsl-lausanne.ch

Abstract

Cosmopolitanisation as defined by Ulrich Beck (Beck 2006) is a change process that goes beyond globalisation. Cosmopolitanisation happens in the global society changing how people think and act, social structures, power and influence, concepts of nationality and national state.

Liquid Times is a concept defined by Zygmunt Bauman (Bauman 2007) explaining the consequences for people of the society moving from "solid modernity" to what Bauman calls "liquid modernity". Concepts of family, career, and progress are being challenged.

Institutions and structures that are shaping the global community and others that are shaping the individual conditions of life are changing rapidly in the transition from modernity to what some researchers call post modernity or in Bauman's terminology liquid modernity.

A key factor in understanding these changes is to look at the concept of "trust" (Giddens 1991). Trust in the society, trust in the nation state, trust in social structures, trust in money, trust in experts, trust in companies, trust in the future, etc.

The point here is that large multinational corporations are recruiting and will have to continue to recruit and integrate a young generation of employees, who are grown up influenced by these tendencies – cosmopolitanisation and liquid modernity. This generation is called the cosmopolitan generation.

The paper is providing a model for managers in large multinational corporations to understand the cosmopolitan generation based on cosmopolitanisation, liquid times and trust. The paper is pragmatic in its approach and is aimed at encouraging managers to think differently.

Keywords: Cosmopolitanisation; cosmopolitanism; cosmopolitan; Ulrich Beck; liquid times; uncertainty; trust; risk; Zygmunt Bauman; Giddens; sociology; multinational corporations.

Cosmopolitanisation

Definition of cosmopolitanisation

Cosmopolitanisation is an array of unforeseen social consequences of human activities undertaken with other intentions. Cosmopolitanisation is a realistic process rather than the idealistic future state 'cosmopolitanism' abstracted by philosophical thinking.

Cosmopolitanisation is multidimensional being inclusive – as opposed to offering exclusive views – to comprise aspects of ethnicity, nationalism, class, wealth/poverty, knowledge, information, etc.

Cosmopolitanism should not be mistaken for internationalism. They are contradictions. Internationalism presupposes the nation state and some unity of people within the nation state creating the notion of 'us' and 'them'. Cosmopolitanism does not presuppose the national state, but merely sees the nation state as historical political fact.

Cosmopolitanisation is a non-linear, dialectical process in which the universal and the particular, the similar and the dissimilar, the global and the local are to be conceived, not as cultural polarities, but as interconnected and reciprocal interpenetrating principles. (Bech, 2006)

This is an important argument in order to understand cosmopolitanisation.

Firstly the process is a non-linear process. Classic sociology has typically seen development as linear combined with quantum leaps of revolutionary character. The non-linear thinking is picturing the development processes as chaotic and unsystematic with very wide possible outcomes, requiring new methods and concepts to understand and to predict the future.

Secondly cosmopolitanisation is a dialectical process, meaning that it only exists as a result of opposing arguments being met through procedural argumentation creating a full picture comprising what seems to be contradictory.

Thirdly cosmopolitanisation is - based on the previous argument - uniting viewpoints that in classic sociology seem to be incompatible by being both universal and particular, and addressing similarities and well as dissimilarities.

The dialectical nature of cosmopolitanisation can be viewed in the context of modern philosophy. Transcendental dialectic is according to Kant^{xiv} a critique of the logical sense. The transcendental dialectic uncovers the contradictions in the human mind when trying to understand and interpret phenomena that are beyond current knowledge. Dialectic is seen as a contradiction to demonstrated or confirmed knowledge.

It seems to be much easier to comprehend dialectical thinking in the field of philosophy compared to the field of sociology. This argument is even stronger when comparing philosophy to classical management thinking – scientific management. Classical management thinking seems to want to have or do have specific answers to all questions, based on the thinking that if the analysis is deep enough then answers do exist.

Fourthly cosmopolitanisation means that local and global are seen as interconnected and reciprocal interpenetrating principles. Global is only having a meaning when something local exists. And local is only having a meaning when something global exists. Cosmopolitanisation can from this point of view also be seen as a critique of the concept of globalisation.

Interestingly enough both globalisation and anti-globalisation can be seen as phenomena of cosmopolitanisation. The purpose of this article is not to analyse globalisation, but it is worth while noticing, that the term globalisation mainly has been used in connection with free trade, free investment rights, and other economical measures aimed at increasing the total economical wealth of the world; and the term anti-globalisation primarily has been used to describe the resistance, and the opposition to international economical institutions and companies, environmental and sustainability concerns etc. From a semantic point of view both the words – globalisation and anti-globalisation – are heavily loaded with meaning.

Cosmopolitanisation can be seen at both micro and macro level. Cosmopolitanisation at micro level describes changes to people's life, to the micro cosmos of the single person, family or any other social institution. Cosmopolitanisation at macro level describes changes at national and cross national level, companies and institutions.

In chapter four we will see how cosmopolitanisation is having a direct impact on multinational companies and the way they look at and engage with current and future employees, who are grown up in the cosmopolitan era – the co-called cosmopolitan generation.

The origin of the term cosmopolitanisation

The term cosmopolitanisation was first time used by the sociologist Ulrich Beck.

Ulrich Beck was born in 1944. He has held professorships at Ludwig-Maximilians-Universität München and at London School of Economics and Political Science. Ulrich Beck had major influence on sociological thinking during the past 30 years since he published his first book in 1980. Ulrich Beck has covered topics related to modernity, risk society, individualisation, world politics, world economy, and cosmopolitanism. Ulrich Beck is a commentator in the UK newspaper the "The Guardian" where he is known for his sharp pen.^{xv}

Indicators of cosmopolitanism

Business managers will observe cosmopolitanisation in very different practical situations. The following list is based on Ulrich Beck (Beck, 2006) and expanded by me in order to include more business relevant indicators and less political and sociological indicators. The list does not claim to be complete, but only examples.

- Transnational exchange of goods, capital and work. Goods are transported over large distances and finished products typically manufactured based on semi-finished goods or raw materials sources from all over the globe. Capital is increasingly moving freely across national borders and being deployed where the return/risk calculation is most advantageous. Work is moved to the place where it can be done for lowest costs considering required capabilities. Off-shoring, outsourcing, cheap labour markets, etc. Please notice that workforce generally is much less mobile than work.

- Transnational workforce of highly qualified employees performing work across boundaries of nation states. This is a highly mobile workforce and national immigration laws typically allow these professionals to live and work in countries where their qualifications are in demand.
- Transnational location of companies, where also small and mid-sized companies have locations outside the local area. Increasing dominance of transnational companies being active in most countries around the globe.
- Languages spoken by business people, and the use of English as corporate language in companies not originating from or being located in natural English speaking countries or regions. Multiple language requirements and capabilities amongst employees.
- Communication flowing in digitalised form not being restricted by national or cultural boundaries.
- Business travel, mainly air travel.
- Transnational organisations influencing business context like standards organisations, sector based organisations, international regulatory bodies, and also the large international governmental organisations like World Trade Organisation, World Bank, International Monetary Fund, etc.
- Transnational consumerism and consumer representation.
- Nongovernmental organisations, including watch dog organisation and environmental organisations.

The conclusion drawn by Ulrich Beck is:

Cosmopolitan society represents the intensification of the open society, that is, the society open to the world. (Beck, 2006)

Consequences of cosmopolitanisation

Beck is pointing out some of the consequences of cosmopolitanisation. In the context of this article I would like to point out the transnational conflicts that arise from the multidimensional character of cosmopolitanisation.

The term 'transnational' means that the conflicts transcend national boundaries. The word 'international' by definition takes point of departure in the word 'national'. Part of the cosmopolitan vision is that the role of the nation state is rapidly changing and based on that it is not enough to talk about international conflicts. Consequently I use the word 'transnational'. Social conflicts – including conflicts about the creation and distribution of wealth, about power and influence – are changing into a cosmopolitan character.

Ulrich Beck (Beck, 2006) is outlining six forms of cosmopolitan conflicts.

- Conflict between capital and the nation state. Global financial transactions have been liberated in order to generate increasing wealth for the world. Growth in Gross National Product is a predominant – and sometimes tacit – objective of world trade and capital liberalisation. One side-effect of free capital markets is that the power of money has surpassed the power of states. Capital is as a consequence largely beyond democratic and governmental control.
- Conflict between labour and capital. Capital is – as mentioned above – largely transnational whereas most labour is geographically and culturally bound. (There is though a small upper class of highly educated labour that is mobile across the world). Traditional conflicts between labour and capital in the Marxist sense are mostly unaddressed on global level. Unions and welfare systems – or lack of welfare systems – are rooted in the nation states. From a business perspective this can be seen as a matter of managing inequality. The first paradox is that by the nature of the global economy companies are forced to treat employees unequally. Equal treatment of employees is not possible as a consequence of cosmopolitanisation. Furthermore there is a second paradox that unions and welfare systems are rooted in the nation states while capital is global.
- Conflicts between nation states. Some states are increasingly defining their role globally and as such seeking to influence the world and reserve their right to intervene in other states. Examples of this could be the increasing challenges related to the fact that some countries are debt countries and other are creditor countries; military and political influence; influence in relation to access to raw materials.
- Conflicts between nation state and international organisations and non-governmental organisations. International organisations are increasingly influencing the nation states. This is everything from WTO, IMF, World Bank, UN Organisations to specific organisations like International Standards Organisation and IATA having complete control within their area of responsibility. NGOs like Greenpeace, Amnesty International, Médecins sans Frontières are also increasingly seeking influence.
- Conflicts between transnational groups and states. Transnational groups are growing in number, size and in their ability to build transnational communities. Examples of strong transnational groups are Chinese-Americans, Western European Turks, followers of the wahhabi Islam faith living in the West and also to some extent less organised transnational groups like highly educated business people.
- Conflicts between majority and minority. Societies and states are typically defined by a majority classifying minorities in an exclusive manner. In a society where certain race or group is in majority it has the privilege of not thinking about belonging to that

race or group. The minority though is defined by the majority – by nature of social processes rather than decision – and is forced to think minority. Minorities would in some cases then form transnational groups that are in conflict with states as mentioned above.

Transnational conflicts are developing as a result of cosmopolitanisation and represent fundamental criteria for society. Civil unrest, mass migration, violent conflicts, building of ghettos where civil order is different from the surrounding society, etc. are all risks that need to be handled managerially.

Liquid times

Definition of 'liquid times'

'Liquid times' represent a move away from solid modernity. Liquid times expresses that the foundation for life is changing, the foundation on which people build their career, family, social life in general, their future, ambitions and dreams are changing. Individuals are confronted with new challenges, where society traditionally does not prescribe or offer solutions.

Liquid times paint a picture of society where everything is liquid, unstable, and floating. It is a society of uncertainty where predictability is decreasing.

.....the passage from the 'solid' to a 'liquid' phase of modernity: that is, into a condition in which social forms can no longer keep their shape for long, because they decompose and melt faster than the time it takes to cast them. Forms, whether already present or only adumbrated, are unlikely to be given enough time to solidify, and cannot serve as frames of reference of human actions and long-term life strategies
(Bauman 2007)

This definition is important to understand liquid times.

Firstly the definition of liquid times is pointing out, that speed of change in social structures has a significant influence of people's life, because it is no longer possible to aim at or aspire to anything that is life-long. Consequently life becomes a series of more or less connected phases.

Traditional thinking of concepts like "born to be", "taking a good education for life", "life long career", "upwards social mobility" are all changing in liquid times. None of the foundations that these concepts build on are stable any longer. The family does not provide enough long term stability to provide a solid basis for a life project. Education and educational systems are changing so fast that only meta knowledge and meta competences have the possibility of providing mid or long term value for a life project, and even that is questionable. Life long careers assume that organisations exist for at least the time span of a career, but they generally don't, and if they do they undergo constant significant internal changes, that makes it very difficult, if not impossible, for the single individual to change as quick as the organisation. Upward social mobility has in solid modernity been more widespread than downwards social

mobility, based on a general increase in wealth and social standards, and based on social structures of welfare systems (developed countries) or family support (developing countries). But in liquid times upward and downward mobility will be equally possible.

Secondly the definition of liquid times is saying, that because people know that the time does not allow for social structures to be solidified, people's believe in and adherence to social structure – whatever state they are in – decrease or disappear. Consequently there is a self enforcing process of decomposing and unstable social structures leading to even more liquidity. This process seems to be unstoppable, spiralling into increased liquidity.

Liquid times are both enforcing and enforced by the decrease of long term thinking and the disappearance or weakening of the social structures in which long term thinking could take place.

Liquid times are enforced by the separation of power and politics. From a cosmopolitan viewpoint we know, that international flows of goods, capital and work, combined with the influence of multinational organisations, including corporations, international governmental organisations and non-governmental organisations, diminish the influence of the nation state. Politics are rooted in the national state, and as a consequence of the changing role of the nation state, politics are losing influence. It could be claimed that liquid times are controlled by market forces, capital interests and private initiative rather than political ideology. Please notice that there is no value judgement here, this is not a consideration about what is right and what is wrong, but a simple observation.

In chapter four we will look at liquid times the context of multinational companies and their relationship with current and future employees. Liquid times as concept could be seen as abstract, but we will see that there are very specific consequences for multinational companies, especially when focussing on recruitment and management of the so-called cosmopolitan generation who are growing up in liquid times.

The origin of the term 'liquid times'

The term 'liquid times' was first introduced by the sociologist Zygmunt Bauman.

Zygmunt Bauman was born in Poland in 1925. Baumann began his academic career in Poland and has since 1971 been living in the UK. Bauman was Professor of sociology at the University of Leeds (and since 1990 emeritus professor). Bauman has become best known for his analyses of Holocaust and of the contemporary society. Bauman is critical of the capitalist and free market political economical model.

Some elements of 'liquid times'

The notion of liquid times draws consequences in many aspect of contemporary life. In the following section I have selected some of those consequences; the list represents examples and is a result of selection rather than analysis. The list is inspired by Bauman (Bauman, 2007 and Bauman 2008).

Artists of life – victims of fate

Life is a work of art ... Life can't not be a work of art if this is a human life ... will and choice leave their imprint on the shape of life, in spite of all and any attempts to deny their presence and/or to hide their power (Baumann 2008).

By this Baumann is pointing out, that one of the characteristics of liquid times is, that human beings have will and choice. The claim is not that choice is equal for all, but that choice is a fundamental characteristic of liquidity. Following Baumann's thinking there is a breaking point between modernity and liquid times to the extent that people are provided with options. Please notice that this has to be questioned for many people in developing countries and some people in the developed world as well. Please see the following chapter 2.3.2.

Consequences of the concept of people being "artists of life" are also, that there is no pre-destination and no lifelong continuity of how life develops. Human will and choice are liquid by nature. Liquidity is contradictorily to the concept of fate, although social conditions are strongly influencers of the possibilities within which each of us can exercise our will and make our choices. With a modernistic viewpoint of fate, then careers and social positions would tend to be seen in lifelong perspectives. Born to be something. Having a career as farmer, carpenter, servant, doctor or what it might be, where only misfortune would break that pattern, and leave people in lower social status. In liquid times this is different.

Happiness – and loss of hope

Bauman (Bauman 2008) is telling us, that happiness increased with the level of economical wealth until the point of gratification of essential survival needs. There is no reason to believe that absolute wealth beyond essential survival needs provides any increase in happiness. Bauman proves that happiness is mainly related to the hope of becoming happier. Hope of improvement makes happy. And secondly Bauman proves that relative wealth is having some influence on happiness, meaning that it is good to possess a little more wealth than the people you compare yourself with, but not too much more.

Opposite it can be argued that the loss of hope leads to loss of happiness. Bauman (Bauman 2007) argues that humanity is on the move based on the fact that an increasing share of the world population is deprived from any hope of increased living conditions and that there is no reaction to it. Bauman is talking about the fullness of the planet and continuing that *the volume of humans made redundant by growth is unstoppable and comes close now to exceeding the*

managerial capacity of the planet (Bauman 2007). Bauman foresees undefeatable consequences, whatever they are.

Combining these two arguments, on the one hand that happiness is connected to hope, and on the other hand that an increasing number of people are deprived from hope, it becomes clear that it is not possible to have common aspirations for the society as a whole.

One question that Baumann does not answer is: What does liquidity mean for the part of the population that is deprived from any hope? Do liquid times still provide will and choice within that limited frame of possibilities?

Fear and safety

The cohesiveness of society is dependent on social structures and individuals' sense of belonging to those structures. Social structures provide safety mechanisms that prevent individuals from having to act individually, and enable a collective reaction, sharing of resources and emotions.

The liquidity of social structures leads to a decrease in safety, and thus an increase in fear.

Peoples' reaction to fear is typically to increase safety measures. In liquid times these safety measures will be based on individual initiatives rather than on social structures. The increased individual safety measures make fear even more tangible and could again be a reinforcing the spiral of safety measures and fear.

Personal safety concerns are important for peoples' behaviour in the liquid society. Safety concerns are used in political arguments, have a central position in media, are drivers of consumption, and are determining individual reactions.

With a cosmopolitan outlook, some of the major problems in the world have a global nature, e.g. concern for the environment, climate change, famine, energy sourcing, etc. The dilemma is that the fear for being influenced by these problems also sparks safety measures that are unfit to solve the problems and in some cases only increased them. According to Bauman *No American child can feel safe in its bed, if in Karachi or Baghdad children don't feel safe in theirs.* (Bauman, 2007)

Living together

Liquidity is seen in the role of urbanisation, where Baumann (Baumann 2007) quotes Nan Ellin^{xvi} for her observations on the shifting role of urbanisation in human life. In the origin of urbanisation, cities and settlements were made by people to protect each other, moving together, building defences; and by that making a clear boarder between "us" who are together and "them" who are different and dangerous to "us".

The city was there to protect. We are talking about citizens (Eng.) bourgeois (Fr.), and Bürger (Germ.) and give a certain meaning to those words.

Liquid times are seen in the way that the city today is synonymous with danger. Social tension is highly visible within the city, norms are changing and not necessarily socialised across various population groups in the city, and anti-social behaviours are defined by some groups in opposition to other. As a consequence of the liquidification of the role of the urbanisation new smaller entities are being build inside the city as protection against outsiders. This can be observed from “gated communities” in the one end of the scale, where wealth and lifestyle is protected by barbed wire and security guards with access for “members only” and their “servants”. To the other end of the scale with shanty towns or criminal neighbourhoods where access is just as limited as for the “gated communities” although for other reasons.

Liquid times also change the role of the home, from being the physical frame around a family or small social entity and the base for social interaction, into a protection for a family or small social entity reducing social interaction with others.

Cities are increasingly having walls inside them as oppose to outside them. Walls were previously seen as having an inside and an outside distinguishing who is “in” and who is “out”. In liquid times walls are having a much more complex character as the difference between being “protected from somebody else” and being “fenced in” is very subtle.

Trust

Definition of trust

‘Trust’ is a very common word – in contradiction to the constructed words of ‘cosmopolitanisation’ and ‘liquid times’ – and requires some more precise definition to be used in the context of this article where the word has to be a trigger for new sociological thinking.

The Oxford English Dictionary^{xvii} defines trust in relation to reliability, truth, or ability of someone or something, and as an archaic hope or expectation. Trust is about allowing somebody else to have, use, or look after something with confidence, it is about safekeeping, having confidence in, and putting reliance on.

Giddens (Giddens 1991) is viewing trust from eight different perspectives^{xviii}.

- Trust is integrating differences in time and space. Trust is required because of differences of time and space. If a person is present in time and space, there is no need to trust anybody else in that situation. If a person is fully part of a system, there is no need to trust the system, but only to know and participate. Trust is necessary as a consequence of lack of full information and understanding.
- Trust is related to reliability of variable outcomes. Trust is a measure of the reliability of a certain outcome of what in principle could be contingent.
- Trust is the link between faith and confidence. Faith on the one hand is the belief in and devotion to a given subject and confidence on the other hand the level of

certainty about the given subject – some given knowledge about the subject. Trust is linking “I have faith” with “I know”.

- Trust can be given to symbolic tokens and expert systems. Trust in money, and trust in the systems that make up society are examples that we will return to a little later in this article.
- Trust can be seen as confidence in the reliability of a person or a system in which a given set of input will lead to a given set of outcomes.
- In modernism the concept of trust exists acknowledging firstly that human activity is socially created rather than merely given by nature; and secondly that social systems are constantly changing. In modernism the concept of “risk” is replacing the concept of “fortuna”.
- Risk and trust are interrelated. A central element in sustaining trust in somebody or something is usually that the risks involved are acceptable. In certain cases trust is based on some kind of expert knowledge to limit the risk factor, making the risk better acceptable, and this linking trust to expertise.
- Trust and risk are not only personal, but certainly valid for larger groups of people, up to the entirety of mankind. This is a link between the ongoing cosmopolitanisation and trust. We will explore that in more detail later in this article.

Tokens of trust

Giddens (Giddens 1991) is pointing out that some of the core elements of modernity – money, expert systems – are tokens of trust. In the following we will explore these arguments about the importance of trust in modern society and then in the next chapter analyse how trust is developing under assumption of cosmopolitanisation and liquid modernity.

One background for understanding money and expert systems as tokens of trust is to look at the shift from traditional societies to modern societies. This is a movement from dominance of small scale systems, agrarian systems, into modern complex social systems. Social relations have been lifted out from a local context into a global context.

Human interactions as well as material transactions are not bound to actually being together in time or space. It can be claimed that most parts of human interaction is neither based on spending time together nor on being together in the same place. Then a philosophical questions about lifestyle and quality of life for the individual, serving individual psychological needs, can be raised, but this is not the scope of this article. It could be claimed that the wellbeing of humans are dependent on contact with other humans direct in time and space.

The concepts of time and space – simultaneity and proximity – have changed as a consequence of the shift into modern societies. Giddens (Giddens 1991) is calling these processes the “disembedding mechanisms”.

Trust is related to many other factors than money and expert systems. These tokens of trust are selected as a basis for understanding the concept of trust. When looking at the interpretations and consequences for multinational companies in chapter four the other elements of trust becomes visible; trust in companies as employers, trust in companies as citizens, trust in brands, trust in market models and concepts, etc.

Trust in money

Money is a token of trust.

The nature of money is widely discussed between sociologists, economists, philosophers, and a wide range of other scholars. There is no single definition or concept of money. It is said that money is a “circulating media” in modern society on parallel to “power” and “language”. Pierre Bourdieu^{xix}, French sociologist, is talking about three kinds of capital; economical capital, cultural capital, and symbolic capital. Bourdieu is in this context seeing money as one of the capital flows that social structures in modern societies are build upon.

This thinking of money as a liquid flow can be questioned. Because liquids - e.g. a water reservoir with a water pipe – cannot be seen independent from time and space. Water cannot move across time and space, the flow is limited by the capacity of the pipes and the amount is limited by the capacity of the reservoir.

Money in modern society is defined as accounts of credit and debt and flows of liquid money. The value of money is based on trust in the systems that master these accounts and flows, governments, central banks, note issuing banks, private banks, financial institutions, regulatory bodies, companies, etc.

The value of money is fluctuating based on the level of trust. This is reflected in changing currency rates and changing market values of financial instruments. More trust in some currencies than in other currencies, and more trust in some financial instruments than other. The whole system of exchange rates and interest rates that are signs of trust in money form a picture of how trust is dynamic and as such the same dynamics are reflected in money.

Some would add gold and some other raw materials to the same category as money.

Money is instrumental in the disembedding process separating time and space. Money carries a trust based value non-simultaneous and non-proximate across time and space. Transactions can be lifted out of the specific social context by the mean of money, and as such money becomes independent of social context, as long as the trust in the money still exists.

Trust in expert systems

Expert systems are tokens of trust.

Expert systems are in this context various social systems *of technical accomplishments or professional expertise that organise large areas of the material and social environment in which we live today* (Giddens 1991).

Expert systems are pervasive in the modern society. All aspects of life are influenced and regulated by expert systems. Whatever human activity we are looking at, it is influenced by expert systems. Giddens is using the example of a normal residential house. I have trust in the fact that the electricity installation is safe, trust in the engineer who constructed the staircase that it will be able to carry my weight, trust in the utilities supplies that we keep the house being useful, trust in the design that the current storm outside will not make the house collapse. I do not have the possibility of checking all this myself, but I trust others who have the expertise.

Expert systems are fundamental for economical activity, where the division of work, is typically based on economies of scales as one factor, and core competences – expertise – as another factor. In this article we shall not analyse the relationship between economical activity and expert systems, but merely note the fact that economical activity is based on trust in expert systems.

Expert systems are – like money – disembedding time and space because they create distance between the context in which the expertise is developed and exercised in the one end to the utilisation and benefit of the expertise in the other end. Going back to Giddens' example of a residential house, the house owner or inhabitant is seldom the house builder, and the house is seldom build by one person but by a whole array of experts in each their field.

Expert systems are fundamental in modern societies. Or I could even suggest going one step further and say that expert systems is one of the defining factors for modern societies. Societies without expert systems can hardly be seen as modern and would rather be characterised as traditional or less developed. Expert systems express trust and can as such also be seen as tokens of trust. Please notice that idea that the expert systems are tokens of trust – like money – is not expressed by Giddens.

Five ways to think cosmopolitan

In chapter one, two and three we have seen cosmopolitanisation as an unstoppable fundamental change process, we have seen that society is moving into liquid times, and we have seen that trust is a fundamental building block for society.

The purpose of this paper is to analyse how cosmopolitanisation, the realisation that we live in liquid times, and trust could influence the thinking of large multinational corporations. This

is done from the perspective of leadership practice in large multinational corporations and the recruitment and management of a new generation – the co-called cosmopolitan generation – grown up in cosmopolitan and liquid times.

The analysis is conceptual based on the models of cosmopolitanisation, liquid times and trust and the one side, and general observations in multinational corporations on the other side. More exploratory research is required to substantiate and document these ideas. This conceptual approach only aims at analysing, evaluating and developing existing knowledge^{xx}.

The cosmopolitan generation is naturally questioning the corporations' sustainability environmentally, economically and socially; their overpowering focus on profit maximisation as opposite to the creation of shared value for the society; their ability to serve consumers; their focus on people beyond the idea of human resources, etc.

In the following pages you will find five different ways to think about and address the cosmopolitan generation. Please notice that the cosmopolitan generation covers the young generation entering the labour market, which have both will and choice in their employment decisions. It should not be underestimated that there are large quantities of poorly skilled people, especially in the developing countries, who have little choice. These people will make employment decisions based on fundamental survival needs and the need to care for a family, or in some cases they will even be in forced labour. This part of the labour force is not subject to the analysis below.

Take a stand – neutral doesn't exist

The complexity of the cosmopolitan outlook and the inherent transnational conflicts are fundamental conditions for the cosmopolitan generation. The cosmopolitan generation does not only observe the cosmopolitanisation process, but they are part of it. The cosmopolitan generation expects from companies – what they expect from themselves – that companies take a stand, have an opinion, make a clear choice on which side they want to be on in any given conflict. Neutral does not exist!

There is no possibility for multinational companies to say that they are not a part of the cosmopolitanisation process, they are. So in that process the companies are expected to take responsibility and act accordingly. Trust is earned on the basis of the entirety of the multinational company's position in the cosmopolitanisation process.

I want multinational companies to be responsible. They are influential, they earn their money from the world, and they have to give something back. I expect them to know and to have an opinion about the world.

Global is individual – individuals are global

The cosmopolitan generation does not make a general distinction between what is global and what is individual. Global is about individuals. And individuals think and act globally.

There is no dilemma between global and individual, global and individual are integrated. When multinational corporations communicate with an individual, it also communicates with the whole world, and the other way around. There is no point in distinguishing between global and individual statements.

I am the world. I can influence the world, and the world is influencing me. I cannot look away from what is happening in the world, I can understand and feel when something wrong is happening somewhere else. Me, myself and I have to face the consequences of what is happening in the world or I can choose not to.

Think liquid – forget linear

The cosmopolitan generation do not trust traditional planning and linear thinking. Too much is changing, the cosmopolitanisation process is not foreseeable, time is liquid. The cosmopolitan generation cannot trust thinking models that claims to unambiguously being able to predict the future.

All future thinking needs to be based on an array of different outcomes and scenarios. It needs to be dynamic and continuously adapting to the changes in the surrounding world in order to be trusted.

The cosmopolitan generation will require to know the future visions of the multinational corporation, and will make employment decisions based on the extent to which the employee is aligned with the strategy and trust the success of the strategy. Strategic alignment between corporation and employee is not only an ongoing strategic process within the company, but also a pre-requisite for employee commitment before, during and after employment.

Strategic alignment cannot be seen as a traditional top down – bottom up process of goal alignment, but needs to be seen as a dialectic process between employees on all levels in the social structure of the corporation in order to capture the minds of the cosmopolitan generation.

I do not believe in continuation and continuous development. The world is much more chaotic, things that nobody thought about are shaping the world. Burning of fossil fuels. Deregulating trade and financial markets. Nobody were capable of predicting the outcome, it all came as a surprise. What will be the next surprise? The breakdown of the western economies, including USA, because of debts? A situation where increased interest rates cannot be financed by the gross national product of debtor countries?

Companies are social structures – not only business

The cosmopolitan generation view companies as social structures – although constantly changing structures – providing the options for individual to connect. The company is a part of the cosmopolitan scene, and the cosmopolitan generation may choose to be actors on the company stage or merely spectators, or just having an opinion about the play, without participating in any shape or capacity.

The multinational company provide a social structure that is interwoven with other social structures, from the perspective of the cosmopolitan generation. The company who defines itself as a business only, would not be conscious about the broader role of the company, as an organiser of social activity across all aspect of the liquid society.

The company is playing a role as a guardian of safety, but not necessarily in any mid or long term capacity, in the way it provides “compensation”, access to knowledge, social frameworks, access to resources, separation from uncomfortable or unwanted situations, prestige, legitimacy etc. But it is important to understand than in liquid times this role is no longer based on the company’s ability to pay salary and possibly retirement benefits long term.

For me the company is a mean, not a goal. So long the company can provide me a platform, from where I can speak and evolve, then I like working for them. But when the company want to overpower me, and decide for me, then I don’t need it any longer. The company provides a temporary – always temporary – social structure to serve my needs, including my needs for safety, and making contacts with people in the world. The company enables me to make a difference, doing something for somebody, and serving me at the same time.

Earn trust – don’t expect to be trusted

Trust in expert systems is still a fundamental characteristic of modern society, but expert systems will and are being questioned. The cosmopolitan generation know that expert systems have failed to address major risks to global society and would need to have other grounds of trust.

Multinational companies will have to have a broader perspective on how to earn trust. Trust is not earned based on business results, and not only based on traditional modernist views of the role of business, like supplying products, serving customers, investing in society, providing stability, paying employees well.

The cosmopolitan generation will trust companies based on the ability to act in synchronisation with the cosmopolitanisation process, to understand and reflect liquid times, and to have the ability to develop expert systems that are transparent.

Money remain a token of trust, money has value because money is trusted. But that should not be mistaken for a believe that possession of money attract the trust of others.

Can I trust in the environmental, economical and social sustainability of the company? Can I see for myself, finding proof, that I am right? I have been to cocoa plantations in Ivory Coast, I have been to coffee plantations in Brazil, I have been in the wheat fields in Ukraine, I have seen how rainforest was replaced by palm trees in Indonesia. Can I trust the experts?

Closing remark

Cosmopolitanisation is a change process that goes beyond globalisation. Cosmopolitanisation happens in the global society changing how people think and act, social structures, power and influence, concepts of nationality and national state.

Liquid Times is explaining the consequences for people of the society moving from "solid modernity" to what Bauman calls "liquid modernity". Concepts of family, career, and progress are being challenged. Institutions and structures that are shaping everything from the global community to individual conditions of life are changing rapidly in the transition from modernity to liquid modernity.

A key factor in understanding these changes is to look at the concept of "trust". Trust in the society, trust in the nation state, trust in social structures, trust in money, trust in experts, trust in companies, trust in the future, etc.

Trust is generally defined as some combination of confidence and reliance, and as such trust is also related to the notion of risk. And risk – uncertainty – then relates back to the ongoing cosmopolitanisation of the world society and the increasing liquidity of the conditions under which people live.

There is a whole generation influenced by these factors. This is what we call the cosmopolitan generation.

This article provides a framework for managers to understand the cosmopolitan generation and to think in a way that is relevant and valuable for this generation, for them to be attracted to a multinational corporation, and being managed as valuable contributors – employees.

More research is needed in this area. Please see this paper as an invitation to scholars and business managers alike to join the debate and to contribute to development of new thinking in this field.

Abstract

The activities of organization and production of travel are expressed in the preparation of packages, earlier in time compared to the formulation of requests from customers, and involves the recruitment of a significant proportion of economic risk, linked to the success of initiative.

From this condition can be deduced that the competitive advantage achieved by a tour operator, is closely related to: (i) cost effectiveness, perceived by consumers when purchasing a pre-packaged tourism product, (ii) the ability of the operator to provide advantageous economies of scale (operating on large numbers), (iii) promptness in identifying the needs of the target market chosen, and then meet them with a homogeneous combination of services.

This work aim is to investigate the role of marketing in the tour operating companies, focusing in particular on marketing strategies regarding the definition of the target market and marketing mix variables. The analysis is conducted through a short but continuous examination of Italian literature in this context, and through the observation of the largest tour operating companies operating in the Italian context.

At the conclusion of the above analysis it can be stated that while in past years the tour operation was focused exclusively in offering a significant number of trips and vacations standardized prices to the tourism market, currently, and even more in future years, will be indispensable to ensure a good competitive level, knowing how to add value to the tourism product mix, through appropriate analysis of the needs and characteristics of target market segments.

Keywords: Service companies, tour operating companies, marketing strategies, target market, marketing mix, crisis management, the Italian context.

Introduction: Tour Operating companies

The brokerage firms operating in the tourism sector, although in a variety of managerial and operational characteristics, are united into a single blurred class, both in the operational reality and for scientific inquiry (Alvino, 2003).

The tour operating company can be defined as a company that acquires the availability of a wide range of tourism services (transport services, accommodation, catering, entertainment, excursions, etc.) in order to make up a particular type of package tour or travel catalog, which will be marketed directly or through a network of retail travel agencies.

Considering the segment of the tour operator, the operating conditions considered necessary to achieve satisfactory levels of efficiency and management efficiency can be identified (Berretta, 2000), which constitute at the same time, the main phases of the business process under observation:

a) well in advance formulation of some strategic choices such as:

- identification of potential market segment;
- the selection, of both the destinations to offer and the service providers, thus leading to the main features of the product;

b) creation of the package, thanks to the direct intervention of some operational areas, achieved through the assembly of basic services and the formalization of relationships with service providers in order to mediate the risk of acquisition (risk brokerage), increasing absorption by the suppliers of individual services, business risks;

c) presentation of the product catalog (defined as paper, media, electronic or otherwise);

d) promotion of the offer, through a proper distribution network;

e) establishment of a competitive price, than the alternative of direct purchase of individual services by the end consumer (Poon, 2000).

Considering the above exposition, especially regarding the typical business process, the tour operator cannot be considered simply an intermediary and it also features management and strategic characteristics, similar to those of a processor. In this case, we use "intangibles raw materials" such as environmental attractions and tourist services, in order to create an innovative and good quality product, having a higher value than the mere sum of basic similar services (Peroni, 1989). In this regard, the tour operator recognition of the nature of enterprise transformation is prevalent in the literature for its ability to combine the inputs of production - represented by environmental factors of attraction and tourist services from other companies - in products with features of novelty, originality and exclusivity with respect to the individual elements that compose it.

Marketing role in tour operating companies

Marketing activities and strategies can be considered a complex of coordinated actions, "by which an organization intends to accomplish the needs of persons or other organizations, making them available products or services, supporting ideas, or claiming values in society" (Pellicelli, 1990).

Given the characteristic activity of the tour operator and the type of product offered to the market, the marketing activity assumes a strategic importance, both during the market analysis and in the management of political communication and marketing of the product. In particular, the marketing strategies are the set of decision-making on the choice of two basic elements:

the target market, *i.e.* the set of buyers, which focus on marketing policies;

the marketing mix, *i.e.* the set of variables that characterize the supply and are fully controllable by the firm.

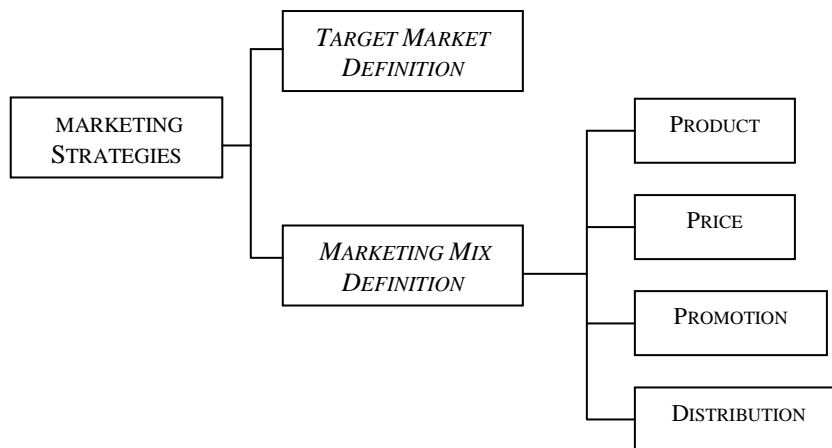

Table n. 1: The decisional variables in the marketing strategies

In order to analyze the marketing activities conducted by a tour operator, it is essential to deal with the most significant phases separately, in particular the analysis of target market and the definition of the four variables that define the marketing mix.

The analysis of target market

The analysis of target market focuses on assessing and selecting opportunities emerged in the research, looking, in particular, to understand its compatibility with the objectives set by the company. In particular, in order to arrive at a definition of market trends and a good perception of the demand, we must analyze the main factors underlying the decision-making process of potential consumer purchasing.

The moment the individual consumer takes decision making purchasing, some significant phases can be identified (Pellicelli, 1990):

- birth of need;
- product identification, act to meet the need;
- information retrieval;
- analysis and evaluation of alternatives;

- the purchase decision;
- evaluation and after purchase.

The need to travel must be included in the category of recreation or leisure needs, bringing the consumer to desire, at some point in their lives, to depart from the requirements of daily life experiences to deal with creative or recreational activities in order to restore themselves both physically and psychologically. In this context, the tour operators can help to identify or stimulate the desires of consumers, translating into demand for specific products. It should be considered that, in the decision process of a tourism product, some forces take over interacting with each other deeply and are ready to be conditioned, such as:

- the motivation, which is a decisive factor in the choice process;
- the personal characteristics of the individual, such as age, sex, occupation, leisure interests, income level, the cultural and personal attitudes;
- past experience, that in some cases significantly reduce the possibility of choice: therefore it is the responsibility of tour operators, through valid communication campaigns, to change attitudes of potential consumers, highlighting that some attributes of the offer have not been adequately considered;
- the views of the target group, especially in the crucial case of persons belonging to social classes who perceive the trip as a status symbol.

The phase of identification of the product, suitable to satisfy the need for recreation is conditioned not only by internal stimuli, external variables, present in the general context (social and political conditions in certain locations) and the ability, by operators of sector, to convey to potential customers a complete set, reassuring and consistent with their interests.

Normally a tourist faces the choice, after a deep search of alternative products, warning, however, a certain degree of uncertainty, determined on the untouchability and the lack of standardization of the goods. Consumers, when choosing an unknown tourist product, has a few elements of certainty: the price, destination, duration, type of accommodation, the image of the operator and descriptions resulting from the catalog. As a result, the strategic role of tour operators will be to provide a complete service, offering the most relevant information possible to reality, by highly specialized personnel, and ensuring the overcoming of difficulties that might arise before departure or during the trip.

After a series of assessments, on the characteristics of different opportunities, the potential customer makes his decision to purchase that includes a request for a reservation, using the direct channel with the tour operator or, as happens in most cases, passing through retail travel agency.

In this context, a need to prepare modifications to the generality of the package, in order to make the product best suited to specific individual users and, therefore, more salable. However, because of the nature of the goods offered, tour operators opt for a market segmentation, implemented through the identification of groups of potential buyers, with homogeneous characteristics and expectations, on which specific policies of the marketing mix are formulated (Idili and Siliprandi, 2002).

In this regard, as pointed out by research conducted by scholars of the field, behavior very different related to the same market niche can be identified, as part of tour operators. Given three well-known tour operators of the Italian context – Alpitour, Orizzonti, Club Vacanze - three different approaches to the market can be identified, which are chosen according to: the general objectives, the image of the implications of organizational and marketing strategies, unique to each company.

In this regard:

- Alpitour focuses marketing strategies on the image and the guarantees offered rather than on the product, aiming to reach and serve a client mass, by offering a range of products supported by an advertising campaign does not focus on market segmentation;
- Orizzonti seeks to offer specialization and segmentation, using non-targeted advertising campaigns, but addressing a specific niche market, often identified by travel agencies in a young and unsophisticated target;
- Club Vacanze are specialists in the direct management of facilities offered to the public by focusing all business decisions on the image, specialization, exclusivity and treating a single market segment.

Analysis of the di marketing mix variables

Product management

Each package, considering the output of the characteristic activity of the tour operator, must be able to fully satisfy the requirements of the consumer, through the appropriate combination of a plurality of elements that characterize the service.

In particular, to operate in a highly dynamic sector on the demand side, but at the same time, poor of radical innovations, compared to other service areas, involves:

- a continuous redefinition of the individual elements that make up the package, in order to increase the interest of potential customers;
- a line of differentiation, giving customers a choice between similar products, but with different characteristics, in order to increase the competitive advantage over competitors.

It follows that, currently, the product strategy adopted by tour operators tend to increase the product portfolio, adding to the standard packages, custom trips, on specific request, and incentive travel, which involves an organization and management of study and design, aimed to a creation of a product which satisfies the requirements of the customer.

The distinguishing feature of personalized trips focuses on the fact that the components of tourism demand to be met are, in turn, suggested by individuals or by groups of potential consumers. For this reason, the activities of tour operators, in this case defined as tour organizer, assume very similar traits to the production on demand and tends to implement marketing strategies, primarily product-oriented.

The incentive programs are well fitted package tours, not for individual customers, but for businesses that, implementing strategies for encouraging human resources, want:

- encourage staff to achieve certain objectives;
- reward and at the same time, strengthen the corporate culture and group membership.

In order to optimize the implemented marketing policies, the tour operator has to design a product with specific characteristics, in line with requests made by both the promoter and the recipients, going beyond standard offerings already on the market.

The efforts made by the tour operator focuses mainly on the organization of the prize trip, combining the destination, which is normally chosen by the promoter, the period, closely connected to the destination and usually coincident with low season, the duration, optional services, that should be of good quality and appropriate to the social level of the participants, the price, featuring all inclusive, in order to allow the possibility of visits, trips and attend events. This particular type of product allows the tour operator to operate in a niche market demanding, but at the same time able to ensure significant profit margins and the possibility of achieving advantageous economies of scale.

An analysis of the product portfolio of a tour operator shows that there are product lines able to meet the relevant market shares and marginal lines with respect to which the operator is in a peripheral position of the market. Therefore, the tour operator, based on the development of demand and its market positioning, must constantly redefine the political management of the product through:

- modifications of the characteristics of products already on the market;
- investments in support strategies that allow to keep unchanged the characteristics of products, considered a must, which enhance the image identification of the organization;
- elimination from the market of products which have failed to arouse public interest and did not provide significant contributions to corporate profit;

- investments in new product lines, which result in an increase in additional costs and, in some cases, the need for organizational adjustments.

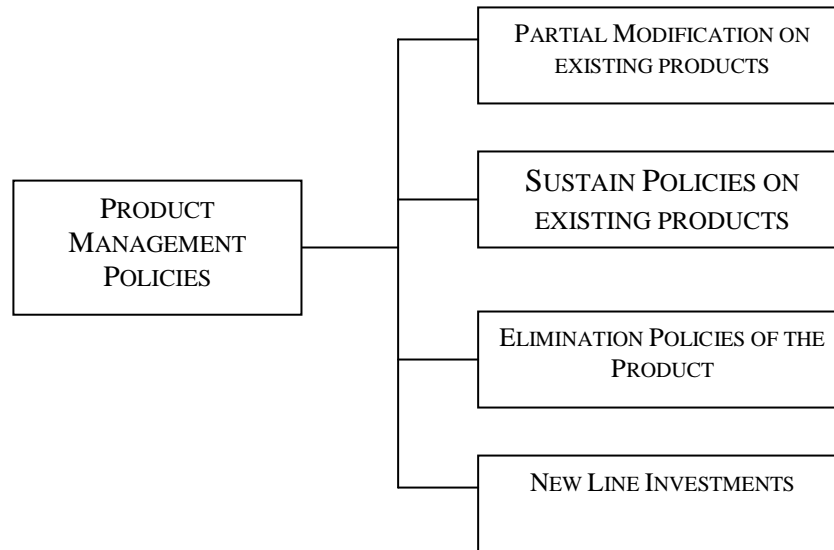

Table n. 2: Product management policies

Price policies

Marketing activities, focused on the definition of money, have played, especially in recent decades, an increasingly significant relevance in the context of corporate strategies. In general, the process of formulating the price is influenced by a number of variables of different nature, including the extent of incurred costs, the size and characteristics of demand and the impact of competitive strength. In particular, the tour operator also has the need to differentiate prices between different target customers, based on certain factors such as frequency of use of services and the type of question, distinguishing between an individual or group demand.

In the formulation of decisions regarding sale prices, it is therefore essential pursuing objectives focused on:

- the maximization of profit, realizable in the short term, only if the behavior of demand is sufficiently price elastic;
- expansion of market share, especially in the presence of a lively competition or on the basis of political penetration of new markets, a competitive pricing strategy can be crucial to winning new business premises;
- the consolidation of market position: in fact, if the firm had a precarious balance in the structure of the competitive sales market, the price may be critical to prevent a future foreclosure market;

- maximizing the investment, this point focuses on measuring the return on capital employed for the study, creation and marketing of specific product or product line.

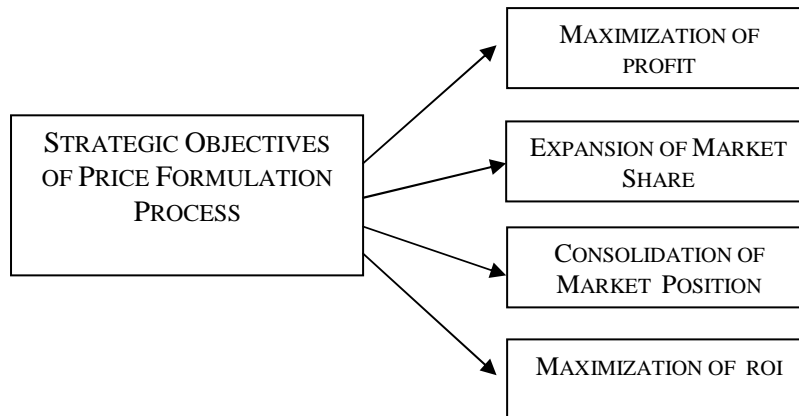

Table n. 3: Pursued objective from the price formulation strategy

Moreover, the pricing strategy, in a company operating in the tourism sector intermediation, must not underestimate the impact the appearance of seasonal sales, which requires, in some periods of the year, characterized by unfavorable climatic conditions (season rainfall in tropical countries, lack of snow on ski slopes etc.) or negative conjunctures socio-political (such as the situation in the Middle East, the terrorist attacks of 2001 etc.), to offer the product at very low prices, but allowing at least to cover variable costs.

In the policy of pricing different criteria and operational methodologies can be found, focused on:

- a) the full cost (cost plus pricing) or incremental (marginal pricing);
- b) the behavior of the demand (target rate of return);
- c) competition.

a) The production cost represents the minimum level, below which the firm cannot make a price for long periods, without compromising its financial equilibrium. In setting prices on a cost, two cost configurations are achievable: full cost and incremental cost.

The prices, fixed according to the full cost, cover all production costs (fixed and variable) and include a profit margin (mark up). The profit margin is expressed by a percentage evaluated on production costs, in such a way as to allow:

- to cover the costs of general management;
- to cover the costs imputed, represented by the return of the entrepreneur, interest on capital invested, the imputed rent etc.;
- the realization of a certain profit margin or net profit.

The method of marginal pricing, however, is based on knowledge of marginal costs that must be sustained increasing the sales volumes. If a company had already achieved a sales volume that can provide coverage of fixed costs, marginal cost resulting from a volume of incremental sales, could allow a reduction in prices compared to those obtained with the method of full cost, thereby increasing the potential competitive in the marketplace.

b) The determination of the price compared to trends in demand, has two potential situations:

- demand is low, but there is a large probability to increase the likelihood when the consumer is able to perceive the product and the use of it (the typical case that can occur during the introduction of new products);

- demand is high, but a future decline is expected, due to saturation of the market competition and aggression. In this case it should be noted that the relationship between demand and price of travel services, which are offered to the market, is generally inversely proportional.

c) The definition of the price of the package, based on the behavior of the competition comes from the comparison with the current prices charged by businesses. In this regard, it is possible to identify two different situations in which:

- enterprises, considered leaders, thanks to the characteristics of the product portfolio, the market shares achieved and the type of targets that have served a limited view of the competitive behavior;

- enterprises operating in a weak market position that is badgered by a fierce competition, and opt for the formulation of prices below those charged by competitors in order to convince consumers to change their purchasing decisions.

Distribution choice

The choice of distribution channel, defined as the path pursued by the products in order to move from manufacturer to the end user (Pellicelli, 1990), is one of the major problems that marketing tourism businesses are facing. In particular, in sectors such as tourism, characterized by high levels of competitiveness in the market of supply and high dynamics demand, companies tend to respond to input from the external environment, by adopting, in most cases, new distribution solutions, that help to improve customer satisfaction through the implementation of new management methods and new organizational forms.

Several can be identified as the factors underlying the choice of distribution channels, among which you can find:

- the nature and characteristics of tourist product, offered to the market;
- the buyers, more and more demanding and aware of different opportunities that are presented by the market;
- the fiercest competitors and more numerous;

- the rapid changes that characterize the environment, both general and specific;
- the climate of recession, that from the nineties, urges the world's economies, resulting in a significant reduction in demand for goods, considered secondary;
- predictions of slow development, which require judicious distribution policies in order to reach the final consumer on time and in the manner most appropriate.

As a consequence of this context and in the presence of variables not directly controlled by individual companies, the marketing activities carried out by tour operators, is increasingly taking on a great importance and is focused on an accurate assessment of distributive policies, in order to identify:

- the distribution channel that best meets business needs of specific company (channel long, medium or short);
- the best solution to reach the final consumer by implementing an intensive, selective or exclusive distribution, considering the specific nature of the service offered, target market, the number of intermediaries involved and, ultimately, the nature and size of interested economic reality;
- the actions that are undertaken by competitors, to distribute tourism products with similar characteristics.

Each company, therefore, may use different distribution channels that are different, depending on the number of intermediaries involved in the passage of goods from producer to the final user. The distribution function, typical of the chain of organized tours, is based on short to mid-channel and consists of a single intermediary, represented by the retail travel agencies.

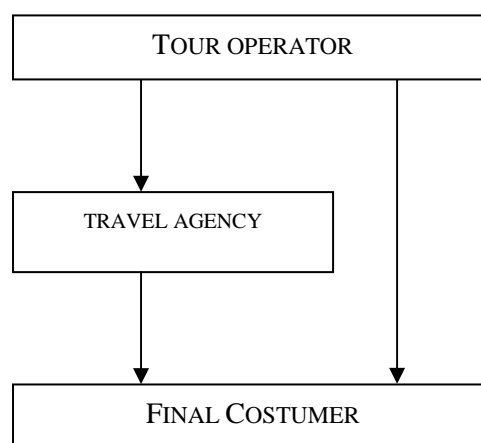

Table n. 4: Types of distributive channel of a tour operator

In the investigation has been defined the main variables that influence the selection process of the retail travel agency, and it was possible to find out which ones are the critical points of the evaluation process:

- the level of turnover in previous years: from this piece of information, considering both qualitatively and quantitatively, it is possible to infer, at first, the volume of business, the type of customer and its reliability in making payments;
- prospects of development and cooperation in future reports, the agency related to the reliability and the ability to handle customers;
- location and image: a tour operator usually tends to locate stores in strategic locations (e.g. in city centers), relying on the product to an image characterized by well-established agencies, to ensure safe relationships intermediation and the provision of qualitatively significant information about offered packages;
- professionalism and reliability of the front office staff: skills and the potential relationship of agency personnel are considered one of the key variables in order to implement successful business strategies.

The main functions, that within the distribution policies are assigned to intermediate agencies, can be traced to:

- capillary location of products and services over a vast territory and internationalized, otherwise difficult to reach by the individual tour operator;
- collect and concentrate in one location different lines of products, designed for different target market, creating opportunities for differentiated sell;
- professional sales force, in assessing the needs of each client and consulting on various proposed solutions.

Despite the validity of intermediate distribution choices, some tour operators are opting for alternative routes. In some cases, in fact, they tend to establish more immediate relationship with consumers by implementing direct sold policies, through the opening of sales offices or vertically integrating downstream with agencies that deal with the exclusive distribution of their products.

Such policies, in addition to requiring significant installation costs, narrowing the action field to large tour operators and with a significant financial potential companies, tend to discourage other retailers to treat the same type of product, with the risk to greatly reduce the chances of commercialization.

With the rapid expansion of travel agencies and tour operating companies, the decisions regarding distribution policies are becoming more complex. Therefore it's possible to identify three strategies that focus on ways of:

- intensive distribution: aimed to achieve high coverage of the market, distributing packages, using all available intermediaries;
- exclusive distribution, characterized by a limitation in the number of agencies to which is entrusted the exclusive sale of offered products; this can easily be achieved through contracts or franchise network of travel agencies of ownership (vertical integration or vertical coordination in the valley);
- selective distribution, identifiable as a strategic distribution intermediate between the intensive and exclusive distribution; in this case the distribution of tourism products is used in a limited number of travel agencies, selected according to specific criteria.

	<i>Opportunity</i>	<i>Constraints</i>
<i>Tour operator</i>	<i>Loyalty Adv/client Ongoing rational and strategic relationship, Types of client definition Homogeneity of buying behavior</i>	<i>Consolidation of the clients Difficulty in exit from the channel</i>
<i>Travel agencies</i>	<i>Large choice Fast and simple Comparison possibility Custom and direct relationship</i>	<i>Overdependance from TO Difficulty in understanding the rules of a large supplier Reduced availability of investment</i>

Table n. 5: Matrix of opportunities constraints distributive chain tourist sector

Communication strategy

The subsequent step in the creation of the product, the definition of price and choice of distribution channel, is the set of activities, aimed to persuade the potential customer to choose the product offered.

In particular, the promotion of marketing is an activity which aims to inform, remind and persuade people to buy or sell (if they were intermediaries), and possibly recommend the use of a product or service. The first distinction between different forms of promotion is that between the forms of communication that pass through channels different from people (non-personal channels) and forms of communication transmitted through direct contact with recipients (personal channels).

Therefore, the most important goal of the promotional activity of any company can be listed as the desire to convince the potential consumer to react positively, both towards the company and the undertaking of the products offered by that market.

In this regard, it is appropriate to envisage a set of activities that tour operating companies should take in order to obtain good results in the context of promotional policies, mainly addressed to:

- stimulate demand;
- inform and convince the potential customer;
- create a brand image or company.

First, the ability to stimulate the demand has as its objective the ability to win new market shares, triggering a virtuous cycle that increases the competitiveness of the company.

The disclosure of information and belief is so strategic, especially in a sector such as tourism, characterized the untouchability of the output produced. In particular, each potential consumer, in the process of purchasing a tourist product, attaches significant importance, during the decision-making, to the opportunity to be informed on the product features, price and on the conditions of usability, hoping for some assurance about the credibility and efficiency of the bidder. The purchase of a tourism product determines in the user the fulfillment of many expectations, made up of sensations, ideas, values, often stimulated by promotional activities that allow the proposer to spread and claim a brand image in order to attract new buyers and retain existing customers.

The corporate image in the tourism sector is a key factor to influence purchasing decisions by customers who, unable to test and assess the characteristics of the product, before they have received it, believe in a relationship of trust that is to onset with the travel agency reference and, subsequently, with the tour operator.

The most important forms of promotion are:

- the sale by staff;
- advertising;
- the sale;
- public relations.

They have different characteristics and objectives and, very often, in order to implement an effective promotional strategy should be used in a synergistic way.

As we have already seen, the tour operator entrusts the task of direct communication with the consumer to front office staff of the agency to detail, specially selected and trained, in order to convey competence, availability and efficiency to the customer during the task of presenting and marketing services, and also must have the ability to identify new customers or any latent needs.

In particular, the activity of the promoters of sale (sales) should focus on:

- the clear and complete presentation of all the offers displayed in catalog, paying particular attention to the peculiarities of individual products and highlighting differences with competitive offerings;

- on the full availability in the resolution of problems encountered by the direct sales force;
- assessment of retail operators, in order to plan and define any incentive programs, targeted at individual agencies.

The advertising business for a tour operator plays a crucial strategic role in order to influence the buying behavior of individual consumers who do not come into direct contact with it. In general, the tendency is to direct the consumer to specific destinations, using pictures or articles in professional journals, which are not caught in the immediacy as advertisements, but greatly influence future choices.

The activity of sales promotion in tourism is particularly directed to the sales force and in particular to travel agents, that are in direct contact with consumers, and is mainly run by promoters, which play a crucial role in the bidding process of the products.

Public relations, then, have two objectives: to gain a favorable presentation of the media, creating an accurate picture of the company, and convince organizations, individuals and public opinion favoring the spread of a favorable attitude towards the company and products.

Critical of current business realities

The deep changes that have affected the competitive landscape of tourism intermediation, in recent years, have had significant effects on the structure of management and, consequently, on economic and financial performance of companies.

The role, increasingly important and strategic, held by the intermediation sector of tourism in the national economy, has led the industry to implement competitive strategies focused on decision-making models of quantitative nature, and not to follow intuition, reinforced by practical experience. Furthermore, considering the stage of maturity reached by the traditional tourism product, especially in recent years, continuous adjustments of services to the diverse needs of the market were necessary, and they have imposed differentiation, through innovative proposals and increasingly diversified.

In this context, characterized by high dynamism of the market, the tour operating companies should not limit their activities to the production of packages, i.e. the selection and coordination of basic services that make the provision of travel, but must focus much part of their resources on operational processes, in which the creative aspect is of paramount importance, transforming the simple trip into a real tourism experience, able to engage positively all persons to whom it is intended.

KNOWLEDGE CREATION IN ORGANIZATIONS: THE INFLUENCE OF INTERNAL AND EXTERNAL NETWORKS.

Izunwanne, Pamela C.¹

¹ University of Agder, Kristiansand, Norway. Email: pamelaci@uia.no

Abstract

The organizational knowledge creation theory by Nonaka has been widely accepted by researchers as a theory that focuses extensively on how knowledge is created in organizations through knowledge conversion. Innovative products and services are the number one source of competitive advantage for multinational corporations in today's global economy. However, in order to develop cutting-edge innovative new products/services, multinationals must first determine what their most strategic assets are and utilize it to the maximum potential. Organizations possess several assets which they deploy to achieve innovation goals. Studies have shown that one of the most important strategic assets organizations possess is the networks that their employees are embedded in within and outside the firm. Continuous creation of new knowledge is important for organizations to be able to attain and maintain a competitive edge but in order to achieve this; they need individual employees as knowledge can not be created in a vacuum. Individual employees are often embedded in various networking relationships internally and externally, it therefore becomes crucial to understand their networks and networking relationships especially for employees that are connected with new product development. The purpose of this study is to investigate how organizational knowledge creation (knowledge creation for new products and services) is influenced by internal and external networks in terms of their nodal characteristics and the qualitative nature of their relationships. The study specifically attempts to understand the role that networks play at various stages in the SECI/Ba framework.

Keywords: Organizational knowledge creation; Social networks; new product/service development; nodal properties; SECI/Ba framework.

Introduction/Theoretical Framework

The organizational knowledge creation theory by Nonaka is composed of the SECI/Ba framework that provides explanations of the organizational knowledge creation mechanism.

The knowledge conversion processes: socialization, externalization, combination and internalization are said to be facilitated by different knowledge creation contexts (Bas): originating ba, dialoguing ba, systemizing and exercising ba. However, individual organizational actors are sometimes not effectively encouraged or motivated to participate or facilitate these processes and bas. Nowadays with the internet, increased competition and globalization, interconnected social relationships are becoming more pronounced and influential thereby making organizational actors more prone not only to internal influence but

also equally to external influence. Organizational actors are also becoming increasingly embedded not only in various internal/external interconnected social relationships but also in various institutional contexts. These involvements typically affect the Bas their organizations are facilitating or maintaining thereby enabling or constraining the knowledge creation efforts of the organization.

A growing body of theoretical and empirical research shows that networks and the relationships they contain influence knowledge creation, knowledge transfer and knowledge diffusion. This influence has however been found to vary across different levels of analysis, contexts and institutional frameworks (Phelps et al., 2012). Networks have several characteristics, forms and properties. Relational and structural properties are the most studied properties, but knowledge properties are now increasingly being researched and the term: 'knowledge networks' is often being used to describe the knowledge activities that occur in networks.

Structural properties include: network position; ego network structure and whole network structure while relational properties include: nodal properties; nodal proximity/similarity; tie strength and governance. Networks can be studied at various levels: Interpersonal; intraorganizational and interorganizational and consequently, scholars have considered different approaches, methods and levels of analysis in their studies sometimes producing conflicting results.

Extant literature particularly shows that conflicting results exist especially within studies considering the role of networks in organizational knowledge creation at the intraorganizational and interorganizational level (Phelps et al., 2012). Some scholars suggest that whole network density enhances the diffusion of information and the generation of new knowledge (Abrahamson and Rosenkopf, 1997, Ebadi and Utterback, 1984), while other research suggests that network density reduces the diversity of knowledge that is required for generation of new knowledge (Lazer and Friedman, 2007). More significantly, scholars have been calling for more studies involving the relational properties of whole networks (particularly, nodal properties) and the impact they have on knowledge creation (Phelps et al., 2012). According to a recent review by Phelps et al, (2012), nodal characteristics are particularly not extensively accounted for in research involving social networks as they relate to knowledge creation. More research is therefore required to clarify these existing gaps and discrepancies in existing results.

Expantiating on networks, the social embeddedness of actors should typically include institutional involvements (i.e., informal systems like culture, political and legal institutions) but these are often not emphasized in similar studies (i.e., studies considering the relationship between knowledge creation and social networks).

This study however, plans to address this existing gap by comparing cases from two different institutional frameworks: cases of product/service development at two high technology firms in Nigeria and Sweden. Cases of successful and unsuccessful product/service development activities will be analyzed. The comparison will answer the question how, when, and why informal institutions (such as culture) and formal political-legal institutions (such as the content and enforcement of particular laws, regulations, and codes) enable or constrain 'organizational knowledge creation in networks'. This comparative institutional study would help establish the boundary conditions and generalizability of organizational knowledge creation/ network processes and outcomes identified in existing research. A Comparison of the cases will be made taking into consideration the structures in place in the organization and the interaction between participation in networks and the SECI/Ba framework.

Intended Contribution

This research will not only extend the organizational knowledge creation theory, it will also make significant contributions to the social network theory and enable organizations fully understand how they can energize their Bas and knowledge conversion processes using networks.

Theoretical/Conceptual Framework

Organizations cannot create new knowledge in a vacuum, they need individuals in order to create knowledge for new products and services as well as for any other operations they may be concerned with. Since these individuals are involved with or embedded in all sorts of social interrelationships, it is useful for organizations to understand how those involvements might influence their knowledge creation activities in general.

According to the organizational knowledge creation theory, Ba is said to facilitate the knowledge conversion processes SECI and they work to ensure organizational knowledge creation. This study further believes that the role that networks play in organizational knowledge creation is as a result of their influence on the knowledge conversion processes (SECI) as well as the knowledge creation context (ba) that organizations try to promote or energize.

Individual level knowledge still has to be amplified and articulated by organizations for instance in the form of new products and services as this study is concerned with and the way organizational knowledge creation is structured plays a huge role. Different approaches (organic, formalized and semi-structured) may yield different outcomes in organizations.

The role of networks in an organic setting may be different from the role of networks in a formalized or semi-structured setting. Knowledge creation structure may be organization wide or limited only to specific projects. For example, an organization that adopts an organization-wide organic approach to knowledge creation may still decide to formalize the activities of

specific departments or to formalize the knowledge creation activities geared towards the development of particular products and services (Turner and Makhija, 2006, Pugh et al., 1968).

A major aim of organizational knowledge creation theory is to discover the conditions that enhance or facilitate knowledge creation in order to increase the competitive advantage of organizations by fostering innovation and learning (Nonaka, 1994, Nonaka et al., 2000, Nonaka et al., 2006, Vonkrogh, 1998). The contextual nature of knowledge makes organizational knowledge creation equally context specific. The concept of a knowledge creation context is denoted by the Japanese word known as 'ba'. Ba has a here and now quality characterized by shared meaning; shared interpretations and shared understanding (Nonaka et al., 2000). It is considered very crucial for effective knowledge creation in organizations. It can be intentionally or spontaneously formed and often combine with each other to form bigger ba. According to Nonaka et al, (2000), ba is categorized into four forms: originating ba; systemizing ba; dialoguing ba and exercising ba.

Ba is said to be facilitated and energized by conditions like autonomy; creative chaos; redundancy; requisite variety; love; care; trust and commitment (Nonaka et al., 2000) mostly informal situations but because these conditions are not easy to develop or maintain, knowledge creation activities especially in big multinational organizations may often not yield the desired outcomes (Cummings and Teng, 2003). A Ba developed by an organization may be unable to achieve the necessary results due to incompatibility with individual employees, subgroups within an organization and external influence. The network theory at this point, presents some insights. It's fundamental argument is that "actors are embedded in networks of interconnected social relationships that offer opportunities for and influence their behavior"(Brass et al., 2004). It is believed that both formal and informal internal and external networks can result in knowledge spillovers (Dahl and Pedersen, 2004, Reagans and McEvily, 2003, Widén-Wulff and Ginman, 2004) that have the potential to not only generate important rents for organizations (Brass et al., 2004) but to also interfere greatly in existing systems.

As seen in Nonaka et al (2000), originating ba offers an avenue for socialization and is characterized by personal and direct interactions where people share experiences with each other. It is not uncommon to observe that individuals from the same departments in an organization socialize with each other more than they would do with individuals from other departments. Dialoguing ba offers an avenue for externalization and is characterized by collective interactions. Here, skills are converted into common terms and captured as concepts. Systemizing ba offers an avenue for combination and involves collective and virtual interactions: news groups and electronic mailing lists are good examples. Exercising ba provides avenue for internalization. In this case, individuals internalize and personalize the knowledge that is found in manuals and other company documents.

The conceptual framework illustrated in figure 1 and table 1 present a hypothesized description of the mechanism under investigation: In the framework, the SECI processes interacts continuously with the organizational Ba. Networks influence the SECI/ba independently and they are all embedded in the organization's knowledge creation structure which can be said to exert an overall influence on organizational knowledge creation.

Knowledge Creation Structure (Formalized, Organic, Semi-structured), institutions (culture)

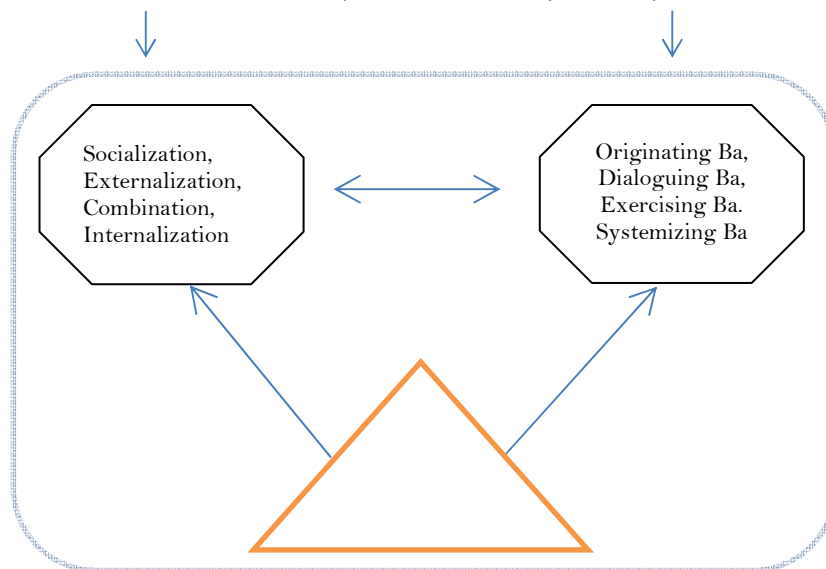

Figure 1: Conceptual Framework

Components of the Conceptual Framework

Socialization: this process occurs in the originating ba (Nonaka et al., 2000). It could involve attempts to generate new ideas through socializing with internal or external parties.

Externalization: this process occurs in the dialoguing ba. Here managers facilitate creative and essential dialogue, through the use of 'abductive thinking', the use of metaphors in dialogue for concept creation (Nonaka et al., 2000) and etc. It could be said to involve idea generation activities as well because emphasis is placed on the articulation and conceptualization of ideas.

Combination: explicit to explicit knowledge conversion occurs in the systemizing ba. It involves assembling internal and external data by using published literature, computer simulation and forecasting (Nonaka et al., 2000). Here emphasis may be said to be placed on idea selection and making selected ideas known to all organizational members.

Internalization: this process occurs in the exercising ba. It involves personal experience; real world knowledge acquisition where managers engage in 'enactive liasing' activities with functional departments through cross-functional development teams and overlapping product development. This activity can be said to be geared towards realizing circulated outcomes in

the organization in the form of accepted new products and services that are ready for distribution by the organization.

Table 1 below further illustrates the hypothesized interactions that occur between components of the conceptual framework presented in figure 1.

Objective of Research

This study is interested in answering the following question and sub-question: How do internal and external networks influence the knowledge creation processes (SECI) /knowledge creation contexts (Ba) in an organization? Is this influence affected by an organization's knowledge creation structure (organic, formalized and semi-structured) and informal institutions (culture)? The research question is illustrated in table 2.

Research Design

This study would use case studies to assess to what extent the interaction pattern and nodal characteristics of internal and external networks in the SECI/Ba framework can explain the difference between successful and unsuccessful product/service launches. New products and services are used as proxies for organizational knowledge creation; this is consistent with previous studies. Successful and unsuccessful new product/service development is specifically used to determine variances in how networks influence the organizational knowledge creation activities. The study would adopt a partial grounded theory approach that would consist of a series of investigations to be systematically carried out to answer the research question in a step by step manner. Data collection will be done in phases using interviews.

For each SECI process and corresponding facilitating Ba, the impact of internal and external networks will be investigated. I would particularly consider comparable cases of product/service development at two high technology firms in Nigeria and Sweden. Case studies of successful and unsuccessful product/service development activities will be selected and analyzed. Comparisons will then be made taking into consideration the structures in place in the organization, informal institution (culture) and the interaction between participation in networks and the SECI/Ba framework.

The first and second phase of this research study would be carried out in the Nigerian firm and the Swedish firm respectively. The same questions will be asked in both phases. The interview would be structured using a retrospective approach to study how selected new products and services were developed or not developed as the case may be.

<i>Knowledge creation context (ba)</i>	<i>Knowledge conversion process</i>	<i>Networks</i>
<i>Originating ba: context for socialization: Place where individuals share experiences, feelings, emotions and mental models</i>	<i>Socialization: tacit to tacit Wandering inside or outside the firm to generate new ideas</i>	<i>Generating new ideas from colleagues within and outside the firm, bringing in contradictory and different ideas and ideologies</i>
<i>Dialoguing ba: context for externalization: Place where individuals' mental models and skills are shared, converted into common terms, and articulated as concepts.</i>	<i>Externalization: tacit to explicit Managers facilitate creative and essential dialogue, the use of 'abductive thinking', the use of metaphors in dialogue for concept creation</i>	<i>Groups with different ideas existing within the organization; not accepted here syndrome.</i>
<i>Systemizing ba: context for combination. Collective and virtual interactions</i>	<i>Combination: explicit to explicit Assembling internal and external data by using published literature, computer simulation and forecasting.</i>	<i>Role of professions; different weight ascribed to different groups within the organization, who is listened to the most?</i>
<i>Exercising ba: context for internalization: Here, individuals embody explicit knowledge that is communicated through virtual media, such as written manuals or simulation programs.</i>	<i>Internalization: explicit to tacit Personal experience; real world knowledge acquisition: managers engage in 'enactive liasing' activities with functional departments through cross-functional development teams and overlapping product development</i>	<i>Inertia in different groups and individuals; they don't know what they are doing syndrome.</i>

Table 1: SECI/Ba framework and Networks

The third phase of this study would involve a comparison of the two studies. Since the two organizations differ significantly in terms of their services and products, this study would only involve similar departments (Departments in charge of managing the activities for generating new products and services) in the two firms and will then determine areas in which the two cases converge or diverge as far as the research question is concerned. The comparison approach adopted in this study might reveal an impact of culture, nature of products/services or management. These are the areas that create the most significant differences in the two organizations.

Social network analysis and other relevant statistical methods will be used to analyze the interactions going on within the internal and external networks of the organizations that will be studied. Social network analysis is a well grounded quantitative approach that analyzes social networks (Tichy et al., 1979).

	<i>Socialization/ originating ba=(idea generation)</i>	<i>Externalization/ dialoguing ba=(idea generation)</i>	<i>Combination/ systemizing ba=Idea selection (New product prototypes and service plans)</i>	<i>Internalization/ exercising ba= (Accepted or distributed new products and services)</i>
<i>Successful new product/service</i>	<i>Role of network interactions?</i>	<i>Role of network interactions?</i>	<i>Role of Network interactions?</i>	<i>Role of Network interactions?</i>
<i>Unsuccessful new product/service</i>	<i>Role of network interactions?</i>	<i>Role of network interactions?</i>	<i>Role of network interactions?</i>	<i>Role of network interactions?</i>

RIGHTING THE RIGHT OF PPP

Kalogirou, Sofia¹; Maniatis, Antonios²

¹ Hellenic Open University M. Sc. Student, Engineer, Greece. E-mail: sofoklo@hotmail.com

² Chair of Track No 42 of the EuroMed Business Academy Annual Conference 2012, Adjunct Assistant Professor of the Business Administration Department of the Higher Technological Educational Institute of Patras, Lawyer, Greece. E-mail: maniatis@dikaio.gr

Abstract

PPP does not consist uniquely in the correspondent contract, regulated by the relevant legislation. Within this model, there are eventually two types of ancillary agreements, which may be considered as informal PPP contracts. They are related to the supervision of the execution of the contract by an Independent Controller and to procedures of alternative resolution of disputes relevant to the aforementioned execution. Besides, there are two informal types of PPP, beyond the PPP contract model, namely on the one hand the concession contract and, on the other hand, the institutional PPP having the form of a company belonging to both public and private sectors. Anyway, the PPP exemplifies the New Public Management, which recommends private sector mechanisms for state services. So, righting the right of PPP implicates correlation of the PPP contract with the various other versions of the same methodology.

Keywords: PPP contracts / institutional PPP, Concession, Ancillary agreements, Supervision, Resolution of disputes, New Public Management

Introduction: The question of the PPP methodology

The acronym PPP means Public Private Partnership, which nowadays has been an important trend worldwide, coming from the United Kingdom. This model needs an in-depth analysis in scientific level as it is quite new and related to various other innovations.

In exception of the United Kingdom, states having institutionalized this mechanism have adopted a specialized law on the matter (Maniatis, 2011). For instance, in Greece there is in vigor Law No 3389/2005 "Public Private Partnership", as slightly modified through Law No 3483/2006. According to this new regime, in order to submit a work or a service to the PPP model, the conditions to meet are the scope of the contract, which is either a technical work or a service, the undertaking of an essential part of the risks by the private partner in the framework of the allocation of risks between the contracting partners, the financing model consisting in financing the contractual scope with assets coming from the private partner and the fact that the upper cap of the budgeted cost is two hundred million Euros (200.000.000,00 €). There are two state bodies, the Joint Ministers' PPP Committee and the Special Secretariat for the PPP, which have several competencies, including the selection procedure, the evaluation of the proposal and, in general, the administration of the process. The Committee may decide unanimously the

submission of a scope to the PPP model, even if one of the last three aforementioned conditions is not met.

Anyway, law recognizes only a contract model as the potential PPP and, as a result, the following paper hypothesis on the PPP methodology on international scale emerges:

We assume that PPP constitutes a *unique* method, of *contractual* nature.

Contracts within the PPP contract: the PPP ancillary agreements

The supervision ancillary agreement for the execution of the PPP contract

According to Law No 3389/2005, the function of supervision on the execution of the PPP project may be exempted from the public partner's strict control contrarily to the traditional model of construction of public works. For instance, PPP contracts are monitored on account of the final technical results to achieve and, therefore, the contractor benefits from the freedom, for instance, of selection of the relevant materials. This flexibility is conducive to creativity and is completed by the possibility of awarding the supervision to an independent third. In other words, the supervision may be held not only by the competent services of the state but also by private carriers, namely independent companies which are hired by both partners in common, mainly in case of specialized projects, for which the contracting authority has no appropriate experience.

Given that the role of the Independent Controller is contradictory to the fact that he has to control his own employer, the public partner, his impartiality is considered as indispensable. Besides, the contracting authority reserves the right to award the control of the construction to receive, to another person or company, even after the emission of the certificate of use by the Independent Controller.

Ancillary agreements on non-judicial confrontation of the PPP disputes

According to Law No 3389/2005, any dispute on the application, interpretation or validity of PPP contracts or ancillary agreements will be settled through arbitration, upon the Greek material law. Besides, the same law clarifies that PPP is regulated by the contract terms (included in the text of each PPP contract) and in a complementary way by the Civil Code. Although according to the motivation report of the law, in principle the public works legislation is not applicable in the PPP projects, in practice it is applied indirectly, through the relevant contract terms. In other words, the private law principle of contractors' freedom, institutionalized through the prevision on contract terms, leads to the traditional public law (public works legislation).

As for arbitration, it presents, compared to the trial before the state courts, the advantages of quickness as for the judgment, specialty of arbitrators and confidentiality.

Moreover, the PPP contract or ancillary agreements define the rules on the appointment of arbitrators, the arbitration rules, the fees for arbitrators, the headquarters of the arbitration court and the language in which the arbitration will be conducted. The judgment of the arbitration organ is irrevocable and automatically enforceable. The exclusion of state courts has raised

severe criticism as it transgresses the disposition of paragraph 1 of article 20 of the Greek Constitution, on the right to protection by the tribunals.

Fortunately, the law implies that the arbitration method, which costs money and may be a reason of delay, is not the unique one to adopt. Indeed, the PPP contract or an ancillary agreement may institutionalize the consensual resolution of disputes. In a theoretical level, therefore the following set of methods prior to eventual arbitration emerges (Venieris, 2007):

Consensual resolution

It is about the settlement of disputes between the two parts without the intervention of thirds.

Expertise

It is not about a team of jurists, on the opposite the experts usually have only technical knowledge. These thirds are supposed to assess the factual data and the emerging problems on the basis of technical or economic parameters. Their decision is not obligatory, unless the parties have previewed within the PPP contract that a third expert will be appointed on concrete technical questions and judge in a binding way for both parties.

Mediation

This method consists in the emission of a non-binding opinion of an independent team of persons that is likely to include jurists and engineers. This organ works like arbitrators do in the arbitration procedure.

PPP contracts beyond the PPP contract

The concession contract

The concession contract model constitutes an institution old as the hills. For instance, in ancient Greece, cities – states hired a foreign engineer, Chairephanes, in an attempt to drain a marshy area, called "lake of Ptechai". This is the first known project according to the "Build Operate and Transfer (B.O.T.)" model, whose financing was undertaken by the contractor and his partners, who would take advantage of the land for ten years. As the PPP contract model is in substance a modern version of the concession contract one, it has its origin in ancient times.

In modern history of Greece, there is no legislative definition of the contract of public service concession. However, this is an institution that is constitutionally recognized and regulated by various constitutional provisions. Indeed, paragraph 2 of

article 23 of the Greek Constitution refers to all forms of enterprises of public character or common utility, whose function has a vital significance for the service of basic needs of the society, as for the restrictions of the right to strike.

Besides, paragraph 3 of article 106 refers to the right of the state or other public carriers either to buy or to participate obligatorily in companies, provided that these companies have a

character of monopoly or vital significance for the exploitation of national wealth resources or have as a principal purpose the provision of services to the society.

It is to signalize that the concession of public service is a dynamic phenomenon, following the needs of Public Administration and private investors. Moreover, it has not been abolished or marginalized by the adoption of the PPP contract model in spite of the fact that the earlier model is proved to be able to provide all the things that the concession model does.

The institutional PPP

The term «institutional PPP» refers to enterprises owned by the public sector and the private one in common, namely to companies of mixed economy, for instance as for water infrastructure in Portugal (Marques and Berg, 2010).

In Greece, the Constitution provides this phenomenon in article 106 without using this name, as already indicated. Besides, it is to signalize that there are companies that are entitled to act neither as public partners nor as private partners in an official PPP because they are enterprises of mixed economy. So, the legal framework on PPP contracts has introduced an absolute distinction of this innovation against the institutional structure of the enterprises which themselves constitute an autonomous type of partnership between the public sector and the private one (Maniatis, 2008). Therefore, even if national legal orders do not recognize them officially as PPPs, they do constitute a type of PPP, legally complementary of the official type.

It is about legal entities under the private law, through which a public entity establishes a partnership with a private one, to implement a project of public utility, whose budget may be higher than the one described in Law 3389/2005. For instance, such companies are the Power Public Corporation, which was established to generate and supply electricity in Greece and the Gas Public Corporation, which has been created to implement the major project to introduce natural gas in the energy balance of Greece.

Managerial implications of PPP for New Public Management

Principles, tools and premises of New Public Management

The New Public Management is a contemporary theoretical approach to the way of change of Public Administration. It started in the United Kingdom, expanded initially in the United States of America and Australia and then in Scandinavia and elsewhere in Western Europe. It refers to the tendency to adopt the principles and values of the private sector in order to meet financial objectives and goals. It is about a "business" type of cost management, based on an efficient and economical system of public service. Its two main ideas are the organizational policies and procedures for the implementation of the decisions and a systematic analysis of administrative practice (Koimtzolgou, 2005).

This School of Thought is characterized by the following elements:

- Reflection of an ideological commitment confirming the superiority of market over the state, emphasizing the introduction of market forces and principles of private management in the domain of Public Administration.
- Supporting of the opinion that the enhancement of competition between the public sector and the private one as well as within the function of the public sector promotes efficiency and makes public services more “responsive” to citizens.
- Concentration of the formation of the political strategy (mainly the political objectives and the budget) in the hands of a few senior officials at the core of the government, by creating a narrow but strong network of service officials and political ones.
- Extraversion (the citizen - recipient of the service is considered as a customer and is treated in this way).
- Quality of services.
- Effectiveness (qualitative and economic).
- Lack of vertical hierarchy. It decentralizes the executive area of public policy through many public offices and agencies, including local authorities, private contractors, etc. that exercise operating administrative authority within the frame of the central political strategy that is fixed by the political power. It “cuts” the Public Administration into many pieces by encouraging further division related to customers / contractors and providers / buyers.
- Interdisciplinary character (Sociology, Economics, Law Science, Psychology, Political science are the sciences supporting the function of New Public Management).

The reasons having led to the emergence and consolidation of this School of Thought are:

- The functional failure of large bureaucratic organizations in conditions of financial crunch.
- The informational and technological bang.
- The economic globalization and the international competition.
- The increased demands of the citizens-customers of public services for quality services and their distrust in capacity of state institutions to provide it.
- The employees’ need in jobs that do not offer them merely a reward but also allow them to develop their own personality (Koimtzoglou, 2005).

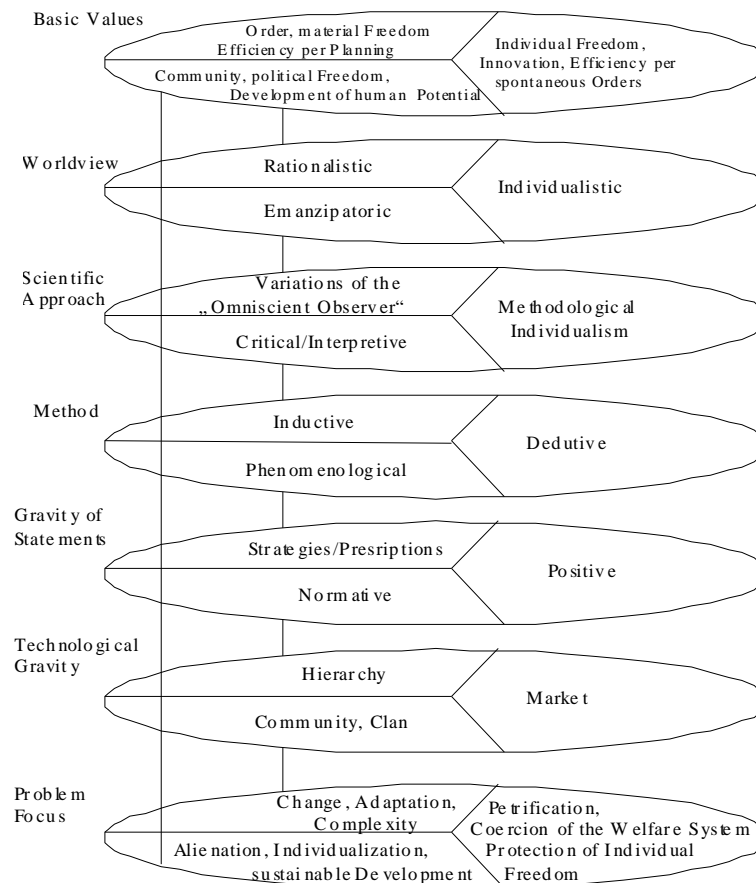

Figure 1. Dominant patterns of scientific worldviews (Gruening, 1998)

PPP exemplifying New Public Management

In accordance to New Public Management, the entrepreneurial governance is exemplified by [PPP that constitutes a](#) democratic model of relations between the public partner and the private one. A contract of this type gives to the private partner the opportunity to offer services without having to comply with specific orders and requirements, particularly from the public partner himself. This partner is exempted from extensive paperwork in relationship with the implementation of the project and may benefit from methods prior to arbitration or, at least, to trial as for the confrontation of eventual disputes related to the PPP. He may also suggest ways and tactics, taking advantage of the explosion in technological development, to achieve the best possible result in the best time with minimal financial burden. In other words, the PPP innovation is proved to be conducive to various other innovations, even if these are not necessarily produced uniquely through this institutional framework. Anyway, he has a special commitment to the success of the project as his reward depends on the accomplishment of his long-term contractual obligations.

In this context, the public partner has the opportunity to modernize not only his infrastructure but also his know-how and, above all, his way of thinking as PPP model

does not constitute merely a method of public works construction and of provision of services but also a philosophy itself...

Conclusion: A new approach to the right of PPP

The hypothesis of the present paper has not been confirmed by the completed analysis as the PPP methodology does not consist uniquely in the PPP contract having as a scope the construction of a technical work or of the provision of services. Of course, this contract has a central significance but it is officially related to a set of other contracts, namely the ancillary agreements. It is to signalize that two categories of them, having to do with the supervision of the project and the resolution of disputes emerging from the execution of the contract, may be interpreted as informal PPPs within the official PPP because they implicate the involvement of thirds coming from the private sector, usually having an independent status towards both partners (controllers, mediators, arbitrators...). So, there is an important upgrade of the role of engineers, exemplified not only by the legal position of the private partner but also by the involvement of various other carriers.

Besides, there are also PPP techniques even beyond the official PPP contract model, which equally have, as a general rule, a contractual legal nature. This is the case of the concession of public service and the creation of companies of mixed economy. These enterprises accomplish a complementary and, as a result, an alternative function in comparison with the one of the PPP contract model.

So, it is highly recommendable to correlate the three formal or informal PPP agreements within the PPP contract model (the so-called contract itself, the agreement on supervision and the agreement on resolution of disputes), through the relevant legislation by upgrading the two ancillary agreements. Moreover, all types of PPP (PPP contract, concession and institutional PPP) should be jointly regulated in the legislative level, through a unique state codification. So, righting the right of PPP implicates correlation of the PPP contract with the various other versions of the same methodology.

Finally, this right is significantly promoted not only by the law science research but also by the School of Thought of New Public Management that implicates a participatory, democratic approach to the cooperation between Public Administration and private sector.

VALCA: VALIDATING CONJOINT ANALYSIS – EVIDENCE FROM THE GERMAN TELECOMMUNICATION MARKET

Kaltenborn, Tim¹

¹ Research assistant and Lecturer at BiTS Iserlohn, Germany. BiTS Business and Information Technology School gGmbH, Reiterweg 26b, D-58636 Iserlohn . Email: tim.kaltenborn@bits-iserlohn.de

Abstract

Conjoint Analysis is today a widely used method to support management with insightful data for product development, customer segmentation and pricing decisions. Marketing opportunities and value drivers for a certain product or service can be identified and market simulations can be performed based on Conjoint Analysis. While many researchers worked on developing improved and more sophisticated algorithms for Conjoint Analysis, relatively little research is conducted on the validity of the different methods in use. This work therefore examines three state-of-the-art conjoint methods with respect to their validity. Hybrid Individualized Two-level Choice-based Conjoint and Graded Paired Comparison are compared to classical Choice-based Conjoint based on a study in the German telecommunication market with respect to internal validity. Measures of validity for Conjoint Analysis are discussed and applied in order to provide first insights and results on the performance of the compared algorithms. It was found that with respect to internal validity, newer developments do not necessarily perform better than Choice-based Conjoint and that the decision for a particular method should depend on the actual study design. Based on the internal assessment, first recommendations are derived and suggestions for further research on the topic of validating Conjoint Analysis are offered.

Keywords: Conjoint Analysis, CBC, HITCBC, Paired Comparison, Validity, Preference measurement

Introduction

First used in the 1970's conjoint analysis continues to represent an important market insight tool. Conjoint analysis (CA) is widely used to estimate the relative importance consumers place on different attributes of a product/service as well as the utilities they attach to various levels of each attribute. Conjoint analysis is one of the most prominent methods to support management decisions with respect to product development, pricing and positioning. Over the last years researchers have developed a manifold of new and improved algorithms as well as different methods to estimate part-worth utilities. Heidbrink (2006) found in a meta-analysis that CBC with HB-estimation performs best amongst the compared methods. However, newer conjoint methods have not yet been tested with respect to validity, and especially external validity.

For a researcher, whether being scholar or practitioner it is of utmost importance to understand the amount of uncertainty in the results of conjoint-data. The results of Conjoint Analysis are frequently used to systematically develop and modify products and services. However, if neither researcher nor management can be sure about the external validity, thus the accuracy of the results, they can hardly manage the results and show some accountability for their actions and strategies. It is not the goal of this study to question the overall validity of CA or other methods to measure customer preferences. However, the amount of uncertainty should be made aware to those applying CA results in their daily business, in order to adapt decisions to this uncertainty. Furthermore, it should be clear that conjoint analysis is not collecting consumer behavior, but statistically calculates preferences, and thus will never be able to eliminate uncertainty in the results. Thus the overall objective of the study is to provide some insights on the performance of different conjoint methods based on data from the German telecommunication market.

Since Heidbrink (2006) found in his Meta-analysis that CBC-HB performed best amongst the compared methods at this time, this study will use CBC-HB results as a baseline for further analysis. CBC-HB is compared to one of the newest developments in Conjoint Analysis, HIT-CBC (Eggers & Sattler, 2009) and one widely used method, the Graded Paired Comparison (GPC).

One of the recent CA developments is Choice-Based Conjoint Analysis (CBC), which is based on the Discrete-Choice Analysis by McFadden (1974) and was first introduced into Marketing by Louviere and Woodworth (1983). Meanwhile, CBC is at least in German speaking countries the most prevalent used algorithm for CA (Hartmann and Sattler, 2002a; Melles & Holling, 1998). In comparison to other methods such as Traditional CA, the respondent does not have to rank or rate the stimuli but has to make a discrete choice within a set of stimuli. The preferred concept out of a given set should be selected by the respondent, bringing him/her the highest utility (Gensler, 2003).

Hybrid Individualized Two-level Choice Based Conjoint (HITCBC) was first introduced by Eggers and Sattler (2009). This CA method was mainly developed in order to accommodate a high number of attributes and to reduce the problem of the Number of Level Effect (NLE). HITCBC combines, as any other hybrid model, parts of self-explicated measurements and a decompositional part. The decompositional part in this case is routed into an efficient choice design based only on the individual best and worst levels for each attribute. By reducing every attribute to only two levels, HITCBC not only eliminates the NLE, but also reduces the complexity for the researcher in creating an efficient choice design. A detailed summary of conceptual advantages of HITCBC can be found in the work of the authors (Eggers and Sattler, 2009).

GPC is based on pair wise trade-off, an approach which is also included in Adaptive Conjoint Analysis. Especially in Germany, many market research institutes and academic researchers use this pair wise trade-off as standalone method to CA. The objective is, that in addition to the actual choice between one of two concepts the strength of the preference is measured and used for parameter estimation. However, it was found by Heidbrink (2006) that ACA along with other methods performed worse than regular CBC. Other research found that GPC best performs with up to three attributes (e.g. Reiners, 1996). However, in this study GPC is tested with 7 attributes.

In the following, the overall study design will be outlined, followed by a short discussion of the applied validity criteria and an overview of the design of the different conjoint interviews. Afterwards the results are discussed and a conclusion is provided.

Study Design

For the systematic comparison of the CA methods, an appropriate research object has to be selected. Since CA cannot account for random elements in the buying process, the research object should reflect a limited and important buying process with high involvement from the respondent. Random elements and social effects should only have a limited impact. Furthermore, in order to be able to validate the results externally, respondents should really encounter the simulated buying decision within the next six months. Thus, post-paid mobile phone contracts in Germany have been selected as research object for this study. It seems obvious that due to the long-term focus (generally two-year contracts) and the involved costs, the conclusion of a mobile phone contract is a limited, but nevertheless important decision for a customer and generally involves high involvement. In addition, the spread of mobile phones and post-paid contracts in the consumer markets implies prior knowledge of common features. It can be assumed that the majority of the respondents will have gone through this decision process at least once in their lifetime. In order to be able to design conjoint experiments, the research object has to be defined by several attributes and attribute levels. Table 1 shows the operationalisation of the research object. Seven attributes with each four to five levels have been defined. Even though the inclusion of mobile internet as attribute for post-paid mobile phone contracts is increasing in its relevance for providers, this attribute has been excluded from the Conjoint Analysis in order to exclusively reflect talking contracts only. It has been considered that all important attributes, reflected in offerings of the four providers Deutsche Telekom (formerly T-Mobile), O2 Telefonica, BASE (formerly EPlus) and Vodafone, have been included. The selected attributes and attribute levels reflect the contracts offered in summer 2011. All stimuli based on these attributes will be presented within the different conjoint methods as tables with verbal description.

Data collection took place during summer 2011. The data used to analyze the validity of the different conjoint algorithms was collected through two online access panels. Respondents were

randomly assigned to one of the CA interviews. Since the focus of this study is on validity, comparability, not representativeness of the sample is crucial. The chi-square test showed no significant differences across the methods with respect to age, gender, household size, professional category or income.

Attributes	Provider	Price / min. own provider	Price / min. landline	Price / min. other providers	Price / SMS	Included minutes	Monthly base price
Level	Base	0.00 €	0.00 €	0.00 €	0.00 €	0 min.	0 €
	O2	0.09 €	0.09 €	0.09 €	0.09 €	50 min.	5 €
	Telekom	0.19 €	0.19 €	0.19 €	0.19 €	100 min.	10 €
	Vodafone	0.29 €	0.29 €	0.29 €	0.29 €	200 min. 500 min.	15 €

Table 1: Overview of included attributes and attribute levels

Validity measures

In order to be able to assess internal validity of the three CA methods compared, five Holdout tasks have been constructed. These holdouts are fixed for all respondents and purely used for validation purposes. The sets are constructed using the real talk-only contracts offered by the four providers. Sets are constructed in a way that they reflect a wide range of different features included. Based on the holdouts, Hit-rate, mean absolute error between empirical and predicted shares of preferences and Cramer's V as a measure of dependence can be calculated.

One of the most commonly used measures of validity of Conjoint Analysis is the Holdout Hit-rate. The stimuli shown in the holdout tasks are not included in the estimation for the part worth utilities, but they are used to test the ability of the part-worth utilities to predict real ratings, rankings, or choices. Holdout-criteria can be calculated on both, the individual and the aggregated level. Today, holdouts are widely used in conjoint analysis, even though they might not be directly relevant for the purpose of a study. However, they provide a very pragmatic measure of validity and are often used as a selling tool for the usefulness of CA.

In addition and since for many marketers the hit rate is not a really relevant measure to derive marketing actions based on conjoint analysis but a special focus is put on the appropriateness of predicted market shares, a second focus will be put on the absolute difference between *Shares of Preference* (SoP) and empirical Market Shares (MS) (e.g. Natter & Feuerstein, 2002). Since this measure aggregates the predictions across respondents it can be assumed that it is bias free, nevertheless very important to support strategic decision making.

In order to be able to analyze the relationship between the predicted and the empirical Market Shares, Cramer's V was chosen. Natter and Feuerstein (2002) proposed to use the squared

correlation (r^2) between SoP and MS. However, since market shares in general are not independent from each other, a Pearson product-moment correlation would not be appropriate. Furthermore, the concepts included in a Holdout task are nominal. Therefore it is more appropriate to interpret the predicted and empirical concepts across all respondents as a contingency table and apply Cramer's V.

After the conjoint interviews, the subjective assessment on the conjoint interview is collected for every respondent. This usability scale is based on similar questions by Hartmann and Sattler (2002b) and Orme and Johnson (2008) and provides an overview on subjective reactions towards the conjoint interviews from the respondents.

In addition, the time used to complete the individual interviews will be compared in order to gain an understanding towards differences in the efficiency of the different methods.

Conjoint Analysis Design

The following section deals with the set-up and design of the different CA methods.

For all CBC interviews, all seven attributes were included. Every respondent had to answer 16 choice-sets with three stimuli each. The experimental design was based on a random selection of choice-sets out of a full profile design. All prohibited concepts were excluded manually. CBC was included with three individual interviews, every interview featuring a different pricing approach. The pricing approaches included represent three widely used methods which are fixed pricing, conditional summed pricing, and continuous pricing (for a discussion of the different pricing approaches see Orme, 2007). For the analysis of the validity of the Conjoint Analysis, all three pricing approaches will be aggregated later on.

Welches der drei Angebote würden Sie bevorzugen, wenn sich diese ausschließlich in den angegebenen Merkmalen unterscheiden?

Figure 1. Screenshot from CBC interview

After data cleaning, the raw data was coded into the format needed for the estimation with Sawtooth HB-CBC software. All estimations within the software were run using standard settings and with a total of 20,000 iterations. The estimation for CBC and all other interviews included in the study consider main-effects only.

For the graded paired comparison, all seven attributes were included in the design. Each respondent had to answer 30 stimuli sets with two concepts each. Preferences could be graded on a seven-point scale from strongly prefer left to strongly prefer right. Figure 2 provides an example of a GPC stimuli set and the included scale. The experimental design was constructed using a two-level shifted pair's design as proposed by Bunch et al. (1996). A design without prohibited pairs could be found by repeating the proposed shifting procedure twice. In total, three interviews for graded paired comparison were included in the study. Every interview featured one of the three pricing approaches.

Welches der beiden Angebote würden Sie bevorzugen, wenn sich die beiden *ausschließlich* in den angegebenen Merkmalen unterscheiden?

Sie können Ihr Urteil auf der Skala im unteren Bereich abstimmen.

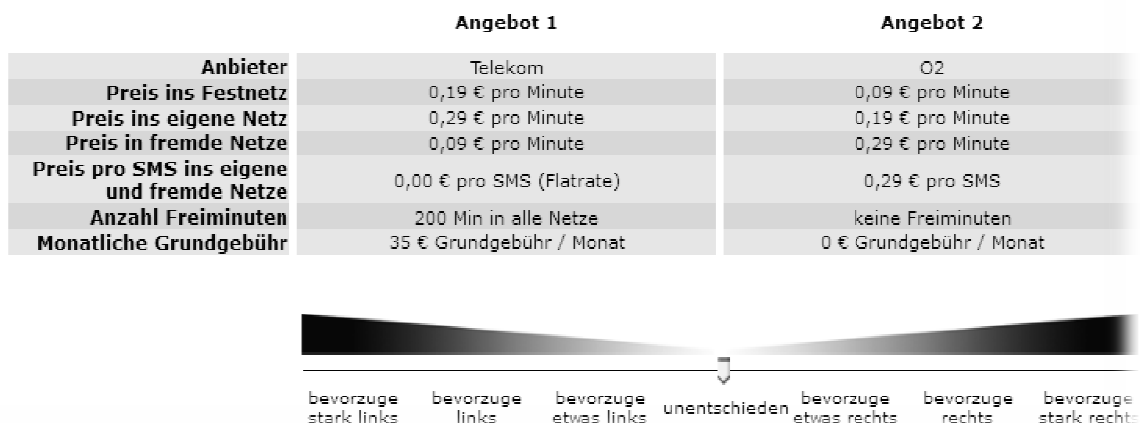

Figure 2. Screenshot from GPC interview

One of the main advantages of GPC is the possibility to directly estimate part-worths. Thus, the part-worths could directly be exported from the Conjoint-Analysis software and be used for further analysis.

The algorithm for HITCBC was incorporated based on the description provided by Eggers and Sattler (2009). Each respondent had two answer 16 choice-sets with three stimuli each. The HITCBC interviews featured a fixed as well as a conditional-summed pricing approach. Figure 3-5 provides an overview of the different tasks within the HITCBC interviews.

After data collection and data cleaning, part-worth utilities were estimated for the individual best and worst levels using Sawtooth Software HB-CBC with standard settings and 20,000 iterations in total. Afterwards, the best and worst levels were translated back into specific attribute levels and the intermediate levels were adjusted according to the level-ratings from the last section during the HITCBC interview.

Results and Discussion

In order to ensure comparability of the different methods all estimated part-worth utilities were further transformed and scaled prior to simulation and validation of the results.

In order to assess the internal validity of the methods compared, a simple first choice rule was applied. First of all, the estimated utility for all 20 post-paid call-only mobile contracts under consideration was calculated for every respondent. Based on these utilities, the maximum utility concept per Holdout-task was identified and then compared to actual response given during the master questionnaire. In case that two or more maximum utilities per Holdout exist, the choice was split among the number of maximum utility concepts.

Figure 3. Screenshots from HITCBC interviews

Validity

As mentioned earlier, the study has the objective to assess the overall predictive validity of conjoint algorithms. Since no real world purchase behavior of the respondents has been collected so far, the discussion will focus on internal validity. Table 3 provides an overview of the results for all three methods across all three validity criteria. The results are presented for every Holdout, as well as on average across all five Holdouts. The better mean results are presented in bold and in case of statistical significance it is indicated to which method they are superior.

The Hit-rate counts the percentage of correctly predicted choices in the Holdout. When analyzing the Hit-rates in table 3, it becomes clear that the above mentioned difficulty of the task is not necessarily reflected in the results for all methods. Overall, all methods compared within the study show Hit-rates above the random Hit-rate (4 concepts per Holdout, thus random hit-rate = 25%). CBC shows the highest Hit-rate per Holdout (CBC H1: 50,95%) and also a significant better average Hit-rate across all five Holdouts than GPC and HITCBC ($p < 0.001$). The average Hit-rate for GPC (41.39%) is still better ($p = 0.01233$) than that for HITCBC.

When considering the prediction of market shares, and thus aggregating the results of individuals, the goal should be to be as close to the empirical shares as possible. ΔMS , the absolute deviation between SoP and MS measures the quality of the level estimates (Natter & Feuerstein, 2002). Since predicted MS often provide the basis for managerial decision making, the accurateness of these predictions are of special importance for the performance oriented comparison of the different CA methods. The smaller ΔMS the closer are the predicted SoP to the observed MS. Here it shows, that actually all three methods are quite close together on average across all five Holdout-tasks. Especially HITCBC yielded very good results for Holdouts 1 and 2 and has also the smallest ΔMS across all 5 Holdouts (7.10). CBC, while being ahead of the other methods for the Hit-rate, does perform worse than the other methods on the ΔMS (Avg. H1-5 = 7.63).

Cramer's V represents the strength of relationship between SoP and MS and indicates the quality of the attribute effects measured by the conjoint estimates. Table 3 shows, that the average Cramer's V for CBC indicates a strong association between SoP and MS. For GPC, the Cramer's V still indicates a moderate association between SoP and MS, while for HITCBC no relevant association can be interpreted.

Subjective Assessment

The subjective assessment or usability of a CA method provides the researcher with an indication of how the conjoint tasks are perceived by the individual respondents. It could be that in case of a boring or too complex task, the results of the CA will be biased due to confusion of the respondent, the application of simplified decision making strategies, or simply less interest in revealing true preferences. When analyzing the results of the applied usability scale (Fig. 4), it becomes obvious that CBC and GPC, while eventually asking for different tasks to be performed by the respondent score equally on almost all dimensions. However, the task of the GPC, where the respondent has to judge on the strength of his preference seems to be a bit more confusing and less comprehensible to the respondents than classical CBC. HITCBC scores lower than the other two methods especially on the dimensions of the task being boring, being low fun and providing low realism. The perception of being boring and low fun could be assigned to the fact that only best and worst levels are included and thus the tasks seem to be repetitive for the respondent. The low score on the dimension of too little information could

indicate, that the tasks of the three stages have not been explained sufficiently by the author. However a detailed analysis of what kind of information is missing was not possible.

<i>Method</i>	(1) <i>CBC</i>	(2) <i>GPC</i>	(3) <i>HIT-CBC</i>

<i>Average H1-H5</i>	0.3019	0.2278	0.1686

Table 3: Validity Criteria per method

Figure 4: Subjective Assessment of CA methods

Time

In addition we observed the median duration spend for the completion of the CA-tasks. While CBC was used as baseline, the respondents on average spend 3.6 minutes longer to complete the GPC interview and 3.4 minutes longer for the HITCBC interviews. While for the HIT-CBC the additional time needed is explained by the two additional interview sections, the number of tasks in GPC is almost double as it is in CBC (GPC: 30, CBC: 16). When analyzing the median time in comparison to the results of the validity criteria, it can be assumed that CBC is the most time-efficient of the three methods compared.

Conclusion

Based on state-of-the-art methodological approaches to Conjoint Analysis, the author have set-up a study to compare different algorithms with respect to their validity. Based on a first fieldwork period, the methods under investigation have been analyzed with respect to internal validity and usability. Thus the study provided a lot of useful insights into the real world performance of different conjoint methods. In the setting of German post-paid mobile telecommunication contracts, the results showed that newer developments of CA are not necessarily better than classical CBC. CBC has been used as a baseline method in this study.

So far, no final recommendations can be given, to neither users, scholars nor software developers, which methods performs best with respect to predictive validity. This work

showed, that with respect to internal validity, newer developments are not necessarily better than regular CBC. However, these research findings are only applicable to the setting of the research object used in this work. Prior research showed that results from one product category cannot be transferred to different product categories (Natter & Feuerstein, 2002) Therefore, when applying Conjoint Analysis, researchers should always be fully aware of their research object and the purpose of their study.

Furthermore, it became clear, that HITCBC is not necessarily the method to use for a regular Conjoint-Analysis. However, as indicated by the authors, HITCBC was developed for particular settings in which it can improve performance due to the elimination of the NLE (Eggers & Sattler, 2009). Furthermore, it was shown, that GPC, as it is used by many German market research institutes provides reasonable results across all tested validity criteria. Even though, HB-algorithms for the estimation of graded paired comparison exist, a regular OLS-regression was chosen. By this, one of the main advantages of GPC becomes clear. Individual results can easily and immediately be estimated and further used within the actual research project. However, using a standard setting of 30 paired comparisons within the GPC interviews lead to a significantly longer interview than for classical CBC. Nevertheless, this longer interview duration had no significant impact on the subjective assessment of GPC by the respondents.

Taking into consideration the time efficiency of CBC, CBC with HB estimation still is the method to use for a standard Conjoint Analysis, not featuring too many attributes and not dealing with unbalanced attribute levels. However, depending on the actual knowledge and abilities of a researcher, GPC with OLS estimation provides a reasonable and easy to use alternative for researchers, especially if results of the CA should be immediately used in the further interview.

Limitations

The author presented a methodological comparison of different state-of-the-art conjoint methods. Three different algorithms have been compared with respect to internal validity. However, as with almost every empirical study, this work has limitations. The applied experimental designs for CBC, HITCBC and GPC might not be fully orthogonal due to the exclusion of prohibited pairs. This might lead to biased estimation results. The underlying study so far only investigated main effects. In order to provide an overview of the existing effects and their impact on internal validity of CA, interaction effects between attributes should be considered and estimated in addition. The HITCBC results are contradictory to the findings by Eggers and Sattler (2009). The algorithm has been implemented based on an interpretation derived from the work by Eggers and Sattler (2009) incorporating slight changes in the final phase. The rating of intermediate levels has been changed to a slider between best and worst levels per attribute. While believing that panel members in Germany are used to sliders, this might have led to biased results for intermediate levels in HITCBC.

Furthermore, the results from this work cannot be generalized and are based on the research object and the German telecommunication market. In addition, as for every CA, it needs to be questioned, whether the key assumptions of CA have been fulfilled (Wittink, 2000).

Directions for Further Research

Following a prominent group of researchers (e.g. DeSarbo et al., 1995; Orme & Heft, 1999; Natter & Feuerstein, 2002; Arenoe, 2003), more research with a focus on real world performance and validity of Conjoint Analysis is needed besides this study. However, additional measures how to validate CA should be developed and shared. Besides, the number of relevant measures is small, and the applicability and interpretation of these measures (as with r^2 and Cramer's V) seems to need some further discussion.

A question which was frequently asked is that of how many tasks should be included in a Conjoint-Analysis. While within this study the author used standard settings for the different methods, it should be further investigated how stable the results remain when considering less tasks, and whether time efficiency could be increased in further applications by reducing the number of tasks for the respondents.

Furthermore, this paper did not deal with the validity of different pricing approaches, different simulation models and different estimation methods. Of course it might be reasonable that GPC results will improve with an HB-estimation, or that a probability or randomized first choice simulation model will lead to better Hit-rates for all methods. These aspects need to be further researched in order researchers to be able to employ the full potential of a particular method in use.

All further research within the area of Conjoint Analysis in general should have one overarching goal: To make CA results manageable and accountable and to provide CA users with a profound understanding of the applied methodology.

Abstract

This paper seeks to throw light on the emerging concept of autotelic capabilities and their impact on operational capabilities and in particular technological capabilities. In doing so, after defining autotelic capabilities and their dimensions, it suggests links among autotelic capabilities and production technologies development. Under the proposed framework, autotelic capabilities can be conceptualized as higher-order entrepreneurial dynamic capabilities that impact the generation of new technological capabilities which support the realization of a novel knowledge-intensive business concept in low-tech sectors, sustaining the indented initial competitive advantage of the new venture.

Introduction

Entrepreneurship literature has so far used the notion of “entrepreneurial capabilities” in a rather general and vague way, referring to the ability of identification and exploitation of the necessary resources in order to act upon opportunities in the market or to create new market opportunities (Arthurs and Busenitz, 2006; Zahra et al., 2006). Advancing entrepreneurial capabilities onto organizational more structured abilities, Aramand (2009) considered them as part of the larger set of dynamic capabilities, while Zahra (2011) tried to approach them as a special type of dynamic capabilities with parallel dimensions.

Focusing on low-tech knowledge-intensive new-to-the-world venture creation, this paper suggests that autotelic capabilities are well-structured entrepreneurial dynamic capabilities which affect the building of technological capabilities and particularly the development of production technologies. Therefore they constitute higher-order strategic processes that

generate, combine and configure the initial technological capabilities which will support the novel business idea and create competitive advantage intended to offer differentiation through concept realization (i.e. products, processes and/or models).

The article intends to accomplish two objectives. We first discuss the autotelic capabilities and their dimensions, as they constitute a novel and emerging entrepreneurial dynamic capabilities framework for new venturing. We then explore links among the dimensions of autotelic capabilities and technological capabilities formation focusing on production technologies, since they are the main (or among the major) means of realizing a business concept in low-tech industries, strengthening the sustainability of the indented initial competitive advantage.

Theoretical background

Autotelic capabilities

In our previous works (Karagouni, 2011, Karagouni and Caloghirou, (forthcoming), Karagouni et al., (2012)) we have introduced the Autotelic Capabilities approach to explore the strategic side of the entrepreneurial start-up activity in low tech industries within the notion of knowledge-intensive entrepreneurship. We have argued that knowledge-intensive processes which shape the initial competitive advantage in Traditionally Low Tech (TLT) competitive arena may be analyzed in terms of capabilities for orchestrating and mobilizing knowledge and other resources at the disposal of the agents. We've further defined Autotelic capabilities as the entrepreneurial dynamic capabilities to engage in non routine activities, improvisation and a flexible and paradox way of collecting and establishing knowledge assets and asset combinations in order to realize transcendent business ideas and address complex entrepreneurial environment through new ventures. Autotelic capabilities have been treated as higher-order entrepreneurial dynamic capabilities that influence the location, selection and the ways of selection of resources and skills and use a priori knowledge in order to capture existing knowledge from various domains and create initial competitive advantages to new ventures.

In an effort to better understand the nature of autotelic capabilities, we follow the trend of differentiating between dynamic and operational capabilities. Indeed several scholars have long dealt with the capabilities categorization (Prahalad and Hamel, 1990; Leonard, 1995). Christensen (1996) distinguishes between capabilities and capacities, and defines capabilities as a "lower-order functional or inter-functional technical capacity to mobilize resources for productive activities", and competence as a "higher-order management capacity of the firm to mobilize, harmonize and develop resources and capabilities to create value and competitive advantage". Zollo and Winter (2002) and Winter (2003) and Protogerou et al (2011) also distinguish dynamic capabilities from operational or ordinary capabilities. An operational capability generally involves performing an activity, such as manufacturing a particular product (Helfat and Peteraf, 2003). Operational capabilities "help sustain an organization's technical fitness by ensuring its day-to-day operational efficiency" (Teece, 2007). In contrast,

dynamic capabilities are those that enable a firm to constantly renew its operational capabilities and therefore achieve long-term competitive advantage.

In the same line, autotelic capabilities are conceived as the capacity of an entrepreneurial team to purposefully and systematically create the new knowledge-intensive venture's future operational capabilities; their configuration supports the realization of the novel business concept and the formation of the initial competitive advantages in low-tech industries.

Dimensions of autotelic capabilities

Although the autotelic capabilities framework is still in its infancy, we propose that they can be defined and more clearly understood through three dimensions, notably bricolage, improvisational and transcendental capabilities. They engage in exploration out of the boundaries of the firm and usually even of the industry they belong, which is a vital role of ACs in building initial competitive advantages.

Bricolage refers to the ability to successfully tap distributed competence and knowledge, reemploy and reframe them and recombine them creatively, or otherwise, support the creation of a concept of intuition. It is strongly shaped and affected by knowledge and scientific areas, knowledge bases and networks within the value chain. *Concentric cycle networking* and *Dynamic "Knowledge puzzle" making* are its main characteristics. The first one refers to the ability to engage in bricolage with regard to knowledge providers, suppliers, customers, financing, advice, employees, collaborators and other members of the business ecosystem or even competitors in a concentric way, using pre-existing networks as a basis for networking expansion. The second one refers to the ability to merge and adjust pieces of knowledge and other resources of different actors involved in research, design and production, which transcend sectoral limits.

Improvisational capability, offers the ability to repeatedly rework the initial concept in the light of new knowledge during the start-up stage which is the most ambiguous period in a firm's life. It evolves through *Fluid communication and interaction with the environment* which shifts focus on pre-existing resources upon which variations can be built (Orlikowski & Hoffman, 1997) and mechanisms of real-time information which can be formal or informal, internal or external, generalized and vague, or very precise and unique. Learning in start-ups is also a continuous and highly dynamic process that facilitates the development of knowledge necessary to start, grow, and manage a new venture (Politis, 2005). *Continuous learning* through any possible way mediates to reach the target of filling in the gap between vision and reality.

The last one, transcendental capability (TC) affects strongly the shaping of the innovative and knowledge-based concept. TC recognizes and analyzes resources of knowledge and its abilities that lead to knowledge-based entrepreneurial results by adjusting the objectives to the abilities and not abilities to objectives, as it is the usual way. An entrepreneurial team with a business idea of creating a global niche market of cheese-based crackers adjusted the initial objective,

when during the efforts of producing the desired products they realized their relative ability to produce certified and 100% gluten-free products and turned to niche markets of world-patented healthy gourmet gluten-free snacks.

Knowledge-intensive means that the resulting innovation by KIE is not only knowledge-based, but is also going beyond the existing sectoral or product field-specific knowledge bases by creating new knowledge, new ways of problem solving or new processes, products as well as new markets not applied or unknown in the industry before. This capability can be conceptualized as the ability of the agents to determine and define *Transcendental Conditions* thus to have a panoramic view of global markets, value chains and inter-sectoral industry potential (*a higher sphere of entrepreneurial being*) and curve ways by exceeding the limited 'known' because of the existence of the unlimited "unknown" (*sense of the entrepreneurial landscape spaciousness*).

A second dimension of this capability is the ability of the agents to rule and harness the act of unifying and combining the manifold of diverse and multifarious information (*receptivity*) through an ability to determine an underlying concept by means of given empirical presentations (*imagination*) into one business idea to realize (*Transcendental synthesis*) (Karagouni and Caloghirou, forthcoming). It is to be distinguished from bricolage which provides the purely conjunction and exploitation of physical, social, or institutional inputs that other firms reject or ignore (Baker and Nelson, 2005). It actually precedes bricolage, since it prepares the data for it by representing a concept even without its presence in intuition. Transcendental synthesis provides the "subjective plans and interpretations" according to which management "reconciles ingeniously existing organizational mechanisms and forms" regarding Ciborra's (1996) definition of bricolage. It is transcendental because it cannot be deduced from any empirical experience, but allows the agents' a priori knowledge to enter into concepts providing them with contents that would otherwise lack.

Hypotheses

The link between autotelic capabilities and technological capabilities

Accepting the notion that higher-order capabilities serve as a basis for acquiring and reconfiguring lower-level capabilities (Protogerou et al., 2011), we refer to technology-related capabilities as key operational capabilities needed to realize a novel business concept, incorporate knowledge into production and support the building of initial competitive advantages in low-tech industries.

Technological capabilities have been defined as the knowledge and skills required to identify, appraise, utilise and create appropriate technologies and techniques relevant to traditional industries, for the purposes of novel production facilities and production processes. They refer further to the engineering and organizational adaptations required to establish the potential of

continuous upgrading and innovativeness on these process and product technologies (Acha, 2000; Lall, 1992; Iamarrino et al, 2009). They institutionalize research and development (R&D) activities; and carry out more basic technological activities, that is basic research (Fransman, 1984). They are built through interactions both within the firm and with external actors (Malerba, 1992).

Lall's matrix classifies technological capabilities with regard to their functions in facilitating particular productive activities. More specifically, all three dimensions named are tightly related to production technologies: 1) investment (pre-investment and project execution) covers technology search and process, and product design, 2) production refers to process, product and industrial engineering) and 3) linkage within the economy is translated as the ability to receive information, skills and technologies (Lall, 1992).

Autotelic capabilities, as entrepreneurial dynamic capabilities, build and configure operational capabilities. Following the argument of Winter (2003), that dynamic capabilities are "complex, structured, and multidimensional" concepts, which make effective use of "zero-order" and higher-order capabilities, we also argue that autotelic capabilities are higher-order capabilities that govern the rate of structuring of lower-order capabilities and notably operational capabilities and therefore can be understood as higher-order constructs.

Paraphrasing Protogerou et al. (2011) autotelic capabilities can be considered as the tools that allow firms to *create* operational capabilities faster and cheaper than competitors. We focus on technological capabilities because they are identified as critical to creating competitive advantage since they are fundamental in producing novel products or services in most low-tech sectors (Spanos and Lioukas, 2001; Danneels, 2008). In Protogerou et al. (2011) technological along with marketing capabilities were assessed by top managers as extremely important for gaining and maintaining competitive advantage.

Hypothesis 1: The presence of autotelic capabilities favors the development of operational technological capabilities in low-tech new KI venture creation.

The link between autotelic capabilities and production technologies

Bricolage capability and production technologies

This paper focuses on the impact of autotelic capabilities on production technologies development capability as a substantial dimension of the technological capabilities under development and a significant and necessary precondition to establish a new knowledge-intensive low-tech venture. Having accepted the fact that the requisite knowledge and skills are distributed across many agents, production technologies are made in turn by tapping together appropriate technology components of various origins and a crucial issue concerns when and how they are called for. Besides focusing on a few technological core competencies, most of these firms sustain competencies in multiple technology fields (Granstrand, 2000). Because of

increasing technology convergence, these fields are often relatively different from the core technologies (Garcia-Vega, 2006), and this puts further emphasis on the importance of successful technology exploitation (Patel & Pavitt, 1997). More and more traditional firms now acquire a substantial part of their technologies from external sources (Lichtenthaler & Ernst, 2007). Agents develop bricolage capabilities and tap distributed knowledge, processes and skills in order to find the best way of transforming the innovative concept into products or processes at an industrial scale, usually with “means at hands”.

According to Orr (1996), whenever bricolage is involved, an approach towards organizational knowledge as emerging from a network of social relations, experiences, and personalized memory will remain essential. Most often knowledge internally generated for new knowledge-intensive traditional ventures is complemented by knowledge emanating from external institutions such as universities and public laboratories and from other industrial actors such as suppliers and customers (Dosi and Grazzi, 2010). Novel technology is developed and promoted jointly with partners that entrepreneurs search and find along the value chain or even out of sectoral borders.

Close relations to the developers and manufacturers of production technologies are crucial. This holds well particularly if technical equipment is custom designed, or if at least certain components and functions are adapted to the particular user needs. Naturally this presupposes relatively close coordination, communication and learning processes between the partners concerned. Entrepreneurs tend to establish teams at all possible levels (strategic, operational) in order to realize their ideas through machinery, processing methods and relevant organization.

This transaction of capital equipment co-development is characterized by a high degree of uncertainty, so an enduring relationship based on trust is important in ensuring an effective transaction. Even machine acquisition is *not* a one-time-only transaction as commonly thought, but rather a process of significant duration starting from the very design and development of it, going through installation and start-up which constitutes a significant stage of learning, and reaching regular operation. The social aspect of the above processes requires frequent interactions, which presuppose proximity of physical or at least some other dimension.

Hence, entrepreneurs rely at first on their pre-existing networks as their primary means of access to the welter of resources needed. Personal and business networks are of great importance during production technology development, while usually new contacts are sought when problems or limitations occur, in a way of adding links to a chain. Furthermore, because of the customization, modification and adjustment which will likely take place during this production establishment process, each application of a given technology is, to some significant extent, qualitatively unique. Subsequently, the expansion of networking presupposes a high level of trust and some kind of proximity (spatial or information-flow enabling).

Lundvall (1988) argues that the above considerations are particularly important where the machinery in question is particularly complex, embodies recently innovated technology undergoing rapid change and is expensive. Consequently, when production technologies are *sui generis*, complex, and embody new technology subject to rapid changes clustering of users, producers and other relevant stakeholders to enable frequent face-to-face contact becomes extremely important.

In most cases it is not actually the products themselves that knowledge-intensive entrepreneurs have in the centre of their novel concepts, neither are equipments and inputs. It is more a matter of design and interaction followed by a series of modifications and a constant refinement of procedures planned by a team and not by a single agent. There are always cases of turn-key production-lines, but there are rare in knowledge-intensive novel business concepts and even then “bits and bites” of technical knowledge have to be collected.

Moreover, the tacit elements involved in know-how imply that learning cost and time can be substantial. The exploration of “pieces of knowledge” that suits and development of new techniques and product architectures can be inspired by techniques and architectures already in use in similar or completely different sectors, be borrowed and modified or be totally novel within the sector, which is rather rare.

Synergies can accrue from access to machinery that can be customized or tailored to meet users’ particular needs, possibly assisting the core competitive advantage of their concept. In addition, many important technological insights originate with users. Producers’ interaction with them provides an essential source of innovative ideas and information. Synergies are further needed to acquire the relevant capabilities and develop joint processes of learning by doing. Thus, the following hypothesis is proposed:

Hypothesis 2: Production technology development is positively related to the bricolage capability in the emerging stage of knowledge-intensive low-tech venture creation

Hypothesis 2.1: Concentric cycle networking has a significant impact on the development of production technologies in knowledge-intensive low-tech starting ventures.

Hypothesis 2.2: Dynamic “Knowledge puzzle” making has a significant impact on the development of production technologies in knowledge-intensive low-tech starting ventures

Improvisational capability and production technologies

After the commitment to physical creation, entrepreneurs garner resources and use them toward technology set-up besides organization creation and marketing. Initial design, planning and implementation of production technologies and products demand resource commitment, consume, often delay market introduction, and add to uncertainty and risk. Technological knowledge concerning methods, processes, arrangements and products is created, replicated,

modified or co-produced. No matter the way, it is a painstaking and often quite expensive business (Mansfield et al., 1981).

Improvisational capability allows modifications, novelties and new insight to happen in a cumulative way, building upon initial plans which have to be transformed in processes and products, using experience and real time information by all partners involved, tangling scientific with practical knowledge and mixing bricolage with new resources of all kind. It blends long-planned arrangements with inspirations of the moment, past experience and good practice with innovative perceptions. Cases present patents arising from extemporaneous solutions during the try-and-error processes of the novel product development or even the erection phase, and leading to certain novelties on manufacturing and production processes as well as new unthought-of till then, products. Improvisational capability enables coming up with difficulties in the transfer from vision to reality, from plans to implementation. This is a common phenomenon in TLT new knowledge-intensive ventures. It can happen while trying to implement R&D to mass production, add or introduce innovative product properties and characteristics, or even during an effort to come up with a novel business or production model.

Inevitably, improvisation affects and becomes a part of the organizational processes that surround production technology at the core (Thompson 1967). It is popular within knowledge-intensive low-tech ventures to provoke the traditional character of the industries in terms of practical knowledge, otherwise by innovation in process specialization. They stretch out into unfamiliar technological territories “interrupting deliberately habit patterns” (Barret, 1998). Improvisation requires the pre-existence of resources which can refer to previous knowledge, contacts and plans formed through rapid processes (e.g. an arising technical problem of transferring a novel process to mass production) or extend to existing equipment, raw material and designs which are reworked in relation to a novel conception adding new features to parts or the whole of an existing business activity. The wider and deeper the knowledge pool, the better the quality of the production output can be, eliminating the risk and uncertainty of the new venture.

Literature acknowledges that real-time information increases awareness and alertness (Vera & Crossan, 2005) of both the internal and external environment and makes diverse teams be ‘present in the moment’ (Hatch, 1999) in order to coordinate their actions (Moorman & Miner, 1998a) even when physical proximity is not obtainable and gain immediate feedback on them (Brown & Eisenhardt, 1997). It can be formal (e.g. through a business contact with partner organizations) or informal (a personal contact with academic professors or even with customers). Regardless the degree and type, available information especially on technical and scientific knowledge allows a fluid communication and interaction among founders and the manufacturing environment, translating ideas into machinery and transferring lab experiments into pilot and mass production. Each particular body of knowledge shapes and constrains the rate and direction of technical change. The use of real time information in low tech industries is

achieved mainly by persistence on remodeling by try & error and fixing processes, usually engaging customers in testing. In fact, technical change is partly driven by repeated attempts to cope with technological imbalances that it itself creates but rarely through an R&D activity. Together with bricolage capability, it enables the use of unconventional tools and methods which result to custom-made or even totally novel technical solutions.

However, within improvisational capability, real time information has to be well exploited, combined and embedded in the newly formed organization. The interactions among stakeholders all along the value chain in creating production novelties, no matter the level and extent of innovativeness, presuppose the capability of continuous learning. As Pavitt (1984) puts it with regards to technological knowledge: “most technology is specific, complex . . . (and) cumulative in its development. . . It is specific to products and processes, since most of the expenditures are not on research, but on development and production engineering”. Specificity leads inevitably to the need of improvisational capability and shared cognition.

Continuous learning processes enable the absorption as well as the creation of technical knowledge through accumulation skills and due to the existing knowledge abilities of the establishing teams. They pose spontaneity and creativity which can be observed in multiple approaches of technical problems when transferring an idea on a machine design, or building certain equipment or even customizing existing ones in order to produce innovation. Moreover, technological learning processes influence the rate of all technological capabilities accumulation facilitating further operational performance being later embedded in relevant dynamic capabilities of knowledge management.

Continuous learning capability further facilitates the trouble and turbulence of unexpected changes and reactions against designs and plans (which however imply improvisation), throughout installation and pilot production where changes can occur due to inspirations of the moment or unexpected problems.

In sum, improvisational capability through real time information and continuous learning enables agents and stakeholders combine a range of skills, capabilities and resources to quickly find out the real ‘size of the prize’, bridging critical gaps in operations demands, business novel vision and information flows.

Hypothesis 3: Production technologies development is positively related to the Improvisational capability in the emerging stage of knowledge-intensive low-tech venture creation

Hypothesis 3.1: Fluid communication and interaction with the environment plays a significant role in the development of production technologies in knowledge-intensive low- tech starting ventures.

Hypothesis 3.2: Continuous learning plays a significant role in the development of production technologies in knowledge-intensive low- tech starting ventures

Transcendental capability and production technologies

According to our previous works (see above) entrepreneurs of knowledge-intensive low-tech industries are able to compose initial competitive advantages when they exceed the sphere of common entrepreneurial phenomena. Hence, they have to overcome the notion that cause and effect are close in time and space (Senge, 1990) and develop a priori knowledge through *transcendental capability (TC)*. TC is fundamental in forming innovative knowledge intensive concepts in order to create the competitive starting advantage of a new low-tech venture, holding a significant role in the evolution of production technologies as well. Common entrepreneurial processes in low-tech sectors follow well trodden paths, complying with market and manufacturing *status quo*; i.e. use of existing technologies to satisfy existing markets, seeking advantages in low prices, productivity increase and better delivery terms.

On the contrary, TC holders overcome the apparent difficulty in converting their business concepts into reality, by challenging the fundamental mismatch between the nature of reality and the common predominant ways of thinking about that reality. That is they adjust technologies and processes to their novel business concepts, without stagnating into “*what seems not to fit*”. Innovative products or processes often need machinery not even invented by relevant manufacturers, while novel business concepts are based on innovative adjustments, rearrangements or combinations of existing manufacturing technologies. Yet, in all such cases realization is the result of a process to determine the origin, the extent, and the objective validity of knowledge having to deal with the laws of market and technology understanding and reason, but in so far only, as they refer *a priori* to set objects, and not, as general logic (as it may be in academic research), in so far as they refer promiscuously to the empirical as well as to the pure knowledge of existing sources, internal or external.

The development of needed technologies entails “an act of discovery, a speculation on the future, but also the creation of a new path through the distributed efforts of many” (Berglud, 2010). Idea implementation rests on combinations of activities which range from pure novelty to modest adaptation but in their essence “they reflect the pragmatic nature of most expressions of technological knowledge” (Pavitt, 1984). Scientific knowledge and new technologies are indeed indispensable for most low-tech knowledge intensive innovations (Hirsch-Kreinsen, 2008). Yet, *a posteriori* knowledge alone is rarely sufficiently robust to support operating conditions, processes and performance.

The goal of generating values in a targeted way refers not only to the formation of proper strategies but also to the creation and processing of production know-how. In knowledge-intensive low-tech firms value is added in most occasions through production technologies which are either the mediators or the much intended scope of innovation. The term “value-oriented production technology” is illuminated within the topic areas of production planning, flexibility and technological capability (Klocke, 2009). Technology understanding can enhance

creativity not only for product and process requirements but also for product and process design, machining and analysis of complex ways of translating a conceptual schema into marketable products.

In this context the development of new values is accelerated by a combination of technological know-how in different areas of competence, whose location though is not as simple as it may seem. It actually depends on the agents' *sense of spaciousness* that defines the width and the quality of sources to seek, resources required and combinations made. A strong *sense of the entrepreneurial landscape spaciousness* stretches to production technologies and technological capabilities building for an initially abstract business idea, depends on the agents' attitudes and cognitive capabilities and enhances possible co-operations and solutions while getting out of the sectorial limits. It appears in different modes according to the traditional sector profile. As innovation it may be sector-specific and more rapid when it refers to developments and appliance of scientific knowledge developed in the relevant, connected or even completely different sciences. Then novel production technologies are developing in robust rates to implement "out of the lab" novelties into production and hence spaciousness is highly related to such processes. In less technologically advanced business ideas, knowledge is sought and mainly developing in parallel with design and business models, as well as the appliance of novel raw and supplementary materials and thus spaciousness regarding to technological capabilities development is limited along the value chain and/or relevant industries.

In any case, the range and intensity of such movements depend on the level of view of global value chains and intra- and inter-sectoral industry potential. A *higher sphere of entrepreneurial being* allows for recognising connections among different input and translating information in novel ways. It enables a wider search of partners for production technologies development even out of the common sector technology producers and manufacturers, benchmarking and stronger focus on the relevant arising problems when trying to transfer the novel idea to physical creation. Many times it defines the framework of cooperation with the business concept visionary to be the leader and not the follower of the production technologies project. That allows for bolder experimentation and closer cooperation which are both enhanced where mutual benefits are expected.

While *Transcendental conditions* refer to the ability to extend horizons, seeking novelty and getting out of the limits, *Transcendental synthesis* rules and harnesses the act of unifying and combining the manifold information to be collected. It entails bottom-up and up-down information processing capabilities which stretch to technologies and processes seeking. It also depends on the cognitive properties of the agents, their knowledge on ways to interpret imagination into concrete issues and ways to locate, retrieve and store relevant data, their mechanisms to process them as valuable information and combine them with relevant resources in order to prepare the manifold.

Knowledge-intensive entrepreneurs through transcendental synthesis amass a great number of concepts that allow them to interpret their needs in different ways. The abstract concept of “seeing kitchen cabinets *not* as furniture” was captured due to *receptivity* (i.e. the conscious harnessing of existing technologies, specificities of the national market, new potential due to arising technologies, knowledge and experience of other industries) and interpreted through *imagination* to the a priori-knowledge based “boxing concept” providing it with contents which would lack without transcendental synthesis dimension (such as flexibility from mass- to one-piece production, parametric structure etc). These contents were translated and filtered with knowledge mechanisms into requested knowledge on technologies, processes and new relations within the value chain arising structural and manufacturing challenges and alerting the bricolage capability for novel reconciliations. Synthesis (regarding production technologies) resulted through the other autotelic capabilities as well, to innovative machinery, novel processes and product design, as well as different but equally important benefits for all stakeholders (e.g. the machine manufacturer won the first award in technology for innovative machinery in the following international relevant machine exhibition). Therefore *receptivity and spontaneity* can combine business concept requirements with technology which can exist, can need modifications or extensions or must even be created by manufacturers who are keen to do so.

Judgment is constantly exercised by applying processes that order and structure the sometimes abstract objects of the business concepts so as to make them cognizable. A judgment consists then of a match between technological potentials, be them technologies, capabilities or science, and the main concept. It is a mediator in the cooperation with manufacturers, a provoker when ideas are too much “out of the box” and a major driver of the combinatory synthesis. Mechanisms of comparison, combination, separation and further elaboration of the amorphous collected knowledge mass are activated to produce machines, processes or even manufacturing models either using a priori knowledge and producing rapid innovation or producing novelties by differentiating.

Hypothesis 4: Production technology development is positively related to the transcendental capability in the emerging stage of knowledge-intensive low-tech venture creation

Hypothesis 4.1: Transcendental conditions play a significant role in the development of production technologies in knowledge-intensive low-tech starting ventures.

Hypothesis 4.2: Transcendental synthesis has a significant impact on the development of production technologies in knowledge-intensive low-tech starting ventures

Discussion and conclusions

There are only rare efforts to connect entrepreneurship with strategic management and specifically with the approach of a more structured capabilities’ framework (Aramand, 2009;

Zahra, 2011). In most cases entrepreneurial capabilities remain caged in reflecting the ability of identification and exploitation of the necessary resources in order to act upon opportunities in the market, or to create new market opportunities shifting locus and focus on individuals and the environment they are involved in.

This study makes several contributions to the literatures of entrepreneurship, strategic management and dynamic capabilities.

The notion of autotelic capabilities generates new knowledge about how a new low-tech but knowledge-intensive venture can obtain initial advantage based on novelty derived from intra and inter-sectoral knowledge, fueling entrepreneurial activities and extending the scope of the entrepreneurial capabilities concept. In fact, our definition of autotelic capabilities as higher-order capabilities and our delineation of their impact on production technologies suggest a shift in both entrepreneurial and strategic perspectives. The suggested links among entrepreneurial dynamic capabilities and operational capabilities highlight the need to go beyond individual-centered explanations of entrepreneurial activities towards the formation of integrated capabilities which can be built and sustained due to pre-existing resources (ranking from personal traits and experience to physical ones) and impact operational level as well, shaping new venture's course and performance.

The novel view sets off the role of the inter-sectoral business ecosystem even in low-tech industries, since autotelic capabilities engage significant interactions beyond sectorial limits to derive and combine resources, form processes and build operational and higher-order capabilities. To our knowledge this is among the first attempts to distinguish a specific set of distinctive entrepreneurial dynamic capabilities, although there is an on-going discussion about the entrepreneurial aspect of dynamic capabilities (Teece, 2007; Zahra, 2011) and the very first effort to recognize links among such capabilities and operational-level capabilities.

The paper supports the suggestion that autotelic capabilities are not vague abstractions used to explain success and failure in low-tech knowledge-intensive new ventures; instead they are very specific, can be managed, act as a catalyst and endue new ventures with technological capabilities, as they relate to product and management development.

Implications for practice

As Zahra (2008) states "Opportunities discovered or created by entrepreneurs often fall well beyond management's thinking and strategic vision". Assuming that opportunities are created through the exercise of autotelic capabilities extended to operational level and thus production technologies, entrepreneurs should recognize technological patterns connecting seemingly unrelated science and technologies, through bricolage and improvisational capabilities in order to realize a priori schemata of novel business concepts. That means the ability to relate technologies and processes to concepts and form relevant strategic priorities is not self-evident.

A major problem among scientists is the inability to connect science or technology to mass production and firm performance (Krabel et al.,2009).

Therefore, agents should be keen to connect diverse input, getting out of known limits such as national, sectorial or even specific science-related, mobilizing all sources (e.g. human capital and networking capability) to realize business concepts. Knowing how and to what extent to shape both dynamic and operational capabilities is critical for new market and business space orientation and definition. Bricolage, improvisation and transcendental capability are not idiosyncratic traits and gifts. Intentional and organized cultivation of autotelic capabilities supports competitive new venture creation through changing existing or creating new business ecosystems, and sustainable development of both operational and dynamic capabilities.

Entrepreneurial and/or managerial teams should realize the importance of possessing and further cultivating autotelic capabilities by recognizing potential resources to synthesize the specific capabilities' set and further cultivating it. They should further prioritize the creation of operational capabilities which will allow for the physical realization of the business concept and which however are strongly linked with the autotelic capabilities development and quality.

Implications for theory and further research

The concept of Autotelic Capabilities is a first attempt to connect corporate, knowledge intensive and strategic entrepreneurship, regarding the emerging stage of venture creation and the initial competitive advantage in low-tech sectors. The present paper proposes a further evidence of their importance by providing potential links among autotelic and operational capabilities and more precisely, technological capabilities. Thus, it suggests that autotelic capabilities are higher-order capabilities which can be measured and managed and impact the formation of lower level capabilities.

As it is only a theoretical approach, the hypotheses' validity needs empirical evaluation. A qualitative fourteen-case research in Greek low-tech new-to-the-world ventures, contacted in 2009-2011, has established the existence of ACs and how they relate to dynamic capabilities (see references above). The research is now extending to explore the links among autotelic and operational capabilities in general, prove or reconsider the above hypotheses, encompassing certain dimensions of the bricolage, improvisational and transcendental capabilities and include corporate venturing as well.

Besides limitations, the autotelic capabilities concept and its impact on the formation of both operational and dynamic capabilities of new ventures suggest a fruitful area of investigation. The very concept of autotelic capabilities needs far more theoretical and empirical research to establish the existence of ACs, tighten the framework, describe dimensions and their measures and construct a compact and comprehensive relevant theory. Research could also be extended to the evaluation of the relationship between ACs and firm survival and performance, whether ACs exist in high tech and the determination of the conditions under which ACs are effective.

Researchers, seeking to understand how companies venture beyond the scope of their traditional domains, need to understand and explore deeper the nature of autotelic capabilities and their central role to the actual genesis of key new venture's operational capabilities.

The present paper has further focused on a very specific dimension of operational capabilities; i.e. technological capabilities with an emphasis on production technologies. Research should stretch to the rest operational and other key capabilities such as marketing, finance and R&D capabilities and examine whether the above hypotheses apply for them too.

Another research direction could be the empirical exploration of the concept's generalizability across a variety of contexts. Firm size, age, industry sector, environmental dynamism and other significant contextual factors can be included in order to control for effects autotelic capabilities may have on new venture's survival and performance.

Conclusion

This study seeks to throw more light on the newly formed framework of autotelic capabilities which constitutes a novel approach to the exploration of successful entrepreneurial activities and a shift from individual traits and skills to a structured capabilities' framework. It conceptualizes autotelic capabilities as higher-order capabilities and links them with the operational capabilities a new low-tech venture needs for the realization of novel knowledge-intensive business concepts. It aspires to urge researchers of relevant fields into a more strategic approach of the phenomenon of knowledge-intensive entrepreneurship in general.

CORPORATE SOCIAL RESPONSIBILITY: THE VISITORS' VIEW

Kuokkanen, Henri¹; Macdonald, Michael²

Abstract

Corporate Social Responsibility (CSR) has proven difficult for companies to apply in their business strategies (Dahlsrud, 2008) and tourism and hospitality are no exception. Studies of the link between financial and social performances show mixed results (Kang, Lee & Huh, 2010; Lee & Park, 2009; Inoue & Lee, 2011), and the suggestion of a competitive advantage through CSR as presented by Porter and Kramer (2006) is yet to materialize in these industries. This paper investigates consumer preferences for CSR as potential explanatory factors. The aim is to explore the practical aspects that visitors (customers to tourism and hospitality services) value as CSR and to attempt to establish a relationship between these and the visitors' willingness to pay. Surveys were distributed to visitors in the alpine resort of Zermatt in Switzerland; based on a sample of 266 respondents, perceived importance of different CSR aspects and methods of CSR communication were analysed using ANOVA-modelling. The results reveal confusion about the current supply of CSR in the minds of visitors, but also indicate a connection between the respondents' willingness to pay and certain aspects of responsible actions and communication. They also highlight the need for a more thorough understanding of customer preferences for CSR in order to differentiate between financially successful and failed responsibility initiatives.

Keywords: Corporate Social Responsibility, CSR, consumer preferences, communication, competitive advantage

Introduction

Chiquita Brands International, a multinational fruit company accused of wrongdoings, went through an important corporate social responsibility (CSR) restructuring around the millennium, and it has been presented as a case study of successful CSR program implementation (Werre, 2003). Despite the initial success, doubts have hampered the long-term potential of that program ("Business Ethics: Going Bananas", 2012). This raises the question of whether the investment in CSR has been financially beneficial or whether shareholder value was lost in pursuing ethical goals. Such examples are all too familiar in any industry; while the fruits of new product development or marketing efforts are readily measurable in terms of financial performance, CSR remains opaque. Lack of confirmed benefits creates hesitation over the attention responsibility should receive, reducing investment in the domain. In various polls

and surveys, consumers have indicated valuing such actions (Vogel, 2006, p. 47), but in practice they often seem to fail to 'walk the talk'. Was the suggestion of competitive advantage and additional profits through CSR, laid out by Porter and Kramer (2006), a failure, or is the profitable form of CSR yet to be found?

Tourism and hospitality are financed by the extra funds consumers have available after fulfilling their basic living needs. As the domain also exerts a close connection with the environment it operates in (Kasim, 2006), competitive advantage through CSR should be an appealing opportunity for service providers. However, solid financial gains have not been demonstrated so far (Clavier-Cortés, Molina-Azorin, Pereira-Moliner, & Lopez-Gamero, 2007; Kang, Lee & Huh, 2010; Lee & Park, 2009; Inoue & Lee, 2011). Similar to the Chiquita example, it seems that tourism and hospitality service providers are missing some crucial aspect from their CSR offering, an aspect that would intrigue consumers and meet their demand for CSR.

In the words of Dahlsrud (2008, p. 6): "...the challenge for business is not so much to define CSR, as it is to understand how CSR is socially constructed in a specific context and how to take this into account when business strategies are developed". In this case, the context is the consumer perception of CSR; the definitions created by service providers do not necessarily match potential clients' expectations. The aim of this study is to explore the aspects that visitors (customers to tourism and hospitality services) value as CSR and to attempt to establish a relationship between those and the visitors' willingness to pay. The results should help businesses in the hospitality and tourism sector to understand the context for CSR, and thus plan successful CSR strategies. This paper will start by discussing the relevant literature, followed by the methodology employed, the study findings and finally the discussion and conclusions.

Corporate social responsibility

Aspects and effect on performance

Corporate Social Responsibility was conceptualized by Carroll (1979, 1991), with his model consisting of economic, legal, ethical and philanthropic levels of responsibility. The model, shaped as a pyramid, suggests that the levels build on a foundation of economic performance. It is often discussed together with the stakeholder theory of Freeman (1983), presenting the groups toward whom CSR should be directed. The two theories provide advice on employing CSR. A further model, important especially for practitioners, has been the Triple Bottom Line (TBL) by Elkington (1997); it has been widely used as the basis for company CSR reporting (Painter-Morland, 2006). Such reports are often presented in the TBL structure (economic, social and environmental responsibilities), with the Global Reporting Initiative (GRI) as one of the most widely used frameworks. Yet the practical guidance given by the models remains vague and while exploring definitions of CSR among academics and non-profit organisations,

Dahlsrud (2008) found 37 ways to define CSR. Convergence was evident, but practical advice was lacking, thus complicating the pursuit of responsibility.

The MSCI KLD 400 Social Index has provided a baseline for CSR studies, particularly by ranking companies' performances in different aspects of CSR. Current categories include: 1) the environment, 2) community and society, 3) employees and supply chain, 4) customers (quality) and 5) governance and ethics (MSCI Research, 2011). Inoue and Lee (2011) differentiated the supply of CSR based on these categories in their study of the impacts of CSR dimensions on financial performance in tourism-related industries. Holcomb, Upchurch and Okumus (2007) found that the CSR-related reporting of ten large hotel companies revolved around five themes: 1) community 2) the environment, 3) relationship with marketplace (e.g. suppliers), 4) vision and values and 5) workforce. These categories are supported on a general level by Dahlsrud (2008), who condensed the 37 CSR definitions into five main themes: 1) stakeholders 2) social aspects 3) economic aspects 4) volunteering and 5) the environment. These themes, with some variation, reoccur in most studies as the dimensions of CSR supply.

According to Mohr and Webb (2005) and Sen and Bhattacharya (2001), CSR can create a favourable consumer effect towards the products of responsible companies. The concept of "fit", as in how well consumers perceive the CSR activities of a company to be part of the business, has been found important for a successful CSR program (Becker-Olsen, Cudmore, & Hill, 2006; Brammer & Pavelin, 2006; Husted & Allen, 2007). This suggests that consumers differentiate between CSR actions. Yet consumer expectations of CSR have received less attention than the CSR actions undertaken by companies. Basing a study on Carroll's CSR pyramid, Golob, Lah and Jancic (2008) discovered that the economic dimension of CSR is less important and not positively correlated with the other of Carroll's dimensions; they further concluded that consumers expect companies to go beyond the minimum economic and legal requirements. Studying the related field of sustainability, Choi and Ng (2011) discovered a gap in the literature related to the multiple dimensions of sustainability and compared the environmental and economic aspects. Their finding that environmental sustainability was dominant over economic sustainability in consumer responses supports the earlier findings of differing consumer perceptions of the various aspects of CSR.

Numerous studies of the link between Corporate Social Performance (CSP) and Corporate Financial Performance (CFP) have attempted to discover whether a connection between the two exists. Authors such as Orlitzky, Schmidt and Rynes (2003) and Waddock and Graves (1997) have found a positive link between the two variables, while others, such as Margolis and Walsh (2003) and Griffin and Mahon (1997) discovered no evidence of a clear connection; the overall picture is mixed. In the hospitality industry, research has painted a picture equally unclear; studies in Spain (Clavier-Cortés et al., 2007) and the US (Kang et al., 2010) could not establish significant and consistent links between CSP and CFP, while Lee and Park (2009), studying US hotels and casinos, concluded that there may be a positive link

provided that the initial cost of CSR remains reasonable. Inoue and Lee (2011) concentrated on the effects of CSR dimensions on CFP in airlines, casinos, hotels and restaurants, and established differences in the relationships between the dimensions and the industries. Community aspect and product quality had an effect on CFP in several industries, yet many CSR dimensions studied demonstrated no such effect.

Why the financial results of CSR remain unconvincing, despite clear consumer interest demonstrated in surveys, is a question of key importance. Research into consumer behaviour has attempted to clarify this. Studying Fair Trade products, Pivato, Misani and Tencati (2008) discovered that trust is a significant mediating variable in creating brand loyalty. Trust was also found to be a key factor in successful CSR marketing according to Vlachos, Tsamakos, Vrechopoulos and Avramidis (2009). Kim, Kang and Mattila (2011) analyzed how consumers perceive a CSR message, and found a distinction based on the type of activity. They classified activities as either promoting a good cause or preventing negative impacts. If the activity was aimed at prevention, the type of action was crucial to consumers' interest, as they were sceptical about the real motives for CSR. When promoting positive aspects, there was no significant difference in consumer perception of activities. Pomeroy and Dolnicar (2008) suggested that companies should do more to help consumers create a connection with the CSR initiatives undertaken. This agrees with the findings of Sen and Bhattacharya (2001) on consumer-company (C-C) –congruence; if consumers find the promoted CSR values in line with their own, they are more likely to act based on them. Yet consumers with even the best of intentions may remain inactive. Auger and Devinney (2007) studied differences between consumers' ethical opinions and their willingness to pay extra to support them, and found inconsistent correlation patterns between the two; ethical beliefs did not often seem to lead into financial commitment. Beckmann (2007) criticized existing consumer studies for gaps in methodology related to the social desirability of CSR that easily blurred answers, but also emphasized that further studies of consumers' interests in the domain and their preferred communication messages and methods are required.

2.2 Communication of CSR

Without effective communication, consumers will not be aware of the CSR actions a company undertakes. In a conceptual paper on CSR communication, Du, Bhattacharya and Sen (2010) emphasized the challenges posed by consumer scepticism; CSR communication is extremely delicate and could easily turn against a company if perceived as unjustified marketing. One of the key aspects they raise as a differentiating success factor is whether the message emphasizes commitment to a cause or the impact of an investment in a cause, with commitment implying a higher level of involvement. This follows the findings of Hartman, Rubin and Dhanda (2007), who established a difference between US and European CSR communication regarding whether companies see themselves having a role within a community, or responsibilities toward one.

Studies investigating CSR communication in different countries emphasize cultural aspects and the resulting different expectations for communication (Birth, Illia, Lurati and Zamparini, 2012; Hartman et al., 2007). One-size-fits-all solutions do not work in this field, and companies must take the audience into account. Similar aspects of adjusting communication based on audience were advocated by Dawkins (2004). Morsing and Schultz (2006) propose that stakeholders prefer official communications over advertisement-type releases, but note that releases endorsed by third parties can help companies gain CSR credibility. Morsing, Schultz and Nielsen (2008), after studying Danish CSR communication, furthered this argument by suggesting a model of indirect communication based on independent endorsements. The differentiation between the media used for communication (e.g. CSR report, company website, third party) was raised by Du et al. (2010). A Swiss study by Birth et al. (2012) encouraged careful selection of topics to be communicated, along with better use of reporting standards; local preferences were again deemed key for selection. Interviewing Swedish managers, Arvidsson (2010) stressed the fears of management related to the validity of CSR information communicated; the need for evidence and measures was emphasized in this study.

Arvidsson (2010) further suggests that companies see CSR communication as demand-driven. Additionally, communication is often aimed at preventing negative publicity through 'good enough' work. While these findings could indicate that the supply of CSR communication reflects the demand from various stakeholders, closer analysis of the preferences of those groups has not received thorough attention. Basil and Erlandson (2008) established that presentation of internal CSR items (such as codes of ethics and policies) on the websites of Canadian companies had increased significantly during their study period of 2003-2006, while there was no significant change in the presentation of external items (such as sponsorship or donations to charity). As reported earlier, agreement on the need for tailoring the message to different stakeholder groups exists, but the demand from those groups, especially consumers, should first be recognised (Beckmann, 2007). This would enable efficient delivery of the message. Sweeney and Coughlan (2008) emphasized that CSR reports should not only be targeted at shareholders, but the report should be relevant to a wider group of stakeholders. A company aspiring to gain financially from CSR must make consumers aware of actions undertaken; without communication that meets the interest of those consumers, this will fail.

Methodology

To build on previous quantitative studies of consumers' preferences and attitudes towards companies and CSR (Mohr & Webb, 2005; Choi & Ng, 2011), this research employed a quantitative methodology. Data were collected as part of a larger survey, with a separate set of questions concentrated on the dimensions of CSR actions and CSR communication. The variable 'willingness to pay extra for responsibility in the future' was shared with another study. A seven point Likert-scale (Strongly disagree – Strongly agree) was used to measure the

respondents' level of acceptance of the statements. According to Lozano, Garcia-Cueto and Muniz (2008), the optimal number of alternatives on a Likert-scale is between four and seven, and reliability and validity increase with alternatives as long as the respondents are capable of distinguishing between them. We felt that when trying to establish the level of the tie between beliefs and actions, more choice is essential. The questionnaire was piloted at the Montreux Christmas market in December 2010, and French and German versions were translated by native speakers to assure validity between languages.

Questions on CSR evaluated whether respondents agreed with the importance of five aspects of CSR as part of holiday activities and events: fair pay to employees, use of local suppliers, environmental practises, accessibility for the disabled, employment of local communities and service quality. These follow KLD categories as employed by Inoue and Lee (2011) and the themes found by Holcomb et al. (2007). In addition, three non-CSR aspects were added for control purposes: safety, low price and importance of new experiences. The items used to measure consumers' perceived importance of different CSR communication aspects were constructed based on the studies by Basil and Erlandson (2008) on internal versus external items and Arvidsson (2010) regarding measurement. Three questions measured the perceived importance of general CSR releases, communication of CSR goals and releasing an annual CSR report, with two further question concentrating on the importance of communication examples and evidence of CSR. Finally, the questions associated with willingness to pay extra were oriented towards the respondents' future intentions to select a more expensive provider, assuming the responsibility of a product / service would satisfy them. The approach of 'paying extra' was chosen not because responsibility would always cost more, but because a choice between a responsible and a normal product, *ceteris paribus*, might make the analysis invalid; the choice for responsibility could be too obvious. Statements such as 'I could consider paying extra for responsible and sustainable practises if the arguments were convincing' were used.

The questionnaires were distributed in March 2011 to visitors to the Swiss alpine resort of Zermatt, located at the foot of the Matterhorn. Zermatt was selected as it is a destination for both daily and longer-term visitors; furthermore, the international reputation of the resort allows for a better mix of domestic and foreign tourists. A Saturday was chosen as many package holidays and apartment rentals start and end on Saturdays; along with regional day-visitors, the turnover was maximized. Zermatt is a no-car village, so all visitors must travel the last stretch of the trip (Täsch-Zermatt) by a rail shuttle. With the permission of the rail company, we distributed the questionnaires at the beginning of the train ride and collected them at the end of the 12-minute trip. Passengers in every second row on each side of the compartment were asked to participate in the questionnaire. This stratified random sampling prevented the selection of 'suitable' candidates as the row pattern was pre-determined, increasing the validity for testing statistical significance. Few persons declined, and after excluding local residents the

sample size was 266 visitors. The questionnaires were generally completed properly but N varies across the results due to some missing answers.

Data preparation

The results for CSR activities and CSR communication questions were ordinal variables. Willingness to pay was calculated as an average of two questions targeted at measuring the future intentions of the respondents and tested with Cronbach's Alpha, scoring a qualifying 0.862 for variable validity. However, the variable did not fulfil normality criteria on skewness and kurtosis (skewness / kurtosis < 1 and (measure / std. error of measure) < 2). A logarithmic transformation LG10 (8 – value) was performed to normalize the variable to a level acceptable for statistical analysis (based on skewness and kurtosis), with the sample size of 266 supporting normality conditions. Visual inspection of Q-Q plots suggested that the data is distributed in an approximately linear fashion versus normal distribution.

Findings

Males were slightly over-represented in the sample (56%). Approximately 80% of respondents fell within the age category of 25-64 and they were fairly evenly spread within this range (Figure 1). All levels of education were represented, but higher education was overemphasized, as half of the respondents held a bachelors' or masters' degree with another 10% a doctorate. This is not surprising considering Zermatt is a high-end resort. 30% of the respondents chose the English questionnaire, supporting the international nature of the sample.

Figure 1: Description of the sample: education and age

CSR activities significant for willingness to pay

The first objective was to explore how important the respondents perceived the different practical aspects of CSR, and to compare those perceptions with non-CSR control aspects of a holiday experience. Table 1 ranks the aspects, revealing that starting with service quality, the non-CSR control factors are most appreciated by the respondents. The uncertainty of the respondents grows as the importance of the aspect decreases. Only low price was less important

than the CSR aspects of a holiday experience. Examination of inter-item correlations revealed that the CSR aspects marked with a star consistently had higher correlations (above 0.4) with each other than the control aspects. In particular, the use of local suppliers, fair pay and employment for local communities were closely correlated with each other with correlations of over 0.8. Service quality demonstrated low (<0.4) correlations with CSR aspects and was thus classified as a non-CSR aspect for the rest of the analysis, in contrast with the classification by Inoue and Lee (2011). Low price was perceived clearly as the least important factor.

<i>Aspect</i>	<i>Mean</i>	<i>Standard deviation</i>
<i>Service quality</i>	6.30	0.829
<i>Safety</i>	6.16	1.052
<i>New experiences</i>	5.90	1.076
<i>Environmentalism*</i>	5.73	1.148
<i>Use of local suppliers*</i>	5.73	1.239
<i>Accessibility*</i>	5.67	1.209
<i>Fair pay*</i>	5.66	1.339
<i>Employment for local communities*</i>	5.61	1.282
<i>Low price</i>	5.08	1.431

Table 1: Ranking of aspect variables. * notes a CSR aspect.

<i>Source</i>	<i>Adjusted R Squared</i>	<i>F-value</i>	<i>P</i>
<i>Model</i>	0.169	3.786*	0.000
<i>Environmentalism</i>		4.672*	0.000
<i>Accessibility</i>		2.695*	0.015
<i>Employee fair pay</i>		2.160*	0.048

Table 2: ANOVA results. Dependent variable: willingness to pay extra for responsibility.

* denotes significance at 5% level.

Next, the connection between CSR actions and consumers' willingness to pay extra was analysed. As all the independent variables were ordinal, multifactor ANOVA modelling with intercept using SPSS GLM was used, with willingness to pay extra for responsibility as the dependent variable. The non-CSR aspects, as expected, did not significantly explain changes in willingness to pay for responsibility. Environmentalism, accessibility and employee fair pay were significant in causing changes in willingness to pay (Table 2). Levene's test ($F=1.122$, $p=0.272$) confirmed equality of error variances across the three groups. R squared of the model is fairly low at 0.169 and thus a large part of the change is explained by other factors. Using local suppliers and providing employment to the local communities were not significant in explaining changes in willingness to pay, possibly due to the high correlation between the three CSR variables discussed earlier.

The effect of CSR communication on willingness to pay

The respondents' perceptions of the importance of the five aspects of CSR communication were first explored through a comparison of means, as presented in Table 3. Practical examples and evidence of actions were considered most important and these two items also demonstrate the highest inter-item correlation at 0.7; other correlations vary between 0.351 and 0.628. An official CSR report was seen as the least important by the respondents. However, the differences in mean values are small.

<i>Communication item</i>	<i>Mean</i>	<i>Standard deviation</i>
<i>Practical examples of CSR</i>	5.71	1.139
<i>Evidence of actions taken</i>	5.68	1.143
<i>CSR releases</i>	5.54	1.111
<i>Stated goals for CSR</i>	5.54	1.201
<i>CSR report</i>	5.36	1.276

Table 3: Ranking of CSR communication aspects.

As with the CSR actions, multifactor ANOVA modelling with intercept using SPSS GLM was used to analyse whether various aspects of communication have different effects on willingness to pay extra for responsibility. Evidence of actions taken, CSR releases and CSR reports were not significant factors and were thus not included in the final model. As table 4 indicates, the final model and two independent variables (stated goals for CSR and practical examples), are significant, with gender also demonstrating a significant effect. As earlier, adjusted R squared is fairly low at 0.208. Levene's test confirmed the equality of error variances ($F=0.981$, $p=0.496$).

<i>Source</i>	<i>Adjusted R Squared</i>	<i>F-value</i>	<i>P</i>
<i>Model</i>	0.208	5.952*	0.000
<i>Stated goals for CSR</i>		3.681*	0.002
<i>Practical examples of CSR</i>		3.383*	0.003
<i>Gender</i>		4.953*	0.027

Table 4: ANOVA results. Dependent variable: willingness to pay extra for responsibility. * denotes significance at 5% level.

Discussion and conclusions

The purpose of this study was to explore the importance consumers place on typical CSR actions and communication methods, and to study whether perceived importance of these factors explains changes in willingness to pay extra for responsible products. The question was thus whether current implementations of CSR interest consumers. The results of the two sections will first be discussed separately and then synthesized.

Comparing the aspects of a holiday activity or event presented to the respondents, the non-CSR aspects of quality, safety and experiences clearly stood out compared to the CSR aspects. The perceived importance of these aspects would not, as expected, instigate significant changes in willingness to pay extra for responsibility. That the traditional aspects were deemed more important than CSR suggests that the effect of social desirability (Beckman, 2007) was not overwhelming. However, due to human nature, the reported level of CSR importance may still be somewhat too high, limiting the interpretation. The mixed results in CSP-CFP studies support the relative unimportance of CSR observed; should CSR aspects dominate over traditional aspects, a CSP-CFP link should also be clear. The aspect of low price was clearly the lowest importance, and this may be explained by the reputation of Zermatt as a high end resort, along with the average age and high educational level of the respondents. The CSR aspects used were based on established dimensions of CSR from earlier, supply-oriented studies (Inoue & Lee, 2011; Holcomb et al., 2007; Dahlsrud, 2008), but some of them demonstrated fairly high inter-item correlations. This could imply that respondents who perceive one CSR aspect to be important do so for all. However, lack of clear identity for the categories could provide another explanation; respondents cannot potentially differentiate the aspects of CSR. Confusion over CSR actions could further lead to overall disinterest, reducing the willingness to support company actions and increasing the risk of perceived greenwashing.

The environmental aspect was the strongest factor explaining changes in willingness to pay extra. This clearly differs from the findings of Inoue and Lee (2011), who found that environmental actions demonstrated no link with the measures of profitability (ROA, Tobin's q) used in their study. On the other hand, product quality, defined as a CSR aspect earlier, was not perceived accordingly; in service industries quality is likely to be seen differently. The emphasis on the environment could reflect the results of Choi and Ng (2011) on the dominance of environmental over economic sustainability, but as economic aspects of CSR were not studied, a direct comparison is impossible. Limiting the results of this study, the three categories linked to local communities and compensation were very highly correlated with each other and reduced to one in the ANOVA analysis, raising further questions on whether the respondents are making a connection with practical actions (Pomering & Dolnicar, 2008).

The ranking of CSR communication aspects revealed that respondents considered CSR reports least important and this finding corresponds well with the notion of Sweeney and Coughlan (2008) of CSR reporting targeting shareholders. Such reports, very formal in their presentation and resembling standard financial reports, fail to excite consumers. The two aspects ranked most important provide little surprise either; practical actions, along with measured evidence of actions, are perceived most important. Such communication is better designed for a public audience (Dawkins, 2004), and thus raises more interest. The questions in this study did not differentiate between types of evidence, as no company was used as an example. This limits further analysis related to earlier findings on using third party

endorsement as evidence, but the ranking suggests that consumers share the fears of the validity of CSR information expressed by company managers (Arvidsson, 2010). Actions and evidence are deemed in most demand by consumers, and further research on these actions, and how evidence should be provided, will be necessary.

The effect of communication on willingness to pay extra for responsibility was reduced to two factors; stated goals of CSR and practical examples, both with a significant effect on willingness to pay. Evidence, perceived as the second most important aspect in absolute terms, was not a significant factor in the ANOVA analysis, but this may be explained by the high correlation between evidence and examples. Respondents' capability to differentiate between the statements limits the results here; few companies provide measures or other evidence in their consumer-oriented communication, and with their lack of experience the respondents may have perceived 'examples' as similar to 'evidence'. This may also relate to why CSR communication is so prone to consumer scepticism (Du et al., 2010). If examples are not distinguished from evidence, communication with examples can easily be judged as 'unjustified' marketing; no evidence is provided even if intrinsically expected by the audience. This supports Beckman's (2007) recommendation to explore the demand of different stakeholder groups related to CSR communication.

This study aimed to provide insight into the consumer perception of CSR in hospitality and tourism, as previous research has generally taken a supply-oriented view. The purpose did not include modelling how CSR could convert into willingness to pay extra; rather, it aimed merely to identify significant factors involved. The ordinal nature of the data was a clear limitation to this study. Yet the results suggest that consumers of tourism and hospitality services cannot fully differentiate between the separate aspects of CSR as suggested in the literature. This can lead to blended reactions toward the efforts made by service providers, and dilute the potential positive effect of CSR. Confusion over the methods and aspects of communication, also suggested by these results, compound the problem.

Based on the low R-squared values of each explanatory analysis, other predictor and / or mediator variables of how CSR actions in hospitality and tourism could convert into extra revenue are likely to exist. One of these could be trust (Pivato et al., 2008; Vlachos et al., 2009). The problem of greenwashing is always present when responsibility is discussed, and the actions, together with credible communication, should be directed at creating trust to overcome this scepticism. Moral values and personal ethics are also very likely to play a role, though hard to interpret (Auger & Devinney, 2008). A logical next step in would be to model the interaction creating extra profits. The aim of this paper was to provide an exploration into how customers of hospitality and tourism sector perceive CSR; in other words, to explore the demand for CSR. Only by matching supply with demand can a competitive advantage be achieved. The results, with significant effects between the input variables and willingness to pay extra, are encouraging but call for in-depth analysis of consumers' preferences.

Abstract

The paper deals with the contribution of information and communications technology to economic growth and environmental sustainability by examining the long-run equilibrium relationships between information and communications technology, carbon emissions, and economic growth. The paper provides an international perspective by presenting the results for panel data of the group of twenty countries stacked from 1991 to 2009. The paper examines the long-run equilibrium relationship using panel cointegration techniques and Granger causality using fixed-effects and random-effects models. The test results indicate that a long-run equilibrium relationship exists among these variables. By testing directional causality, the information and communications technology infrastructure has been an important contributor to economic growth; especially, the role of information and communications technology has been most accentuated in the G7 advanced economies rather than the emerging economies. However, the information and communications technology infrastructure has also generated a large increase in carbon emissions as a consequence of the economic contribution, especially in emerging economies. Strong bidirectional causality also exists between carbon emissions and economic growth.

Keywords: economic growth; economic development; information communications technology; environmental sustainability; carbon emissions

Introduction

The Group of Twenty (G20) is a group of heads of government or state from 20 major economies, made up of 19 countries – Argentina, Australia, Brazil, Canada, China, France, Germany, India, Indonesia, Italy, Japan, South Korea, Mexico, Russia, Saudi Arabia, South Africa, Turkey, the United Kingdom, and the United States – plus the European Union. Collectively, the G20 economies account for around 90% of the global GDP, 80% of world trade, and two-thirds of the world population (<http://www.g20.org>). Despite its lack of formal ability to enforce rules, the G20 Summit gives it a strong input on global policy. It brings together the world's major advanced (also called G7) and emerging economies. The main objective of the G20 is to coordinate policies among its members in order to achieve global economic stability

and sustainable growth, among others. Following the objective, at the 2006 G20 Meeting, the theme of “building and sustaining prosperity” was proposed and the related issues discussed, including domestic reforms to achieve sustained growth, global energy and resource commodity markets, and so on.

Carbon dioxide (CO₂) emissions stem from the burning of fossil fuels and the manufacture of cement and include carbon dioxide produced during the consumption of solid, liquid, and gas fuels and gas flaring. According to a report by the International Energy Agency (2011), the CO₂ emission levels are relatively high in most G20 countries. Along with the rapid economic growth, the emission levels have been growing fast. Population growth, rapid urbanization, and industrialization as well as the growth of business sectors such as information and communications technology (ICT) and manufacturing may be putting tremendous pressure on the natural resources and environment in the countries. Despite continued growth, a wide gap exists in the G20 member states between advanced and emerging economies. However, environmental problems know no economic boundaries since they are complex in nature and transcend national boundaries.

The challenge facing the G20 is how to develop policy responses to counter the effects of the current environmental problems and climate change and lay the foundations for robust and sustainable development that generates employment and at the same time reduces the CO₂ emissions from industries. These policies may differ from those pursued in the past as they not only have to lead to high or sustainable growth rates but must also lead to rapid and sustained employment generation as well as structural changes in the business sectors. In this regard, the increased economic importance of the ICT sector raises new questions for the governments regarding the best policy frameworks to encourage continued economic growth and a reduction in CO₂ emissions. Thus far, there is no systematic time series approach that analyzes the relationship between ICT development, CO₂ emissions, and economic growth for the G20. This research questions whether the development of ICT infrastructure is causing an increase in CO₂ emissions and leading to economic growth.

Literature Review

ICT Development and Economic Growth

Economic growth reflects the ability of a nation to produce more goods and services. The use of ICT infrastructure and products enables goods and services to be produced and provided more efficiently and rapidly (Lam and Shiu, 2010). ICT infrastructure and products provide a framework for the efficient delivery of goods and services, improve communications between firms, and spread to other industries, thereby contributing to overall economic growth (Koutroumpis, 2009). They ease in the trade of goods and services and the creation of new businesses and jobs (Arvanitis and Loukis, 2009; Carayannis and Popescu, 2005). Hence, the ICT

sector in many countries continues to attract the interest of their governments in view of its potential to contribute to economic growth.

Many studies have reported that the ICT sector is one of the main drivers of better economic growth and sustainable growth (Daveri and Silva, 2004; Lipsey and Carlaw, 2004) and higher productivity (Laurson, 2004; Plepys, 2002). Thompson and Garbacz (2007) reported that the growth of the ICT sector has a significant positive impact on productivity growth for the world as a whole by improving the efficiency of how it and other resources are used. The broad conclusion of these studies is that a positive and significant link exists between the ICT sector and economic growth on the country level. They report that the growth of the ICT sector plays an important role in economic growth. To conclude, this study expects that the ICT sector will play an important role in economic growth. Accordingly, the following hypothesis is considered:

Hypothesis 1: ICT development leads to economic growth.

Economic Growth and Carbon Emissions

Is there a relationship between carbon emissions and economic development? The question is whether or not emission levels are connected with development levels. This line of research argues that the relationship between economic activity and carbon emissions may change as the economy moves through different stages of development. Economic activity may be a key driver of carbon emissions. Economic growth is often associated with high carbon emissions per unit of output. Many studies have examined the time-series dynamics between economic growth and CO₂ emissions to infer the direction of causality cross-country (Coondoo and Dinda, 2008; Lee and Lee, 2009; Luzzati and Orsini, 2009). The general consensus of these studies is that there is a close correlation between economic growth and environmental degradation: when an economy grows, the quality of the environment declines. This trend can be demonstrated by charts of human population, economic growth, and environmental indicators. A plethora of literature (Swart et al., 2003; Wilbanks, 2003) introduced the relationship between sustainable development and climate change with the emphasis on the degree to which climate change mitigation can have so-called co-benefits. These effects contribute to the sustainable development goals of the economy in question.

In this regard, many researchers employ a combined approach by examining the dynamic relationships between economic growth, energy resource use, and CO₂ emissions together, especially in the EU (Keppler and Mansanet-Bataller, 2010), and in Asian-Pacific countries (Niu et al., 2011). They find that economic growth is closely related to CO₂ emissions, especially in the recent decade in emerging economies. In sum, it is expected that higher economic growth may require greater energy resource use and thus result in high CO₂ emissions. Given all these existing findings, the following hypothesis is considered:

Hypothesis 2: Economic growth is related to an increase in CO₂ emissions.

ICT Development and Carbon Emissions

The relationship between the ICT sector and CO₂ emissions may be jointly determined because higher growth of the ICT sector requires more energy consumption. A combined approach of the joint impact of energy consumption and environmental degradation on economic growth has emerged to examine dynamic relationships between economic growth, energy consumption, and environmental degradation (Bowden and Payne, 2009; Pao and Tsai, 2010). The results of the links are however inconclusive. The results of those studies show that there are different causal links between energy consumption, economic growth, and CO₂ emissions at different stages of economic development in different countries (Dinda and Coondoo, 2006; Soytas and Sari, 2009).

The relationship between energy consumption with the particular sectors of the economy and environmental degradation has not gained much attention. The ICT sector is one of them. So far, there is no systematic time series that analyses the relationship between the ICT sector, CO₂ emissions, and economic growth. The development of ICT infrastructure and the use of ICT products can contribute to economic growth while leading to an increase in energy consumption. For example, the increased use of ICT products and the development of ICT infrastructure result in higher demand for energy which may lead to an increase in CO₂ emissions. Hence, the following hypotheses are formulated:

Hypothesis 3: ICT development is related to an increase in CO₂ emissions.

Hypothesis 4: There is a long-run equilibrium relationship between ICT development, economic growth, and CO₂ emissions.

Research Methodology

Data

This section describes the data and outlines the methodology used in the development or selection of the indicators and the normalization of the data.

GDP. The real GDP is used to measure economic growth. The real GDP represents the gross domestic product adjusted for changes in money value. Real GDP figures allow us to calculate a GDP growth rate, which tells us how much a country's production has increased or decreased in comparison with the previous year.

CO₂. CO₂ emissions stem from the burning of fossil fuels and the manufacture of cement. They include carbon dioxide produced during the consumption of solid, liquid, and gas fuels and gas flaring. CO₂ is represented in thousand metric tons.

ICT. ICT development is measured using ICT readiness, reflecting the level of ICT infrastructure and access. The indicators measuring ICT readiness include mobile cellular telephone subscriptions per 100 people, Internet users per 100 people, and fixed broadband

Internet subscribers per 100 people. Since mobile cellular telephone technology is increasingly replacing fixed telephone lines in many developing countries, this is a key indicator for measuring telephone access and uptake. To generalize the validity of the core indicators of ICT development, this study establishes a composite index that combines the three indicators. Their average score is used as a proxy of ICT development.

Human Capital. The proxy used to measure human capital development is a composite index that combines the three gross enrolment ratios (% of gross enrolment) of primary schools, secondary schools and tertiary schools in each country. The gross enrolment ratio is the ratio of total enrolment, regardless of age, to the population of the age group that officially corresponds to the level of education shown. Human capital development is included in the model as a control variable.

Exports. Exports represent the total value of exports of goods and services in current United States dollars. The dollar figures for exports in this study are converted from the percentage of GDP using the current currency exchange rates in the international currency market.

The sample is restricted to the period for which annual data are available: from 1991 to 2009 (19 observations for each country). The above time series raw data are collected and retrieved from the World Development Indicator database published by the World Bank (<http://data.worldbank.org/>). Normalization of the data is necessary before any aggregation can be made. Therefore, transformation into a natural log mitigates the possible distortions of the dynamic properties of the series. The numeric values of the descriptive statistics of the time series and the results of Pearson correlation analysis are not reported here due to space conflict.

Panel Unit Root Test

The data generated for many economic variables are characterised by stochastic trends that might result in spurious inference if time series properties are not investigated. A time series is said to be stationary if the autocovariances of the series do not depend on time. Any series that is not stationary has a unit root. The formal method of testing stationarity is the unit root test. The recent literature suggests that panel-based unit root tests have a higher power than unit root tests based on individual time series (Breitung, 2000; Choi, 2001; Hadri, 2000; Im et al., 2003; Levin et al., 2002; Maddala and Wu, 1999). The panel unit root tests the null hypothesis that a series has a unit root (i.e. is non-stationary).

The numeric values show that the null hypothesis of a unit root cannot be rejected at the level of the series, implying that each time series is panel non-stationary. However, when applying the panel unit root tests to the first difference of the series, the null hypothesis for each of the series can be rejected at the 1% significance level. All the series with the first difference are stationary, which confirms that they are integrated of first order or I(1). The numeric values of the results of the panel unit root test are not reported here due to space conflict.

Panel Cointegration Test

A large number of studies suggest various test methods of cointegration in a panel setting (Maddala and Wu, 1999; Pedroni, 1999, 2004). Pedroni (1999, 2004) employed the Engle–Granger cointegration test framework. Engle and Granger (1987) pointed out that a linear combination of two or more non-stationary series may be stationary. The stationary linear combination or the cointegrating equation may be interpreted as a long-run equilibrium relationship among variables. Maddala and Wu (1999) proposed that the Fisher-type panel cointegration test using the Johansen (1991) test methodology is more efficient than using the Engle–Granger test method because the maximum likelihood procedure has significantly large and finite sample properties.

The results of the Pedroni panel cointegration test indicate that the null hypothesis of no cointegration can be rejected for all the model specifications using both the panel ADF statistic and the group ADF statistic at the 0.05 level or higher. For the Johansen panel cointegration test, the null hypothesis of no cointegration is rejected at the 0.01 level. Moreover, the Trace test statistic indicates that at least three cointegrating vectors exist at the 0.01 level and the maximum eigenvalue test statistic indicates that at least two cointegrating vectors exist at the 0.05 level. These cointegrating variables imply the presence of a long-run relationship between the variables. This finding supports hypothesis 4 that there is a long-run equilibrium relationship between ICT development, CO₂ emissions, and economic growth. The numeric values of the results of the Pedroni panel cointegration test and the Johansen panel cointegration test are not reported here due to space conflict.

Testing for Granger Causality

There are several types of panel data analytic models, including constant coefficient models, fixed effects models and random effects models. The quandary of random effects or fixed effects models can be solved using the Hausman specification test. The Hausman test is the classical test of whether the fixed or random effects models should be used. The results of the Hausman test indicate that the random-effects model is more robust for the case using the GDP as the dependent variable while the fixed-effects model is more robust for the case using CO₂ emissions as the dependent variable. The sources of Granger causation can be identified by testing for the significance of the coefficients of regressors.

Table 1 reports the results of panel-based error correction models using random-effects or fixed-effects model. In Table 1, the numeric values in the cells are coefficients of the regressors, representing the short-run elasticity, and the standard errors follow in parenthesis. In testing hypothesis 1, stating that ICT development leads to economic growth, Table 1 shows that ICT development has a positive impact on economic growth and is statistically significant at the 0.01 level. In testing hypothesis 2, which states that economic growth is related to CO₂ emissions, Table 1 shows that economic growth has a positive impact on an increase in CO₂

emissions and is statistically significant at the 0.01 level. It also suggests that an increase in CO₂ emissions is affected by economic growth and is statistically significant at the 0.01 level. Hypothesis 3, testing whether ICT development is related to CO₂ emissions, is supported and statistically significant at the 0.01 level.

For the two control variables, human capital development exhibits an inverse relation to economic growth but a positive relation to CO₂ emissions at the 0.05 level. The coefficients indicate that a 1% increase in human capital development reduces economic growth by 0.147% while it increases CO₂ emissions by 0.226%. Exports also exhibit an inverse relation to economic growth but a positive relation to CO₂ emissions at the 0.05 level.

Discussion and Policy Implications

The results of this study show that ICT development strongly leads to economic growth in the G20 and the G7 as well as emerging economies. At the same time, this study finds a highly significant direct effect of ICT development on increased CO₂ emissions, an indicator of environmental degradation in the G20, especially for emerging economies. This finding suggests that ICT development leads to greater usage of energy resources in emerging economies and thus accelerates the environmental degradation in the countries. The finding implies that ICT development has played a critical role in boosting the economic growth in the G20 countries while it has been generating a large portion of the CO₂ emissions instead.

The development of ICT has been an important contributor to sustained growth for the G20 over the past two decades, especially for the G7 advanced economies. During the same period, the ICT sector has generated a large portion of CO₂ emissions, especially for emerging economies, even though there is little evidence that the increase in CO₂ emissions for emerging economies has been inherently generated by the ICT sector. It appears that it is equally important for governments to know that an increase in productivity could only be achieved if fuelled by substantial improvements in the use of ICT in production and if operated on the right path to environmental sustainability and sustainable growth.

For example, over the past two decades, the role of the ICT sector as an important contributor to CO₂ emissions has been marginalized for the G7 countries. For the G7 countries, technical progress might have led to a rapid improvement in the use of ICT and could thus have reduced CO₂ emissions relative to other industries. For example, there has been significant technological advancement and innovation in the use of ICT in production and thus environment-friendly ICT goods and services have been produced. As a consequence, ICT has been increasingly used as an important input in other industries. In addition to its direct contribution to output growth, ICT has generated spillovers or augmented benefits that might exceed the direct returns to the ICT development. Given the evidence, in its role as the foundation of the industrial infrastructure and an accelerator of the sustained growth, ICT has increasingly contributed to output growth and at the same time to environmental sustainability.

Regression model	Random-effects model			Fixed-effects model

Table 1: Results of Granger Causality Test

Note: Probability values for rejection of the null hypothesis of zero (0) coefficient are employed at the 0.05 level (***, p -value < 0.01 and **, p -value < 0.05).

According to a global information technology report by the World Economic Forum (Dutta and Mia, 2010), encouraging signs of sustainable development have appeared in some emerging economies such as China, India, and South Africa. The governments are continuing their progression in the ICT infrastructure and network readiness rankings. While it could undertake a lot more to make the environment more ICT-conducive, the governments have declared ICT to be one of their priorities and have already made extensive use of ICT. Over the last decade, the governments have prioritized and taken initiatives to boost the development of ICT, particularly in software production, Internet infrastructure, and ICT-related human resources development. As such, governments should take a greater role in promoting the awareness of the benefits associated with the use of ICT. Successful deployment of ICT can contribute to sustainable development by closing the socio-economic gap between the haves and the have-nots and the geographic gap between urban and rural areas.

The G20 has made environmental protection a priority area and put in place a number of agreements and measures to protect and improve the environment. This is demonstrated by the number of international agreements and treaties the G20 member states have signed. However, there are major problems in addressing environmental issues that relate to enforcement, environmental management, and governance. These problems cannot be viewed separately from economic, social, and developmental concerns. Any analysis of the environment in the G20 should take an integrated approach. New policies must be different from those pursued in the past as they not only have to lead to sustainable growth rates but must also lead to sustained employment generation and accessibility to the ICT infrastructure.

Simultaneously, the challenge facing the G20 is how to develop policy responses to counter the effects of the current environmental problems and climate change and lay the foundations for robust and sustainable growth that generates employment and at the same time

reduces the CO₂ emissions from industries. As an important contributor to sustainable growth in the G20 member states, the ICT sector may play a leading role in fostering environmental and social sustainability both within its own sector and as an industry-wide infrastructure. The governments must design strategies that will allow the nations to move from their present processes of growth and development onto sustainable development paths. This will require policy changes in many countries, with respect both to their own development and to their impacts on other nations' development possibilities. Therefore, critical objectives for environment and development policies that follow the concept of sustainable development include reviving growth, changing the quality of growth, and merging the environment and economics in decision making.

Additionally, the integration of economic and ecological factors into decision-making systems within countries has to be matched at the international level for effectiveness. The growth in energy and material use dictates that the direct physical linkages between the ecosystems of different countries will increase. Economic interactions through trade, investment, and travel will grow and heighten economic and ecological interdependence. Hence, in the future, sustainable development will require the unification of economics and ecology in economic development.

Societies, businesses, and citizens should all be scrambling to find a more efficient and greener way to operate and grow. Supporting this pressing need is a growing consumer population and a proliferation of innovative services. Together these trends promise to usher in unprecedented business models and changes to social behavior. ICT lends itself to new models of profitable services and innovation so businesses will find it lucrative to innovate in this space. The green use of ICT, coupled with innovative business models and progressive policymaking, will play a critical role in the reduction of the CO₂ emissions. ICT offerings may address environmental sustainability concerns in ways that can also be aligned with social and economic goals. There is a growing role for ICT in the pursuit of green or sustainable growth goals because governments and local authorities are increasingly expected to focus on environmental sustainability. ICT roles can facilitate their abilities in smart information management and environmental management and lead to the creation of new services that benefit company, society, and government.

The discussion above implies that actors and actor coalitions are important and that there is increasing evidence of multilevel patterns of governance and transnational networks of influence on global environmental issues. Emphasis should be placed on sectors with high potential for green job creation or employment that contributes to protecting and preserving the environment. It is critical to identify how these activities can accelerate the transition to green growth. Although several social, economic, and technological innovations would produce an emission reduction, the actual mitigation will require the implementation of policies to reduce

CO₂ emissions. Measurement can provide feedback and guidance, but it cannot substitute actions.

Conclusions

This paper integrates economic growth and ICT development in a multivariate format that includes CO₂ emissions and human capital development, employing the cointegration and Granger causality tests with the panel data on nineteen nations of the G20, unlike recent research on this topic. It is claimed that the economic growth of the G20 has been accomplished by strong growth in ICT development. The results from an empirical analysis support the hypotheses that were set forth. ICT development leads to a substantial direct effect on economic growth and at the same time a significant direct effect on CO₂ emissions or environmental degradation. CO₂ emissions and economic growth exhibit a positive and statistically significant relationship with each other. The strong indication of causality from economic growth to environmental degradation implies that economic growth is accompanied by the specific conditions of ICT development and its association with environmental degradation.

Abstract

Research often calls for integration between the general laws and the diagnosis of an issue. Analysing the potential methods from the available approaches can be a challenge for the researcher, especially when it comes to the justification of the final selection. The researcher is expected to choose, in accordance with the aim and objectives, the most suitable strategy for the undertaken research. Vital role play among others the size of the institution, its activities and the model it belongs.

Keywords: Action Research, Bank, Interventionist, Qualitative Approach, Quantitative Approach.

Introduction

The present paper deals with various research methods and values. It introduces 'Action Research Approaches' and proceeds with an in depth comparison of them with other non Action Research Approaches.

The author will present the selected topic and provide information regarding the organization, where the issue is detected. Thereupon, there will be a statement of the research aim and objectives. Moreover, the author will provide definitions over Action Research, non Action Research quantitative and non Action Research qualitative approach. Then the author will provide an analysis of how a potential method from each of the above three categories could be approached. Concluding, the author will choose the most suitable one for the undertaken research and explain that choice.

Selected Organization & Selected Issue

The organization which the author has chosen is a local Bank in Cyprus. This financial institution made its first appearance in Cyprus at the end of the 20th century and ever since has successfully managed to establish its presence and has raised its eminence in the banking domain in the island. Gradually, the Bank has greatly increased the total number of branches and inevitably increased the number of staff, becoming in this way a large company. This financial institution managed to introduce new electronic services and innovate in multidimensional accounts becoming a known and preferable institution by the market.

The author having fully access in the organization's archives has located a weakness through the employees' annual appraisals. This weakness concerns the selling results of the employees

having constant contact with customers. Those employees need to anticipate customer's wishes with high quality service, and at the same time be efficient and productive, satisfying in this way the organization (Singh, 2000). To be a successful employee in such position you need to be productive and maintain high quality during the communication with the customers (Bank's archive, Job Description). Those two elements are influenced by various factors. My research focuses on the quality, which requires emotional and laborious efforts. Cook and Hababou (1998), quoted Deloitte and Touche statement, which actually delineate the urgency for change: "In the future, the banking branches that do succeed will likely function more as sales centres than service outlets".

The author focuses in the effectiveness when it comes to foreign customers for a number of reasons. Firstly, Cyprus has important - strategic geographical position and this has always been the reason for many unprovoked assaults and wars, since a number of powerful empires tried to dominate Cyprus (Dinkov and Stoyanov, 2005). Moreover, Cyprus attracts a lot of foreigners for various reasons. The population coming from EU and other countries increases dramatically. In the beginning of the century, only 9% of the population of Cyprus were foreigners. Today, the percentage increased to 21,4% (Statistical Services of Cyprus 2011). Also, Cyprus' low taxation (Cyprus Stock watch, 2011) attracts a lot of foreigners to visit and settle as financiers and investors. Furthermore, recent facts are estimated to increase the number of foreigners in the island. Scientists discovered about 11 milliard cubic feet of natural gas (Chasopoulos, 2011). There are some discordant views with reference to the bigness of its quantity. For example, another source reports that the gas findings are estimated to reach up to 33 trillion cubic feet (Rubin 2011). The discovery of such a treasure has attracted America's, Israel's, Russia's, France's, Britain's, Norway's, Turkey's and Netherlands's attention (Chasopoulos 2011). Several international companies are in the process of entering the Cyprus market because the aforementioned treasure that has been found, advances their financial performance, make the economy more robust and enhance their profits. Therefore, with the establishment of such international organizations the percentage of foreigners within Cyprus will dramatically increase and our island will become cross-cultural in a very high degree. Consequently, the author's focus lies on the intercultural competence of the employees in contact with customers.

Several authors have stated the importance of intercultural competence in today's world. Chen and Starosta (1996) stated that intercultural competence is a sine qua non for success, due to the globalization and the need for intercultural selling (Chairsakeo and Speece, 2004). According to Furnham and Bochner (1986) and Hall (1959), as cited by Chen-ya and Mattila, it is observed that when people do not share the same culture and have different values there is an increased likelihood misunderstandings might arise (2010). The skill of intercultural sensitivity empowers performance when interacting with international customers or prospect

customers (Wang and Mattila, 2010). Same authors encourage further research in various service industries on this field.

Intercultural competence refers to the cultural awareness which affects a person's behaviour on others. Moreover, cultural awareness includes the comprehending of other cultures' characteristics and accordingly adopting the behaviour. Second component of intercultural competence is cultural sensitivity, open-minded and does not reprehend, since the person is trying to understand and appreciate of other cultures' values. The last component is cultural adroitness and it applies when someone knows what to do or what to avoid, communicating in this way effectively, evading offending someone else (Chaisrakeo and Speece, 2004).

Existing models need to be adjusted not only in today's environment but also in Cyprus' context too. For example, research conducted on intercultural competence has not been robust enough on the individual level. Pliopaitė and Radzevičienė (2010), stated that no systematic approach to Intercultural Competence exists, in order to create interculturally competent banking institutions in the European Union with emphasis on behavioural approach and less emphasis on emotions and knowledge. Their study focused on the organizational approach leaving untouched the individual and emotional dimension. Also, there is an important factor missing from their model, which is the culture of the nations. According to Hoffstade (1994), as cited in Vrontis et al. (2008), different countries have different idiosyncratic conditions and so require different strategic practices. Lastly, there should be something to distinguish that this model refers to the Banking Institutions.

The aim of the current paper is to develop a conceptual framework in order to promote better performance for those employees in contact with foreign customers in the banking sector in Cyprus. As far as the Research objectives concern, the author will systematically review the literature on the synthesis of concepts relating employees' performance who are in contact with foreign customers working in a banking sector in Cyprus. Secondly, the author will investigate if correlations exist between relevant concepts and then develop a conceptual framework as a result of synthesizing pre - existing knowledge. Moreover, the author will test the developed conceptual framework in the banking industry in Cyprus, in order to produce new knowledge contributing in this way both in theory and in practice.

Action Research Approach – A Potential Method

As cited in Eden and Huxham (1996), Lewin have identified first the notion of Action Research, who believed that when it comes to research for social practice, there is a need for integration between the general laws and the diagnosis of an issue. Scholars have created action-oriented methods focusing on the effective individual aspect, forming a self-development kind of action research. Same authors refer to Whitehead's (1994) definition: "academics research their own practice as teachers, managers and researchers...action research is a systematic form of enquiry undertaken by practitioners into their attempts to improve

quality on their own practice.” (p.77) Eden and Huxham (1994) refer also to Argyris and Schön’s (1991) view which distinguishes action research from the scientific research. On the contrary, Eden and Huxham believe that a decent action research could and should be also scientific.

According to Cochran-Smith & Lytle (1999), as cited in Hadfield (2005), the knowledge produced in action research is connected with the ‘knowledge in practice’. According to Coghlan & Coghlan (2002), the action research researches in action and not about action.

Sappington et al. (2010), quoting Reason & Bradbury (1994), Hamilton (1994), Whyte (1991) and Kemmis & McTaggart (2005), state that action research has been created by qualitative researchers who carried out their methods trying to bring to surface challenges for new findings and debates. The participants, as part of their social context, are involved and reflect on the arising points. Knowledge is actually created during action and it is not transferred to the working environments. The knowledge created from scratch belongs to the constructivist’s view (Cochran-Smith & Lytle, 1999).

According to Argyris and Schön (1991) as cited in Dickens and Watkins (1999), those theories built during practice will be tested with intervention experiments trying to test a hypothesis and effect a situation at the same time. The people who will take part in the experiments will try to solve the diagnosed problems.

Dickens and Watkins, quoting Peters and Robinson (1984), stated that Action research has not developed as a single theory (1999). On the contrary, action research has led to different definitions and descriptions. According to the same authors, there are different schools of thought regarding action research. The authors refer to Brown, and according to him, Northern School believes that action research focuses on reforming organizational change whereas the Southern School claims that action research focuses on social change. On the other hand, same authors quoting Elden and Chisholm (1993), state that action research focuses on innovation.

There are various action research approaches. According to Raelin (1999), there is the action learning, action science, developmental inquiry, cooperative inquiry and participatory research. According to Marsick and O’Neil (1999), there are three Theoretical Schools of Action Learning: the Scientific School, the Experiential School and the Critical Reflection School. Same authors quoting Revans (1984), state that regardless the different schools, it is commonly accepted that in action learning the participants work on actual situations and there is not a right or wrong answer to a problem. It is also agreed that the participants will communicate on their progress. According to Putnam (1999), the aim of action science is to find the way of designing action and creating better organizations. The idea of an action science was of Chris Argyris and Donald Schön and it is accepted that action science helps to the collective reflection on the hidden beliefs which will lead to change and improved choices. Developmental action inquiry is the approach which is improving personal, group, organizational and society awareness regarding

strategies, politics and other data (Torbent, 1999). Cooperative inquiry introduces the cooperation of co-researchers and co-subjects, trying to successfully deal with a project. There is a need for understanding the world and learn how to improve. This kind of research is usually undertaken by universities and research institutes (Reason, 1999).

Continuing, the aforementioned 'Southern' perspective was then named as the participatory research (Park, 1999). According to Hall (1991), as cited by Park (1999), 'Participatory research' has its roots in Tanzania, where the aim was to show that the research of a group of development workers was based on people's participation, trying to absorb information from the community in which they worked, and thus provide solutions to the problems. There was the shift from being the outside expert who provides ready solutions, in being one of the locals, dealing with the local problems and providing new local answers. According to Park (1999), the researcher in participatory research, first needs to value the community's needs, as those needs are often urgent. That is why, according to Plaut et al. (1992) as cited in Park (1999), handing over questionnaires would not be a good idea, as the people are engaged because of a great importance. The researcher then will contribute as a partner with various roles. For example, the researcher will act as an organizer, facilitator or even coordinator participating in this way research.

The author of this paper, chose to analyse this approach because participatory research applies when the actual needs of a group demand research. The arisen problem in this particular study is the weakness of the employees in creating the kind of relationship with foreign customers, which will allow them to promote their products and transform their customers to devoted and committed customers. This need for improvement on their performance, which will make them satisfied about their self and generate valuable relationships with foreigners, would be an important goal for the researcher, who would join and adopt various roles in order to be taken as a partner (Rosellin, 1999). According to McTaggart (1991) as cited by Marsick and O' Neil (1999), participatory action research demands commitment and research from all the participants. The origin of the terminology of 'Participatory Research' has strengthen the selection, because the authors' view is that every country has its uniqueness, thus every problem should be seen in the social context it is arising. Furthermore, one of the advantages of participatory action research is that, it offers practical outcomes and brings positive results. Also, the fact that the participants are committed allows the access to the mentality and knowledge of the certain group. Moreover, it is the appropriate kind of research when the problem is identified from the group its self and not from an expert (Walker, 1993).

According to Habermas (1987) as cited in Park (1999), the knowledge produced in the participatory research will eventually exceed the initial technical objective and will affect people's behaviours and have an impact on their lives. Eden and Huxham (1994) describe 'participatory action research' as an approach which involves both practitioner's and

researcher's contribution. On the one hand, the practitioner participates forming the outcome of the research. On the other hand, the researcher is actively involved in the organization's world in order to take eventually action and contribute. As far as the type of theory development, which is appropriate for action research, authors suggest that it cannot produce detailed theory testing. The reason is because it cannot be repeated and have the exact same results as the context and the circumstances cannot be exactly the same.

A non Action Research Qualitative Approach – A Potential Method

Reflecting on the research aim and objectives, the author would follow the inductive approach as the objective is to understand the phenomenon, collect data and analyze them formulating a theory, so 'Theory would follow data' (Saunders et al., 2009, p. 126). The inductive analysis, according to Burns (1998) as cited by Damnet (2008), helps the researcher describe well a phenomenon, interpret and evaluate the key concepts.

The most suitable strategy for the current research is the case study. According to Robson (2002), as cited by Saunders et al. (2009), case study promotes empirical investigation of a specific phenomenon. This kind of research strategy involves among other techniques data collection and interviews (Eisenhardt, 1989). Case studies answer to questions 'What?', 'How', in other words the type of questions stated earlier as the Research Questions.

The population of the current research would be the employees in contact with foreign customers, who work at a bank in Cyprus. Those people, who are the sample group, are the group to which the researcher wishes to generalize. More precisely, this is the theoretical population. On the other hand, the study population, which will be accessible to the author, are the employees in contact with customers, who work in a specific Banking Institution in Cyprus (Research Methods Knowledge Base). The Sample will be the particular group of people which will be under investigation (Hussey and Hussey, 1997) are all the employees in contact with customers of a commercial Bank in Cyprus. The Sample size is a subdivision of that particular population (ibid.). In this case the sample size will be 25 employees in contact with customers of the specific banking institution.

The author will use the purposive sample as it fits better to the research purpose. In the current study only particular employees can participate in the research because only those employees are part of the certain phenomenon being researched. To avoid bias the employer will not participate in the selection process of the sample.

According to Patton purposive sample allows the selection of cases which will provide information for in depth study (2002). The current study needs in depth-understanding on intercultural competence to answer the research questions. The judgemental sampling will allow the researcher to choose the participants based on particular criteria since the sample is quite small and it actually depends on the research questions. This heterogeneous sampling

offers description and explanation on the key themes through the collection of data (Saunders et al., 2009). According to Patton, choosing from small samples with contradictions – maximum variation – could become an advantage for the whole research, as it helps the emergence of different patterns and key themes (2002). To sum up, heterogeneous sampling will provide high-quality data without excluding any kind of uniqueness and at the same time will allow the detection of patterns.

As mentioned earlier, one of the most common techniques in qualitative method is Interview, which is the technique to be used in the current study. Interviews allow the collection of reliable data that are connected to the Research Questions. Berg (2001) points out that the researcher should be familiar with the interviewees' world.

The overall aim of using interviews is to understand how the interviewees deal with a multiculturalism and intercultural competence, and at the same time be able to influence the view they have (Hussey and Hussey, 1997). Also, an interview will allow to moot complex questions and proceed to follow-up questions gaining more knowledge. Moreover, it helps the observation of non-verbal communication (ibid.). Lastly, according to Berg (2001), interviews offer intangible but inner reward to the interviewees as they talk about matters they care.

More particular, the chosen type of interview would be semi – standardized, individual and face to face. Semi-standardized interviews are the most suitable as the conducting study is exploratory. This involves the preparation of questions, which helps the researcher to state in a consistent order the questions but at the same time allows the interviewer to divagate from those questions. As mentioned above, the interviews will be composed of only one interviewee at the time, so that he or she would feel comfortable to express his or her opinion and emotions. Also, it will be face to face so that non-verbal communication will be taken into consideration and analysis.

A non Action Research Quantitative Approach – A Potential Method

A deductive approach in quantitative research allows the development of theory (Saunders et al., 2009). The author in this case would be independent and would just observe the research's progress. In order to generalise the researcher will need as a sample a sufficient numerical size (ibid.). The aim of this approach is to distinguish the causal explanations, since the researcher tends to believe in a cause-effect relationship between variables. This kind of approach moved from theory to data (ibid.).

Survey strategy is more closed to the deductive approach. 'Survey refers to a method of data collection that utilizes questionnaires or interview techniques for recording the verbal behaviour of respondents' (Ghauri and Gronhaug, 2002, p. 93). Surveys allow among others the collection of opinions, attributes and relationships.

Survey and questionnaires are very popular in business studies, both the analytical and the descriptive ones. The analytical takes the logic into the field and tests a theory, putting the emphasis on specifying the independent, dependent and extraneous variables. On the other hand, descriptive surveys focus on the identification of a phenomenon and of the particular characteristics of a population at a certain time or at various times in order to compare.

Frequently, questionnaires use coded close-ended questions in order to have precise answers and provide the results easily (Ghauri and Gronhaug, 2002). In order to examine the reliability of the quoting, there is a need for a second person to code the same data independently, and then let the degree of agreement measure the reliability.

The above non action research quantitative approach does not apply to the aim and objectives of the current research. The author needs to go in depth and have long conversations with participants, reading both their words and their body language. In fact the author describes accurately the chosen approach.

An Overall Selection

The author will try to find the answers regarding the undertaken study using qualitative techniques, inquiring in more 'natural' places and receiving data accordingly. There would be an attempt to achieve fruitful insights in a phenomenon, something employed in qualitative research. Strauss and Corbin (1998) stated, as cited by Lin (2007), that this kind of research suits to researchers who investigate to find concepts and relationships so that they can create theoretical explanatory frameworks. Qualitative methods are indeed needed in this research in order to collect in-depth information and understand attitudes. This is the method for gaining insights, discover and interpret. The quantitative approach would not be adopted due to the fact that the author is not interested in generalizing or discovering universal laws; the author is interested in understanding the specific phenomenon in the specific contextual framework (Noor, 2008).

The approach would not be the participatory action research because this kind of research does not have a research leader. In the present issue a leader is required to facilitate the communication and navigate the dialogues. Also, in the current case, participatory action research may be impractical due to the fact that the author also works and it would be impossible to be absent a lot of hours, and due to the fact that the participants are working in different locations and cities. Moreover, this kind of research approach does not have a timeline and it would be difficult to realise when the actual issue is resolved or when the research should stop because it has nothing else to offer.

The influence of the choice

Considering the size of the chosen banking institution, and its activities, it belongs to the model of 'transactions banking' (Executive Compensation and Business Policy Choices at U.S.

Commercial Banks). It grows using credit bureaus, financial process and fee based income. Comparing to other banking institutions which have transformed their business models into something more risky with subprime mortgages, the banking institution which the author is researching is a traditional profitable one (Teece, 2010).

The current research is focusing on the performance of employees in contact with foreign customers. The outcome of the research is intended to assist the growth of profit. The subjects of the research, employees in contact with foreign customers, perform the 'transactional' activities of the bank and they have the closest communication with those customers. According to Bateson, as cited in Singh (2000), employees in contact with customers have a job which is "three-cornered tight." This means that they have to anticipate customer's wishes with high quality service, and at the same time be efficient and productive, satisfying the organization. They are the link between the bank and the customer (Stephenson and Kiely, 1991). Nowadays, those employees must be efficient, "obtaining, analyzing, and using information", satisfying customers' requests, being friendly but at the same time professionals. Concluding, the aim of the research is to develop a conceptual framework in order to promote better performance for those employees in contact with foreign customers. Qualitative approach will give an insight to the reality and provide an in-depth knowledge on how employees comprehend intercultural competence and its impact on problem solving, negotiation skills and other relationship aspects.

Moreover, the selection of the qualitative approach suits the author's philosophical position. The outcomes of the research will eventually mirror the way the author's paradigm.

According to Guba and Lincoln (1994) paradigms are an aggregate of basic beliefs, which means that those beliefs even though they should be satisfactorily argued, they are accepted simply because this is the way an individual thinks. It actually stands for the way someone sees the world and the way he or she comprehends his or her position in the world. Paradigm is reflected on which ontological, epistemological and methodological position someone fits into.

Ontology refers to the researcher's view regarding the nature of reality or being (Saunders et al., 2009). There are various ontological positions such as Positivism, Realism, Interpretivism, and Pragmatism. The researcher's view regarding the nature of reality or being belongs to the ontological position of Critical Realism. The author agrees that "What we experience are sensations, the images of the things of the real world, not the things directly" (ibid., p. 115). Cook and Campbell (1979), as cited in Guba and Lincoln, claim that the existing reality should be under critical and thorough search in order to achieve its closest comprehension (1994).

Epistemology according to Oxford Dictionaries is 'the theory of knowledge, especially with regard to its methods, validity, and scope, and the distinction between justified belief and opinion'. In other words epistemology refers to what is acceptable knowledge in a specific field (Saunders et al., 2009). The author also agrees with Roy Bhaskar (1979), as cited in Reed (2008),

who argues that for critical realists the analysis given on the ontological limits regarding the results of an experiment depends on the reason why the whole experiment was originated.

Moreover, Methodology shows how the researcher will try to find the answers regarding his or her undertaken study (Guba and Lincoln, 1994). The author will use qualitative techniques inquiring in more 'natural' places and receiving data accordingly. As mentioned before the author employing the exploratory research, is trying to achieve fruitful insights in a phenomenon, something employed in qualitative research. Also an exploratory research is selected when the researcher wants to identify categories of meaning (Marshall & Rossman, 1999). Strauss and Corbin (1998), as cited by Lin (2007), stated that this kind of research suits to researchers who investigate to find concepts and relationships so that they can create theoretical explanatory frameworks. Qualitative methods are indeed needed in this research in order to collect in-depth information and understand attitudes. This is the method for gaining insights, discover and interpret (Noor, 2008).

According to Gummesson (1991) the researcher will have to confront and overcome some challenges. Firstly, will need access to reality, in other words, the researcher should have the availability to empirical data as a base for further analysis. Secondly, should have the required pre-existing knowledge on the field understudied, and secure the 'understanding', in other words attain the knowledge needed during the research. Thirdly, in order to avoid bias in the research, the author will have some criteria, such as credibility, transferability, dependability conformability, reliability and validity (Javalgi et al., 2011). Reliability refers to the findings of the research and whether in a repetition of the same research the results obtained will be the same. In order to avoid participant error, observer bias and observer error, the researcher will develop some kind of protocol in order to use as a basis in every interview and which will be available for another researcher who would be interested in conducting the same study.

On the other hand, validity exists when the findings do reflect and represent the reality (Saunders et al., 2009). The current study should be more aware for protecting internal than external validity because external has to do more with testing theories and verifying patterns. On the contrary, according to Yin (1994), as cited by Lin (2007), internal validity especially concerns explanatory researches and it would be wise to use relevant tactics and data that converge.

In conclusion, the case study responds directly and to the organization's philosophy and benefit and at the same time the author, who will gain insights in the way employees deal with and understand intercultural competence. The above decision has been strengthened and secured.

Interventionist versus non Interventionist

The former presentation of the various research approaches facilitates the present part of the assignment. Interventionist and non-interventionist approach, both aim to contribute in theory by trying to understand, conceptualize and then explain a certain phenomenon. Both of them is

not very easy and possible to replicate as the context is always unique and the participants differ (Jönsson and Lukka, 2007).

On the other hand, they share some differences mainly in the way in which information is absorbed and the way in which the researcher is used. Jönsson and Lukka (2007), quoting Keating and Lukka, state that the main target in non interventionist approach is to show, improve and test previous theory. If there is a gap, the researcher will create a theoretical framework and generalize the knowledge, contributing in this way in theory. The important is that, in non interventionist approach, the researcher selects information mainly through interviews and archives and not so much from observation. The researcher examines what, how and why a phenomenon has occurred in the past (Jönsson and Lukka, 2007).

On the other hand, in interventionist approach the researcher focuses on the empirical data collected from observation. The information coming from the archives is important, but it is rather the starting point of the research (ibid.). The researcher becomes a member of the group and have the other people committed and truly interested in the research. It is a problem which really matters them and the researcher has the opportunity to witness their behaviour and most probably the true *causa causans*. Jönsson and Lukka (2007), quoting Argyris and Schön (1974) stated that the researcher will better understand the theory which is actually used, rather than the created theory. The researcher in interventionist approach is trying to solve a problem providing practical solutions. Except the academic knowledge, the researcher will gain practical knowledge as well.

On the other hand, during the interventionist approach, the researcher is becoming a member of the 'community' and this involves the risk of bias. Of course, if the analysis of the data is done properly, the results would be no less reliable than the one coming from non interventionist approach.

Researcher values

Researchers are influenced by their own values. Greenbank (2003), quoting Rokeach (1973), presents the terminal and instrumental values of the researcher. The first one refers to the moral and competency values, which refer to what a researcher feels right or wrong and to how he or she should proceed in order to reach to an efficacious research. On the other hand, 'terminal values', reflect the hopes of a person, regarding itself and the society. Those values will affect the researcher's ontological and epistemological position, which will define the adoption of a specific research method (ibid.).

The researcher, who presumes the 'truth' trying to minimize the effects of his or her personal perspectives and values and trying to be as neutral as possible, belongs to the positivistic approach (ibid.). Generally that researcher would adopt the more 'scientific' methods, like surveys, experiments and quantitative methods. The researcher is writing in a formal using the

passive voice, in order to give the impression that does not adopt any personal view and his or her research is objective (Hussey and Hussey, 1997). People in this approach, tend to value that that human behaviour should be conducted just like the natural sciences, because they assume that the society does not depend on human. They also value the laws, which they believe should be the basis of explaining a phenomenon and predicting it.

On the contrary, there are researchers who accept the influence of their own values and want to understand human behaviour from an individual's perspective (Hussey and Hussey, 1997). According to Pring and Cohen et al., as cited by Greenbank (2003), the researchers who believe in various realities tend to use the qualitative approaches, such as unstructured interviews and observation. Those researchers belong to the interpretivist approach. They believe that society is affected by people and that the realities depend on the mind (Hussey and Hussey, 1997).

Required skills for different methods

Research skills are those skills which the researcher needs in order to undertake a research. Moreover, research skills refer to the knowledge required for collecting and analyzing the data (Andreatta, 2005). There are different ways of discovering and creating knowledge (ibid.). But in all cases, research skills develop through time and experience.

On the one hand, qualitative methods are used when no data or when the variables should be kept unaffected. The data are collected through observations and focus groups and show how the relationship of the variables works (ibid.). Qualitative methods require the capability of choosing subjects that will best serve a question. Also, a researcher needs to be observant and careful in order to collect the data while happening. Moreover, have the ability to filter from a huge amount of words, the meanings and collect the data (Houser, 2008).

On the other hand quantitative methods are used when the data already exist and the researcher can numerically measure them and statistically analyze them, trying to discover if causal or correlational relationship exists between the variables (Andreatta, 2005). Thus, quantitative methods demand that the researcher can define variables and use measurements which are valid. Of course, this person needs to be able to analyze the results using the statistical techniques (Houser, 2008).

It is worth noting that, in the case of interventionist approaches, even if there is a need for the aforementioned qualitative skills, nevertheless, there are some other skills crucial and fundamental for the collecting data. The researcher in interventionist approaches is typically trying to solve a problem in an organization. He or she needs to have analytical skills and know the existing literature in the specific field, just like the other research approaches. Moreover, interventionist approaches require people skills and courage. The researcher should be able to understand the organizations' background and also be very careful and very good in interpersonal relationships but at the same time remain objective, as he or she must be taken

seriously in order to make meaningful interventions. Other than that, since interventionist approaches take time, the researcher need to patient (Jönsson and Lukka, 2007).

Conclusion

The author has presented definitions over action research, non action research quantitative and non action research qualitative approach. Also, there was an analysis of one potential method from each approach and then a justification of the final selected approach.

The words limitation forced the author to be brief and use concentrated word, something quite challenging, as the assignment is composed of a lot of definitions and literature.

REFLECTING ON A DBA JOURNEY

Leonidou, E.¹; Christofi, M.²

¹ University of Gloucestershire. Email: erasmialeo@hotmail.com

² University of Gloucestershire. Email: michael-chr@live.com

Abstract

Each one experiences an incentive and a journey through the lenses of our paradigms with a unique way. Reflecting on those paradigms and the procedure of questioning the accuracy of those 'mental maps' during an advanced academic qualification, will contribute to the development of an academic identity. The ignorance of the existence of those 'maps' slows down the process of self-knowledge and self-development. Reflection on the things that generate dilemmas, conflicts, risks and uncertainty becomes fundamental during a DBA journey as it may eventually lead to an outcome. People would get the best out of a reflected action while writing a learning journal. Reflecting on the understanding and the representation of the understanding is very crucial in the development of critical thinking and general questioning.

Keywords: Reflection, DBA, Learning, Problem Solving, Learning Journals, Critical Reflection.

Introduction

The current paper reflects on the author's experience as a DBA student and offers insights into the author's gradual progress, both in personal and academic level. More specifically there is a presentation of the experiences the author came across. The author have made an effort to analyse the challenges which constantly faces while trying to comprehend the academic practice and develop her own academic identity.

The way the author decided to reflect on the journey follows a chronological path, from the day she decided to enter the DBA program up until today. The author decided to structure her ideas but at the same time let herself free to reflect on the decisions. In the last chapter the author reflects on the modules one by one, which have assisted in the framing of changes.

Reach to the Decision

Cavafis' poem, 'Ithaca', has been an inspiration and has affected the author's decision in undertaking a DBA program. What touches the author the most is the part where Cavafis claims that 'Ithaca' (target) is the opportunity to meet new people and experience new situations.

Up until recently the author couldn't be familiar with a DBA program, since her BA was in History and Archaeology. Only when the author concluded the professional qualification from the American Institute of Banking, could she realised, that she wanted to take part in a

program, which would allow personal and professional development. The thought of getting cracking with the subject the author is interested in it was becoming a deserving case. Either way, the author was convinced that qualifications are quit appreciated in Cyprus and especially in the Banking Institution where I work.

It seems that the model of Skinner et al. (1998) cited in Schunk (1991) worked exactly on the author. They suggest that perceived control over a situation composes 'means-ends' beliefs, which is about the believe that a prospective target will bring certain results; 'agency' or 'capacity' beliefs, referring to whether a person is or will be able to accomplish that particular target, and 'control' beliefs, which shows that the person can reach the wanted outcome or results of the aforementioned target. What happened to the author, is that she held a means-ends belief that participating in a DBA programme and working hard on it would made her expertise in the subject and in her job, a capacity belief that she could study hard and dedicate the majority of her time to it, and a control belief that the author could be an expertise in her subject and in her job.

In addition to the above and according to the expectancy theories mentioned by Schunk (1991), people get motivated to act, only if they believe that they are likely to achieve a specific goal and that the goal it is worthwhile. In the author's case, even when she faces a challenge, the author does feel that the completion of the DBA is attainable and that by the time she finishes it she would be a better individual both in personal and professional life. The DBA journey is full of adventure, meeting interesting people and professionals, and of course it is a reservoir of knowledge.

The theme that inspired the author and got her started came from my working environment. Working for three years as a front line employee at a local Bank in Cyprus, the author was confronted with a challenge and there discovered the motif of my DBA. Even though the author was very precise and fast in my transactions, by the end of each year she was told that she was expected to attract and maintain customers. Of course after the author was transferred from a branch to the Human Resources Department she discovered through the appraisals that this was the case for the majority of the front line employees. The attraction of new customers could be an easy job with Cypriots but when it comes to a foreign customer the situation becomes more challenging. A front line employee is easy to please a foreign customer by being fast and precise but when it comes to selling or solving a problem or even negotiating, things can get rough.

The reason that the author was so concerned about the foreign customers is because the population coming from EU and other countries to Cyprus increases dramatically (Statistical Services of Cyprus 2012). In the beginning of the century only 9% of the population of Cyprus were foreigners. Today is 21,4% and is about to increase more due to the discovery of about 11 milliard cubic feet of natural gas (Chasopoulos 2011). There are some discordant views with

reference to the bigness of its quantity. For example, another source reports that the gas findings are estimated to reach up to 33 trillion cubic feet (Rubin 2011). The discovery of such a treasure has attracted America's, Israel's, Russia's, France's, Britain's, Norway's, Turkey's and Netherlands's attention (Chasopoulos 2011). Several international companies are in the process of entering the Cyprus market because the aforementioned treasure that has been found advances their financial performance, makes the economy more robust and enhances their profits. Therefore, with the establishment of such international organizations the percentage of foreigners within Cyprus will dramatically increase and our island will become cross-cultural in a very high degree.

In the author's decision to proceed in a DBA program, she was not alone. The author's fiancée, who had recently finished his MBA wanted to proceed also in an advanced academic qualification. The author must admit that this provided both of them with courage to begin and continue with commitment. Both of them applied and both of us were accepted. They were together at the rough beginning and continued studying hard together every day. The author drew strength from her partner. Reflecting on our choice to do it together, the author can now see that it was a brilliant idea.

Reflection on the 'journey' – Personal Growth

Moon (1999) suggests that some adults reflect more than others, but nevertheless, everyone is capable of reflecting. Adults, who truly reflect without needing an incentive to act upon, are those people whose life has been accompanied by reflection and it is in their own idiosyncrasy. Gender and cultural issues may affect the easiness of reflecting and the sharing with others.

More precisely, "Reflection is a form of mental processing – like a form of thinking – that we may use to fulfil a purpose or to achieve some anticipated outcome or we may simply 'be reflective' and then an outcome can be unexpected. Reflection is applied to relatively complicated, ill-structured ideas for which there is not an obvious solution and is largely based on the further processing of knowledge and understanding that we already possess" (Moon, 1999, p. 37). Moon carries on saying that when it comes to the academic world reflection involves a purpose leading to an outcome. Furthermore, the quality of what is written is affected by the necessity of the formal presentation and future assessment.

According to the foregoing definition, people reflect on things that do not have obvious or straight forward and structured solutions. On the contrary, people need to reflect on things that generate dilemmas, conflicts, risks and uncertainty. That is exactly why reflection during a DBA journey becomes fundamental. Numerous ideas, concepts and thoughts constantly pop up and the students should not let any of them slip away. Everything might contribute to the creation of knowledge as each student owns a unique perspective of the world which is affected by their culture. When someone understands that an action is actually influenced by various factors and that it can be interpreted and studied under a number of perspectives, then that person can

critically reflect (Hatton and Smith, 1995). Moon (1999) also suggests that deeper reflection increases awareness. That means that someone can take advantage of the internal experience and use it to his or hers own advantage.

According to Moon (1999) there are multiple reasons why someone should write a learning journal. For instance, one can learn from an experience especially when the focus of the recording is on the process of reflection. In this way a person gets the better of a reflected action or even assist others pick his or her brains. Moreover, a learning journal helps a person remember how he or she reached to a decision, a truth or a solution. In this way, there is a reflection of the understanding and the representation of the understanding.

Another reason why learning journals are very crucial for the DBA journey is the development of critical thinking. The skill of thinking and general questioning helps overall completeness on a subject. Coinstantaneously, reflective writing helps individual improve their problem-solving skills. When it comes to a DBA program, students constantly run into difficulties where they are requested to come up with the right solutions. So, there is a great need for reinforcing problem solving skills. In parallel to these, a learning journal strengthens reflective practice. It is also argued by Moon (1999) that reflective writing helps to the personal development which will lead to the professional development, as well as self-empowerment. In a challenging journey, like the one a DBA program offers, a person needs to have internal motivation and self-empowerment in order to revive its own spirits. Even small rewards may contribute to the continuity of the journey with even greater tenacity.

As far as the learning process, Kolb (1984) offers a well-defined termination: "Learning is the process whereby knowledge is created through the transformation of experience" (p. 38). This definition indicates three major issues. Firstly, that learning is not something static. Learning is a continued process, where a person keeps learning from the results. A concrete example is that of scientific disciplines, where an experiment is taken place in a controlled environment and its results are registered and may lead to the next experiment. Second important issue, is that knowledge is something vivid which is transformed according to the learning experience. Another arising element of utmost importance is that learning affects and determines experience. In this sense, a person needs to record knowledge and experience at the same time because there is a constant interaction. It is of great importance to know how experience affects the way of learning, interpreting and understanding. In the author's case, she felt that her acquaintance with the English language has affected her perception and understanding. Experience is crucial in learning and only when is systematically registered can indicate the process of knowledge and personal and learning progress.

Journals help the growth and implementation of the reflective practice, which according to Moon (1996b), exists when someone has the appropriate skills to maintain a critical attitude towards practice.

A journal which is about a particular theme and it is intensive, is called 'Period Log'. This kind of journal is quite appropriate during a DBA program as it offers perspective and observation of change, the ups and downs of a journey. Reflective journal-writing is for me very private and supplies me with valuable guidance. Moon (1997), constantly refers to other authors, like Rainer and Fox, who use the word 'voice' and which accompanies their writing. Someone may say that there is no parthenogenesis, since even during the ancient times inspirational people like Homer proceeded first to the invoked of the Muse, who was actually the inner-voice, helping them inspire and eventually thrive.

Sambrook and Stewart (2008) developed a number of questions, which concern critical reflection in a DBA program. The author considers two of them very important and relevant to this module and she will infra discuss it. Each of these questions applies both directly and indirectly to my situation. The first question refers to the concept of critical reflection, and the other refers to the factors which comprise critical reflection.

Regarding the first question, according to Sambrook and Stewart's (2008) view, critical reflection is very much connected with management education, since it involves the reflection of an experience in a socio-political context. This means, not only reflecting in a personal context but in a wide spectrum of values and conditions. On the same subject, the authors adduced Mezirow's theory on critical reflection, where what was actually underlined, was the importance of critically reflecting on previous knowledge in the current context. This concept was actually experienced by me during the DBA journey, up to the present time. All previous knowledge bobs up every now and then with different meanings and signs. This is when the author realised that every piece of knowledge gained in school, university, work has its power and effect. Simultaneously, the author realised that knowledge is classic and diachronic. Knowledge is not something static but can be transferred to the present and future. When someone is able to lap up information and reflect on a number of valuable ideas and integrate them with the information already have at hand, can reach to important findings.

Referring to the second question, which regards the factors comprising critical reflection, Brookfield (1995), suggests that three interacted processes exist. Firstly, adult's ability to query and challenge the as yet commonly acceptable truths. Secondly, the processes by which adults are able to see new scopes and conversely choose new ways of thinking and acting. Lastly, critical reflection focuses on the process which allows adults to realise the power of culture on a person's idea of the world. The author started reflecting on the existing knowledge and indeed realised that is better to question everything because those afore-mentioned 'truths' are knowledge created by some human beings lived in a specific period of time influenced by

specific writers and cultural norms. This means that knowledge created in India does not necessarily mean that can be automatically transferred in Cyprus. The 'truth' in Cyprus can differ.

For example, what actually attracted the author's interest from the early stages of the DBA journey was one article created by Grandey et al. (2010). The authors after conducting a survey in four culturally distinct countries with almost alike levels of industrialization, concluded that while for example in USA phony smiles are accepted and encouraged during customer service, French value authenticity in expressions, even the negative ones. In some countries, like France and Israel it is acceptable to express anger to customers, giving intimation on the 'typical Hofstede dimensions'. Before DBA, the author would never consider questioning well accepted writers, but now she considers it beneficial and inevitable to have a constant question mark over head. There is a constant need for reflection and eventually validation.

Furthermore, one of the most important issues occupied the author's mind was confidence. As a DBA student the author was expected to maintain a high level of quality. Even if this is the case, self-esteem and self-integrity often are assailed with a failure or a sharp criticism. Every time the author was leaving her supervisors office I always felt like going shopping. Of course this had to do nothing with the supervisor as he is always totally polite with an affable mien. The problem is exclusively with the author as she needs to find ways to boost her confidence in order to regroup and continue even more vigorously.

Johnson and Stapel (2011) stated that some people boost their self esteem through reflection and some other with self-reflection, setting a distinct line of demarcation between them. There are some people who reflect on other people integrating the other's aspects in the self. On the other hand, there are some people who proceed to self-affirmation. According Sherman and Cohen (2006) when there is a threat to self-integrity there are few ways of proceeding to self-affirmation. Firstly, accommodating threat or failure and then try to rectify, secondly try to cope through defensive mechanism based to information coming directly from the event, and lastly reflect to events unrelated to the current threat, understanding that integrity does not depend upon that specific failure. The last way works on me as it helps me salvage self-integrity because I do not feel that I should directly address the threat and I am more relax and open minded to respond later constructively. This happens unconsciously when my efforts did not meet with success. Usually, the author focuses on irrelevant happy events, such as the success in a competition, personal and professional noteworthy events and even previous academically cases which made me proud. The author usually tends to remember how proud she is of herself, being able to study, work and learn German all at the same time. When the author manages to regain confidence and control of herself, then she sees that there can be no higher accolade that the earnest effort.

Reflection on the actual progress - Towards integration

DBA 503 – Literature Review

At the beginning of the author's DBA journey, she was focusing exclusively on the sales performance of the front line employees. As the author mentioned earlier, as practitioner she believed that what distinguishes a successful front line employee from a less successful one was their sales performance. The author could only see the results because at that moment she could not see the causes leading towards it. The author did not have the knowledge to go beyond the results in order to attempt finding a possible solution.

This decision was not the right one but as they say, 'at the end every cloud has a silver lining'. All this studying on sales made me realise that there was not a magic recipe or a formula to be found. Right when the author thought she was in the depths of despair she started reflecting on a particular article which made me realise that she should really focus on something specific. That article was created by Churchill et al. (1985). They cited that each predictor has on its own on average 4% association with the sales performance. Consequently, models on sales performance should include multiple variables including personal variables like the intra individual characteristics; moderator variables like the customer and product type; and lastly the major determinants such as aptitude, skills, motivation, role, personal factors and organizational/environmental factors.

The above findings were for the author's eyes about 10 DBAs! This is when she knew that she had to march in depth rather than in breadth. It is something we were told by the very first day but only after reflection this advice made a clean sweep.

From the aforementioned variables she found herself being interested in investigating the personal factors and the skills because this is what I wanted to study from the beginning. Unfortunately the author's initial knowledge did not assist her and she had to take the more complicated way to return again to the starting point. When concluding the DBA503 and started reflecting on the results the author was becoming familiar with the right terminology, like Emotional Intelligence, Intercultural Competence, problem solving and negotiation skills. After boning up on the theories around emotional intelligence I realised that intercultural competence should be incorporated in Goleman's framework. The author chose Goleman's model because his work is more tested and applicable in the working place (Fernandez Berrocal and Extremera, 2006). As Kok-Yee and Early (2006) suggest, when it comes to intelligence and of course outcomes, researchers and practitioners cannot ignore the impact of culture in today's global business environment. The author thought how interesting it would be to focus in intercultural competence and more specifically the problem solving approach and negotiation skills. All these should be obviously part of the interpersonal and social skills.

The work the author had done in DBA503 was presented in a conference. In October 2011 she participated in the 4th Annual EuroMed Conference of EuroMed Research Business Institute. There the author had the opportunity to discuss my intentions, ideas and present my findings to some experts and adept in my field of research. Reflecting on their comments the author realised that she had to be more precise and able to explain my decisions. The conference was very helpful as it gave me the opportunity to meet also journal reviewers who shared their criterion and their standards for accepting a paper. The fact that my paper can be found in the conference proceedings makes me feel quite proud.

DBA 501

As the author handed over DBA503 she decided to distant herself from studying for two weeks. She really felt that this kind of forbearance would help her reflect on the work she had done until then. In order to continue with the Methodology part the author had to go through my research question. Those question would determine and be determined by my Literature Review and Methodology and Methods. Those fifteen days the author tried to relax and enjoy the sun. Penaluna et al. (2012) claim that a solution to a problem and a creative idea comes more often when someone is relaxed or even when is wondering.

By July the author was thankfully able to bring her research questions into being. It was clear that the area of interest is intercultural competence for the employees in contact with foreign customers. That is why the research questions pivot on this subject. For example, one of the research questions was investigating how the aforementioned employees value multiculturalism and diversity and how they apprehend their organisation's position towards intercultural approach.

While studying for DBA501 the author had to reflect on my paradigm which according to Guba and Lincoln (1994) are an aggregate of basic beliefs. In conformance to that, even though the author had to satisfactorily argue on my beliefs, they would be eventually accepted simply because this is the way the author sees the world and the way she comprehends her position in the world. The author paradigm was going to be reflected on which ontological, epistemological and methodological position she would fit into.

After exhaustive study the author was finally in a position to comprehend the above terminations and decide on my position. Firstly, the author found that Saunders et al. (2009) offered a meticulous explanation on ontological theory and ontological positions. In accordance to them ontology refers to the researcher's view regarding the nature of reality or being. Reflecting on those theories the author's view of the nature of reality or being belongs to the ontological position of Critical Realism. The author agrees that "What we experience are sensations, the images of the things of the real world, not the things directly" (ibid., p. 115). Cook and Campbell (1979), as cited in Guba and Lincoln, claim that the existing reality should be under critical and thorough search in order to achieve its closest comprehension (1994).

Secondly, regarding my epistemological position the author appreciated the terminology found in the Oxford Dictionaries, 'the theory of knowledge, especially with regard to its methods, validity, and scope, and the distinction between justified belief and opinion'. In other words epistemology refers to what is acceptable knowledge in a specific field (Saunders et al., 2009). After studying and reflecting on Roy Bhaskar's thought (1979), as cited in Reed (2008), argues that for critical realists the analysis given on the ontological limits regarding the results of an experiment depends on the reason why the whole experiment was originated. The author agreed as a critical realist that the meanings of social activities can only be understood and not measured as they depend on the concept people give to them. Moreover, Bhaskar (1989) argues, as cited in Saunders et al. (2009), that in order to understand the created sensations of a phenomenon in a social world the researcher needs to understand the social structures that have influenced the particular phenomenon. Guba and Lincoln believe that critical realists give emphasis to pre-existing knowledge especially when it comes from pioneers in the field (1994).

Lastly, referring to the methodological part, the author will attempt to find the answers regarding my undertaken study (Guba and Lincoln, 1994) using qualitative techniques, inquiring in more 'natural' places and receiving data accordingly. The author will employ exploratory research trying to achieve fruitful insights into the phenomenon I am researching. The author has selected an exploratory research because she wants to identify categories of meaning (Marshall & Rossman, 1999). This kind of research suits her because she wants to investigate concepts and relationships so that they can create theoretical explanatory frameworks (Lin (2007). Qualitative methods are indeed needed in my research in order to collect in-depth information and understand attitudes using in depth interviews with semi structured questions. This is the method for gaining insights, discover and interpret (Noor, 2008).

The work done in DBA 501 merged with the one which was done in DBA 503 in order to create an article for the American Marketing Association (AMA) Global Marketing Special Interest Group (SIG) Annual Conference. Fortunately, the author was accepted and will present her work in the Conference which will take place in Mexico in March 2012. The author cannot wait to get feedback from expert professors in the field of study.

On the occasion of the Conference the author took a day off my work and arranged a long morning meeting with my supervisor, expecting to go through the Literature Review and discuss with him an interesting article which was believed could have an impact in my work. The author presented an interesting survey conducted by Pliopaitė and Radzevičiėnė (2010) who tried to present the graveness of intercultural competence at the organizational and individual level in the banking institutions in EU. When the supervisor saw the article advised the author to be more critical and proceed to an appreciation of their results.

Reflecting on his words the author realised that even though the results on the organizational level had been empirically tested, the results on the individual level were not sufficiently proven. The reason is because the questionnaires requested an organizational position and clearly indicated that they should not state any kind of personal opinion. Obviously the article was showing lack in the individual level, which is exactly the gap I am investigating.

Furthermore, even though the title of the article refers to the EU Banks, the focus of the aforementioned article lies on the Baltic region, as the authors decided to group their results to Nordic, Baltic and other EU countries. This grouping does not satisfy me as a researcher. According to Jankowicz (1994) and Kruzela (1995), as cited in Kolman et al. (2002), there are a number of cultural differences between the Central and Eastern European countries. Also, Kolman et al. (2002) claim that it is expected to happen more dramatic changes of value in the Central and Eastern European countries rather than in other parts of the world.

Another argument used to support the author's opinion is the fact that Cyprus like all the other countries has its uniqueness. According to Hofstede (1982), various elements, like government system, legal system, education system, army, religion, the way families are structured do reflect country's mental programming. Since 1974 Cyprus is divided and there are constant political discussions trying to find a solution for the so called "Cyprus Problem" (Papadakis et al., 2006, p. 1). The dichotomy was caused due to the Turkish invasion. Even after repeated resolutions from international organizations like the U.N., the island suffers from the invasion and installation of foreign troops and there is a daily impingement of the human rights by Turkey (Ministry of Finance, 2006). As far as the legal system concerns, even though Cyprus became in 1960 an independent republic, the English legal system is largely preserved (Supreme Court of Cyprus, 2011). In conclusion, Cyprus has some peculiarities which inevitably affect the way Cypriots deal with foreigners, including Turkish Cypriots, who also have a different culture from Greek Cypriots. So it is difficult to admit that Pliopaité's and Radzevičienė's (2010) survey covers Cyprus' position on Intercultural Competence.

Moreover, going through the organizational Intercultural Competence Development Model created by Pliopaité and Radzevičienė (2010), the author observed that the Corporate Mind is empirically tested through elements of intercultural competence, which did refer to the organization's position. On the contrary, there was not an empirical testing on the elements of intercultural competence referring to the Competence Development of the individual. At the same time, there is an important factor missing from that model, which is the culture of the nations. According to Hoffstade (1994), as cited in Vrontis et al. (2008), different countries have different idiosyncratic conditions and so require different strategic practices. Lastly, there should be something to distinguish that this model refers to the Banking Institutions.

Even though Pliopaité and Radzevičienė (2010) concluded in their article that there is no systematic approach to Intercultural Competence for creating interculturally competent

banking institutions in the European Union with emphasis on behavioural approach and less emphasis on emotions and knowledge, their study focused on organizational approach leaving untouched the individual and emotional dimension.

DBA502 – Action Research

This module verified some of the choices the author has taken during the previous modules. The concept of this module was not clear to at the beginning, because it felt as if it was a repetition of the DBA501. Fortunately, later on the author was able to realise the difference.

The extensive research in the field of research and the analysis of potential methods from action and non action research approaches created a concrete basis and justification of my final choice. It helped me realise that a non action research qualitative approach was indeed the right selection for my research.

Moreover, there was a realisation that philosophy should not contradict with organization's philosophy and vision. Up until then, this was not an issue for me. Fortunately, the outcome of the research aims to assist the growth of the Bank's profit, since the employees in contact with foreign customers would eventually be capable of earning trust and maintain valuable customers.

Once more, the research aim and objectives have taken again the centre stage in. The author had to be sure and thus re-examine that the selected research method reflects the research aim and objectives and at the same time positively affects the outcomes of the research for the organization and the researcher. Reflecting on the research aim and objectives, the author will change the way of presenting them, providing a more comprehensible research questions.

This assignment was completed short before travelling to Mexico for the 2012 American Marketing Association (AMA) Global Marketing Special Interest Group (SIG) Expert Forum. Thus, the preparation was done with enthusiasm and thirst for knowledge, looking forward that unique experience.

DBA504 – Reflection

The present assessment has been the framing of the DBA journey. Concluding, DBA504 the author can now realise the hows and whys the research evolved the way it did. The reflection on the people the author met, the adventures she went through and literature she studied, help her understand that everything happened for a reason. Even a failure or a wrong choice helped her understand better the field of study and grow in it as a researcher.

Moreover, the process of reflection it is very important for DBA students as it provides possible solutions to problems and dilemmas. The reflection also improves self confidence as it makes students see the efforts and fights.

The conclusion of the current module was done after the author had returned back from Mexico, where she was lucky to meet very interesting academics and practitioners. The person who impressed the author the most with its humility and its breadth of knowledge was Mary B. Teagarden, who is an editorial board member of the Thunderbird International Business Review. She was willing to provide feedback to the doctoral candidates and at the same time to provide constructive critique on the work which has been done.

Generally, her suggestion regarding my presentation, which was on the Literature Review and Methodology and Methods, was to remove from title "The case of the Banking Industry in Cyprus" in order to have more opportunities in publishing an article. She believes that Cyprus is the country where my conceptual framework will be eventually tested, so there is no reason of putting the country's name in the title. This is something to consider and find out how it will affect my thesis.

Conclusion

The current paper has presented the journey through the DBA program the last eighteen months. The author tried to reflect and then portrait in words my inspiration, the driving force and the incentives for this goal. Then, there was a presentation of some theories regarding the act of reflection and its forms, the learning journals, the thinking, the critical thinking and the process of learning. In parallel, there was a reflection on those theories regarding my experience in each area. After that, the author added some theories that came on the surface after reflection, like problem solving, confidence, expectation theories and other.

Thereafter, there was a reflection on the structure of the DBA program. Next, there was a reflection on each module separately reflecting on the processes and a reflection on the changes and the elements that had a crucial and fundamental impact on the general way of thinking.

In conclusion, the author would like to give some future direction for new candidates. The author would definitely encourage people to keep a learning journal from the very first day. It is probably the only way she was able to capture all her ideas and the ideas of others. It is a golden opportunity as it helps the protection and merge of thoughts.

INTERNATIONAL BUSINESS OF BANKING: THE PRICING EXAMPLE OF RETAIL CURRENCY SPREADS

Listra, Enn¹

¹ Tallinn University of Technology, enn.listra@tseba.ttu.ee

Abstract

In this paper the pricing of a specific service of currency exchange based on the retail exchange rate spreads is studied on the example of four international banking groups. The aim of this study is to explore pricing of currency exchange services based on bid-ask differences in some commercial banks and possible price discrimination in this segment of market comparing the behaviour of Western mothers and Eastern daughters in European international banking groups. The retail currency rate spreads in different bank groups and countries are compared with each other. The main results of the study are that statistically significant differences exist in the spreads set by banking groups in different countries. All banking groups in the pilot sample offer more favourable rates in Western countries indicating that the pricing policy of bank groups may be discriminatory. The volatility of spreads over different currencies suggests that different decision making mechanisms may be present in the groups depending on the location of banking unit. The results of this pilot study suggest that further research is needed to understand the extent and the mechanism of findings.

Keywords: international business, pricing, discrimination, commercial banking, currency rates, spreads.

Introduction

It is well known fact, that the international pricing strategy is a dominant component of marketing mix of multinational companies (Hill, 2009). The main objects of research of this study are the spreads of retail currency exchange rates (that is a way to price the service) offered to customers in commercial bank groups both in Western and Eastern Europe. The retail currency markets of countries seem to be separated from each other and the banks seem to use discriminatory pricing when setting retail currency spreads in these countries.

The study is based on the premise that the currency exchange rates and bid-ask spreads are mainly determined by underlying macroeconomic factors influencing banks in a country in a similar way and by the internal policies of MNC-s that may or may not be discriminatory. Lyons (2001) describes three major approaches to exchange rates: goods market, asset market and market microstructure approaches. The structure and processes of relevant financial markets and institutions should be taken into account to understand the conflicting aims of profit seeking and policy making as forces determining the market outcome.

The processes going on in and the convergence of the financial sector in EU have been subject to number of studies but, surprisingly, the currency rates that the banks charge and pay their customers have almost left out of the interest by academic researchers. The retail exchange rates of commercial banks have not been studied much and the focus has been on the country level and the interbank market. The situation is understandable if one takes into account fact that only about 5% of currency market is connected to economic needs of agents and remaining 95% is driven by speculative motives (Krishnan et al, 2009). Example topics of the research on influence of currency rates on economy are relationship between trading volumes and rates' volatility (Bjønnes et al, 2005) and relationship between currency rates and stock prices (Stavarek, 2004).

The branches or subsidiaries of foreign banks have dominant positions in many of Central and Eastern European countries' banking markets today (Barisitz, 2009). The main hypothesis in the paper is that the differences in exchange rate spreads between banks of the same banking groups in Eastern and Western Europe are significant. The aim of this exploratory paper is to study pricing of currency exchange services based on bid-ask spreads in commercial banks and the existence of possible price discrimination. It is suggested in the paper that exchange rates in banks of Western Europe are more favourable for clients than in Eastern Europe. Following main research questions were kept in mind:

- to explore the pattern of behaviour of different banking units in retail exchange sector inside of same countries;
- to compare retail currency spread inside the banking group units in different countries;
- to compare based on retail currency spreads the behaviour of MNC banking units;
- to prepare methodology for the second stage of study.

In the section 2 an overview of relevant literature is given that is followed by the description of the sample and methodology of comparison. The limitations that derive from data collection process are discussed and data and sources are described in section 3. The results of comparison of banks in the countries under study are described in the section 4. The section ends with the comparison of currency rate spreads in the banks of groups of countries dealing with aggregated differences on the level of country groups. The short discussion of results is given in conclusions part 5.

Overview of related literature

The area of the study is relatively unexplored despite the fact that enormous amount of literature exists on the related fields of research. Extensive literature on the interbank currency exchange market (that is a major factor influencing also retail rates) exists today with detailed studies on the influences of different factors on the currency rates and currency rate spreads. The main features have been long quoted even in textbooks – “spreads on the interbank market

are based on the breadth and depth of a market for a given currency as well as on the currency's volatility" (Clark, Levesseur, et. al., 1993, p. 147). Levi (1990, p. 37) mentions without further discussion that banks charge their customers more than interbank ask rate and pay less than bid rate and that the size of the spread depends mainly on the volume of retail transactions. Lyons (1995) finds that inventory risk is main determinant of currency rate quoted spreads.

Currency rates became important object of research after the breakdown of the Bretton Woods fixed-parity system both because of policy considerations and because of the needs of international financial management in MNCs (Multinational Corporations). The research on the relationship between exchange rates and (goods) prices has been developing rapidly during recent decades (Menon, J., 1995; Goldberg and Knetter, 1997). Either exchange rate pass-through (Goldberg and Knetter, 1997) or the pricing-to-market as termed by Krugman (1987) are main strands of literature.

Studying financial integration in Europe Pichler, Steiner *et al* (2008) mention that "integration and the single market for financial services *per se* are the ultimate objective of the EU's integration efforts". While Horobet, Joldes *et al* (2008) find some exchange rate convergence in Central and Eastern Europe, the findings of this paper contradict to these results in retail markets.

It is well know that if international bank groups have certain degree of monopoly power in their markets then they can increase the profit discriminating against the customers in a particular country of operations (Hill, 2009). The literature on price discrimination has long history and it is customary to speak of three major types of price discrimination beginning from Pigou (1920). Detailed typology of price discrimination was provided early by Cassady (1946) and Machlup (1955). The literature on pricing of (retail) currency exchange services in international setting is far less extensive compared to previous topics despite the fact that the topic is raised on the textbook level.

Main factors influencing the bid-ask spreads have been identified by the microstructure theory: order-processing costs, asymmetric information costs, and inventory holding costs (Koutmos and Martin, 2011). Deeper analysis of determination of spreads is given by later market microstructure literature that counts three or four components for the spreads: inventory risk, operating costs (and profit margin), monopoly power, and adverse selection (Huang and Stoll (1997), Harris (2003)). Monopoly power is frequently excluded in currency microstructure literature (Rime, (2003)). The first prominent study of currency bid-ask spreads by Glassman (1987) showed that these increase with volatility and trading volume.

Example topics of the research on influence of currency rates on economy are relationship between trading volumes and rates' volatility (Bjønnes et al, 2005) and relationship between currency rates and stock prices (Stavarek, 2004). Two important results from recent literature apply to our study. The spread is dependent upon the type of client (Fan and Lyons, 2003) and

upon the level of activity (order flow) influences the size of the spread (Osler, 2006). Based on this result we divide research object and consider in our study separately the big (GBP, JPY, USD) and the small currencies (NOK, SEK, DKK, CHF).

The sample, data, and the methodology of comparison

The sample was composed according to the objective of the study but the number of constraints had to be taken into account when finalizing the sample. Table 1 illustrates the population. The attempt is made to include into the sample both Western and Eastern European countries and the EU banks where the headquarters of the banks are located in Western part of EU and the daughter companies in Eastern Europe.

	Banks	Western countries				xxxx	Eastern countries				
		A	B	C	D		E	F	G	H	I
Western mother	1	A1	B1	C1			E1		G1		
	2		B2	C2	D2	Xxxx	E2	F2	G2	H2	
	3	A3		C3	D3	Xxxx			G3	H3	
	4		B4		D4	Xxxx					
xxxx		xxx x	xxx x	xxx x	xxx x	xxxx	xxx x	xxx x	xxx x	xxx x	xxx x
Eastern mother	5	A5	B5			xxxx		F5	G5		
	6		B6	C6	D6	Xxxx	E6	F6		H6	
	7					Xxxx		F7		H7	I7

Table 1. The structure of the population of the banks.

Seemingly, the potential data set may be enormous. Closer inspection shows that only few banks can easily be incorporated into the study and sample selection is influenced by availability of data. Many banks have subsidiaries or branches in Eastern Europe but only few of them in Western Europe, homepages of Western banks tend to be uninformative about currency rates, and last, only selected retail currency rates are public in majority of banks;

	Unicredit	Erste Group	Raiffeisen	Commerzbank
Czech Rep.	X	X		
Austria		X	X	
Poland			X	X
Germany	X			X

Table 2. Countries and Bank Groups in the sample.

The sample's structure was designed symmetrical with the country and bank pairs described in Table 2. Germany and Austria represent Western Europe in the study, Czech Republic and Poland represent Eastern Europe. The four countries were chosen because of the geographic and economic closeness. The differences (*spread*) from the daily exchange rates of European Central Bank were calculated for all the banks' retail currency rates being compared. Average spreads were found based on the daily time series (January – March, 2010). The analysis and

comparison of banking units is based on these averages. Student's t-test was used to control for statistical significance of findings with confidence level of 0,05 (the results given in Table 5). For the in-country, in-group, and between countries comparisons the differences of corresponding larger and smaller spreads quoted by banking units were found.

Four international banking groups were chosen into the sample – Unicredit Bank, Erste Group, Raiffeisen Bank, and Commerzbank (called Unicredit, Erste, Raiffeisen, and Commerzbank in following sections and Tables for simplicity). Each of these banks runs business at least in two of sample countries and each of countries has two banking units from the sample's bank group present. In all cases the headquarters of banking groups are located in the West and daughter companies are in the East.

Unicredit Bank Czech Republic belongs to the Unicredit Group with Italian roots (History of the Group, 2010). The data were drawn from Unicredit Bank Czech Republic complete Exchange rates (2010). Another bank from the country is Erste Group's Česká Spořitelna (Erste Group, 2010), the data are obtained from Česká Spořitelna exchange rates (2010). From Poland BRE Bank and Raiffeisen Bank Polska S.A. (70% of BRE Bank's shares are owned by Commerzbank) were chosen. Data come from BRE Bank exchange rates (2010) and from Exchange Rates of Raiffeisen Bank Polska S.S. (2010). From Austria Raiffeisen Zentralbank Österreich and Erste Group were included into sample. The data come from Raiffeisen Währungen (2010) and from Erste Bank Market Overview: Currencies (2010). HypoVereinsbank (HVB, called Unicredit below for clarity reasons) and Commerzbank are the two banks from Germany. The data come from Commerzbank Devisen-Marktkurse (2010) and from HypoVereinsbank Währungen (2010).

The data set in the study contains approximately 6950 retail currency rate values. Two types of currencies were chosen for study to control possible size effects based on the results of order-flow literature of market microstructure above. "Big" currencies are GBP, USD, and JPY. "Small" currencies are CHF, DKK, SEK, and NOK. As a benchmark, currency rates quoted by European Central Bank or national Central Banks outside the Euro area were used throughout the study. The data come from European Central Bank Euro foreign exchange reference rates (2010).

The analysis was carried out based on differences of bid currency rates and those of Central Banks (spreads). First, the currency rates of non-Euro countries were transformed to Euro bases using the local Central Bank's Euro versus home currency rates. Second, to make all data comparable the spreads with ECB rates were calculated. Actual comparison of banks and countries was made using these spreads.

As a first step of the study average spreads and the coefficients of variation (standard deviation divided by average value of corresponding spreads) for the sample were calculated

for all spreads over banks, countries and currencies (Table 3). The results indicate that systematic differences exist in the behaviour of bank units in the sample.

<i>Bank</i>	<i>CHF</i>	<i>DKK</i>	<i>GBP</i>	<i>JPY</i>	<i>NOK</i>	<i>SEK</i>	<i>USD</i>	<i>Average</i>
<i>Poland Raiffeisen</i>	3,152 (16)	3,143 (16)	3,151 (18)	3,156 (18)	3,084 (18)	3,135 (19)	3,176 (16)	(17,4)
<i>Poland Commerzbank</i>	2,942 (11)	2,771 (11)	2,436 (16)	2,84 (18)	2,743 (10)	2,775 (10)	2,488 (16)	(13,0)
<i>Czech Erste</i>	1,796 (19)	1,835 (16)	1,838 (27)	1,729 (51)	1,765 (20)	1,761 (21)	1,749 (36)	(27,2)
<i>Czech Unicredit</i>	1,983 (17)	2,012 (14)	2,014 (25)	1,962 (39)	1,921 (18)	1,938 (19)	1,767 (34)	(23,5)
<i>Austria Erste</i>	0,500 (14)	0,376 (2)	0,314 (55)	0,526 (51)	0,338 (42)	0,359 (37)	0,340 (48)	(35,4)
<i>Austria Raiffeisen</i>	0,186 (88)	0,015 (121)	0,393 (58)	0,629 (68)	0,248 (73)	0,327 (55)	0,430 (57)	(74,34)
<i>Germany Unicredit</i>	0,197 (35)	0,272 (4)	0,299 (65)	0,353 (81)	0,302 (56)	0,275 (64)	0,367 (55)	(51,44)
<i>Germany Commerzbank</i>	0,137 (41)	0,268 (3)	0,205 (72)	0,189 (106)	0,245 (50)	0,227 (47)	0,201 (64)	(54,79)

Table 3. Average spreads and coefficients of variation of daily spread (standard deviation divided by average spreads; in brackets, %, January-March 2010).

In-country and in-group comparison of currency rate spreads

First, the results of the comparison of different bank's spreads inside the countries are discussed. The currency rates in the same country are driven by the same factors except in-group policy factors and other possible influences that are derived from belonging to a certain banking group. In this subsection we compare the banking units with the aim to uncover differences of spreads of different banking groups operating in same environment. The data indicate that the different banks' views on suitable currency rates in the same country differ from each other considerably but the differences remain smaller compared to the differences between countries as we will see later in this paper. The bank groups and group units seem to have different policies of towards their clients in different locations.

In Czech Republic Unicredit's and Erste's banking units were compared with each other. Unicredit's spreads are larger in the case of all currencies in sample as can be evidenced on the Figure 1. The spread is the largest for GBP (2,014%) and the smallest for USD (1,767%) in Unicredit. Erste's the largest spread is also for GBP (1,838%) and the smallest for JPY (1,729%). The spreads' differences are significant only in the cases of "small" currencies (Table 5).

The retail currency rate spreads of sample banks in Poland are very similar to those in Czech Republic. In all cases the spread is larger in one bank, Raiffeisen, but the differences of spreads are larger compared to the case of Czech Republic (Table 4). In Raiffeisen the spread is the

largest for USD rates (3,177%) and the smallest for NOK rates (3,085%). Commerzbank's the largest spread is for CHF (2,94%) and the smallest for GBP (2,436%). The differences are statistically significant for all currencies (Table 5).

Figure 1. Comparison of average spreads in Czech banks.

The pattern of the spreads is very different compared to the earlier results in the case of Austrian banks (Figure 2) being distributed unevenly with Erste having larger spreads in the case of 4 currencies and Raiffeisen in the case of 3 currencies. Also the level of spreads is smaller having the maximum below 0,65%. Both banks have their largest spreads in the case of JPY (Raiffeisen – 0,629% and Erste – 0,526%). Erste's the smallest spread is for GBP (0.314%) and Raiffeisen's the smallest spread for DKK (0,015%). Except JPY and SEK the differences of average spreads are statistically significant (Table 5).

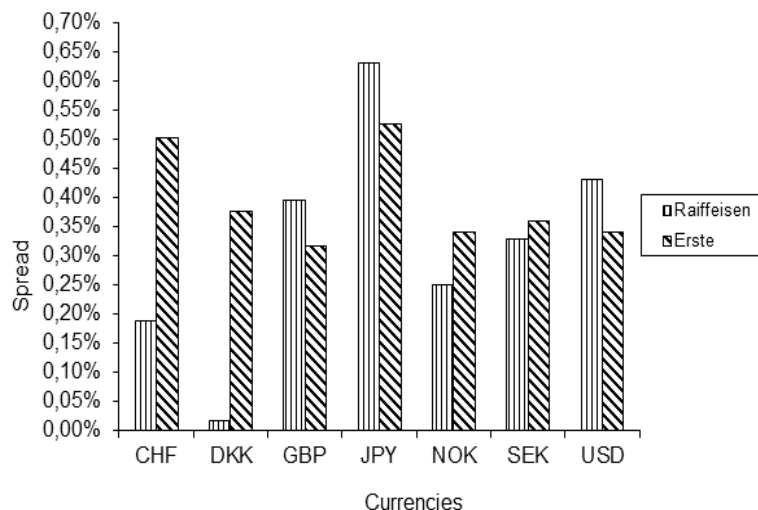

Figure 2. Comparison of average spreads in Austrian banks.

Retail currency spreads in Germany's banking units are distributed very similarly to those in Austria but the level of spreads is lower. The spreads are larger in Unicredit for all currencies in

sample. The largest spread in Unicredit is for USD (0,367%) and in Commerzbank for DKK (0,268%). The spread is the smallest in Unicredit for CHF (0,197%) and in Commerzbank also for CHF (0,137%). All differences are statistically significant (Table 5) except of NOK and SEK

The results of pair wise comparison (statistical significance) are described in Table 5. The reasons for the results are not clear but it seems to be of importance for future research that in the case of smallest banking sector (Czech Republic) the differences were not significant for the big currencies and that in the case of biggest banking sector (Germany) in the sample the differences were not significant only for the two small currencies. The different distributions of spreads in country groups cannot be explained only by macroeconomic factors and they exist most probably due to the in-group policies. The bank groups seem to have different inter group policies toward their customers in two parts of Europe. These policies can exist only if these markets are separated enough and the customers are not able to take advantage of the arbitrage opportunities.

	<i>Czech Rep.</i>	<i>Austria</i>	<i>Poland</i>	<i>Germany</i>
	<i>Unicredit- Erste</i>	<i>Raiffeisen- Erste</i>	<i>Commerzbank- Raiffeisen</i>	<i>Commerzbank- Unicredit</i>
<i>CHF</i>	+	+	+	+
<i>DKK</i>	+	+	+	+
<i>GBP</i>	-	+	+	+
<i>JPY</i>	-	-	+	+
<i>NOK</i>	+	+	+	-
<i>SEK</i>	+	-	+	-
<i>USD</i>	-	+	+	+

Table 5. Statistical significance of differences of spreads (Students t-test, 95% confidence).

Other important questions are whether the banking groups act differently in different countries and to what extent. If price discrimination is present in the data it could be evidenced by comparison of currency spreads of the subunits of same banking group in different countries. The objective is in this subsection to compare the spreads of the same bank group units acting in different countries. The aim is to understand whether the spreads are mainly determined by the membership in a group or they depend on the location. In all cases the first banking unit compared is the Western mother bank and the second is the Eastern daughter bank.

The comparison of the units of Unicredit group in Germany and in Czech Republic (Table 1) showed that the levels of spreads in these countries are considerably different over the countries but very similar over the currencies under study. In Germany the spreads are between 0,19% - 0,4% and in Czech Republic between 1,8% - 2,1%. The differences of spreads are distributed evenly (Table 6). The comparison between units of Erste in Austria and Czech Republic showed that the pattern is very similar to the previous one. In Austria the spreads

were between 0,31% - 0,53% and in Czech Republic between 1,72% - 1,84%. The Commerzbank's spreads in Germany are 0,13% - 0,27% being more evenly distributed compared to Poland (2,4% - 3,0%). The analysis of data from Raiffeisen group gave similar results compared to those above. In Austria the spreads are between 0,01% - 0,63% being most volatile in the whole sample. In Poland the spreads are more evenly distributed and are between 3,08% - 3,18%.

The results of this section indicate again that all bank groups in the sample have different policies towards their Western and Eastern customers (Table 6).

	<i>Unicredit</i>	<i>Erste</i>	<i>Commerzbank</i>	<i>Raiffeisen</i>
	<i>Germany-Czech Rep.</i>	<i>Austria-Czech Rep.</i>	<i>Germany-Poland</i>	<i>Austria-Poland</i>
<i>CHF</i>	1,79	1,30	2,81	2,97
<i>DKK</i>	1,74	1,46	2,50	3,13
<i>GBP</i>	1,72	1,52	2,23	2,76
<i>JPY</i>	1,61	1,20	2,65	2,53
<i>NOK</i>	1,62	1,43	2,50	2,84
<i>SEK</i>	1,66	1,40	2,55	2,81
<i>USD</i>	1,40	1,41	2,29	2,75

Table 6. Comparison of differences (% points) of average spreads from ECB rates.

To finalize the analysis the spreads are compared by countries in this paper. We compare the banking units in two pairs of similar countries and also between the country groups (Eastern Europe and Western Europe).

The spreads quoted by the banks under study in Czech Republic and Poland are compared first. Here, the spreads are calculated based on currency rates of local central banks (National Bank of Poland fixing, 2010 and Selected exchange rates ..., 2010) instead of ECB. It is evident from Figure 3 that the spreads are larger in Poland being also statistically significant. Czech spreads remain between 1,7% - 2% and in Poland the spreads are in interval 2,8% - 3%.

The spreads are distributed very differently in the case of Austria and Germany (Figure 4) compared to the Eastern countries. First, Germany's spreads are distributed more evenly compared to Austria's ones. The volatility over different currencies is considerably higher in relative terms in Western Europe. The levels of spreads are lower compared to those in Eastern Europe indicating that banks have different policies depending on the country of location.

The difference of spreads in two groups of countries is very large – spreads in Eastern Europe are clearly higher (Table 7) compared to spreads in Western country. Relative volatility is higher in Western countries when different currencies are compared. Higher relative volatility over currencies and considerably lower spreads in Western units of bank groups indicates that in-group policy rules in the West and in the East are different in the groups under study.

Conclusions

The aim of this paper was to compare the behaviour toward the customers of different banking groups having business in Eastern and Western Europe. In the case of full integration of the market customers of banks should get similar services with similar prices not depending

on which part of market (country) they are located. As the bases for comparison the retail currency exchange rate spreads were used.

Under the constraint of data availability a symmetric sample of four countries (Austria, Czech Republic, Germany and Poland) and of four international banking groups (Unicredit, Erste, Commerzbank and Raiffeisen) having business at least in two countries of the sample was formed with the headquarters located in Western Europe in all cases.

The average retail currency exchange rate spreads were compared among the banking units and countries to study the banks' units' behavioural patterns. The retail currency spreads should be same in all parts of the market in the case of fully integrated markets. If the spreads are different, the price discrimination is most probably the reason.

Main results of the study were following:

- In-country comparison of the banking units showed that the pattern of spreads belonging to different MNC-s (banking groups) was similar inside the countries. The statistically significant differences existed in most but not in all cases of currency-country pairs;
- In-group comparison of retail currency spreads showed that banking groups offer more favourable terms to their Western customers (the spreads in Western banking units were lower compared to their Eastern counterparts). In all cases the differences of spreads were statistically significant and larger compared to in-country differences;
- The spreads in Western banking units seem to be based on discretion and in Eastern banking units the decision making seems to be rule based over the currencies; considerable differences in volatility over currencies in East and West are bases of this conclusion;
- The comparison of the aggregated data by countries showed that the differences of spreads in banking groups under study were more different between the Western-Eastern country pairs compared to Eastern-Eastern and Western-Western pairs.
- Differences in currency exchange rate spreads between Eastern and Western Europe within chosen countries are very significant. It was found that exchange rates in Western Europe are more favourable for all analysed currencies in the case of all analysed banks.
- One currency (DKK) can be considered as outlier in this study for unknown reasons.

The results of pilot study are contradicting to the assumption made in currency market microstructure literature (Rime, 2003) that monopoly power should be excluded as a factor determining the spreads. The results show that the assumption is most probably not correct in

case of retail currency market and the theory should be improved to fit the reality of retail markets.

All results of the pilot study indicate that commercial banks' in-group policies may be discriminatory and the integration of banking markets at least in retail currency exchange area is not achieved.

Abstract

This case represents an analysis of the telecommunications industry in Peru. We begin by reviewing the history of this industry prior and after its privatization. This overview will facilitate a better understanding of the industry, its development and the main participants in this sector.

We continue by exploring the market structure, its nature, its characteristics and the supply and demand forces. We discuss the establishment of various regulations by the Peruvian government and their evolution from their creation to their present form.

The industry has been traditionally a monopoly; however, due to the rapid advances in technology, the market for substitutes has been gaining importance daily. Thus, we review the products that have become the new substitutes and explore the issue of how their development has created new challenges and threats to the traditional products.

Keywords: Telecom Industry, Monopoly, Privatization, Peruvian Government, Technology.

Introduction

The Telecommunications sector in Peru has experienced some important changes in recent years, transforming from a monopoly to a completely open market environment.

Our objective is to highlight the main participants and strategies that influenced this sector during these evolving times. We focus in analyzing (from the government, firm and consumer perspectives) the impact of these changes in the development of the sector and any real efficiency benefits achieved in the market.

Background

Before privatization (to 1994)

Until 1994, the government managed two firms: “Compañía Peruana de Teléfonos” (CPT) and “Empresa de Telecomunicaciones del Peru”(ENTEL Peru). The first one operated in Lima and Callao, while ENTEL operated in the rest of Peru. This structure was regulated by the Telecommunications Law of 1970 which stated that the telecommunications industry was a strategic sector and private participation should be avoided.

This period can be summarized as follows:

- Only 3.4 fixed telephones existed for every 100 inhabitants. According to the National Census of 1993, Peru had 22,639,443 inhabitants.
- The installation time for a new telephone was 9.8 years and the installation cost was 2,126 Soles or the equivalent of US\$ 607 based on that time's exchange rates.
- The number of fixed telephones was 753,085 of which 470,668 were managed by CPT and 282,417 were managed by ENTEL.

Firms	Fixed telephones (11/1994)	Additional installations (to 12/1994)	Additional installations during 1995	Fixed telephones (in 1995)
Ex - CPT (Lima-Callao)	470,668	62,784	320,980	854,432
Ex ENTEL (Rest of Peru)	282,417	48,088	164,507	495,012
Total	753,085	110,872	485,487	1'349,444

Chart n°1 – Installed Telephones

In November 1991, Fujimori's government started a privatization plan defining the methods of privatization and creating the Special Committees of Privatization of Telecommunication. This program initiated an international auction with the winner being "Telefónica de España" with US\$ 2,002 million. The Peruvian government contracted with "Telefónica de España" in November 1994. This contract required that the operator fulfills the goals of expansion and the improvement of the quality of the services.

	1994	1995	1996	1997	1998
Additional Telephone Lines – Lima	65	84	105	126	126
Additional Fixed telephones – Rest of Peru	39	56	111	133.3	133.3

Chart n°2 – Expansion Plan

	1994	1995	1996	1997	1998
Basic Rent (for Homes)	10.97	14.06	18.64	25.29	31.93
Basic Rent (for Companies)	21.80	25.99	29.43	30.52	31.93
Local Call Price (3 minutes)	0.144	0.140	0.135	0.128	0.120

Chart n°3 – Tariff Plan

In July 1993, "Organismo Supervisor de la Inversión Privada en Telecomunicaciones" (OSIPTEL) was created in order to regulate and supervise the development of the market of telecommunications.

During privatization (from 1994 to 1998)

By 1998, the telecommunications industry had expanded its networks by 167% from 1994. Its density (the number of telephones for each 100 inhabitants) had increased to 7.8. and there was a great improvement in quality, coverage and technology. In 1998, Telefónica del Peru(TDP) achieved the goals established in the concession contract.

	1993	1998
Number of Telephones (thousands)	660	2,012
Density (for each 100 inhabitants)	2.9	7.8
Avg. Waiting Time to installation	118 months	45 days
Connection Cost	US\$ 1,500	US\$ 170
Number of Employees	13,000	34,000
% Participation of he telecomm in the PBI	1.2	2.3

**Source: Osiptel*

Chart n°4 – Goals of the Concession Contract

In June 1998, the concession contract with Telefónica was terminated and the market was opened to new firms. The new firms could use Telefonica's infrastructure by paying a fee of \$0.01208 per minute for the interconnection.

After privatization (1998 – to present)

Initially, following the opening of the market, the telephone tariff was established using the price-cap. From 2001 until today, the factor of productivity is in use, stimulating competition to achieve efficiencies.

Advances in technology have led to increases in services offered to both corporate and residential customers. The new technology facilitated greater penetration and the expansion of coverage has contributed to the growth of the market. **(Appendix n°1)**

The density has been increasing since 2001, reaching 8.38 lines per 100 inhabitants in March 2006. **(Appendix n°2)**

The growth of the market has been heterogeneous. About 66 % of the fixed telephones are in Lima, where 26.7 % of the country population lives. At the end of 2005, the density of telephones reached 16.14 % in Lima versus only 4.42 % in the other areas. These figures provide support for the argument that the market is concentrated in urban zones and in major levels of income. **(Appendix n°3)**

Since 1998, 14 firms have signed contracts but only seven are in operation. TDP operates nationally while the other companies operate only in Lima, catering to corporations. In March 2006, market share was divided among: TDP - 96%; Telefónica Móviles - 3%; and others - 1%.

Structure of the Market

Type of Market

As we have seen, the market turned from a public monopoly to a franchise monopoly in 1994. In 1998, the exclusive concession was eliminated and other companies could enter the market. Currently, this market is a natural monopoly for the following reasons:

Economies of Scale

As output has grown, Telefónica could charge lower prices and still make a profit, since its average cost and its marginal cost have been falling. **(Appendix n°4)**

Market Power

TDP has 96% of the national market, Telefónica Móviles has 3% and other firms have 1%.

Firms	Market Share (%)	HHI
Telefónica del Peru	96%	9,216
Telefónica Móviles	3%	9
Other	1%	1
HHI		9,226

Chart n°5 – Market Power

Therefore, it is a highly concentrated market with 9,226 HHI. In addition, this is a price-taker market but government regulates its behavior primarily through the activities of OSIPTEL.

Number of Producers

There are 14 telecommunication contracts but only seven firms operate in the country. Essentially, only one firm has all the technology and infrastructure to operate in this sector because of the concession given in 1994 (TDP).

Number of Consumers

There are 8.27 lines for every 100 people. Given the size of population in Peru, the potential for growth is great, especially in provinces where the density is 4.42.

Product

There is only one type of product: telephone service without differentiation.

Barriers of Entry

Some of the barriers are:

- The cost of infrastructure; Telefonica has the whole infrastructure and a company wanting to operate, needs to pay an interconnection fee.
- Advertising; Telefonica uses it to highlight its differences and to manage loyalties.

- Legal; to enter the market, new companies must apply to the Department of Telecommunications and follow the legal procedures. Another legal barrier is OSIPTEL which controls the operations of the companies having the power to sanction firms and remove permits.

Demand and Offer

At present, the Peruvian market can be divided in two big groups:

- Fixed Telephony
- Public Telephony

Density has risen from 2.94 in 1993 to 6.14 in 1998 and finally, to 8.50 in June 2006. In June 2006, the wait time to have a new line installed was 12.11 days, which is a substantial improvement over the 70 months and the 3 months of wait time in 1993 and 1998, respectively.

	1993	1998	2005	2006-mar	2006-jun
Density (Fixed Telephony)	2.94	6.14	8.27	8.38	8.50
Density (Public Telephony)	0.36	1.95	5.57	5.68	5.83
Average waiting time to install new line	70 months	3 months	11.86 days	7.64 days	12.11 days

Chart n°6 – General Rates

Indicators of the service of Fixed Telephony

In June 2006, the density in fixed telephony stood at 8.5 lines per 100 persons continuing the improving trend (1.43 % better than the level registered in March 2006). In addition, in June 2006, the number of installed lines of fixed telephony was 2,786,445 while the number of lines in service was 2,332,039, with both figures reflecting significant increases from previous levels. (Chart N°7)

Regarding geographical distribution of telephone service, Lima and Callao account for approximately 64% of the national total lines in service resulting in a teledensity of 16.43 lines per 100 persons. Then come Arequipa and La Libertad with teledensities of 9.28 and 7.83 respectively, capturing 5.4% and 4.8% of the total number of lines in service.

The market is dominated by TDP controlling 96% with the remaining 4% distributed among 8 other operators. (Appendix n°7). According to the ENAHO (National Survey of Homes), 27.31% of the homes nationally relied on service of fixed telephony in June 2006. In the urban zones of the country, 42% of the homes utilized fixed telephony while in the rural zones only 0.14 %. It is also important to emphasize that fixed telephony was contributing 13,094 jobs in June 2006.

Indicators of the service of Public Telephony

The number of public telephones nationally has increased by 3% from the first to the second quarter, reaching 159,933 public telephones in service with a teledensity of 5.83 telephones per 100 persons. (Appendix n°9)

From the total number of public telephones installed, 89.98% correspond to TDP; 4.39% relate to Telefónica Móviles; 3.79% to Gilat; and the rest of the companies, each having less than 1% share of the total number of telephones. (Appendix n°10)

COMPANY	2003		2004		2005		2006 – June	
	Installed Lines	Working Lines	Installed Lines	Working Lines	Installed Lines	Working Lines	Installed Lines	Working Lines
Telefonica del Peru	2,200,673	1,797,919	2,361,881	1,970,594	2,509,789	2,156,638	2,637,777	2,233,586

Chart n°7 – Supply & Demand Lines per Company

Demand

Demand is directly related to the number of inhabitants because they are going to use or “demand” the products offered by the companies showed in the following charts.

INHABITANTS / YEAR	2003	2004	2005	2006 - June
Total Country - Demand	27,436,612	27,745,952	27,219,264	27,444,478
Company				
Telefonica del Peru	115,493	129,194	136,066	143,913
Telefonica Móviles	7,046	7,235	6,890	6,783
Gilat to Home	5,780	5,847	6,062	6,062
Telmex	294	413	1,297	1,370
Americatel	1	4	7	14

Chart n°8 – Lines Demanded per 1,000 inhabitants
2003 - 2006 (June)

Supply (Pricing – Tariffs)

Presently, services offered by the suppliers exceed the demand, according to Opsitel. There are open and control plans with TDP applying price discrimination.

Plans	Fee per Month	Free Minutes	Cost per Minute	Cost per Minute
			Hor. Norm.	Hor. Reduc.
Línea Clásica	57.77	60	0.092	0.042
Plan 1	39.90	60	0.140	0.070
Plan 2	64.90	270	0.128	0.064

Chart n°9 – Types of Prices
In Telefonica del Peru 2006

Graphic n°1 – Supply Curve Offer by Telefonica del Peru

Government Regulations

Monopoly of Telecommunications

Early Public Natural Monopoly

Before 1994, there was only one state-owned operator for local fixed telephony in Peru - CPT which was regulated using a cross-subsidy scheme. A cross-subsidy is a mechanism where some customers pay more for a good or service so that others can pay less. It is most commonly

used in connection with water, gas, electricity, or telephone services, where it may take the form of charging higher prices as consumption of the service rises. Another common practice is to set prices for commercial customers above costs in order to subsidize residential customers, both poor and affluent.

The consequences of the application of this system in Peru were:

- Poor service (inefficient procedures)
- Short coverage (3.2 lines per 100 Peruvians)
- Long time for responses (9.8 years to install a new line)
- High costs (US\$ 607 per installation)
- High costs for government from subsidies
- No investment; no innovation

Regulated Private Monopoly

In 1994, CPT was included in the privatization process of Fujimori Government, and TDP was established as a Temporary Monopoly for 5 years (exclusivity period). For some people, the period of exclusivity was seen as a way of balancing the tariffs, and increasing the value of TDP. For another group, exclusivity promised to make this business more attractive and to free more resources with the sale of public companies.

TDP increased the telephony density from 3.2 to 6.1 lines per Peruvian and decreased sharply the installation time. That was great news for the customers: more accessibility, more coverage, new technology, etc. With the establishment of the Temporary Monopoly time frame, it was clear from the beginning that the Open Markets would be realized on June 27, 1999.

Free Market Competition (but with High Barriers to Entry)

The fundamental change for the policies in this industry took place with the opening of the market in 1998. Peruvians were surprised when they received notice of the decrees N° 020-98-MTC and 021-98-BTC on August 4th, 1998 from the government. These decrees approved the termination of the exclusivity period on a new date - August 1, 1998 (three days before the decree) and modified other clauses of the concession contracts, particularly those related to tariff regulations.

In general, there were some concerns about this early termination of the monopoly and feelings of poor clarity between Government and TDP. The rest of the telecommunications companies expected an extension period of that exclusivity. Therefore, some observers felt that TDP obtained illegitimate advantages because:

- It knew in advance when the market would open and thus it could be better prepared than its competitors.

- The other participants in this sector were also surprised and were not prepared to react immediately.
- TDP achieved advantages on tariff and other matters in the negotiation with the government.

Objectives of the new Open Market

This new Open Market required a few new goals in order for the sector development to be accomplished by year 2003. Those goals were:

- To achieve a density of 20 lines for each 100 Peruvians
- Incorporate New Services in 5000 new locations
- Increase substantially internet access
- To have service and technology availability becoming a top country in the region in terms of modernization.
- Complete the digital network.
- In Urban Areas, to achieve a 98% attendance of the requests in a time of no more than 5 days.

Government regulation entities

- There are many organizations that play a role in the regulations and policies for this sector. They are:
 - TELECOMMUNICATIONS MINISTRY (MTC), which is in charge of planning and managing the spectrum and giving the concessions.
 - OSIPTEL which is an organization dependent on the Presidency of the Council of Ministers in the government. Its main functions are:
- Promote and maintain competency
 - Resolve controversy and complains from operators and users
 - Support the MTC
 - Set tariffs of public services
 - Manage the subsidies fund of rural telecommunications (FITEL)
 - This includes establishing operational procedures for services and companies, supervising operations and competency, and applying penalties if necessary.
- “La Defensoría del Pueblo” is an independent institution that collects complaints from people, makes an objective analysis and confronts the root of the problems. In

the telecommunication sector this organization plays a minor role but there are some good cases against unfair operator tariffs and criticisms of OSIPTEL.

Additionally, from the perspective of the regulators, they contribute to:

- Improve the final user welfare reducing tariffs and offering more quality of services
- Induce new investment on the sector

Regulations

In this new phase of Open Market, OSIPTEL established many rules about tariffs, concessions, interconnectivity, Long Distance Access, Billing, Accounting Taxes, Universal Access, Spectrum, Operators and Competition.

In addition to these rules, CONGRESS modified the Telecommunication law in January 1999, in order to adapt it to the new Open Market. In the beginning of this new phase some unexpected issues surfaced (e.g. large amount of concessions requested). By December 1999, the TELECOMMUNICATIONS MINISTRY had given 3 new concessions to fixed telephony and 28 new concessions to long distance operators, which presented Peru with difficult implementation tasks.

After giving the concessions and starting dealing with interconnections to new operators, TDP established very high fees for those interconnections. The process became longer because OSIPTEL had to intervene in every case, adjusting the cost for the access to the TDP local networks.

In an effort to calm down the protests and to pressure TDP, the regulator allowed the requestors to operate international traffic using the TDP network directly through subscriber lines, as a provisional measure for seven months. In turn, TDP indicated that its income from international traffic had been affected substantially while the requestors discovered that the provisional business would be more attractive than the original one.

In reality, after the opening of the market, there is no other company operating in Long Distance that competes with TDP under the same conditions; in local service nobody believes in real competition in the short or medium term.

In the current environment, the pressing question for the policy and regulations in this industry is whether to continue the existing form of open market or to introduce some adjustments in order to avoid problems in implementation. There is a growing feeling that some additional decisions are necessary.

Recent Times

The most important regulations from 2005 until now are:

From OSIPTEL

- Changes of TUO (Texto Unico Ordenado) in the interconnection policies for local traffic, improvements in economics condition, administrative issues and policies of infractions and penalties.
- Tax imputation: for controlling price discrimination of the access to some essential facilities and for offering fairer tariffs. Therefore, anticompetitive practices, such as compressed prices and cross subsidies, can be avoided. Currently this measure has been applied on the long distance services of TDP.

From TELECOMMUNICATIONS MINISTRY (MTC)

- Resolutions to change some Open Market policies, emphasizing the use of the spectrum assigned, with the possibility of losing the concession if using a different range of the spectrum.
- Changes of TUO to promote the development of independent operators, especially in rural zones and to approve a new system of charging the corresponding amount for the use of the spectrum.

The implications of these measures will depend on the size and cost structure of the operators. They perceive these regulations as a disadvantage since they imply increasing costs, generating barriers to the market development and discouraging the telephone penetration in poor areas. Generally, the operators demand more coherent regulations from the TELECOMMUNICATIONS MINISTRY and OSIPTEL.

Outstanding Items and Future Steps

As several years have passed since the opening of the market in telecommunications, it is necessary to define goals for the further development of this sector, based on the present market environment and the new technological developments. In order to identify these outstanding points or future steps, we need to:

- Review the implications of the Free Trade Agreement (TLC) between Peru and USA (re-sale, information services and separation of the local loop)
- Review the productivity factor in the concession contracts, focusing on local fixed calls as well as long distance calls.
- Update the legal framework of this sector, to allow participation of new alternative technologies as IP telephony.
- Promote intensely telephone services in rural areas

Today's Congress Commission is committed to negotiate with TDP the following points in the near future:

- Base price applied to customers
- Tariff by second
- Phone call establishment cost
- Diversity on plans
- Charge of mobile phone connections
- Poor competition

As a final note, it's important to cite the Nobel economist Milton Friedman, who said that in the case of a natural monopoly, "there is only a choice among three evils: private unregulated monopoly, private monopoly regulated by the state, and government operation." He said "the least of these evils is private unregulated monopoly where this is tolerable." He reasons that the other alternatives are "exceedingly difficult to reverse", and that the dynamics of the market should be allowed the opportunity to have an effect and are likely to do so (Capitalism and Freedom).

Possible Substitutes for Traditional Telecommunications at the Peruvian Market

The substitution effect in the telecommunications industry is derived from the technology effect and the experts of the industry use the term "convergence". This might have different meanings as it takes place in several services of telecommunications.

In a practical sense, the convergence is used frequently in reference to the combination of voice (telephony, generally), data (productivity applications) and video in a single network. This convergence occurs in the levels of the communications nets (diverse infrastructure use of transmission), the networks of access to the final services and the applications. In this context, Protocol Internet (Internet Protocol, IP) is the essential element for the substitution effect.

Thus, the technologies that previously worked independently can now share resources and interact among them, improving the efficiency of the handling and network operations and lowering costs.

Since the appearance of the Internet and protocol IP, the levels of convergence have increased considerably. Initially, the voice & data networks were integrated on IP, which allowed long distance communication costs to fall rapidly in companies and homes.

Currently, the presence of voice and data in the same network and the addition of the video result in a very complete combination. This phenomenon allows the suppliers of television by cable to compete with the suppliers of traditional telecommunications offering uniform services in a common platform.

Due to the reduction of costs in wireless technologies, a greater level of substitution between the voice and the data has emerged, through this new technology instead of fixed networks and those transmitted through radio networks.

The Wi-Fi technology has helped in the substitution between the fixed communications and the wireless communications. By the introduction of Wi-Fi (in combination with the voice by IP), the necessity to make calls through the terminals of movable telephony is eliminated.

The important changes in the industry structure generate convergence in a fast pace; the industry has gone from a traditionally vertical structure (suppliers downward integrated, starting off of the infrastructure for the services) to a horizontal structure composed of several submarkets: network infrastructure, network handling, communication services and information service.

In addition, the convergence facilitates intensified competition at the different submarkets; thus, new rules in the telecommunications industry are required. In Peru, the VIP regulations are a pending subject.

This situation will impel the necessity to change the regulatory approach and to give more attention to the access conditions to each level, as well as to the price regulation to be applied. Presently, the Peruvian telecommunications industry is a Natural Monopoly.

On the other hand, it will require a different level of analysis for the regulatory issues, so the Peruvian government might cover the retail, wholesale markets and the different conditions of calls of origin and completion. Also, the service classification and the licenses granting is another matter that will have to be reviewed. The convergence blurs the traditional distinctions between the telecommunications services.

The local telephone companies offer a broad range of additional services beyond basic telephone service to both residential and corporate customers.

Residential value-added services are aimed at the generation and completion of traffic, such as call waiting, call forwarding, call transfers, conference calls and others.

Value-added services for corporate customers are geared towards efficient use of the telecommunications infrastructure for the customer's benefit as well as towards the generation of traffic, such as transmission of voice, data, music and video.

One hundred percent digital network and the addition of new technologies such as the Smart Network, Intelligent Voice Respond System Type, Platforms and Custom Local Area Signal Service support, have allowed offering a broad range of value-added services. VTR offers basic dial tone service as well as several value-added services including voicemail, caller ID, 3-way calling, speed dial, wake-up service, call waiting, call forwarding, local bill detail, unlisted number and directory assistance.

VoIP is a term used in IP telephony for a set of facilities for managing the delivery of voice information using the Internet Protocol. This means sending voice information in digital form in discrete packets rather than in the traditional circuit-committed protocols of the Public Switched Telephone Network. A major advantage of VoIP and Internet telephony is that it avoids the tolls charged by ordinary telephone service.

A demand for videoconferencing and push technologies is further encouraging this infrastructure development.

The common services of corporate telecommunications include basic voice, data, and image transmission services. The products offered include the following:

- frame relay;
- private telephony;
- internet dedicated access and related services;
- point-to-point channels;
- IBS;
- satellite broadcasting;
- telex, X25, X28, ISDN and Very Small Aperture Terminals (VSATs).

Most new wireless phones and networks use digital technology. Telecommunications in the world have crossed a process of fusions and acquisitions that originated by the smaller firms in the nineties and now involved bigger companies. In those earlier years, we had faced a “speculative bubble” that disappeared by 2006. This process has forced the global companies of telecommunications, to address in a more solid way the dramatic technological changes that the sector has experienced.

THE IMPACT OF ONLINE ATMOSPHERIC CUES ON EMOTIONS AND WORD-OF-MOUTH: GENDER DIFFERENTIATION

Loureiro, Sandra Maria Correia¹; Ribeiro, Lara²

Abstract

This research reviews the concept of virtual atmosphere, its atmospheric cues and the S-O-R framework, and aims to analyse the differences between the perceptions of male and female participants relatively to the online environment. To this end, we proceeded to the questionnaires given to students in higher education and senior university students.

The main findings suggest that pleasure is the most effective emotion to lead to a positive word of mouth for both female and male. As found in previous studies in offline stores, this study in online stores seems to reveal that women are more willing to say positive words to others than men. The differences between genders are revealed in the impact of emotions on the worth of mouth. Women are more influenced by the delight and pleasure while men are influenced only by pleasure.

Keywords: online purchase, atmospheric cues, gender, emotions, word-of-mouth.

Introduction

The activity of designing artificial environments is not recent it goes back to ancient times. However, more recently, there has been a major concern with the attractiveness of environments, in workplaces and in commercial spaces. This concern is due to the increasing recognition that the way a space is projected develops specific sensations in the costumers, reinforcing their shopping intentions (Kotler, 1973-1974).

The first definition of atmosphere emerged in the 70's of the twentieth century. According to Kotler (1973-1974, p. 50), the atmosphere is the "silent language" in communication and results of "the conscious designing of space to create certain effects in buyers". It reflects the effort of creating commercial environments that are intended to produce certain emotional effects on the buyer and increase the likelihood of purchase. It can be defined as the collection of atmospheric cues, that are, any component in a commercial environment, designed consciously and external to the individuals, that fall within their field of perception and stimulate their senses, and affect the entire costumer experience of being in a particular space and in a particular time (e.g., Koo and Ju, 2010; Milliman and Fugate, 1993).

In this investigation, we are going to explore the virtual environment or web atmospherics, and according to Dailey (2004, p. 796) web atmospherics is “the conscious designing of web environments to create positive effects (e.g., positive affect, positive cognition, etc.) in users in order to increase favourable consumer responses (e.g., site revisiting, browsing, etc.)”. The atmospheric variables in the virtual environment can be defined “as the sum total of all the cues that are visible and audible to the online shopper” (Eroglu *et al.*, 2001, p. 179).

Despite numerous studies on the influence of the virtual environment in the consumer behaviour intentions, these investigations haven’t analysed the differences between the perceptions of female and male participants (e.g., Eroglu *et al.*, 2003; Koo and Ju, 2010; Menon and Kahn, 2002; Mummalaneni, 2005; Novak *et al.*, 2000; Wu *et al.*, 2008). Moreover, these studies usually consider samples of students and/or young participants, and they do not tend to analyse the consumers above 50 years old. In what concerns emotions, as mediators in S-O-R model, previous studies usually consider arousal and pleasure as antecedents of intentional behaviour or emotional response, in this study the sample contemplate both youth and seniors participants. So, as far as we know, this is the first attempt to integrate the delight emotion in the S-O-R model and compare perceptions between male and female consumers in the context of virtual environment. Therefore, the main objective of this study is to analyse the effect of atmospheric cues on three emotions (arousal, pleasure, and delight), how these three emotions contribute to a positive word of mouth (WOM), and compare the perceptions of male and female participants in virtual environment.

Following this introduction, next section provides a theoretical foundation of the S-O-R model and a review of previous research on atmospherics, customer emotional responses and intentions. Then, we present a research model and propose hypotheses to be tested. Section 4 describes the research methodology of the empirical study. Section 5 reports on results and the final section introduces the implications, limitations, and suggestions for future research.

Literature Review

Stimuli–Organism–Response (SOR) framework

The current study is based on the model proposed by Mehrabian and Russel, S-O-R (stimuli, organism, response) and applied for the first time in a commercial context by Donovan and Rossiter (1982). This model suggests that the stimuli precede and affect the consumers’ emotional states, which influence their retail behaviours such as re-patronage, store search and in-store behaviour (Thang and Tan, 2003).

An adequate S-O-R framework must consider 3 elements: taxonomy of stimulus, organism and taxonomy of responses (Donovan and Rossiter, 1982). The stimulus is the set of characteristics inside the environment which affect the internal states of the individuals (Baker *et al.*, 1992; Eroglu *et al.*, 2001; McKinney, 2004; Sherman *et al.*, 1997), organism refers to the

intervening internal process, that take part between the stimulus and the final actions, causing alterations on the emotional states of the consumer. That process allows the consumers to convert the stimulus into meaningful information and utilise them to understand the environment before making a decision (Koo and Ju, 2010). The response is used to express the satisfaction or dissatisfaction with the consumer experience (McKinney, 2004) and according to Donovan and Rossiter (1982) that can be through approach and avoidance behaviours.

In this investigation, the virtual atmospheric cues present in the web sites are the stimuli, the organism is the consumer's emotional states and the responses are operationalised as consumers' word of mouth.

Online atmospheric cues

In the current study the virtual atmospheric cues are grouped into three categories: design factors, layout, and information. These three groups result from the literature review, which analysed several online and offline atmospheric cues categories (eg., Eroglu, *et al.*, 2001; Hausman and Siekpe, 2009; Manganari *et al.*, 2009; McKinney, 2004; Turley and Milliman, 2000; Wakefield and Baker, 1998).

The design factors are comprised of elements such as architecture, decoration, colours scheme and the overall design (Wakefield and Baker, 1998). The layout is the site configuration that can be analysed through the easiness of finding products and services and its variety, through graphics and images and facility of navigation. This variable has a great importance in the virtual atmosphere since it defines the route of the consumer within the site (Manganari *et al.*, 2009), so the layout shouldn't be too simple but clear, to have the chance of **unpredictability** and surprise (Spies *et al.*, 1997). The presence of information on sites is reflected by the amount, importance and availability of information about products and services and on the presence of information about the forms of payment. A website that offers full information has an important role in the decision-making process for consumers (Novak *et al.*, 2000).

Emotional responses

In most retailing investigations, the emotional states analysed were pleasure, arousal, and dominance. However, Eroglu *et al.* (2001) suggest that arousal and pleasure adequately capture the range of appropriate emotional responses, so, the present study captures the emotional responses with pleasure and arousal.

Pleasure is defined as "the degree to which a person feels good, joyful, happy, or satisfied in a situation" (Menon and Kahn, 2002, p. 32).

The arousal is defined as "the extent to which an individual who engages in an online shopping feels stimulated, active, or excited when he navigates web pages of the online store" (Koo and Ju, 2010, p. 380). It reflects the affective dimension that ranges from sleep to frantic excitement (Kaltcheva and Weitz, 2006).

In this investigation, pleasure is the degree to which a person feels happy and pleased to be in a specific website, and the arousal is the degree to which an individual who visits a website feels stimulated and awake.

We also introduce delight as an emotion arising from pleasure and arousal. Indeed, the emotions theories in the social psychology field describe delight as a second order emotion, characterised by a combination of a number of first order emotions. According to Plutchik (1980), there are eight basic emotions that may be collapsed into four dimensions with opposite poles (sadness – happiness; surprise – anticipation; acceptance – rejection; and anger - fear). By combining these basic emotions, more complex emotions would arise. According to this theory, a secondary dyad is defined as a combination of two basic emotions which generate a more complex emotion. Thereby, delight would be defined as a secondary dyad comprised of joy and surprise.

Other emotion-based theories define delight as a combination of arousal and pleasure (Russell, 1980), or as a positive affect implying a high level of activation (Watson and Tellegen, 1985). Furthermore, Richins (1997) identified the most outstanding emotions in marketing studies on consumption, and included delight in the category of "joy". Oliver *et al.* (1997) highlight arousal and the positive affect (pleasure) as antecedents of delight. They also hypothesize that delight creates a desire for further pleasurable service in future intentions.

Word-of-mouth as intention

Intention refers to an online consumer's predisposition towards using a website store in the future (e.g., Zeithaml *et al.*, 1996), measured by the word of mouth (WOM). WOM happens after the purchase experience, when the costumers share with others their experience; it's exchanged through oral communication in real time and in a limited geographical space (Amblee and Bui, 2007). According to several studies (e. g., Arndt, 1967; Danaher and Rust, 1996; Herr, Kardes, and Kim, 1991), customer interactions through word-of-mouth can have a major impact on the consumer's response to a product. Rogers (1995) and Murray (1991) concluded that WOM is especially effective in disseminating new products, more risky or uncertain products and in decision making regarding services.

Moderator

The current study introduces gender as a potential moderator. Gender has been used in marketing as a segmentation variable because it is easily identifiable, its information is accessible, and its segments are large enough (Meyers-Levy and Sternthal, 1991; Palanisamy, 2005). Traditionally, research on retail shopping has indicated strong differences in shopping behaviour based on gender (Otnes and McGrath, 2001; Grewal *et al.*, 2003).

Moreover, recent studies, mostly in the North-American context, have revealed evidence suggesting an increase in male participation in shopping-related activities. This is a

reflection of the trend whereby men are increasingly sharing shopping duties (e.g., Dholakia *et al.*, 1995; Lee *et al.*, 2005). Researchers have explained important differences in cognitive processes and behaviour between male and female consumers (e.g., Fisher and Dubé 2005; Meyers-Levy 1988, 1989; Meyers-Levy and Maheswaran 1991; Meyers-Levy and Sternthal 1991). There are studies showing that women are more loyal customers than men (e.g., Blumstein and Schwartz, 1983; Hansen, 1987).

There are several theories that contributed to explain different perceptions and behaviours between men and women. Cross and Madson (1997) suggest that women are more interdependent whereas men are more independent. However, the theory of self-construal (Baumeister and Sommer, 1997) states that a fundamental difference between men and women lies in the duality 'relational vs. collective' interdependence. Thus, women are more likely to establish and maintain relationship with friends, family, and social contexts and tend to focus more on bonds than men (Gardner *et al.*, 2002; Markovits *et al.*, 2006). On the other hand, men tend to focus more on a group, for example, to identify themselves with a social category such as college student (Sedikides and Brewer, 2001). In this context, female customers would be more emotional and loyal to individuals, whereas male customers would be relatively more loyal to groups and group like entities.

Eagly (1987) and Eagly and Wood (1991) view the differences between men and women as a result of social roles and stereotyping. Brody (1999) highlights that gender differences exist in the experience and expression of emotion due to stereotypes, the sense of emotional intensity, and self-concept. Thus, women are viewed as being more emotional than men (e.g., Spence *et al.*, 1975; Cross and Madson, 1997). Women express emotions more extremely than men (e.g., Brody and Hall, 1993; Wood *et al.*, 1989; Johnson and Shulman 1988; Grossman and Wood 1993; Hess *et al.*, 1997; Plant *et al.*, 2000), are more affectionate (Briton and Hall, 1995), and experience more intense joy and sadness (Fujita *et al.*, 1991). As an exception of this general rule, men tend to experience and express anger and pride more frequently and with greater intensity (Plant *et al.*, 2000) than women.

Research model

The model based on S-O-R from environmental psychology perspective is presented in Figure 1. In our research, the stimuli are operationalised as atmospheric cues (design, layout, and information) present in the websites, the organism are the emotions that consumers feel, and the responses are operationalised as the positive word-of-mouth to others. Delight is viewed as a function of arousal and pleasure based on emotion theory of Russell (1980) and on model proposed by Oliver *et al.* (1997).

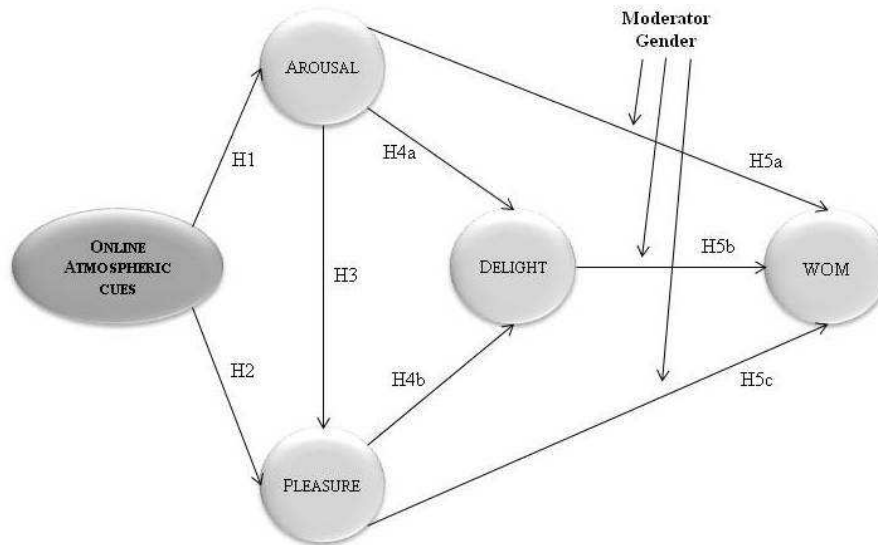

Figure 4. Proposed model

Atmospheric cues has been seen as influencing positively on emotions, such as arousal and pleasure (e.g., Lin and Lu, 2000; Mummalaneni, 2005; Davis, Wang, and Lindridge, 2008; Ha and Stoel, 2009; Koo and Ju, 2010). Therefore, we hypothesized:

H1: Atmospheric cues have a positive effect on arousal.

H2: Atmospheric cues have a positive effect on pleasure.

Several studies have found a direct and positive effect between arousal and pleasure, especially when regarding a high arousal which operates as a mechanism of activation (e.g., Mano and Oliver, 1993; Sherman *et al.*, 1997; Oliver *et al.*, 1997).

H3: Arousal has a positive impact on pleasure.

Delight is viewed as one of the second level emotions, characterised by a combination of high pleasure and high activation (arousal) (Russell, 1980; Watson and Tellegen, 1985). In the studies of Mano and Oliver (1993) and Oliver *et al.* (1997), delight appears as resulting from pleasure (or positive affect) and arousal. Thus, the following hypothesis is proposed:

H4: Delight is positively affected by (a function of) arousal (H4a) and pleasure (H4b).

In the S-O-R model, responses are the result of emotions, and empirical studies have shown such relationships (e.g., Menon and Kahn, 1995, Eroglu *et al.*, 2003, Koo and Ju, 2010). Delight is also viewed as an emotion that impacts positively on future intentions (Oliver *et al.*, 1997; Loureiro and Kastenholz, 2011).

H5: WOM is a function of arousal (H5a), delight (H5b), and pleasure (H5c).

Finally, based on the last section of literature review we expected women to be more inclined to use positive words to others when atmospheric cues of websites positively influence emotions. Therefore the following hypothesis is formulated:

H6: The effect of shopping-related emotions on WOM is higher for women than for men.

Methodology

For the present study a questionnaire was adopted from previous literature (Wakefield and Baker, 1998; Turley and Milliman, 2000; Koo and Ju, 2010; Hausman and Siekpe, 2009) and to ensure that the wording of the questionnaire was clear it was validated with a pilot test. Therefore, ten consumers were personally interviewed (five under 30 and five over 50).

The survey was conducted for two months (May and July, 2010), in major regions located in the North and Centre regions of Portugal. The sample was comprised of students of higher education schools and senior university students that never used the website analysed here before. To avoid errors in completion, given the specificity of the selected sample and the type of questions, we decided to apply the questionnaire individually with the aid of a laptop, for the respondents to have access to the website. More than four hundred (412) questionnaires were distributed, but only 365 were considered valid. The sample is characterised especially by female participants with 61.2% and the remaining 38.8% per male participants. Most of the sample consists of people between 20 and 30 years with 41.5%, followed by participants with over 60 years (20.2%).

The brands chosen for analysis have a high profile in Portugal, two are national, Agência Abreu and Pingo Doce and two are international, Zara and Renault. The choice of these brands takes into account the binomial utilitarianism / hedonism to reach a balance.

Regarding hedonic characteristics, the choice fell on clothing and travel (Zara and Agência Abreu), with more utilitarian features, and cars and groceries (Renault and Pingo Doce).

The questionnaire contains a section with the socio-demographic variables and the items of the latent variables: three atmospheric factors (design, layout, and information), three emotional variables (arousal, pleasure and delight), and online intentions. The items used were formulated and adapted from Hausman and Siekpe (2009); Koo and Ju (2010); Turley and Milliman (2000); Wakefield and Baker (1998). Respondents rated all measures on a 5-point Likert-type scale ranging from 1 ("completely disagree") to 5 ("completely agree").

Items	Design	Layout	Information	Pleasure	Arousal	Delight	WOM

Table 4. Item loading and cross-loading full sample

A structural equation model approach using PLS (Ringle *et al.*, 2005) was employed to test the hypotheses of this study. PLS is based on an iterative combination of principal component

analysis and regression; it aims to explain the variance of the constructs in the model (Chin, 1998). In terms of analysis advantages, PLS simultaneously estimates path coefficients and individual item loadings in the context of a specified model. As a result, it enables researchers to avoid biased and inconsistent parameter estimates. Based on recent developments (Chin *et al.*, 2003), PLS has been found to be an effective analytical tool to test interactions by reducing Type II errors. By creating a latent construct that represents an interaction term, a PLS approach significantly reduces this problem by accounting for error related to the measures (Echambadi *et al.*, 2006). Tenenhaus *et al.* (2005) propose the geometric mean of the average communality (outer mode) and the average R^2 (inner model) as overall goodness of fit (GoF) measures for the PLS (Cross validated PLS GoF), which range from 0 to 1. Wetzels *et al.* (2009) point out that three different effect sizes for R^2 have different acceptable GoF values. The effect size for R^2 (f^2) defined by Cohen and Cohen (1983, p. 155) is determined by $f^2 = R^2/(1 - R^2)$. Thus, the effect sizes for R^2 include the limits: small = 0.02, medium = 0.13, and large = 0.26. Following GoF criteria for each effect size has been proposed: $GoF_{small} \geq 0.1$, $GoF_{medium} \geq 0.25$ and $GoF_{large} \geq 0.36$ (Wetzels *et al.*, 2009). The model proposed in the current study has formative constructs and moderating effects. Thus, in order to test the model we used the repeated indicators method (Chin *et al.*, 2003; Kleijnen *et al.*, 2007) and we choose the PLS approach because it avoids two problems: inadmissible solutions and factor indeterminacy (Fornell and Bookstein, 1982).

Table 5. Reliabilities and discriminant validity

Note: Diagonal elements in the correlation of constructs' matrix are the square root of average variance extracted (AVE). For adequate discriminant validity, diagonal elements should be greater corresponding off-diagonal elements.

CR: composite reliability

Results

The PLS model is analysed and interpreted in two stages. First, suitability of the measurements is assessed by evaluating the reliability of the individual measures and the discriminant validity of the constructs (Hulland, 1999). Then, the structural model is appraised.

Item reliability is assessed by examining the loading of the measures on their corresponding construct. Items with loadings of 0.707 or more should be accepted, which indicates that more than 50% of the variance in the observed variable is explained by the construct (Carmines and Zeller, 1979). In this study, all the items (see Table 1) have item loading equal and over than 0.712 and so they were not eliminated from the structural analysis. Composite reliability was used to analyse the reliability of the constructs since it has been considered a more accurate measurement than Cronbach's alpha (Fornell and Larcker, 1981; Sánchez-Franco and Roldán, 2005). Table 2 indicates that all constructs are reliable, since the composite reliability values are over 0.7 (Nunnally, 1978).

The measures demonstrated that convergent validity as the average variance of manifest variables extracted by constructs (AVE) was at least 0.5, indicating that more variance was explained than unexplained in the variables associated with a given construct. The criterion used to assess discriminant validity was proposed by Fornell and Larcker (1981), and suggests that the square root of AVE should be higher than the correlation between the two constructs in the model. Table 2 also shows that all latent variables have discriminant validity.

The structural results (full sample) are presented in Figure 2. In this study a nonparametric approach, known as Bootstrap, was used to estimate the precision of the PLS estimates and supports the hypotheses (Chin, 1998; Fornell and Larcker, 1981). All path coefficients are found to be significant at the 0.010, 0.025 or 0.050 levels, except three: atmospheric cues>pleasure, arousal>word of mouth and delight>word of mouth. Therefore, for the full sample, H2 is not supported and H5 is partially supported.

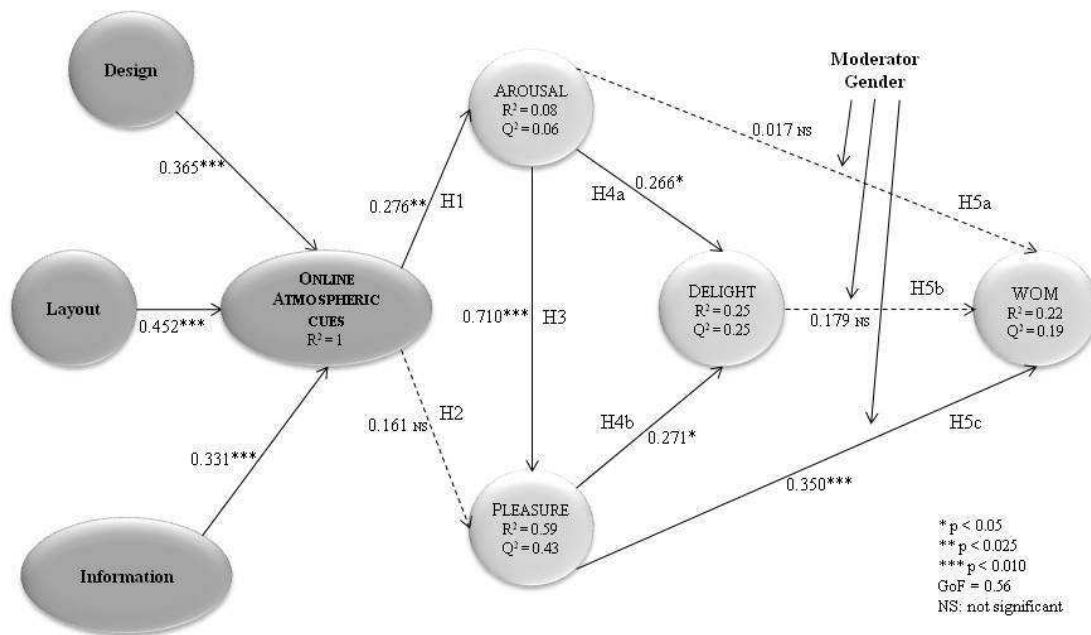

Figure 5. Structural results for full sample

However, as models yielding significant bootstrap statistics can still be invalid in a predictive sense (Chin, 1998), measures of predictive validity (such as R² and Q²) for focal endogenous constructs should be employed. All values of Q² (chi-squared of the Stone-Geisser Criterion) are positive, so the relations in the model have predictive relevance (Fornell and Cha, 1994). The model also demonstrated a good level of predictive power (R²), especially for pleasure, as the modelled constructs explained 59% of the variance in pleasure, 25% of the variance in delight and 22% of the variance in WOM. In fact, the good value of GoF (see Figure 2), regarding the large effect size, reveals a good overall fit of the structural model. Atmospheric cues ($\beta = 0.276^{**}$) significantly influence arousal and this emotional state significantly influences ($\beta = 0.710^{***}$) pleasure. In turn, pleasure ($\beta = 0.350^{***}$) exercises a significant effect on WOM. In what concerns atmospheric factors, design ($\beta = 0.365^{***}$), layout ($\beta = 0.452^{***}$), and information ($\beta = 0.331^{***}$) have a positive effect on atmospheric cues.

To test the moderating effect of gender, we estimated two more separate models in PLS, the women's sub-sample (n=222) and the men's sub-sample (n=141), using the test for differences suggested by Chin (2011). The measurement results for each of two sub-samples reveal reliability of the individual measures, as well as, the convergent validity and the discriminant validity of the constructs. The structural results for full sample and the multi-group analysis are presented in Table 3. In order to compare the two groups (the women's group and the men's group) we used the procedures described by Chin *et al.* (2003) and Chin (2011). A comparison of results suggests that differences exist across sub-groups. The structural model predicted 17.2% more of the variations in word of mouth in the women's sub-group than in the men's sub-

group. The results seem to reveal that the women's sub-sample fit the proposed model better. The t-test results suggest that there are significant differences in the causal order relationships related to hypotheses H5(a), H5(b) and H5(c). So, the sixth hypothesis is supported.

Conclusions and Implications

This study introduces for the first time the second order delight emotion into the context of S-O-R model and compares two sub-groups: women and men. The findings suggest that the three factors of atmospheric elements analysed have significant influence on the arousal and do not have a significant influence on the consumers' pleasure. In turn, both emotional states directly affect the second order emotion delight. It seems that it is pleasure which exerts a major influence to get people to speak well about the website store.

In general, the design, layout, and info included in the website significantly influence the arousal that people feel, but do not show a significant impact on pleasure. On the other hand, to be aroused and alert when visiting the website strongly influences the pleasure feeling. The fact that people feel content, happy, satisfied, pleased and free reflects on the way they speak well about the online store and when recommending it to others. However, WOM is not directly influenced by the arousal or delight of the users

When dividing the sample by gender, we can observe that for women atmospheric cues have a stronger significant influence in the sense of arousal and pleasure when compared to the total sample. On the other hand, whereas in the total sample the arousal and pleasure significantly influence delight, for the men sample only pleasure has a significant effect on delight and in the case of women only on arousal.

For women to praise the website and recommend it to other people they have to feel pleasure and even more delight during their online experience. Whereas for men it is the sense of satisfaction, happiness or pleasure that makes them favourably speak about the website store and brand. Hence we can conclude that emotions influence the women's group in a stronger way that makes them favourably speak about the websites than men. Thus it seems that the proposed model is more adjusted to women than to men.

This seems to be in sync with the investigations by Blumstein and Schwartz (1983) and Hansen (1987), although their study was aimed at proving that women are more loyal than men. In the present study, women tend to speak more positively if the stimuli create strong positive emotions.

According to the total sample, this study corroborates that of Oliver *et al.* (1997) by confirming in the online context that delight is formed from the arousal and pleasure, having the pleasure the same meaning that Oliver *et al.* (1997) attributed to positive affect. Although the results we found need further confirmation, in order to achieve delight, website and brand managers should take care to differentiate the stimuli presented in their websites according to gender. The

findings suggest that brand website managers, marketers and designers should create websites that have a collection of activities that make them more dynamic, in order to stimulate men more. It would also be relevant to segment the construction of websites based on women/men dichotomy and not just present a single website proposal for the whole population in general, especially if they want to attract the men's attention for products such as groceries, which are not the most attractive for men. This is increasingly important since as Dholakia *et al.* (1995) and Lee *et al.* (2005) mentioned, lifestyles are changing and men under the current circumstances are more prone to life alone for longer and to go the supermarket to do shopping or even buy more useful and daily products.

Table 6. Structural results and Multi-group Analysis

Note: Unbiased estimator of average error standard variance; test: $t=1.645^*$ is significant at 0.050; $t=1.960^{**}$ significant at 0.025, $t=2.326^{***}$ significant at 0.010; NS: not significant

As a limitation and opportunity for further research, we draw the attention to some aspects: to study in the future other factors that can start the whole emotional process either for men or women; to consider other output without WOM; to bring in positive and negative emotions to the model; to try and understand that other variables can contribute for the S-O-R framework to adjust better to men, which can be related to the type of stimulus that creates positive emotions; to use more product categories (useful and hedonic) that from the start will stimulate both genders alike, and also take into consideration products that are more "male" (e.g., gadgets).

Abstract

Sustainability in higher education has been regarded as an important issue for success of universities and other institutions where students, once trained and qualified, will exercise their professions.

The main goal of this study is use the Theory of Planned Behaviour to analyze sustainable attitudes and behaviours among students in higher education institutions across five countries: United States, Portugal, Cyprus, Serbia, and South Korea.

The results suggest that individualism, masculinity, and power distance could be important dimensions to explain difference in attitude and behaviour of students concerning sustainable issues. Students in more individualistic and masculine societies will be more pro-active and assertive in their attitudes, decisions, and reactions towards sustainability. In universities located in societies that score high in power distance, professors and top managers should be very clear in establishing the rules about university courses and how to behave in classes and campus regarding sustainable issues.

Keywords: Sustainable development, Higher Education, Theory of Planned Behaviour, Cross-Cultural Studies

INTRODUCTION

The planet is a dynamic system which is continuously changing. There is an “increasingly closer connection between nature and society, the idea of sustainable development has emerged on the political agenda over the last thirty years” (Barth et al., 2011, p. 100). The term of sustainable development was born with the report Our Common Future (WCED, 1987), described as the “development that meets the needs of the present without compromising the ability of future generations to meet their needs”. The concept focuses on two important pillars related to “importance of eradication of poverty and meeting the basic needs of all; to promoting the principles of inter-generational and intra-generational equity, to recognizing the link between a healthy economy and a healthy environment, and of accepting the limitations set by carrying capacity of the environment” (Kagawa, 2007, p. 317).

Sustainable development in higher education is a relatively new and emergent area of inquiry (Wright, 2010). Despite of this fact and according to the Agenda 21 (UNCED, 1992) and the Ubuntu Declaration (2002), the role of higher education is critical to developing a sustainable society. Consequently, the study of sustainability in higher education is an emerging field that has been led by studies such as sustainability education, the greening of physical operations, or university policy analysis (Wright, 2010). According to Wright (2010, p. 62), the mentioned type of studies still search for a conceptual idea around the term “sustainable university”, and there are only few studies to date that investigate the attitudes and behaviours related to the sustainability among the various stakeholders within a university. In line with Qablan and Al-Qaderi (2009, p. 184), who state that “attitudes and behaviours need to be modified to secure a sustainable future”, it seems paramount to study actual attitudes and behaviours amongst universities in general, and in all of their stakeholders, including the students, in particular.

Relating to an underpinning conceptual model used to investigate behaviours, Davis and Morgan (2008, p.106) point out “there has been recent interest in exploring the use of models from social psychology to provide a theoretical framework for understanding householders’ recycling behaviour”, such as Theory of Planned Behaviour (TPB).

Regarding the geographical scope of the various exiting studies in this field it is important to mention that they focus specifically on a restricted place or university. With the ongoing trend towards globalization, it is important to enlarge the scope of study, so the authors intend to contribute to fill a gap in this area, providing the results of a study across countries, or better, across cultures. In this vein, the purpose of this study is to compare the sustainable attitudes and behaviours amongst the students of universities in five countries regarding, for example, recycling and waste minimisation, energy efficiency, water conservation and green purchasing: Portugal, Cyprus, Serbia, United States and South Korea, using the cultural dimensions proposed by Hofstede (1980).

The remainder of this article is structured as follows. Next, the conceptual background on sustainable development, sustainability in higher education, and the Theory of Planned Behaviour is provided. Then, we present the research model and develop several hypotheses, bearing in mind four cultural dimensions to be tested. The third part describes the empirical approach and the data collection. The last section outlines the implications of the findings and discusses avenues for further research.

CONCEPTUAL BACKGROUND AND CONCEPTUAL MODEL

Sustainable Development

Sustainable development is a concept widely accepted and used since Our Common Future, commonly known as Brundtland Commission Report (WCED, 1987). In Chapter 2 of the report Our Common Future, the original concept of sustainable development is defined as follows:

“Sustainable development is the development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts:

- *the concept of ‘needs’, in particular the essential needs of the world’s poor, to which overriding priority should be given; and*
- *the idea of limitations imposed by the state of technology and social organization on the environment’s ability to meet present and future needs.*

Thus the goals of economic and social development must be defined in terms of sustainability in all countries - developed or developing, market-oriented or centrally planned. Interpretations will vary, but must share certain general features and must flow from a consensus on the basic concept of sustainable development and on a broad strategic framework for achieving it.

Development involves a progressive transformation of economy and society. A development path that is sustainable in a physical sense could theoretically be pursued even in a rigid social and political setting. But physical sustainability cannot be secured unless development policies pay attention to such considerations as changes in access to resources and in the distribution of costs and benefits. Even the narrow notion of physical sustainability implies a concern for social equity between generations, a concern that must logically be extended to equity within each generation” (WCED, 1987).

Sustainability in Higher Education

According to Kagawa (2007), the concept of sustainable development was popularized with Agenda 21, which was born in the United Nations’ Conference on Environment and Development that took place in Rio de Janeiro, in 1992. This document “delineates a wide range of strategies for realizing sustainable development” (Kagawa, 2007, p. 318). The education area is highlighted in Chapter 36 calling for the necessity to re-orienting education towards sustainable development (UNCED, 1992). In more detail, it “suggests accessibility to environmental and development education in formal and non-formal education for all age groups in integrating ‘cross-cutting issues’ in all disciplines using both innovative and traditional pedagogies.

In terms of higher education, Agenda 21 encourages cross-disciplinary courses, ‘which promote research and common teaching approaches on sustainable development as well as university partnerships with other sectors” (Kagawa, 2007, p. 318). Emphasizing the central contribution of universities in this context, Barth et al. (2011, p. 100) stress that “among the various educational institutions, universities are increasingly recognized as playing a crucial role in the context of sustainability by generating, transferring and communicating new knowledge as well as offering education and training”.

Despite the awareness created by the various aforementioned sources, sustainability in higher education, according to Wright (2010), is a relatively new and emergent area of research stream. Various studies on this theme have been appearing in recent years. For example, the

investigation of Kagawa (2007) was conducted to discover University of Plymouth students' perceptions, considerations, and attitudes toward sustainable development and related concepts and issues. The results reveal that a majority of students regard the sustainability as a "good thing". This does, however, not mean that they know the real meaning of the concept. Indeed, students strongly associate the concept of sustainable development with environmental aspects neglecting economic and social aspects of the concept (Kagawa, 2007).

Cotton et al. (2007) studied the lecturers' view of sustainable development and its contribution to the higher education curriculum. They found that in the University of Plymouth a wide range of understandings of sustainable development as well as a high level of critical debate about the concept itself exists (Cotton et al., 2007). In this line of thought, Wright (2010, p. 62) "examines how a cohort of university presidents and vice-presidents in Canadian universities conceptualize sustainable development, sustainable universities, the role universities play in achieving a sustainable future, key issues facing the university over the next decade, and the barriers to implementing sustainability initiatives on campus". The findings point out that the majority of participants "are well versed in the concept of sustainable development, but less familiar with the concept of a sustainable university. The most significant constraints to moving towards sustainability reported are financial predicaments, lack of understanding and awareness of sustainability issues amongst the university population, and a resistance to change" (Wright, 2010, p. 61). In addition, Tuncer (2008) investigates university students' perceptions of sustainable development and changing life styles and examines the effect of gender and enrolment on environmental-related courses, through a case study from Turkey.

Theory of Planned Behaviour

The Theory of Planned Behaviour is an extension (TPB) on the Theory of Reasoned Action (TRA) made necessary by the original model's limitations in dealing with behaviours over which people have incomplete volitional control (Ajzen, 1991; Armitage and Conner, 2001). Explaining the main change of TPB, when compared to TRA, is related to the "inclusion of perceived behavioural control that provides information about the potential constraints on action as perceived by the actor, and is held to explain why intentions do not always predict behaviour" (Armitage and Conner, 2001, p. 472).

The core factor of the Theory of Planned Behaviour is the individual's intention to perform a given behaviour, i. e., "the intentions are assumed to capture the motivational factors that influence a behaviour; they are indications of how hard people are willing to try, of how much of an effort they are planning to exert, in order to perform the behaviour" (Ajzen 1991, p. 181). The key lies in the idea that the stronger the intention is to engage in behaviour, the more likely should be its performance.

TPB comprises three independent variables of intention. The first, attitude toward the behaviour, “refers to the degree to which a person has a favourable or unfavourable evaluation or appraisal of the behaviour in question” (Ajzen 1991, p. 188), the second variable relates to a subjective norm that focuses on the perceived social pressure to exert or not to exert the behaviour, and, the third one, is the degree of perceived behavioural control, that refers “to the perceived ease or difficulty of performing the behaviour and it is assumed to reflect past experience as well as anticipated impediments and obstacles” (Ajzen 1991, p. 188). Here, the key conclusion is that “the more favourable the attitude and subjective norm with respect to behaviour, and the greater the perceived behavioural control, the stronger should be an individual’s intention to perform the behaviour under consideration” (Ajzen 1991, p. 188).

Figure 6. The original TPB.

Source: Ajzen (1991, p. 180)

To put it in a nutshell, the model presented by Ajzen (1991, p. 206), depicted in **Error! Reference source not found.**, proposes the following: “Attitudes toward the behaviour, subjective norms with respect to the behaviour, and perceived control over the behaviour are usually found to predict behavioural intentions with a high degree of accuracy. In turn, these intentions, in combination with perceived behavioural control, can account for a considerable proportion of variance in behaviour”. In other words, according to Kwon & Wen (2010), perceived behaviour control, attitude and subjective norm should be seen as determinants of behaviour intention.

Attitudes and Behaviours

According to Wixom and Todd (2005, p. 86), mentioning the expectancy-value theory, “external variables influence beliefs about the outcomes associated with performing a behaviour, which in turn shape attitudes toward performing a behaviour”. Subsequently, attitude influences the intention to execute the behaviour and, finally, the behaviour itself.

In the TPB context there is a discrepancy between attitudes and behaviours. Nigbur et al. (2010, p. 260) suggest that “attitude is just one of several determinants of behaviour, and not even its most direct antecedent”. However, TPB advises that the intention to engage in a particular behaviour is its most proximal predictor. In this context, intention is seen to be related to attitudes, subjective norm and perceived behavioural control. Thus, due the fact, that attitude is one contributor to behavioural intentions, it does not predict behaviour perfectly.

TPB and Sustainability

Contributing to a more comprehensive understanding, Davis and Morgan (2008, p. 106) state that “there has been recent interest in exploring the use of models from social psychology to provide a theoretical framework for understanding householders’ recycling behaviour”. They also allude that the environmental attitudes and situational and psychological variables are likely to be important predictors of recycling behaviour.

As mentioned before, the TPB offers a theoretical model for systematically studying the variables which influence behavioural choices, and is used in various types of behaviours, such as, amongst others, leisure choice or driving violations (Davis and Morgan, 2008). The theory “assumes that people have a rational basis for their behaviour, in that they consider the implications of their actions” (Davis and Morgan, 2008, p. 106). Thereby, in TBP the direct consequence of behaviour influences the individual’s intention to perform or not that behaviour.

Boldero (1995), Chan (1998) and other researchers use the TPB in their investigations about recycling behaviour. However, although there is considerable support for its use, there are concerns about its suitability for explaining the recycling behaviour (Davis and Morgan, 2008), and, in consequence, sustainability behaviour. So, similarly to Bolero’s study (1995), we can include additional variables within the model so as to increase the level of explanation of behaviour even more. Ajzen (1991) highlights, that TPB allows the incorporation of those. Following this suggestion, Davis et al. (2009) intended to characterize sustainable attitudes and behaviours amongst non-academic staff within Griffith University, Queensland. They found that “TPB was effective at determining staff attitudes and behaviours and determined that staff were overall satisfied with the current efforts by Griffith University to become more sustainable” (Davis et al., 2009, p. 136).

Based on the previous discussion, this research aims to extend this field of study to the context of undergraduate and graduate students in higher education. Thereby, in the current study, the authors analyze sustainable attitude in the classroom (turn off the power switches on the wall before leaving the room; turn off the air-conditioner / heater before leaving the room) and shopping (choose to buy green products; prefer to buy products labelled as ecologically or environmentally friendly; prefer to purchase eco-friendly electric and electronic devices). The student’s perception of social pressure to recycle (the subjective norm) comprises the university

pressure to recycle the office paper, providing separate paper recycling bins, being environmentally pro-active and worried about the ecological footprint. The third component of TPB, perceived control, is regarded as the student's perception of their ability to perform the behaviour, i. e., the perceived influence of individual behaviour on the resource usage, on maintaining the university as an environmentally responsible place, or be aware and know whom to report a water leak). Finally, intentions are analyzed as the students' willingness to continue to recycle their waste, explain to their friends and family the benefits of green products, and encourage their friends and family to recycle their waste. Thus, based on above considerations the following hypothesis is proposed:

H1: There is a positive relationship between (a) attitude towards shopping and intentions, (b) attitude towards classroom and intentions, (c) perceived behaviour control and intentions, and (d) subjective norms and intentions

RESEARCH MODEL AND THE MODERATING EFFECT OF NATIONAL CULTURE

The main goal of this study is the validation of the proposed model representing an adaptation of the TPB in the context of sustainability in higher education among five countries: Portugal, Cyprus, Serbia, United States and South Korea (see figure 2). National culture has been regarded as a major cultural characteristic that underlies differences in individual behaviour and in how people (e.g., students) perceive situations or events and interacts with others (e.g., Hofstede, 1980; Inglehart, 1997; Triandis 1999; Schwartz, 1994).

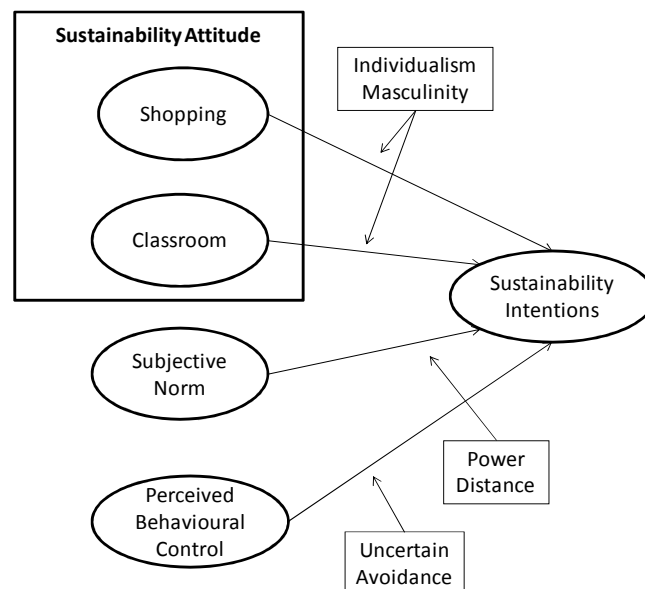

Figure 2. Proposed Model.

Hofstede's (1980, 2001) framework is originally constituted of four dimensions: power distance, avoiding uncertainty, masculinity/femininity, and individualism/collectivism. Power distance explains the degree to which members of society acknowledge as legitimate that the power in organisations is unequally distributed. Avoiding uncertainty represents the extent to which members of society feel uncomfortable with uncertainty and ambiguity. Masculinity/femininity is defined as a preference for personal accomplishment, success, heroism, severity, and material success, as opposed to a preference for relationships, modesty, attention to the weak and quality of life. The Individualism/collectivism dimension describe people in individualistic societies as caring for themselves and only their closest relations, whereas collectivist societies are seen to put greater emphasis on group welfare and loyalty. Later, Hofstede introduced the long-term orientation dimension to try to distinguish the difference in thinking between the East and West. However, Hofstede only provide information about this dimension for few countries being the reason for not considering this factor in this study.

Triandis (1989, 1999) alludes that cultures differ in terms of the types of information they choose to extract from their external environment. Thus, major differences are found between cultures that are located at an early stage of economic development and complex information driven societies, 'tight' (many behavioural- rules, intolerance to deviations) or 'loose' (tolerating deviations from norms), as well as individualistic ones (cultures which display mainly personal, internal attributes) and collectivistic ones (cultures which sample relationships, roles duties, and obligations).

Triandis (1995, 1999) also proposes that individualism/collectivism should be conceptualised as a polythetic construct: definition of the self (collectivists view the self as interdependent with others), structure of goals (for the collectivist, individual goals are usually compatible with in-group goals), emphasis on norms versus attitudes (among individualists the determinants are attitudes, personal needs, perceived rights and contrasts), and emphasis on relatedness versus rationality (collectivists emphasise relatedness whereas individualists emphasise rationality).

Schwartz (1990) criticises the individualism-collectivism dichotomy as proposed by Hofstede and develops an alternative theory of the structure of cultural values (Schwartz, 1994, 1999). The theory describes seven types of cultural/societal values: conservatism, hierarchy, intellectual autonomy, affective autonomy, mastery, harmony, and egalitarianism.

Lastly, according to Inglehart (1997), two main dimensions account for over half of the cross-national variance: traditional/secular-rational and survival/self-expression. Traditional societies, in contrast to societies with secular-rational societies, emphasise the importance of ties between parent and/child in traditional families, and deference to authority, and are highly patriotic and nationalistic. Societies characterised by survival values emphasise materialistic

orientations, report relatively poor health, tend to be intolerant of out-groups, and emphasise hard work, rather than imagination or tolerance.

In sum, this study follows the Hofstede's (1980, 2001) cultural framework and his four dimensions (see table 1) as the cross-cultural sample population from the United States (USA), Portugal, Serbia, Cyprus, and South Korea represents a wide range on the dimensions of power distance, individualism/collectivism, masculinity/femininity, and uncertainty avoidance (see table 1).

Country	Power Distance (PD)	Individualism/Collectivism (I/C)	Masculinity/Femininity (M/F)	Uncertainty Avoidance (UA)
Portugal	63	27	31	104
Gk. Cyprus	60	35	57	112
Serbia	86	25	43	92
USA	40	91	62	46
South Korea	60	18	39	85

Table 7. Country Ratings by Cultural Dimensions.

Source: Hofstede (2005)

Individuals in more individualistic societies are expected to be oriented to personal achievements and individual rights. In the same line, in masculinity societies individuals should be assertive and self-centered. So, it was expected that in countries such as USA and even Cyprus (more masculinity than Portugal, Serbia or Korea), students would be more self-centered and the conscience about sustainability issues will be more pro-active and assertive in their attitudes, decisions, and reactions toward sustainability and recycling. This leads to the following hypothesis:

H2: The positive relationships between (a) attitude toward shopping and (b) attitude toward classroom and intentions are stronger in national cultures in which Individualism and Masculinity higher.

People in a culture that scores high in power distance accept the hierarchical order, centralization is popular, and subordinates expect to be told what to do. In this vein, students in universities of such culture are expected to follow the social pressure toward sustainability induced by professors and top managers of university. Therefore, we propose the following:

H3: The positive relationship between subjective norm and intentions is stronger in national cultures in which power distance is higher.

Individuals in societies not tolerant to uncertainty are not at all comfortable in ambiguous situations. Uncertainty avoiding cultures try to minimize the possibility of such situations by strict laws and rules, safety and security measures, and on the philosophical and religious level by a belief in absolute values. Therefore, we expect that students in more uncertainty avoiding

cultures need to perceive how to control the situations, such as sustainable issues, and so we propose the following hypothesis:

H4: The positive relationship between perceived behaviour control and intentions is stronger in national cultures in which uncertain avoidance is higher.

METHODOLOGY

Samples

A survey was conducted to empirically validate the theoretical model. Data collection occurred from February 2011 to September 2011. This extended data collection period was necessary to obtain reasonable sample sizes for the statistical tests. Data was gathered from several universities in five countries: South USA (300 respondents), Portugal (300 respondents), Serbia (100 respondents), Cyprus (250 respondents), and South Korea (250 respondents). Table 2 shows the profile of respondents. Both undergraduate and graduate students participated in the study from a range of courses. Each country sample is split almost equally between genders.

Country	Gender	Age	Courses designation
USA	Male:44% Female:56 %	Mean= 25.2 SD= 7.1	Advertising, business, law, nursing, psychology, sociology, marketing
Portugal	Male:40% Female:60%	Mean= 26.3 SD= 7.8	Finance, biology, economy, management, engineering, marketing, psychology, tourism, languages
Serbia	Male:55% Female:45%	Mean= 22.7 SD= 2.9	Accounting, auditing, business, ,tourism, engendering
Cyprus	Male:53% Female:47%	Mean= 23.9 SD= 4.3	Economy, hospitality, law, marketing, finance, management
South Korea	Male:54% Female:46%	Mean= 23.9 SD= 3.4	Textile, language, business, engendering, law

Table 2. Respondents' profile.
SD Standard Deviation

Variables and Measurement

Drawing from the literature review, a questionnaire containing the items of the latent variables and a section with the socio-demographic variables was first constructed in English (British) and then translated into the several languages of the five countries (inclusive adaptations to the South United States English). Back translation was then used to ensure that the questionnaire communicated similar information to all respondents (Brislin, 1970; Sekaran, 1983). A pilot sample in each country was conducted to ensure that the wording of the questionnaire was clear.

The items used to measure the constructs (see table 3) were adapted from previous research (Boldero, 1995; Davies et al., 2002; Tonglet et al., 2004; Davis et al., 2006; Davis et al., 2009). For each item, respondents were asked to rate their degree of agreement and disagreement with its measuring items on a 5-point Likert-type scale.

Data Analysis

The Partial Least Squares (PLS) approach was employed to estimate structural paths coefficients, R^2 , Q^2 , and Bootstrap techniques. PLS is based on an iterative combination of principal components analysis and regression, and it aims to explain the variance of the constructs in the model (Chin, 1998). R^2 indicates the amount of variance explained by the exogenous variables (Barclay et al. 1995). Q^2 (chi-squared of the Stone-Geisser Criterion) is used for evaluating the structural model, the cross-validated redundancy (Chin, 1998). If the relations in the model have predictive relevance, then $Q^2 > 0$ (Fornell and Cha, 1994). Tenenhaus et al. (2005) propose the geometric mean of the average communality (outer mode) and the average R^2 (inner model) as overall goodness of fit (GoF) measures for the PLS (Cross validated PLS GoF). The GoF ranges from 0 to 1.

In terms of advantages, PLS simultaneously estimates all path coefficients and individual item loadings in the context of a specified model and, as a result, enables researchers to avoid biased and inconsistent parameter estimates. Moreover, it has proved to be an effective analytical tool to test interactions by reducing type II errors (Chin et al., 2003). Wold (1985, p. 590) holds that "in large, complex models with latent variables, PLS is virtually without competition". Thus, PLS was chosen to accommodate the presence of a large number of variables and formative factors.

RESULTS

First, a principal components analysis with Varimax rotation method was employed using the aggregate data of the five countries. The fifteen items used to measure attitude classroom, attitude shopping, perceived behavioural control, and subjective norm generated four factors that accounted for 63.4% of total variance. Only factors with eigenvalue equal to or greater than one were considered to be significant. All factor loadings are significant since they are equal or greater than 0.5 (Hair et al., 1998). After that the PLS approach for each sample of each country was applied.

The PLS model was analysed and interpreted in two stages. First, the adequacy of the measurements is assessed by evaluating the reliability of the individual measures and the discriminant validity of the constructs (Hulland, 1999). Then, the structural model was appraised.

<i>Construct</i>	<i>Items</i>
<i>Subjective Norms</i>	<i>The University encourages the recycling of office paper</i>
	<i>There is a strong sense of "community spirit" in my department</i>
	<i>The University provides enough separate paper recycling bins</i>
	<i>The University is an environmentally pro-active organization</i>
	<i>The University is serious about working towards sustainability</i>
	<i>The University's administrators are worried about the ecological footprint of the institution</i>
<i>Perceived Behavioural Control</i>	<i>I believe that my individual behaviours can have a direct influence on the resource usage within my department and the University</i>
	<i>If I found a water leak, I would consider it important to report it</i>
	<i>I am concerned with maintaining my university as an environmentally responsible place to study</i>
	<i>Sustainability is important even for Education</i>
<i>Attitude Classroom</i>	<i>If I were the last one to leave the classroom and the lights were on, I would turn off the power switches on the wall</i>
	<i>If I were the last one to leave the classroom and the air-conditioner / heater was on, I wouldn't bother to turn it off</i>
<i>Attitude Shopping</i>	<i>In my grocery shopping and whenever I have a choice, I always choose to buy green products</i>
	<i>I prefer to buy products labelled as ecologically or environmentally friendly</i>
	<i>I prefer to purchase eco-friendly electric and electronic devices</i>
<i>Intentions</i>	<i>In the future, I will continue to recycle my waste</i>
	<i>I will encourage my friends and family to recycle their waste</i>
	<i>I will explain to my friends and family the benefits of green products</i>

Table 3. Measures Items and Constructs.

Item reliability is established by examining the loading of the measures on their corresponding construct. Items with loadings of 0.707 or more should be accepted, which indicates that more than 50% of the variance in the observed variable is explained by the construct (Carmines and Zeller, 1979). For each country the items with item loading lower than 0.707 were eliminated from the structural analysis. Composite reliability was used to analyse the reliability of the constructs since it has been considered to be a more accurate measurement than Cronbach's alpha (Fornell and Larcker, 1981). Table 4 indicates that all constructs are reliable since the composite reliability values exceed the 0.7 threshold (Nunnally, 1978). The measures also demonstrated convergent validity since the average variance of manifest variables extracted by constructs (AVE) was at least 0.5, indicating that more variance was explained than unexplained in the variables associated with a given construct.

The criterion used to assess discriminant validity was proposed by Fornell and Larcker (1981), suggesting that the square root of AVE should be higher than the correlation between each two

constructs in the model. Table 5 shows that all latent variables (constructs) have discriminant validity.

The structural results for the five countries are presented in table 6. In this study, Bootstrap, a nonparametric approach, was used to estimate the precision of the PLS estimates and supports the hypotheses (Chin 1998, Fornell and Larcker 1981). All path coefficients are found to be significant at the 0.001, 0.01 or 0.05 levels, except for the relationship Subjective Norm->Intentions in all five countries and the relationship Attitude Classroom->Intentions for Portugal, Serbia, and South Korea. Thereby, hypothesis H1 is only partially supported.

<i>Path</i>	β USA	β Portugal	β Cyprus	β Serbia	β S. Korea
<i>Attitude Classroom -> Intentions</i>	0.226**	0.088 ns	0.178*	0.041 ns	0.070 ns
<i>Attitude Shopping -> Intentions</i>	0.321***	0.413***	0.432***	0.402***	0.279**
<i>Perceived Behavioural Control -> Intentions</i>	0.323***	0.287**	0.285**	0.390***	0.300**
<i>Subjective Norm -> Intentions</i>	0.075 ns	0.026 ns	-0.002 ns	0.118 ns	0.135 ns
<i>R²</i>	51.4%	38.5%	45.7%	61.6%	52.8%
<i>Q²</i>	0.44	0.37	0.40	0.58	0.25
<i>GoF</i>	0.58	0.49	0.55	0.66	0.48

Table 6. Structural Results.

* $p < 0.05$; ** $p < 0.01$; *** $p < 0.001$; ns not significant

All statistically significant coefficients are in the expected direction, with a single exception for the Subjective Norm->Intentions path, which was expected to have a positive coefficient, but it has a negative and not statistically significant effect in Cyprus. All values of Q² are positive, so the relations in the model have predictive relevance. The model also demonstrated a good level of predictive power (R²), especially for Serbia (61.6%), South Korea (52.8%), and USA (51.4%).

In general, it seems that the proposed model structure holds across the different countries. The values of GoF reveal a good fit. However, that is not to say that the countries are homogeneous in terms of the path coefficient. For example, the path coefficient Subjective Norm->Intentions is not significant, but the value is higher for S. Korea and Serbia than for the other countries. The path coefficient for Attitude Classroom->Intentions is only significant for USA and Cyprus.

Table 5. Discriminant Validity.

For adequate discriminant validity, the square root of AVE should be greater than corresponding off-diagonal elements.

To undertake a more systematic exploration of between-country differences in the path coefficients, the estimated coefficients and the cultural dimensions proposed by Hofstede (2005) were plotted (see figures 3, 4 and 5).

Figure 3. Graph of Attitude->Intention beta coefficients, I/C and M/C

Figure 3 shows two graphs of the coefficient estimates of attitude →intention and two dimensions of culture. The higher the country on the I/C (Individualism) and M/F (Masculinity) scales, the stronger the values of path coefficients of AC->I are. In other words, the line of I/C and M/F dimensions flows in the same way than the line of the beta coefficient estimates of attitude classroom →intention. However, it is not possible to see the same alignment on the second plot. The attitude shopping->intention path strength does not vary systematically with I/C and M/F. Thus, we find evidence in partially support of H2.

Figure 4 shows one graph of the coefficient estimates of subjective norm \rightarrow intention and power distance (PD) dimension of culture. The line of PD dimension tend to flow in the same way than the line of the beta coefficient estimates subjective norm \rightarrow intention. Therefore, the H3 is supported.

Figure 4. Graph of Subjective Norm->Intention beta coefficients and PD

Figure 5 shows one graph of the coefficient estimates of perceived behavioural control \rightarrow intention and uncertainly avoidance (UA) dimension of culture. The perceived behavioural control \rightarrow intention path strength does not vary systematically with UA. Therefore, we do not find evidence to support of H4.

Figure 5. Graph of Perceived B. Control ->Intention beta coefficients and UA

CONCLUSIONS AND IMPLICATIONS

In this study, the effects of pro-environment attitude, perceived control, and subjective norm of universities students, based on TPB, were investigated across five countries in South USA, Europe, and Asia. These countries have been shown to vary across the cultural dimensions of uncertainty avoidance, individualism, masculinity, and power distance (Hofstede, 1980, 2001).

Support could be found for attitude toward eco-shopping and perceived behavioural control related to sustainability issues on student's intention to continue to recycle, encourage others to recycle and to explain the benefits of green products in all universities in the countries analysed. More specifically, attitude toward classroom, i.e., a pro-active attitude toward sustainability seems to generate a positive intention to continue recycle and encourage other to recycle, in particular in more individualism and masculinity orientated societies. Subjective norm did not impact significantly on intentions. However, the results reveal that in more power distance societies, when universities encourage to recycle and are an environmentally pro-active organization, in turn, their students tend to more active encouraging others to recycle and explain the benefits of green products.

In more individualistic and masculinity orientated societies, students tend to be more assertive and self-centered. If the university is oriented to sustainability, the students will be more self-centered and conscious about sustainability issues which, in turn, lead them to be more pro-active and assertive in their attitudes, decisions, and reactions toward sustainability.

In universities located in societies that score high in power distance, students expect to be told what to do. So, professors and top managers should be very clear in establishing the rules about university courses and how to behave in classes and campus.

This study is the first attempt to apply the TPB to the context of sustainability in higher education in a cross-cultural comparison. Future research should collect data to analyse the Hofstede dimensions and /or Schwartz values system in a direct way, asking students to fill in a questionnaire with items which allow us to calculate such dimensions. The use of score values from the Hofstede (2005)'s website, as done in this study, could be regarded as a limitation, since we do not measure directly the cultural dimensions of the respondents. Another limitation lies in the fact that the students who participate in the study could not represent the perceptions of all university students across the five countries. This aspect seems to be particularly important in the case of United States. Our sample could be regarded as representative of the universities in the south of the country but not in the whole country. Finally, future research should also consider other variables integrated in the TPB, as Boldero (1995) suggested. In addition, it is suggested to regard more carefully other aspects beyond the recycling, waste, energy efficiency, water conservation, and green purchasing.

POWER TO THE PEOPLE!? THE ROLE OF PROCEDURAL FAIRNESS WITHIN DECISION PROCESSES OF COMMUNITY-BASED NATURAL RESOURCE MANAGEMENT IN NAMIBIA

Abstract

Community-based natural resource management (CBNRM) is a way of devolving rights over resources to rural residents on communal land, thus enabling them to manage the land themselves. In Namibia, three such approaches are currently applied: Conservancies, Community Forests and Integrated Park Management, whose legislation, decision-making, implementation and benefits to the local population differ significantly. The purpose of this study is to examine if the fairness of decision procedures is positively related to the local population's acceptance of and satisfaction with the respective approach, and to their willingness to comply with rules and regulations. A qualitative review of legislations, policies and constitutions reveals a solid basis for fair decision processes; however, primary research identifies many issues that hinder fair decision-making. The study reveals that fair decision processes influence acceptance and rule compliance partly; however, many further issues influencing CBNRM in Namibia make it a complex context.

Keywords: Procedural Justice, Community-based Natural Resource Management, Namibia, Conservancies, Community Forests, Integrated Park Management

Introduction & Background

The land surface of Namibia can be divided into proclaimed national parks (12% of the country), and land outside of those parks, to which the tenure systems of the rural economy apply. In the north, communal land covers up to 45%. Communal land is state owned, but occupied by rural tribal communities constituting currently 68% of the Namibian population (Forslund, 2007; MAWF, 2005). Before Namibia's independence in 1990, the attitudes of local people towards the inherited colonial natural resource conservation system was generally very negative which has led to an extensive exploitation of natural resources (MET, 1995; Jones, 1998).

In order to control this development, community-based natural resource management (CBNRM) has been introduced in the early 1990s by the Government of Namibia. CBNRM is 'something that takes place where a specific group of people have clearly defined rights over a resource and collectively take decisions over the use and management of the resource. By implication, this defined group of people is able to retain any financial benefits that might accrue from the use of the resource and are able to

decide how they will use the benefits' (Jones, 1995 as cited in Forslund, 2007: p.5). The rights that rural residents have gained through CBNRM are to take managerial decisions about the way they use their natural resources themselves, allowing deriving income and other benefits from their usage (NACSO, 2008).

The Government of Namibia has enabled three approaches of CBNRM: Conservancies, Community Forests and Integrated Park Management (IPM). Conservancies regulate the right to use game, Community Forests the right to use timber and other forest products, and Integrated Park Management the involvement of residents in the management of proclaimed national parks. While, for example, both Conservancy and Community Forest strategies follow the same principles of empowering local communities to manage natural resources and to share related benefits, the different resource types lead to specific technical requirements with regard to management scale, resource assessments and management planning (Sprung, 2010).

Even though CBNRM has been the subject of a variety of research in the last decades of active practice, little is known about how the rural communities, who are addressed by the approach and are who are meant to be the ultimate beneficiaries of the resource allocation decisions, perceive the programme. While a vast amount of literature can be found on what has worked and what has not worked in CBNRM practice, the factors that influence the community members' acceptance of and satisfaction with the programme and also their willingness to contribute to its progress by complying with rules and regulations have not yet been determined. Looking at previous theoretical and practical research from the field of organisational justice, it becomes evident that the fairness of decision-making procedures is related to the acceptance of the outcome of those decisions (see Colquitt et al., 2001).

Theory and Conceptual Framework

The overall aim of this study is, therefore, to investigate whether the procedural justice of decision-making within the different CBNRM programmes influences the acceptance and rule compliance of the local population with the three approaches of CBNRM in Namibia and, in doing so, to compare Conservancies, Community Forests and IPM.

Organisational justice refers to "the extent to which fair procedures and processes are in place and adhered to and to which individuals see their leaders as being fair and sincere and logical or rational in what they do" (Skarlicki & Latham, 1996).

As found by Thibaut & Walker (1975), procedural justice – comprising process control (the decision recipients' influence on the process) and decision control (influence on the actual outcome) – influences the reactions of individuals to the outcome they receive, as well as their evaluation of the authority that is responsible for the decision. The following rules were identified as essential for the judgement of a process as being fair (Thibaut & Walker, 1975; Leventhal et al., 1980):

- Consistency: Decision processes are consistent with regard to different persons and over a certain time period
- Neutrality: The decision is not influenced by self-interest or bias of decision-makers
- Accuracy: Correct and detailed information is collected and considered at the time of decision-making
- Correctability: Decisions can be changed
- Representativeness: Need and opinions of all persons concerned are taken into consideration
- Ethicality: Decision-making process is in line with the values of the persons concerned.
- Transparency: communication and information systems are working

Recent studies have found that “procedural fairness has a greater impact on employees’ support for decisions, decision makers and the institution that the decision makers represent when the outcomes of the decision are relatively unfair or unfavourable” (Brockner et al., 1997: p. 560, Brockner & Wiesenfeld, 1996). At the same time, fair processes lead to organisation citizenship behaviour, higher commitment and rule compliance (see Colquitt et al., 2001). Trust in the motives of decision-making authorities can enhance the perception of procedural justice (Tyler 1989, Tyler & Lind, 1992), whereas low self esteem and uncertainty about one’s own status in the organisation moderate the impact of procedural justice (Brockner et al., 1998; Heuer et al., 1999; Wiesenfeld et al., 2007; De Cremer et al., 2010).

The present research intends to consign the criteria and rules used to measure perceived procedural fairness in a workplace situation to the different CBNRM approaches in Namibia. Based on fairness judgement rules of procedural justice outlined in the previous sections (Leventhal et al., 1980, Brockner, 1996, Brockner & Siegel, 1997), a conceptual framework was developed that assesses the relationship between the constructs reviewed (process control, decision control, consistency, neutrality, accuracy, correctability, ethicality and transparency) and the acceptance of and satisfaction with the outcome, as well as the rule compliance of the local communities. Resulting from this, the following hypothesis was derived:

Hypothesis: The constitutive components of procedural justice - process control, decision control, consistency, neutrality, accuracy, correctability, ethicality and transparency – will be positively correlated to

- The acceptance and satisfaction with the outcome
- Rule compliance

Methodology

The research has been divided into three parts: First, existing CBNRM legislation and policies were analysed according to the fairness constructs. Also, the constitutions of five Conservancies, five Community Forests and the Kyaramacan Association of Bwabwata National Park were reviewed according to the same fairness constructs by using a qualitative matrix (refer to Appendix A). For the second part, experts in the field of CBNRM and especially the Conservancies, Community Forests and park association under review were interviewed. 13 semi-structured expert interviews were conducted with local stakeholders and industry participants with thorough knowledge on CBNRM initiatives in order to investigate the fairness of decision-making processes in the CBNRM programmes. The third part of the research formed a self-administered paper-based questionnaire, which measured procedural fairness, acceptance and rule compliance according to Colquitt (2001). In addition, experts in the field were asked to fill out the questionnaire, producing in total 15 responses. For that, a snowball sample was used until no more experts were named. Therefore, we conclude that we asked the whole population of available experts.

Policy Review

With regard to the study at hand, the CBNRM policies have been investigated as to their inclusion of fairness constructs. The legislation of Conservancies, for example, includes a part on Conservancy constitutions. These should include issues of process control, decision control, consistency of meetings, correctability through committee elections, ethicality and transparency of financial management. The essential policy framework for Conservancies can be found in Ministry of Environment and Tourism (MET) documents and identify the functions and duties of a Conservancy committee, e.g. to represent the interests of the Conservancy members, to arrange AGMs, and to inform and consult members. Thus, transparency (informing and consulting members), and consistency (regular occurrence of AGMs) should be given. Also, process control and decision control are addressed to some extent through the members' representation by the committee.

Similar to the legislation for Conservancies, the Forest Act specifies the prerequisites a community has to provide before a Community Forest can be formed. Here, decision processes are not referred to in particular, but remarks towards fairness constructs like accuracy, process control and transparency are made in the Community Forest Guidelines and the membership procedures are even fairer than in Conservancies, since all residents become members by default, whereas in Conservancies, proactive applications have to be made.

However, traditional authorities (TAs) play an important role as advisors and decision-makers in Community Forests, which could be an obstacle to democratic decision-making.

Conservancy and Community Forest constitutions include much more details regarding procedural fairness constructs than the park residents' association constitution. This can be explained as most decisions are still made by the MET in IPM, and only few rights are devolved to the board of trustees.

Findings and Discussion

Results from the questionnaire revealed that the highest acceptance and rule compliance across all items measured exist in the Conservancy approach, closely followed by Community Forests, leaving IPM behind, though adherence to rules and regulations achieved very high results in all three approaches.

Examining correlations with the correlation test according to Kendall's Tau b (10% significance level), we recognize remarkable differences between the three approaches. In Conservancies, there seems to be a positive correlation between rule compliance (comprising *participation in a project* and *adherence to rules and regulations*) and consistency, correctability and neutrality (supporting hypothesis 1 partly); while for Community Forests, such a relation is found with accuracy, process control, decision control and neutrality. In IPMs, the data suggest a positive correlation with ethicality, correctability, process control, and accuracy, but a negative one with decision control. We conclude that the construct rule compliance is positively influenced by each of the observed fairness constructs, however, there is no clear pattern or hierarchy of the individual constructs that is generally adaptable for all approaches. Regarding the acceptance construct (comprising *satisfaction* and *well received*), a similarly heterogeneous picture is created. In Conservancies, acceptance is positively correlated with decision control, accuracy and neutrality. In Community Forests, the (positive) influencing factors seem to be decision control, neutrality and correctability. In IPMs, none of the observed fairness constructs influences acceptance positively; in contrary, there seems to be a negative correlation to ethicality and correctability. We can therefore accept hypothesis 2 for Conservancies and Community Forests, but have to reject it for the still young IPM project. All in all, fairness affects the two target constructs most in Community Forests. Neutrality and decision control seem to have great impact on acceptance and rule compliance in Conservancies and Community Forests, whereas process control, consistency and ethicality seem to be of secondary importance. IPMs differ significantly from the two other approaches with regard to the impact of fairness on the target constructs. Possible reasons for that become evident in the upcoming section of this paper, where the results for all three programmes are now being analysed and discussed.

In general, we can say that rule compliance in the form of attendance is rather low because of money, transportation and information flow issues in Namibia. Acceptance of Conservancies and Community Forests is high and not necessarily influenced by fair procedures, since living standards have increased, jobs have been created and income has been generated by the implementation of CBNRM, and those facts are hardly moderated by unfair decision procedures (N. Faschina, personal communication, 2010).

The good results of conservancies can be attributed to the fact that the Conservancy Programme has run the longest, so that the communities have had the time to get accustomed to the programme. Regarding IPM's lower results, one has to note that the history of the national park management is a difficult one, which might have caused scepticism and resistance among the park residents, even

though consistency, neutrality and accuracy are all high rated, which refers back to the decision-making of the MET.

In the following, a short explanation of the individual results of all procedural justice criteria is given:

Process Control

Decentralized structures seem to be a key to process control in CBNRM programs, as they enable the members to take part in decisions even if the situation does not allow them to attend meetings. These structures are widely established in Conservancies, but still a problem in Community Forests. A major problem of both Conservancies and Community Forests is inefficient AGMs, which is due to the inability to gather enough people or the unwillingness of the committee to open the books for the public.

For IPM, the management of the national parks is still a function of the MET, so the participation opportunities of the park population are quite small.

Decision Control

As is well-established in Conservancy constitutions, members have the right to vote; and, therefore, can influence decisions to a large extent – given that AGMs actually take place.

Results for Community Forests may be lower due to the influence of the TAs who oftentimes misuse their influence for their personal advantage.

For IPM, Decision Control is difficult, as decisions often affect the whole region or are even of national importance and cannot be overruled by the wants of the communities.

Consistency

Consistency is one of the constructs which achieved where IPM achieved the highest results which may be due to the fact that consistency is here created by the MET, using management plans. In the other two, the problem is the unrealistic quorum for meetings set in their constitutions. This leads to the fact that too few people attend meetings for valid decisions to be made and a difficulty to report to the MET. Also, as for Community Forests, consistency and accuracy are low, because reporting templates are often not filled in properly due to unwillingness to reveal numbers and the small number of literate persons in the committees.

Neutrality

Neutrality has achieved among the lowest results for Conservancies and Community Forests. According to expert experience, around 50% of the committees act primarily in their own interest, and elite and eloquent community members rise quickly into leadership positions, overruling the opinions of the community.

The neutrality of decisions of IPM is ensured by the MET, the highest decision-making authority, which is a reason for the higher neutrality ratings for this approach.

Accuracy

The accuracy of decisions in Conservancies and Community Forests varies, since pre-defined plans exist, but their execution depends on the ability and willingness of the individual committees.

In IPM, decisions are made by the MET according to a required pattern or technical suggestions, explaining the comparably higher result for IPM.

Correctability

Correctability in Conservancies is again rated comparably high. Members have the possibility to remove committee members and to raise concerns. In reality, though, the African mentality limits the correctability, as Africans would feel uncomfortable to point their fingers at particular persons who might even be remote relatives. In order to address this issue, more recent Conservancy constitutions include a clause on the details of misconduct, enabling members to refer to the constitutions when complaining and thus, evading personal responsibility.

In Community Forests, the slightly lower rating would result from the influence of the TAs, who often cover for the committee's misconduct.

In IPM, the MET is largely still the law enforcing partner – a reason why correctability might not be rated very high. However, MET decisions can be appealed anytime.

Ethicality

Ethicality is rated higher for Community Forests than for Conservancies due to the lacking default membership for Conservancy residents, leaving some non-member residents powerless. Also, according to the reviewed constitutions, the role of women is stronger in Community Forests; however, gender equality is promoted intensely in both Conservancies and Community Forests right now. A further threat to the ethicality of decision-making are the TAs, who, according to experience, execute their authority in sometimes unethical ways. Nonetheless, experts claim that their role might not necessarily be negative, because the still young democracy can use guidance by the TAs.

In IPM, traditional authorities and headmen are very strong, and MET tries to integrate all partners, with mixed results.

Transparency

In larger Conservancies, information does often not get through to members as a large number of people do not attend meetings, area representatives tend not to report back to the community, and the committee only communicates decisions at the next AGM. In Community Forests, information often only reach the villages close to where the committee operates. A reason for all that might be the absence of attractive incentives to inform the members. Furthermore, members often do not make use

of their right to inspect documents, partly because they have never read the constitution, which is difficult to understand; and partly because they do not want to question their elected leaders.

For IPM, the MET has initiated a successful programme to share information over the radio. Still, the usual communication structure with elected village representation is not working as desired due to overly bureaucratic communication structures. Its communication strategy, therefore, is seen as a weakness and not yet well developed.

Conclusion

The thorough analysis of procedural fairness constructs within the decision processes of CBNRM in Namibia has led to the discovery of many issues that communities, committees and eventually all stakeholders have to deal with. It has been found that the constitutions theoretically provide a sound basis for fair and equal decision-making in Conservancies and Community Forests, but are in fact often not used for actual decision-making. However, they at least seem to provide a general guidance.

Decision-making in Conservancies and Community Forests is executed in similar ways. Still, it becomes clear that Conservancies have a significant advance in experience and it seems like Community Forests are making the same mistakes that Conservancies have already overcome, instead of learning from them. A stronger strategic and executive cooperation between the approaches is recommended, though challenging to implement due to the different ministries in charge.

Experience has shown that AGMs create a platform for discussion, but are a difficult setting to reach decisions due to the large number of people involved and the unrealistic quorum of meetings. Africans like reaching decisions by consensus, and are not satisfied with the democratic majority decision-making system. Recent developments of reaching decisions at village level which are then brought together by village representatives, and attempts to facilitate attendance at meetings are very promising regarding this issue.

The results indicate that even though problems with procedural justice exist, the local population can still be satisfied with their CBNRM approach and do comply with the established CBNRM rules. This results, first of all, from an increased standard of living produced by the program, and second from the fact that it is difficult for community residents to assess fairness due to their lack of education and the consequent lack of understanding the processes, and since they are often not even informed about decisions. Trust is in this case an issue, as residents are not able to oversee and understand the processes and do not have any other choice than to trust their committee. Trust might increase perceived fairness and people trust their leaders because they have elected the committee themselves. But trust is not influenced by the fairness constructs offered in the literature – it is rather credulousness and forced traditional trust which can easily be abused – i.e. the committees not acting in the best interest of community members. Still, the committee cannot be blamed for all problems. Sometimes, it has problems to make tough decisions because it is given only little information or has

limited experience. Also, peer pressure makes it hard for individual committee members to make tough decisions due to the low valuation of individualism rating in the African culture.

This study has several implications for the practice of CBNRM in Namibia:

- The reverse fair process effect was shown in the results of this study. This means that unfair processes do not always impact the positive outcome of decisions. Although the reasons for this are obvious, in the long run, concepts of procedural justice should be incorporated and strengthened by integrating an effective monitoring and controlling system that assesses the actions of the committees.
- The importance of process control and decision control has been shown by this study. The MET and other ministries involved should keep in mind that giving the communities voice has a very strong implication on their acceptance and rule compliance.
- Procedural justice influences the evaluation of the decision-making authorities and institutions. Therefore, the committees should be educated in making decision processes fair so that they can maintain their trustful leading position in the Conservancy/Community Forest/park resident community. Also, for the long-term success and positive evaluation of CBNRM in Namibia, procedural justice should become an important topic on the agenda of CBNRM practitioners and it should be discussed how procedural fairness can be increased in the individual cases.
- Procedural fairness addresses areas of human concern, and people feel valued when they are treated fairly. This can have an indirect impact on living standards of the communities, for example by increasing their self-esteem, and should be strengthened, e.g. through workshops that educate them about their rights and options they can pursue when feeling unfairly treated.
- Also, to increase the self-esteem of members and prevent negative peer pressure, specific clauses about members' rights should be included in the constitution. Further, every member should be educated about his/her own status, rights and responsibilities to be able to enforce them when needed.
- The setting of decision-making should be reassessed: AGMs could be split up for the different villages. There, decisions could be made and a pre-established AGM agenda would force the committee to account to members and, therefore, increase transparency. First developments in this direction that have already been made should be continued and enhanced, as they allow more members to take part in decision processes.
- The important issue of communication has been identified in this study. Village representatives are a tool for sharing information, but only if they take their responsibilities seriously. Therefore, incentives in form of money or power should be offered to them to ensure a smooth information flow.

- Decentralised structures allow for mismanagement at two levels. An effective monitoring system that is carried out by an external organisation would help to eliminate this development.
- Accuracy and Neutrality concepts hardly appear in constitutions. Inclusion of those concepts should be considered, as this would strengthen the ground for fair behaviour.
- The exchange of information and ideas between Conservancies and Community Forests should be fostered through regular meetings, so that both can learn from each other and together improve their governance and decision-making.
- IPM is still regarded as difficult by the sceptical communities concerned. Therefore, communication between communities living in the national parks and the MET should be strengthened to promote IPM to all involved parties. This could be achieved by spelling out the rights and responsibilities of each party and educating especially the villagers about their status in the management of the national park and so increase their self-esteem.

In conclusion, the study showed that procedural fairness of decision-making is to some extent positively related to the acceptance (hypothesis 1) and rule compliance (hypothesis 2) of the local population towards all three CBNRM approaches, while Conservancies are generally ranked better than Community Forests, which are ranked better than IPM. However, a direct comparison between the three programmes is a rather simplistic approach and the analysis of results only started to take into account the underlying motives for the results found.

It should not be overlooked that all three programmes have been carefully created to assist rural residents; and the constant development and improvement of CBNRM shows that authorities, NGOs and donors are willing to push it further. Also, the issues that are still to deal with should not minimise the success of CBNRM and the many benefits it has brought to the communal residents of Namibia; while at the same time the future of CBNRM must not be neglected and provisions have to be made to make it self-sustainable in the long run, with less technical, financial or government support.

Abstract

Immigrants' involvement in entrepreneurship is characterized by two critical moments dealing with the creation and the growth of their ventures. The present paper investigates the growth of ethnic ventures and, particularly, attention is paid to the break-out process, i.e. how ethnic entrepreneurs make their businesses grow, passing from competition in the ethnic enclave to competition in the mainstream market, where local entrepreneurs act.

Even if data were obtained from a previous questionnaire survey, which was administered to forty-two Ukrainian entrepreneurs in Caserta (in the South of Italy) about the creation of ethnic ventures, by converging attention on the connections matrix between the twelve independent variables considered, a very interesting result comes into view: Ukrainian entrepreneurs in Caserta decide to compete in the mainstream market only if they can leverage on employees of their ethnic group.

According to this, it derives that financial or physical resources are not relevant to start competition in the mainstream market. Only social capital is determinant.

Keywords: Break-out process; Ethnic entrepreneurship; Ethnic ventures; Immigrants

Introduction

There is a general consensus among scholars that immigrants contribute to the economic development of the countries they settle in (Razin and Langlois, 1996). They create wealth by contributing to G.D.P., they create occupation, and they improve dynamics of economic market by competing with other ventures to conquer market shares (*XX Rapporto Caritas/Migrantes, Dossier Statistico sull'Immigrazione 2010*).

Four different theoretical frameworks have been proposed to study immigrants' involvement in entrepreneurship (ethnic entrepreneurship, enclave theory, transnational entrepreneurship and ethnic business) but, nowadays, empirical results still remain uncertain (Matricano, 2011a).

The part of literature focused on "*ethnic entrepreneurship*" aims to investigate the process through which new ethnic ventures are created. The investigation is about the relevance of the socio-cultural factors of the origin Country and of the socio-economic factors in the destination Country (Matricano,

Although the paper is the result of the joint contribution of the authors, sections 1, 2 and 7 have been written by Mario Sorrentino; sections 3, 4, 5 and 6 have been written by Diego Matricano.

2011b). The predominance of the former group on the latter is known as *supply-based* approach; on the opposite, it is possible to find the *demand-based* approach; the combination of both of them gives birth to the *mix-based* approach (Kloosterman *et al.*, 1999). If none of them is relevant, ethnic entrepreneurs are expected to follow the *vacancy-chain* approach. All the four cases are included in table 1.

	<i>High relevance of the socio-economic factors in the destination Country</i>	<i>Scarce relevance of the socio-economic factors in the destination Country</i>
<i>High relevance of the socio-cultural factors of the origin Country</i>	<i>Mix-based Approach</i> 1	<i>Supply-based Approach</i> 2
<i>Scarce relevance of the socio-cultural factors of the origin Country</i>	4 <i>Demand-based Approach</i>	3 <i>Vacancy-chain Approach</i>

Table 1. The four different approaches to explain the creation of ethnic ventures. Source: Personal elaboration.

The combination of the socio-cultural factors typical of the origin Country and of the socio-economic factors in the destination Country or the predominance of one group of factors over the other one can be evaluated at different geographical levels. According to some authors (Portes, 1995; Light *et al.*, 1994), in fact, the evaluation can be referred to the whole city where immigrants live and work or just to the *enclave*, the limited part of the city where immigrants settle. This is the part of literature known as the “*enclave theory*” (Matricano, 2011a).

Another vein of literature, called *transnational entrepreneurship*, starts from the assumption that immigrants can contemporarily start businesses both in the origin and the destination Country (Drori *et al.*, 2009). Scholars interested in this topic try to catch differences between the creations of business in different Countries.

Differently to the above-cited theories, focused on the creation of new ethnic ventures, the theoretical model named “*ethnic business*” studies the *post entry* ongoing of ethnic ventures. Specific interest is in whether and how ethnic entrepreneurs decide and try to get out of the ethnic enclave to enter the *mainstream* market. This passage is known as *break-out process* (Ram and Hillin, 1994).

The present work aims to review the theoretical model of the *break-out* process and to test it on a sample of forty-two Ukrainian entrepreneurs in Caserta.

Literature Review

In the field of ethnic entrepreneurship, great relevance is assigned to the concept of enclave (Portes, 1995; Light *et al.*, 1994). According to Zhou (2004), the enclave “*refers to a specific phenomenon, one that is*

bounded by an identifiable ethnic community and embedded in a system of community-based co-ethnic social relations and observable institutions” (p. 1045).

Over the years, several scholars have supported the enclave theory (Volery, 2007; Kloosterman and Rath, 2001; Kloosterman et al., 1999) and have contributed to its development. Peterson and Roquebert (1993), for example, contributed to define the concept of enclave.

Other scholars have carried out empirical investigations about this: Basu (1998) investigated three enclaves (Indian, Bengalese and Pakistan) in the UK. The main objective was to compare inclination to entrepreneurship between different ethnic groups in their enclaves. Kloosterman (2003) carried out a similar study in the Netherlands. Zhou (2004) focused his attention on Chinatown, the Chinese enclave in New York, one of the most famous enclaves in the world. The Italian studies about enclaves show a certain delay since most of immigrants do not live and work in their enclaves. However, the rare cases of established enclaves have been studied, like the African and the Chinese enclaves in Milan (Breveglieri et al., 2000, 1997) and, maybe the most famous case, the Chinese enclave in Prato (Bressan et al., 2008).

Differently from the above-cited scholars, some others started investigating the possible paths to growth of ethnic ventures. Specifically, scholars were interested in investigating whether immigrants decide to remain in the ethnic market (path A in Figure 1) or to enter the mainstream market (path B in Figure 1). In the last case, they start a *break-out* process (Ram and Hillin, 1994).

Figure 1. The possible paths that entrepreneurs can take. Source: Personal elaboration.

In reference to the competitive strategy (Sorrentino, 2012), the reasons for the choice to remain in the ethnic market or to enter the mainstream market have to be sought in competition in the ethnic market. All the ethnic entrepreneurs start small by offering their products/ services to the ethnic group they belong to. Competition in the ethnic community has a positive and a negative implication. The positive deals with knowledge of consumers' needs, potential and effective competitors. The negative one, instead, deals with saturation of the ethnic market. Ethnic entrepreneurs have to decide whether to focus on the ethnic market and to remain small players or to grow in the mainstream market. In the last case, this is the time when the breakout process starts. Of course, the choice to enter the mainstream market is not risk free. Ethnic entrepreneurs have to face a new kind of competition and to offer products/services that can satisfy local consumers too. Very interesting contributions about

this have been proposed by Deakins et al. (1997), who investigated the breakout process of African ventures in UK, and by Pio (2007), who did it in reference to Indian ventures in New Zealand. As for the Italian studies, particularly interesting is a study proposed by Ambrosini and Abbatecola (2002) and dealing with the evaluation of different growth options by Egyptian entrepreneurs in Milan.

As already anticipated, the purpose of this study is to conduct an empirical investigation about Ukrainian entrepreneurs in Caserta to find out factors affecting creation and growth of their ethnic ventures. The theoretical frameworks proposed above are a necessary premise to understand the empirical part.

Ukrainian entrepreneurs in Caserta

The choice to focus on Ukrainian entrepreneurs in Caserta is due to empirical data in order to prevent from any possible distortion in results due to subjective decisions.

At first, it is required to define the context of the analysis.

According to the report *Immigratimprenditori in Italia* edited by Fondazione Ethnoland, 2009, in Campania there are 4.222 ethnic ventures. Inside the Region, Caserta is the municipality with the highest percentage of ethnic ventures in Campania (table 2).

<i>Municipalities</i>	<i>Percentage of immigrants' businesses</i>
<i>Avellino</i>	3,2 %
<i>Benevento</i>	2,2 %
<i>Caserta</i>	55,1 %
<i>Napoli</i>	27,5 %
<i>Salerno</i>	12 %
<i>Total</i>	100%

Table 2. Distribution of immigrants' businesses over Municipalities in Campania Region. Source: *Immigratimprenditori in Italia*, Fondazione Ethnoland, 2009.

As for the ethnic group to rely the questionnaire survey on, the XX Rapporto Caritas-Migrantes, Dossier Statistico 2010 maintains that immigrants in Campania Region are 147.057. The Ukrainians' group is the most numerous: they are 33.238 (table 3).

<i>Country of origin</i>	<i>Amount of immigrants</i>
<i>Ucraina</i>	33.238
<i>Romania</i>	24.163
<i>Marocco</i>	12.267
<i>Polonia</i>	10.763
<i>Cina</i>	7.698

Table 3. Distribution of immigrants in the Campania Region according to their origin country. Source: XX Rapporto Caritas/Migrantes, Dossier Statistico sull'immigrazione 2010.

By combining the official data about immigrants and their business it derives that the choice to focus on Ukrainian entrepreneurs in Caserta results reasonable.

Methodology

The present study relies on data obtained through a questionnaire survey administered in the summer of 2011 to a sample of fifty Ukrainian entrepreneurs in Caserta. The questionnaire was developed to investigate the launch of ethnic ventures in the enclave (the dependent variable) and inquired the effect of twelve independent variables (see table 3). These variables are:

- To use capital saved/rent by relatives (PFC);
- To use capital rent by members of the ethnic group (EGC);
- To use capital rent by local banks or different sources (LC);
- To assume employees of the origin family (FE);
- To assume employees of the ethnic group (EGE);
- To assume employees of the other ethnic groups (OEGE);
- To buy inputs from the origin country (OCI);
- To buy inputs from the ethnic group (EGI);
- To buy inputs from other ethnic groups (OEGI);
- To sell outputs to the ethnic group (EGO);
- To sell outputs to the mainstream market (OMM);
- The housing area is in the enclave (HA).

In order to get precise information about the twelve independent variables, asked questions have been structured (the answer can be chosen between some provided alternatives). The main reason is to reduce difficulties in answering due to linguistic problems. Despite this, only forty-two questionnaires of the fifteen administered have been filled in correctly and so have been considered as valid.

Descriptive Statistics

Ethnic entrepreneurship is the result of several factors whose combination needs to be deeply inquired. To reach this aim, it is suitable to focus attention on descriptive statistics that can give very important information

<i>Ethnic Venture in the Enclave</i>	
<i>In the enclave</i>	
YES	73,8%
NO	26,2%

Table 4. Percentages of Ukrainian ventures inside and outside the enclave. Source: Questionnaire survey.

First of all, attention is focused on the creation of ethnic ventures in the enclave (table 4), the dependent variable. More than the 73% of the sample has established a new venture in the enclave. It

means that the creation of ethnic ventures in the enclave is an important goal for Ukrainian immigrants in Caserta.

To comment descriptive statistics about the dependent variables, the order previously introduced will be followed: sources of funding, nationality of employees, markets where to buy inputs, markets where to sell outputs and housing area.

With regard to sources of funding, the Ukrainian entrepreneurs of the sample were asked to indicate the main sources. All of them declare they have invested capital of their own or of their family. A few of them have received capital from members of the same ethnic group. None of them have used capital from local banks (see table 5).

<i>Main source of funding</i>	<i>Percentage</i>
<i>Personal capital/rent from the family</i>	
YES	100%
NO	0%
<i>Rent from members of the ethnics group</i>	
YES	4,8%
NO	95,2%
<i>Rent from local banks</i>	
YES	0%
NO	100%

Table 5. Main sources of funding used by Ukrainian entrepreneurs. Source: Questionnaire survey.

As for the nationality of employees (see Table 6), the Ukrainian entrepreneurs state that they manage one-man businesses with no employees (54,7%). The remaining 45,3% of the sample assumed employees of his family (4,8%) or of his ethnic group (40,5). However, they have never assumed employees of different ethnic groups.

As for the nationality of the market where to buy inputs (see Table 7), it is important to premise that entrepreneurs offering services are not included so the results refer to twenty-two entrepreneurs dealing with production, transformation and sell of products. Generally, it emerges that more than half of the sample acquires inputs from their origin Country (54,6%), only a few of them buy inputs from other members of the ethnic group in Italy (13,6%), the remaining ones acquire inputs from different ethnic groups (31,8%), especially from Italian suppliers.

In reference to nationality of the market where to sell outputs (see Table 8), nearly all the entrepreneurs of the sample sell their products/services to the Ukrainian community in Caserta (97,6%). However, many of them (80,5%), sell their products/services to other ethnic groups too, Italians included.

<i>Main nationality</i>	<i>Percentage</i>
<i>Employees of the family</i>	
YES	4,8%
NO	95,2%
<i>Employees of the ethnic group</i>	
YES	40,5%
NO	59,5%
<i>Employees of other ethnic groups</i>	
YES	0%
NO	100%

Table 6. Main nationalities of employees assumed by Ukrainian entrepreneurs. Source: Questionnaire survey.

<i>Main nationality</i>	<i>Percentage</i>
<i>From the ethnic group</i>	
YES	13,6%
NO	86,4%
<i>From the origin Country</i>	
YES	54,6%
NO	45,4%
<i>From other ethnic groups/Countries</i>	
YES	31,8%
NO	68,2%

<i>Main nationality</i>	<i>Percentage</i>
<i>To the ethnic group</i>	
YES	97,6%
NO	2,4%
<i>In the mainstream market</i>	
YES	80,5%
NO	19,5%

Table 8. Main nationality of the market where Ukrainian entrepreneurs sell outputs. Source: Questionnaire survey.

Eventually, with regard to the housing area (Table 9), nearly 55% of the sample lives in the enclave while the remaining ones (45%) do not.

As already anticipated, the present data were already used to test the creation of ethnic ventures in the Ukrainian enclave in Caserta. The result was that the Ukrainians not living in the enclave were more inclined to launch ethnic ventures in the enclave _ .

Beyond the achieved result, other very interesting information came out by the connections matrix that has been used to test whether any sort of dependence exists between the variables included in the model.

Housing zone	Percentage
In the enclave	
YES	54,8%
NO	45,2%

Table 9. Housing area chosen by Ukrainian entrepreneurs. Source: Questionnaire survey.

Connections Matrix

For all the variables included in the model, the Pearson Chi-Square value and asymptotic significance have been transcribed. As noticeable in table 10, the connections matrix includes a very interesting result in reference to the selling of outputs in the mainstream market.

	1	2	3	4	5	6	7	8	9

Legenda. Constant independent variables excluded from the model: Capital saved/rent by relatives (PFC); Capital rent by local banks/sources (LC); Employees of the other ethnic groups (OEGE).									

Table 10. Connections matrix. Source: Personal Elaboration.

By reading line nine, it emerges that the selling of outputs in the mainstream market (OMM) is connected with the variable employees of the ethnic group (EGE). The statistical results about the Chi-Squared test are included in tables 11 and 12.

The achieved result is very interesting. It underlines that social capital (Portes and Zhou, 1992; Chu, 1996; Zhou, 2004), i.e. all the linkages between members of the same ethnic group including the ones at the basis of work relationship, is relevant for the growth of ethnic businesses, especially for the growth of Ukrainian venture in Caserta. Assuming employees of the same ethnic group is the only condition that can determine the choice to sell goods/services in the mainstream market. By recalling figure 1, it is possible to maintain that to assume employees of the same ethnic group is the *conditio sine qua non* to follow path B and move towards the mainstream market.

Count		To sell outputs in the mainstream market		Total
		0	1	
Employees of the ethnic group	0 = NO	8	17	25
	1 = YES	1	16	17
Total		9	33	42

Conclusions

The main objective of this study is to investigate the *break-out* process, the process through which ethnic entrepreneurs decide to enter the mainstream market.

According to statistical elaborations (connections matrix) based on empirical data about forty-two Ukrainian entrepreneurs in Caserta, it results that the decision to enter the mainstream market is connected to the presence of employees of the same ethnic group. This result underlines that to compete in the mainstream market Ukrainian entrepreneurs need to leverage on their social capital.

This result is in line with that part of literature focused on the relevance of the ethnic network (Waldinger, 1995; Putnam and Helliwell, 1995; Chu, 1996; Menzies, *et al.*, 2003; Stein, 2004; Menzies, *et al.*, 2007; Perreault, *et al.*, 2007). Several scholars, in fact, maintain that ethnic networks are an important support for ethnic entrepreneurs since they are based on ties developed from solidarity (Portes and Zhou, 1992; Zhou, 2004), informal trusting relationships (Johannisson, 1993; Ram, 1994;

Kloosterman *et al.*, 1998; Van Delf *et al.*, 2000) or formal ones (Yoon, 1995; Gold, 2001; Guarnizo *et al.*, 2003).

The results achieved through the present work confirm this view.

Abstract

The evolution of Internet and ongoing development of electronic commerce and communication provide exciting opportunities for implementation of powerful framework of resources, tools and applications that revolutionize way in which healthcare institutions interact with their patients, as well as help to deliver and manage medical services.

In the following paper the authors concentrate on analysis of determinants responsible for engagement of patients and medical units in mutual relations in new virtual environment. The purpose of this study is to identify and describe the models portraying relations of entities on the healthcare services market.

Since introduction of virtual communication tools and delivery of medical services are at the very initial stage, it is necessary to develop a subject relation models on the health services market mainly on the basis of determinants which condition engagement of patients and medical units in building mutual relations in the new virtual environment.

The relationship models of health services market entities in the virtual environment can be developed with the use of a three-factors consumer behavior model (motivation, capacity and opportunity). The model leaves behind the commonly used practice of the so-called summary of variables, i.e. including variables which are presented only on a general and abstract level. Thanks to employing a contrary approach is possible to learn about mentioned determinants influence and that of other more detailed factors that determine these relations in practice. Consequently, through more fathomed analyzes one can reach a methodologically correct as well as simple and pragmatic level.

Keywords: healthcare market, medical units, patients, relationship models, IT, virtual environment

Introduction

The challenges facing healthcare systems in the twenty-first century have been described as the following: the aging population; the increasing prevalence of long-term conditions; improvement of health technologies leading to better survival; and rising expectations of healthcare all combine to put an increasing pressure on available healthcare resources (WHO, 1999). Although each country is pursuing individual solutions to meet these challenges, some common approaches are clearly

apparent, including the use of information and communication technology (ICT); (Chaudhry and Wang, *et al.* 2006). The use of ICT is expected to lead to improvements in healthcare quality (e.g., through better communication) and efficiency (e.g., through reduced duplication of investigations); (Murray and Burns, *et al.* 2011).

The concept of informatization of the healthcare system known as e-health is systematically implemented within the EU. According to the definition proposed by the European Commission e-health consists of application of tele-information technologies in prevention of diseases, in diagnostics, treatment, monitoring and promotion of healthy lifestyle (EC 2006).

Many IT solutions employed in e-health system include both simple and more complicated tools, and range from delivery of health information to patients, facilitation of medical unit management or collection and data transfer to the insurer to the continuous monitoring of patients' health in their living environment through supervision of medical equipment implemented in patients (e.g. monitoring of cardiac patients). The e-health concept embraces such tools as health websites, electronic patients' database, virtual transmission of medical reports, an electronic system of reservation procedures, tele-medic services, health domains and others ICT-based tools. All these elements build a concept of a e-health platform which represents products, systems and services that go beyond simple use of the Internet. They provide information that can be necessary both for local and regional authorities, for medical experts, as well as general public members and patients, thus contributing to improvement of their health condition (Fraczkiewicz-Wronka and Austen, 2008).

All this has resulted in emergence of new research areas concerning the character, range and effectiveness of application of new technologies in the medical services sector. The authors of the paper have mainly concentrated on identification and analysis of the model of relations between healthcare market entities.

Relationship Models – Theoretical Background

Since introduction of virtual communication tools and delivery of medical services are at the very initial stage, it is necessary to develop a subject relation model on the health services market mainly on the basis of determinants which condition engagement of patients and medical units in building mutual relations in the new virtual environment. A great number of diverse factors included in the so-far presented market subject relation models (e.g. EBK or Nicosia models) make these analyzes more difficult and complicate explanation of relation development mechanisms. In the meantime, a good model, among others, is characterized by its simplicity. Hence, it is necessary to present determinants of relations between subjects of the health services market in a relatively simple, measurable and pragmatic way. At that point, however, a dilemma arises: something that can be of utilitarian application (a very simple approach to determinants) is not always acceptable from the scientific point of view. On the other hand, considerable diversification of these determinants, although methodologically correct, can become useless from the utilitarian (pragmatic) point of view.

In the subject literature many attempts have been made to tackle the problem, mainly by focusing on individual aspects of consumer-company relations, leaving behind the principle of *ceteris paribus* (not considered before) for variables and interactions (Poiesz and Robben, 1997). Another approach, in turn, recommends finding a criterion that is followed by markets subjects, with a simultaneous rejection of other variables (Stewart, 1989). Such an approach, however, is contrary to the concept of external legitimacy (influence of the whole environment on the market participants) and a need of full explanation of ways and reasons for interactions between particular market subjects and for maintenance thereof.

Bearing in mind the above, the relation model of health services market subjects in the virtual environment can be developed with the use of a three-factor consumer behavior model (Smyczek, 2007). Although the model has been designed solely for explanation of consumers' market behavior, the universal character of its construction allows for its application with respect to medical units. The model leaves behind the commonly used practice of the so-called summary of variables, i.e. including variables which are presented only on a general and abstract level. Often identification and explanation of relations between subjects on various markets lead to limitations (both theoretical and operations) of the number of determinants which constitute only a summary of variables for a much bigger number of more detailed variables.

Nonetheless, by employing a contrary approach (like in 3F model), i.e. by determination (definition of the influence over the market subject relations) of a narrower group of selected general factors, it is possible to learn about their influence and that of other more detailed factors that determine these relations in practice. Consequently, through more fathomed analyzes one can reach a methodologically correct as well as simple and pragmatic level.

Such an approach has been already presented in subject literature in the context of description and explanation of some selected aspects of the customer-company relations. Consequently, the ELM model (probability of information processing) developed by R.E. Petty and J.T. Cacioppo relates to two main factors: motivation and abilities. These determinants affect the whole process of information processing by market subjects. D.J. MacInnes, C. Moorman and B.J. Jaworski, in turn, have built a model of three determinants responsible for shaping attitudes of market subjects and have distinguished motivation, opportunity and ability (MOA model). The model was further developed into the model of advertising message processing by Th. B.C. Poiesz (Antonides and van Raaij, 2003).

All the models have concentrated mainly on explaining the process of information processing by market players during their entering into market relations with another subject. Nonetheless, the models could be more broadly employed i.e. in a complete explanation of a complicated phenomenon of relations between patients and medical units in the virtual environment.

Research Methods

In the attempt to build the relationship model of subjects of the medical services market in the virtual environment, one should remember that the degree of implementation of virtual instruments in provision of medical services is very limited. Although application of virtual communication tools is becoming more common, in comparison to other markets, virtualization of this sector is in its initial stage. Therefore, it was necessary to elaborate a model which could take into account attitudes of medical units towards engagement in definite market relations within the virtual environment. In practice, respondents representing medical units were asked about motivation that could make them engaged in certain relations in the virtual environment. Additionally, they were requested to define abilities that could be indispensable for development of virtual relations, and to assess opportunities for engagement in the relations at the current stage of virtualization.

In order to empirically identify the influence of motivation, capacity and opportunities on healthcare market entities in virtual environment, a two surveys were conducted with the use of a structured questionnaire. The first study comprised managers of medical units and the second study comprised patients in the six largest Polish cities, taken as representative models of Polish urbanized municipal centers (Karcz and Kedzior, 2004). The research were carried out on a sample of respondents selected by means of a quota sample design. This method is based on the assumption that a test group represents all features (quotas) considered to be important and interesting from the researcher's point of view (Blackwell *et al.*, 2001). The assumed quotas in first study was included size of medical unit and scale of activity and in second study age and education level. The respondents' quotas were selected on the basis of an already-known structure of population to be studied. The structure of the sample group and that of the population were identical. Eligible responses were obtained in first study from 507 subjects and in second study 1.089 subjects.

The questionnaires were designed on the basis of the Likert scale and included in first study 17 variables and in second study 21 variables describing motivation, capacity and market opportunities. Once the questionnaires were prepared, the measurements were evaluated by three marketing and statistics professors in terms of their wording/meaning and relevance. The data were analyzed by means of the AMOS 5 program. The scale was first refined by means of Cronbach's alpha and exploratory factor analysis (EFA).

The results have indicated that in first study seven items and in second study nine items on the scale were deleted due to their low item-total correlation (0.20). Other scale items showed satisfying item-total correlations (>0.30) as well as Cronbach's alpha (>0.70) (Gorniak, 2000). The EFA extracted three factors at an eigenvalue of 1.52 and 1.61 and accounted for 58.32 and 62.04 per cent of the variance. In addition, all factor loadings were greater than 0.50. The refining step indicated that all items measuring the constructs were satisfying, and as such were used in the survey. In the next stage, Cronbach's alpha and confirmatory factor analysis (CFA) were used to assess the measures of constructs based on the collected survey data. Cronbach's alphas of three constructs were above 0.68.

The CFA results of the final measurement indicate that the model had an acceptable fit to the data: the Chi-square value was significant (for first study Chi-square = 731.092, $df = 84$, $p < 0.001$ and for second study Chi-square = 807.126, $df = 92$, $p < 0.001$). A significant Chi-square, however, might be an artifact of sample size; thus other fit indexes are more indicative. In addition, all factor loadings were significant and substantial (>0.50). Therefore, it can be concluded that these measures were satisfying in terms of convergent validity. Also, the correlations between constructs, together with their standard errors, have indicated that discriminant validity was achieved.

Results and Discussion

The exploratory factor analysis was applied in order to identify factors describing relations of patients with medical units in the virtual environment, with variables simultaneously constituting a basis for model development. In order to check if the choice of the factor analysis model is accurate as a method of data analysis, the Kaiser-Meyer-Olkin index was applied (Gatnar and Walesiak, 2004).

For the first study KMO index for 17 analyzed variables equaled 0.764. Next, the adequacy of variable selection was calculated by means of MSA_h index. Measures of sample selection adequacy showed that 8 variables had MSA_h lower than 0.5, and as such should be left out in the analysis. Consequently, the further analysis comprised 9 variables for which KMO coefficient was high and equaled 0.862.

In order to define the number of factors to be included in the further analysis, the scree test was conducted (Zakrzewska, 1994, Gorniak, 2000). In the researched case, the phenomenon of „scree“ occurred between the third and the fourth factor, which proved problematic, as it was difficult to determine which factor should be taken into consideration for further analysis. The subject literature presents two approaches: one recommends leaving behind only factors which are on the „slope side“ together with the one that marks the breaking point, the other one recommends ignoring this factor (Lehmann *et al.*, 1998). In order to determine the final number of factors to be used in the analysis, it was necessary to calculate the eigenvalue and the variance percentage explaining other components. The eigenvalue criterion sets the lower limit of factors numbers which are common in the correlation matrix for population. This means that the number of factors is equal or higher than the number determined by this criterion (Gatnar and Walusiak, 2004). The eigenvalue criterion was bigger than single digits, which showed that the further analysis should include three factors which accounted for 66.2% of variance potential of all variables. The application of the method of principal components with quartimax rotation made it possible to determine factor loadings for particular variables.

As a result of the analysis three factors describing medical units' relations with patients in the virtual environment have been obtained:

- **the first factor is described by variables which inform that in order to become engaged in the market of medical services in e-environment it is necessary to: have adequate knowledge about electronic tools and employ personnel that is knowledgeable about the subject; this factor was called medical unit abilities,**
- **the second factor is characterized by variables which reveal conditions favorable for engagement in relations with patients in the e- environment, namely: significant reduction of costs of service provision to patients, patients must have sound knowledge about medical services, patients' confidence, and patients great self-reliance; this factor was referred to as market opportunities,**
- **the third factor describes variables which encourage a medical unit to get engaged in development of relations with the patient in the virtual environment i.e.: security against competition that introduces such services, widespread and comprehensible information about virtual medical services and legal obligation; this factor were referred to as motivation of a medical unit.**

For second study the KMO index for the analyzed 21 variables amounted to 0.793. Next, the adequacy of the selection of each individual variable was calculated by means of MSA_h index which allowed for elimination of some variables before the analysis. Nine variables have MSA_h index lower than 0.5, and therefore must be eliminated from further analyzes. Consequently, the analysis comprised 13 variables for which KMO coefficient was high and amounted to 0.846.

In order to define the number of factors to be included in the further analysis, the scree test was conducted. In the researched case, the phenomenon of „scree“ occurred between the third and the fourth factor, which proved problematic, as it was difficult to determine which factor should be taken into consideration for further analysis. The criterion of the eigenvalue higher than single digits have proved that further analyzes should include three factors which explain 71.13% of the common variance potential of all variables. Application of the method of principal components with quartimax rotation allowed for determination of factor loadings for particular variables.

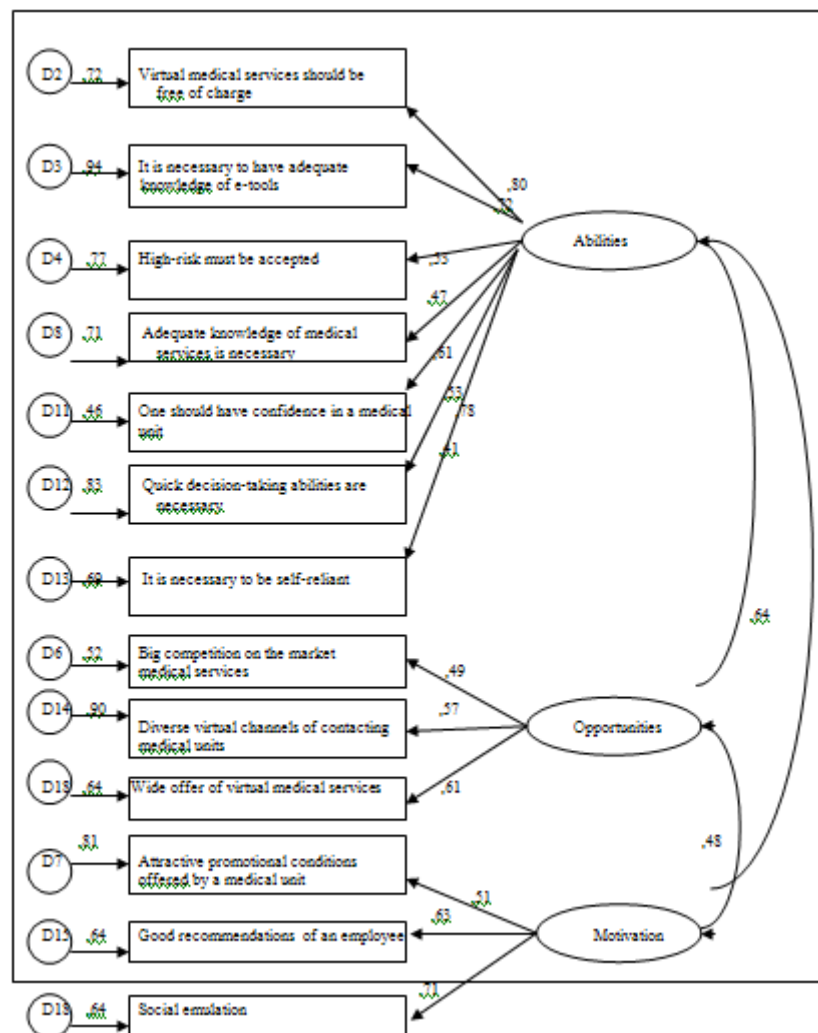

As a result of the analysis three factors describing patients' relations with healthcare units in the virtual environment have been obtained:

- the first factor is described by variables which state that in order to get engaged in relations with healthcare units in the virtual environment the following conditions must be met: medical services must be free of charge, patients must have adequate knowledge about electronic tools, be ready for high-risk acceptance, possess sound knowledge of medical services, be able to quickly take decisions and be very self-reliant; these factors are referred to as patient's abilities,
- the second factor is characterized by variables which reveal favorable conditions for using virtual medical services and include: existence of great competition on the market, diverse

virtual contact channels with medical units, and wide offer of virtual medical services; this factor is referred to as market opportunities,

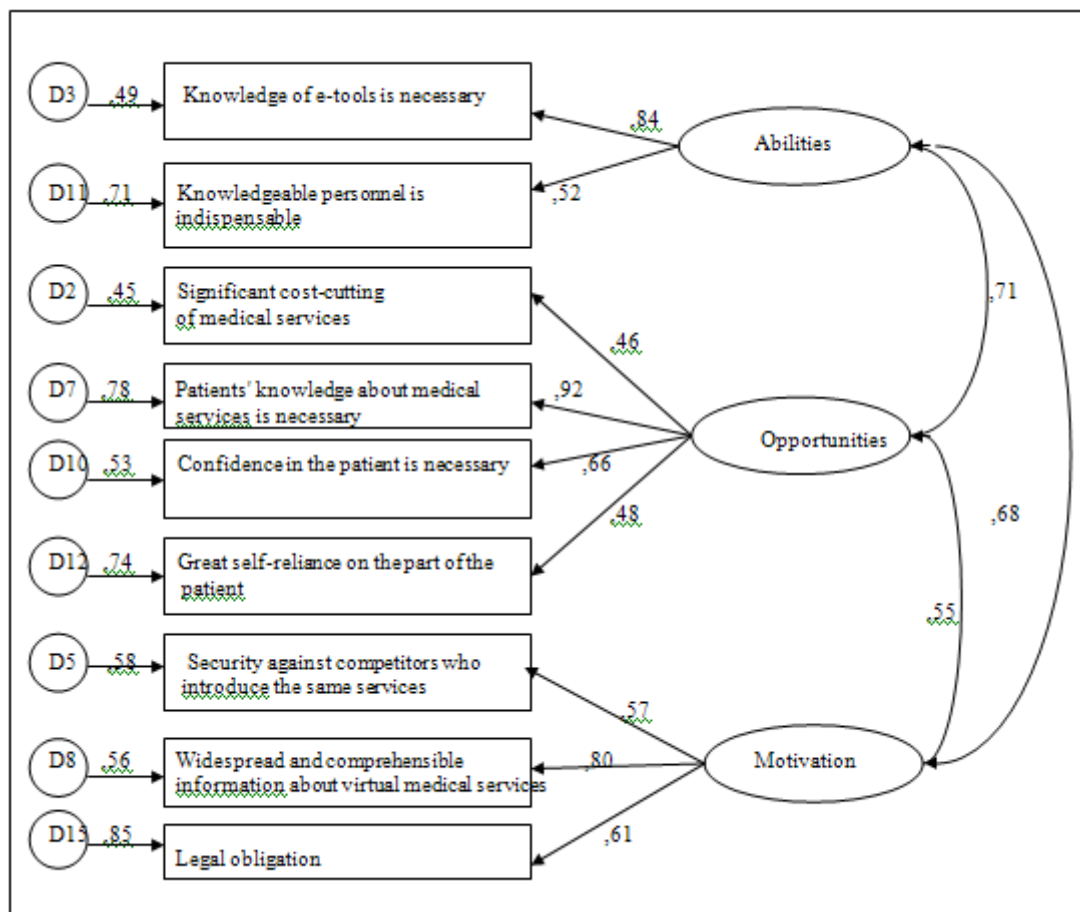

- the third factor describes variables that can induce the patient to use virtual medical services: attractive promotional conditions offered by medical units, good recommendations of a medical unit representative/doctor and using definite virtual health services because friends do, in other words the phenomenon of social emulation; this factor is referred to as patient's motivation.

Figures 1 and 2 show path diagrams of the confirmatory factor analysis of 3F model of patients and medical units respectively. The diagrams show standardized regression values between hidden constructs and observable indexes, i.e. factor loadings – marked over one-direction arrows leading to factors symbolized by ellipses and to indexes symbolized by rectangles. At the two-way arches which link factor - covariance symbols, there are coefficient values of correlations existing between them.

$\chi^2 = 243,017$; $df = 76$; significance level $\alpha = 0,000$; $\chi^2 / df = 3,19$; $GFI = 0,891$; $AGFI = 0,874$; $NFI = 0,825$; $CFI = 0,876$; $RMSEA = 0,012$; $Hoelter 0,05 = 272$.

Figure 1. Structure of dependence in the factor model of patients' relations on the medical services market in the virtual environment (standardized coefficients)

$\chi^2 = 296,145$; $df = 79$; significance level $\alpha = 0,000$; $\chi^2 / df = 3,74$; $GFI = 0,912$; $AGFI = 0,906$; $NFI = 0,874$; $CFI = 0,901$; $RMSEA = 0,011$; Hoelter $0,05 = 262$.

Figure 2. Structure of dependence in the the factor model of relations of medical units on the medical services market in the virtual environment (standardized coefficients)

In the exploratory factor analysis indexes were assigned to hidden, substantially justified constructs (factors). Further on, models assuming existence of these constructs were subject to fathomed analysis with the use of confirmatory factor analysis (CFA) which allowed for measuring the fit of obtained factor models to the data (Szamberg, 2000). Moreover, unlike in the exploratory analysis where each factor can be related to all indexes, in these models particular indexes were assigned to a concrete construct (in other words, it is possible to use non-zero regression coefficients only between a given construct and test-attributed indexes). In CFA the quality of the measuring model was tested.

Tables 1 and 2, in turn, present non-standard regression coefficients and covariance values between factors obtained as a result of model estimation by means of the most credible method based on AMOS program. Interpretation of values of coefficients is more convenient thanks to establishment of factor variance at level 1. Determination of factor variance at level 1 leads to a situation where covariance between them has a value that equals correlation coefficients on the diagram. The Tables

contain values of critical quotients_(relation of the parameter to its standard error), which allows instant verification of statistical significance of obtained indexes by referring to a traditionally set criterion of 1.96 (for $p=0.05$). In the case of researched models all factors were statistically significant.

	<i>Evaluation</i>	<i>Statistical error</i>	<i>Critical quotient</i>	<i>P</i>
<i>P1_3 <-- abilities</i>	0,753	0.020	34.278	0.000
<i>P1_11 <-- abilities</i>	1,364	0.037	32.134	0.000
<i>P1_2 <-- opportunities</i>	1,349	0.028	29.173	0.000
<i>P1_7 <-- opportunities</i>	1,237	0.043	22.573	0.000

<i>P1_12 <-- opportunities</i>	2,045	0.026	33.429	0.000
<i>P1_5 <-- motivation</i>	0,829	0.034	40.728	0.000
<i>P1_8 <-- motivation</i>	1,216	0.022	39.154	0.000
<i>P1_15 <-- motivation</i>	1,592	0.029	49.138	0.000
<i>Opportunities <-> motivation</i>	0,176	0.041	1.04.610	0.000
<i>Abilities <-> motivation</i>	0,182	0.027	5,142	0.000
<i>Abilities <-> opportunities</i>	0,159	0.036	3,554	0.000

Table 1. Confirmatory factor analysis of constructs defining relations of medical units in the virtual environment (non-standard parameters and critical quotients)

Taking note of the above considerations, it can be concluded that the conducted confirmatory factor analysis has verified the hypotheses according to which relation between healthcare market entities in virtual environment is determined by their motivation and ability as well as by market opportunities. Moreover, it has been proved that all these factors influence one another. In addition, except for χ^2 test, the model can be accepted, but it cannot be regarded as well-fitted. All indexes (distinguished on the basis of the explanatory factor analysis) are significantly related to constructs they measure.

Thus, a conclusion can be drawn that definite relations of both patients and medical units in the virtual environment will develop on condition that the subjects are properly motivated and have adequate abilities to get engaged in the relations, whereas market opportunities are favorable. It is worth emphasizing the fact that, as shown by the exploratory factor analysis, in the case of patients a considerable role is played by patients' abilities, whereas in the case of medical units by market opportunities of e-tool application in medical service provision and in communication.

Conclusions

The developed relationship models have many advantages as we all applications. In the first place, it can greatly contribute to development of scientific theories, especially market entities behavior and partnership marketing theories. In addition, the models constitute significant support in understanding complex relations between the medical units and the patient in virtual environment, and helps look upon the managers of medical units decision-making process from another perspective

(a perspective that is different from the one commonly presented in subject literature). Thus, it can be concluded that relationship models fulfills all scientific and practical functions.

Table 2. *Confirmatory factor analysis of constructs defining patients' relations in the virtual environment (non-standard parameters and critical quotients)*

The models of healthcare market entities may be widely applied in the practical operation of medical units. In the meantime, possessing knowledge of the patients, of patients needs and motivation to engage in behavior in virtual environment is indispensable for development of any marketing program, including marketing strategies of medical institutions, and for elaboration of methods of active modeling of behavior of a selected group of patients, i.e. selection of concrete operational activities pursued within a created strategy. Unlike the governmental policy, these activities are meant to serve not only patients, but also interests and profits of a medical institution.

It should be borne in mind that the research has some limitations, which, however, can be turned into advantage for future research. The key limitation of the study is it being focused solely on one market of medical services. Market entities behavior, especially on the market of consumption goods is certainly different, which affects significance of 3 selected factors defining market behavior. It should be also emphasized that the research was conducted in big Polish cities yet, healthcare entities behavior may differ in smaller towns or villages. Nonetheless, it is believed that focusing on different markets, analyzing the phenomenon in smaller population areas as well as sampling different medical units and patients will contribute to better understanding of managers of medical units decisions. It would be also interesting to investigate the hypothesized relationship model in other countries so the results could be generalized cross-culturally.

THE MANAGEMENT OF SOCIAL AND CULTURAL IMPACTS OF TOURISM DEVELOPMENT IN CYPRUS IN THE PERIOD 1960-1996

Mavris, Chris I.¹

¹ Director, Chris Mavris & Associates. Visiting Faculty, University of Nicosia. Email: mavris@ucy.ac.cy

Abstract

The objective of this paper is to determine how tourism development in Cyprus in the period 1960-1996, affected socially and culturally the society of Cyprus. More specifically, this research paper will determine how tourism development in Cyprus has affected social and cultural attitudes, identify reasons that contribute to this effect, how people view this development, and suggest alternative ways to avoid the negative effects of tourism development. The methodology employed involved both desk and field research, including the use of questionnaires and surveys. Recommendations, conclusions and suggestions for future work are reported at the end of this paper, based on the research undertaken.

Keywords: Management, Tourism, Tourism Development, Social Impacts, Cultural Impacts, Cyprus

Introduction

The objective of this paper is to determine how tourism development in Cyprus in the period 1960-1996, affected socially and culturally the society of Cyprus. More specifically, this research paper will determine how tourism development in Cyprus has affected social and cultural attitudes, identify reasons that contribute to this affect, how people view this development, and suggest alternative ways to avoid the negative effects of tourism development. The methodology employed involved both desk and field research including the use of questionnaire and surveys. Recommendations, conclusions and suggestions for future work are reported at the end of this paper, based on the research undertaken.

Foreign tourism to Cyprus has grown rapidly since the mid-1990s and has yielded considerable economic benefits. However, some environmental damage has resulted from the tourist accommodation construction programme. Furthermore, in a few areas the large concentrations of foreign tourists at particular times have caused stresses within the host community. On the other hand, many aspects of traditional Cyprus culture have been revitalised by tourism. Stricter control of tourism developments, while encouraging a more even seasonal and regional distribution of tourists, should enable the economic benefits of tourism to be maximized while minimizing the environmental, social and cultural costs (Witt 1991).

It is the purpose of this paper to determine both the positive and negative economic and sociocultural impacts of tourism development in the Island of Cyprus and suggest the need for sustainable tourism development.

The examination of the data will attempt to demonstrate the positive economic impact of tourism expansion of the island in terms of employment, foreign exchange, output and other factors. The social and cultural analysis however will attempt to reveal that the unprecedented tourism expansion is contributing to the observed change in the social and cultural character of Cyprus. The management of social and cultural impacts of tourism development in Cyprus in the period 1960-1996, is discussed.

Cyprus in Brief

Cyprus is the third largest island in the Mediterranean covering an area of just over 3500 square miles. It has an intense Mediterranean climate with hot, dry summers from mid-May to mid-September and rainy, rather changeable winters from November to mid-March. According to the official estimate at 31 December 1994, Cyprus has an estimated population of 729,800 including 91,500 in Turkish-occupied region and the estimated distribution by ethnic group is 616,681 (84.5%) Greek Cypriots, 91,125 (12.5%) Turkish Cypriots and 21,994 (3%) of other minorities such as Maronites and Armenians. Figures for the Turkish-occupied region exclude settlers from Turkey, estimated at more than 85,000 in 1994 (Department of Statistics and Research, 1994, Nicosia and Europa, 1996, London). On becoming independent from British rule in 1960, Cyprus was a unified country, but in July 1974 Turkey invaded Cyprus and the country was partitioned, with Turkish Cypriots residing in the northern part of the island (37% of the land area) and Greek Cypriots residing in the southern part of the island.

Unfortunately, the 1974 Turkish invasion had a detrimental effect on the tourism in Cyprus. The island was divided into two zones with no freedom of movement between the two zones. The highly developed tourist regions of Famagusta and Kyrenia, which before the 1974 Turkish invasion had 64 percent of the capacity and about 40 percent of the restaurants and bars, are located in the Turkish occupied area. Thus it caused substantial problems for the tourist sector in the Greek zone in the early days after the Turkish occupation. This paper refers to the development and effects of tourism in the southern part of Cyprus, which is under the control of the Republic of Cyprus. Ayia Napa and Protaras areas were developed in the South sharing by 1992, 31% of the total capacity and 23% of the total hotels in Cyprus (Kaminarides, Mavris, Tsiritakis, May 1995: see Table 2: "Regionalism of Tourism in Cyprus, 1971-1992: Number of Hotels and Beds"). The tourism growth also exploded in the cities of Larnaca, Limassol and Paphos. In addition the pine-tree covered mountains of the Troodos range with resort villages such as Troodos, Kakopetria, Prodromos, Platres, Pedhoulas and Kalopanayiotis, provide picturesque scenery and make its resort areas internationally famous, (Kaminarides, Mavris, Tsiritakis, May 1995).

Tourism can bring substantial economic benefits, and it was assigned a high priority in the development effort of Cyprus mainly because of the following considerations: (Andronicou, 1979).

- Foreign exchange earnings – these were assuming increasing importance because of the decline of the contribution of some of the traditional sources of foreign exchange such as minerals and foreign bases;
- Contribution to national income
- Employment-generating capacity
- Regional development.

The Development of Tourism in Cyprus

Mass tourism worldwide started becoming a reality in the second part of this century and has grown almost continuously and consistently since then at a rate much faster than that of the world economy. From 25 million arrivals in 1950 there were nearly 500 million in 1994, whilst income from receipts from tourism have grown at a staggering pace, from about 2 billion dollars in 1950 to nearly 300 billion in 1993 (Vassiliou, Feb. 1995: 38-62). Overall, the total contribution of travel and tourism to the world's economy amounted to nearly two trillion dollars in 1987, equivalent to 10 per cent of global GNP, over 5 percent of global sales of all goods and services and 15per cent of global service sector sales according to the World Tourism Organisation (W.T.O.) Annual Report of 1989. In 1994, according to the World Travel and Tourism Council, the global industry generated a gross output of US\$3.4 trillion and ensured employment for over 200 million people. Europe continued to attract the largest share of international arrivals in Europe. Tourism is estimated to account for well over 7 million European Community jobs (almost 6% of total employment), 5.5% of Member States GDP, 8% of private consumption, 5% of the Community's currency inflow, 4% of its currency outflow (Leeson, October 1993). Tourism and leisure activities are also major growth industries: by the year 2000, it is expected that, as a direct consequence of higher living standards, they will form the single biggest sector in all developed economies. Table 1 presents the global growth of tourism since 1950. It illustrates that the number of international tourists has increased from 69.3 million in 1960 to 550.5 million in 1994, and that the international tourism receipts has increased from 6,8 US \$ billion in 1960 to 354.0 US \$ billion in 1994. As the table indicates, in percentage terms the number of tourists, as well as, the receipts from tourism, show a rising pattern apart from 1982, when the world economy was affected by recession (World Tourism Organisation, 1996).

Further more Table 1 indicates the % contribution of international tourism receipts to the total value of world exports which was fluctuating between the years 1965 to 1994, for example, from the 4% lower value in 1974 to the 6.8% maximum value, in 1993. Between the years 1985 to 1994, this % contribution was stabilised around 6.5%. This indicates an important contribution of international tourism receipts to the total value of world exports (World Tourism Organisation (1996) and International Monetary Fund (1994, 1995)).

YEAR	A	B	C	D	E	F

Table 1: World Tourism Arrivals and World Tourism Receipts

Source: World Tourism Organisation (1996) and International Monetary Fund (1994, 1995).

A: International Tourist Arrivals (thousands).

B: Percentage Rate of Change (%).

C: International Tourism Receipts (Billions).

D: Percentage Rate of Change (%).

E: Total value of world exports (Billions).

F: % Contribution of international tourism receipts to the total value of world exports.

The tourist industry in Cyprus has developed rapidly since independence in 1960. Indeed growth has been phenomenal, with an increase of thirty times the number of arrivals, from 63 thousand in 1960 to nearly 2 million in 1996 and an even bigger increase in receipts from CY £2.3 million in 1960 to nearly CY £800 million in 1996, ie 400 times greater (see Table 2). The tourists industry began to develop in the second half of the 1960s and by 1973 Cyprus was already a major destination in the Mediterranean, with more than 300,000 arrivals. The Turkish invasion of 1974 put an end to the spectacular growth and in 1975 there were only 78,000 arrivals, as most of the hotel industry has been lost to the invading forces, which had occupied the tourist resorts of Famagusta and Kyrenia. Shortly afterwards, as a result of hard work on the part of all Cypriots, the entrepreneurship of Cypriot businessmen and government support, the industry took off again and by 1980 the number of arrivals had already reached the level of 1973. Another political incident in the area that affected Cyprus was the Lebanese Conflict which was heated in 1976-1977. Tourism in Cyprus was interrupted and even declined during the period 1976-1977, due to the Lebanese Conflict. Tourist arrivals were reduced from 180,206 in 1976 to 178,185 in 1977 (Kaminarides, Mavris, Tsiritakis: Table 1: Visitors Arrivals in Cyprus (1970-1992)). The effect of the Lebanese Conflict implied both a positive and a negative effect on the Cyprus Tourism Industry. Positive because of redirecting tourist flow towards Cyprus and away from Lebanon. Negative because of the potential for trouble in the region, such as terrorism (Kaminarides, Mavris and Tsiritakis, 1993). From then on, it continued to grow at the extremely fast rate of 15 per cent to 20 per cent per annum only being interrupted by the Gulf War in 1991 and the recession in 1993 (Vassiliou, Feb. 1995: pp. 38-62). Tourist Development in the Republic of Cyprus has been much greater and the pace of expansion faster, than was predicted by planners and tour operators in the early 1980s. It was thought that the greater distance of Cyprus from the major markets of Western Europe, and the continuing political uncertainty both on the island itself and in the nearby Middle East, would deter visitors.

The fears proved to be unfounded, as the number of visitors has increased by almost 20 per cent annually. There were over one million arrivals in 1988 for the first time, which compares with local population size of 600,000 (The Times, 1987: 39). Cyprus has become the most popular island destination in the Eastern Mediterranean, the rise in visitors being comparable to that in the Balearic Islands in the 1960s (Wilson 1992: 99-115).

According to Michael (1995) the 1980-decade was characterized by very high rates of development, both on the demand side and the supply side of provision of tourism accommodation.

A further point for consideration is the fact that the Cyprus Tourism Development passed since 1980, into a new Cycle (ie the Cycle of a mature tourism development) open to the influence of both external, as well as, internal factors. It can be argued that some of the internal factors are related to political and economic events (including the ongoing debates on the direction of the Cyprus problem and Cyprus accession strategy to the E.U), as well as, negative image and publicity created due to occasional reports of isolated crime (ie such as reports of rapes of female tourists by local male residents etc.). The external factors relate to international economic trends such as globalisation,

liberalisation and competition, currency flow fluctuations, and level of development of Cyprus competitors, the fact that other international tourism destinations enter the international arena, as well as, political events such as the Gulf Crisis in 1991 and the World Recession of 1993. Political unrests and military actions such as the Turkish invasion of Cyprus, the Lebanese Conflict and the Gulf War affected directly and indirectly the tourism in Mediterranean, especially that of Cyprus (Kaminarides, Mavris and Tsiritakis, 1993).

Social and Cultural Impacts of Tourism Development

Sociocultural and economic impacts are closely interrelated. As part of the investigation of socio-economic impacts, attitudinal surveys of residents, business surveys of tourism enterprises and surveys of tourist characteristics, attitudes and expenditure patterns are an important means of obtaining information on sociocultural and economic impacts in developing areas.

In dealing with the sociocultural impacts of tourism development one needs to consider the "host and guest" relationship. Positive types of economic and sociocultural impacts might include: a) economic benefits; b) conservation of cultural heritage; c) renewal of cultural pride by residents; and d) cross-cultural exchange. Negative types of economic and sociocultural impacts might include: a) loss of potential economic benefits; b) economic and employment distortions; c) overcrowding and loss of amenities for residents; d) cultural impacts (such as over commercialisation and loss of authenticity of traditional arts and crafts, customs and ceremonies can result if these are over-modified to suit tourist demands); e) social problems (such as drugs, alcoholism, crime, and prostitution may be exacerbated by tourism) (Inskeep 1991: 365-400).

Cyprus culture has undergone both positive and negative effects over the years 1960 to 1996. These effects were partly due to the Turkish invasion in 1974, (ie negative political developments (impacts) on both the cultural heritage, as well as, the tourism development of Cyprus), but also to a

certain extent related to the positive and negative impacts of tourism development itself, on Cyprus society and culture.

Greek Cypriot cultural and religious heritage in the North of the island has suffered from looting and systematic destruction since 1974. Some examples of this destruction include the case of the mosaics of the Orthodox Church of the Virgin of Kanakaria, built in the 6th century on the ruins of the old Christian basilica church at the occupied Lythrakomi (Our Cyprus; edition 43; 1989, pp. 1-7); the destruction of Axeropietou Monastery at Karavas, built between the 5th and 10th centuries and added to between the 12th and 15th centuries, now used as an army store by the occupying army (Our Cyprus, edition 44, 1989: 1-44); the Byzantine Church of St. Evlaliou at Lambousa, at Karavas, which has also become an army store; and the conversion of the Monastery of Apostle Barnabas into museum (Our Cyprus, edition 52, 1992: 38). Many positive examples of cultural impacts of tourism in Cyprus, include the Cultural Festivities at Paphos, the Regional Festival Dionesia in 25, 26, 27 August of every year (Our Cyprus, edition 44, 1989: 45-46), the preservation of Akamas Heritage (Our Cyprus, edition 45, 1990: 31-32), the positive cultural manifestations of tourism development (eg the preservation of traditional dances, arts and handicrafts) (Our Cyprus, edition 48, 1991: 36), and the establishment of the House of Cyprus in Athens, since June 1987, Cypriot Cultural House, that includes festivities room, gallery, Greek art library, and Cypriot studies library (Our Cyprus, edition 44, 1989: 53). The House of Cyprus in Athens, acts as a source of attraction of tourism from Greece to Cyprus.

According to Vassiliou (1995), Cyprus, Malta and the other Mediterranean islands, as well as, many other small island states in the Caribbean, Asia or the Indian Ocean, are essentially sun-and-sea destinations. There was a period when a good hotel on a nice beach was enough to attract a continuous flow of visitors. Partly the gradual saturation of beaches and the increasing requirements of tourists made it necessary to improve the product and add other dimensions to the sun and sea elements. In the case of Cyprus, this meant the development of agro-tourism, ie adding the mountains to the sea and providing more cultural and leisure activities for potential visitors. The biggest weakness of Cyprus and most other traditional sun-sea destinations was the lack of adequate cultural activities. Visitors were limited to swimming in the sea and visiting restaurants or discotheques in the evenings. In all these countries, because of the lack of either traditions or adequate facilities, the best way to provide for cultural opportunities was through the organisation of special festivals. This would help not only to provide entertainment facilities for visitors, but also to give local inhabitants the opportunity to enjoy performances that would otherwise be out of reach. At the same time, the promotion of special folklore festivals, which aim at reviving and maintaining traditions in the various villages and localities, help to provide colour and enrich the tourist product. The effects of tourism on the social fabric and particularly on the behaviour of young people need to be monitored to ensure the harmonious integration of tourism and local society by spreading the benefits widely and controlling negative phenomena.

Social Effects of Tourism in Developing Regions

Many economic studies have focused on the measurement of primary and secondary benefits and costs derived from tourism (Loukissa 1977: 32-36). Peters (1969), argues that social benefits arise from a widening of people's interest generally in world affairs and to a new understanding of foreigners and foreign tastes (Turner 1973: 228). However Turner, on the subject of tourism in developing countries reports about the almost constant tension between hotel guests and workers. According to Turner, tourism is an industry running directly counter to the chief survivor tactics used by the rich to hang on to their privileges. In tourist generating countries, as their wealth increases the rich move away from the poor. In the tourist receiving countries tourism is basically "shipping the world's richest citizens into some of the world's poorest societies". This may result in political radicalisation and makes peaceful structural changes more difficult to occur (Peters 1969: 126). This is not true however in the case of Cyprus, as Cyprus is regarded as one of the strong island economies, first in the list for accession in the EU in the near future.

A second reason for conflict is that workers speak the native language and the visitors a foreign one. It seems that the difficulty of communication, and the resulting frustration exacerbates the obvious potentials for cultural conflict. This does not apply in the case of Cyprus, as Cyprus uses English as a second language and in addition many Cypriot citizens speak a third and sometimes a fourth international language. Differences in norms of behaviour and expectations, signalled by the language differences are also present. Sutton (1967), point out that while travel frequently widens one's horizons and reduces parochialism, social contact does not always in and of itself lead to understanding.

Sutton goes on to suggest four main elements, which define the social character of tourist encounters (Sutton 1967: 221-222):

- The transitory and mainly nonrepetitive character of the host-visitor relationship.
- The orientation to immediate gratification.
- The tendency to be asymmetrical or unbalanced in character.
- The tourist encounter seems to bring to its participants a persuasive sense of new experience leading to understanding or misunderstanding, offering on the part of the visitors high density of choices, while for the host the irregularity of tourist movement becomes a burden.

These tendencies do not apply in the case of Cyprus, as Cyprus generally provides a very hospitable and friendly environment with repetitive visitors to the Island.

The social and cultural impacts of tourism relate to the way in which tourism contributes to changes in value systems, individual behaviour, family relationships, collective lifestyles, moral conduct, creative expressions, traditional ceremonies and community organisations, ie social and cultural

impacts are the effects on the people of host communities caused by their direct and indirect associations with tourists (Fox 1977: 27-48). One has to take into consideration, however, the additional impacts caused by the mass media and the tendencies of globalisation. The greater the divergence of cultural and economic characteristics between the tourist and the host population, the more pronounced in the social impact. Also the more rapid and intense the tourism development that is taking place, the greater is the social and cultural impacts (Witt 1991).

Positive Effects of Tourism Development in Cyprus

On the positive side the development of tourism in Cyprus has helped create a demand for traditional crafts and handicrafts and this has given an impetus to the revitalization of these crafts. The tradition of the pottery industry goes back hundreds of years and is practised in a small number of villages some distance from the tourist resorts (eg Lefkara Village). These villages now attract tourists who come to admire the artisans who still use their old tools and show great dexterity and high skill quality. Other traditional crafts being practised include weaving (the end products being curtains, lace, tablecloths and so on), embroidery, basketry (making use of canes, reeds and wild grass), jewellery, wood-carving and leather-making. All these crafts have been revitalized and re-established through the demand created for these products by the influx of foreign tourists. Most of the goods produced are handmade and represent real works of art (Witt 1991).

Tourism has also created a demand for drama performances, flower shows, art festivals, folklore dances and so on. These have expanded and flourished in recent years and are now put on the benefit both tourists and the local population (Andronicou 1987: 39-44).

It cannot be denied that tourism development makes a positive contribution to the local economy and the level of employment. Tourism expenditures, indirectly through backward linkages, find their way back to agriculture, manufacturing, construction, and other sectors of the economy. However, as a result of the "demonstration effect", and the imitation of foreign consumption patterns imports could rise, a leakage, and demand for local products could fall. Furthermore, this could put a pressure on the balance of payments, and it could also exercise a negative effect on savings and investment (Kammas, Spring 1993: 70-89).

Tourism development also stimulates the preservation of cultural monuments and local crafts. The various infrastructural projects undertaken for the sake of tourism such as roads, athletic facilities et cetera also benefit the local population in an indirect way (Confederation of British Industry 1992).

A recent study also shows that in Cyprus people believe that tourism expansion contributed to cleanness. Garbage, old cars and other useless stuff have been removed from urban plots of land. In the place of these plots, hotels, small parks, even new roads have been erected (Cyprus Tourism Organisation – C.T.O, 1988).

Negative Effects of Tourism Development in Cyprus

In spite of these positive contributions, tourism brings with it problems too; the most important of them being of an environmental and social nature.

Tourism development may damage unspoilt areas and may disrupt the social fabric and local culture of the society hosting the tourists. Tourism expansion also depletes scarce resources such as water, fertile land et cetera, and imposes a strain on the natural environment. Of course, it should not be taken for granted that these negative aspects associated with tourism expansion and development, are inherent in tourism. A country, which has a comparative advantage in tourism, does not have to promote tourism at any price (Confederation of British Industry 1992). Rationalization and sustainable tourism development should be the objective of proper tourism planning.

It has to be understood that due to the rapid and uncontrolled expansion of tourism during the late seventies and early eighties, small traditional villages, such as Ayia Napa, were found in the middle of this process. As a result rural villages were transformed in a short period of time into urban areas. Old houses and other buildings gave their place to restaurants, cafes, souvenir shops and hotels. The traditional farmer or fisherman even though was not able to follow this rapid change, has suddenly become a restaurant owner, a manager of a souvenir shop, a disco owner. In other words primary production was replaced by tertiary production. In tertiary production, however, unlike primary production, there is more contact between the consumer and producer. Therefore, this type of change was going to have some influence on the local population.

From a social point of view the "demonstration effect" has been cited as one of the criticisms of tourism. The contact with foreign visitors induces the local population to imitate foreign values and behaviour. The inflows of tourists from Europe who have different values and exhibit liberal behaviour was bound to affect the culture of Cypriots, especially those living in rural areas and whose contact with foreigners was until then limited (Kammas 1993).

Measuring the Effects of Sociocultural Impacts of Tourism in Cyprus

The impact of tourism on a society is much more pervasive than the mere economic effects. Due to the nature of the activity, that is the fact that the foreign visitors are present with their own cultures and lifestyles within the country and come into direct contact with the local population, makes the impact of the sector on society very intense and substantially different than any other sector. Indeed, a lot of criticism has been raised against the fast growth of tourism, because it has generated forces, which are believed to have had adverse effects on society. People began criticising tourism because it leads to the fundamental restructuring of some of the rural scenery, it changes the fabric of social life, it affects values, family life and so on. These are issues that are difficult to judge and reflect value judgements (Matsis 1995).

What is interesting is that CTO responded to these concerns by commissioning a Study on the Social Impact of Tourism in Cyprus (C.T.O 1988) through which four communities were selected in

areas where there have been intense tourist activity and where the impact has been the greatest. In these areas they carried out a survey on a stratified sample of about 3-4% of the local population based on a structured questionnaire, direct observation and contact with the leaders of these communities.

The results of the survey showed that people in general believed tourism to have had a positive effect, because of generation of employment and incomes and the fact that it brought about increased affluence and contributed towards the overall impressive economic outcome in Cyprus. Some people believed that tourism had other beneficial effects like it brought local people in contact with other cultures, it enhanced awareness of their own traditions and historical and archaeological heritage.

But the survey also showed that many people expressed reservations. Most of these people had higher education qualifications and identified issues like congestion, noise pollution, destruction of beaches and natural environment, heavy stress on the local population during peak periods of tourism, erosion of family life and the undermining of social cohesion of the small community. Many people also complained about alienation, criminality and hooliganism. It would be interesting of course to have had a survey of the whole society. But what the limited survey found was interesting because it showed people welcoming tourism for its economic benefit to the country but downgrading the adverse social and environmental effects.

Two different studies conducted in Cyprus in 1986 and 1988 revealed that the inflow of foreign visitors has contributed to the change of attitudes and behaviour observed in relation to the younger generation. Young people seek new experiences, and contact with tourists from Europe, who often come from more affluent and liberal societies, affect their lifestyles (CTO 1988, Cyprus Broadcasting Corporation –CBC, 1986). The traditional bonds of close families have been loosened. Parents worry about their children and the way they behave. Gender roles have also been affected, partly because of tourism. The CBC documentary on tourism as well as the CTO report indicate that women nowadays are not bound as much by family rules and restrictions as regards sexual modesty, morality, type of dress worn, staying out late et cetera. The CBC documentary also reveals that even though most young Cypriot men prefer the companionship of female tourists, they would rather marry Cypriot women. These tendencies are considered by the Cypriot Society as reflecting negatively to their traditional way of life and therefore unacceptable form of behaviour (ie. there is a general feeling of the need of maintain a traditional pattern of life in Cyprus).

The middle age generation (parents) believe that the direct contact with tourists has exposed Cypriot youth to a different set of values, and they worry about the spread of drugs and aids as a result of the change in the social and sexual behaviour of the younger generation (Kammas 1993).

The United Nations Development Program (UNDP) also reports that in Cyprus some people, especially the old, prefer the life as it was before tourism became the dominant sector of the economy. The old people are annoyed by the noise that keeps them awake at night, and by the immodest dress worn by foreign guests (World Development – UNDP, 1989).

It is questionable, however, whether these kinds of influences should be attributed solely to tourism. It is also difficult to determine the extent to which tourism is a factor in these problems. Television, movies, foreign periodicals, and labour working abroad make the country more accessible to international influences, and contribute towards the erosion of traditional values (Kammas 1993).

It is expected that the influx of foreign visitors to this small island is bound to have an impact on the traditional social fabric of the country and on the attitudes and patterns of behaviour. It has been observed that the commercial ethics of people have changed. Taxi drivers, restaurant managers, even doctors, among other people, in numerous recorded cases try to attract the unsuspecting tourist. Hoteliers pay commission to taxi drivers to attract tourists to their establishments (Charalambous 1992). Restaurant managers are competing between them in an improper way, in order to attract customers. This is so, because too many restaurants are in many cases concentrated in the same area, often, offering similar and identical type of business. The service provided also is often not of high standards. Especially, during the high season, visitors might have to wait more than an hour to get any kind of service. Some doctors are said to bribe hotel employees in order to receive/attract foreign visitors. Often foreign visitors are overcharged since health insurance companies from their respective countries cover them.

In a separate study the author reached similar conclusions and findings (Mavris, 1997). The study was designed to determine how tourism development in Cyprus has affected the social and cultural attitudes of Cypriots, identify the reasons that contribute to this affect and determine how people view this tourism development. The results were used to suggest ways to avoid the negative effects of tourism development. The study included the use of the survey method and the construction of a questionnaire administered by interviewers. The interviews covered the geographical areas of Paphos, Larnaca, Limassol, Nicosia, Ayia Napa-Protaras and Polis Chrysochous. The interviews took place between March and May 1996. People from a probability form were selected.

People interviewed were local entrepreneurs, as well as, local residents. The geographic areas selected enable the sample to be represented by all major touristic resorts.

Questions were asked in order to obtain the respondents opinion on the sociocultural impacts of tourism over different time periods between 1960-1996 and in order to establish the likely impact over the period 1960-1996 (ie. The same questions were directed to different age groups in order to get their opinions of the likely situation in different time periods over the span of the 36 years between 1960 to 1996). The most important findings of this research study are included together with the findings of desk research, under the section findings, conclusions and recommendations of this research paper.

Tourism Density: Contact Ratio and Social Carrying Capacity of Tourism in Cyprus

In Cyprus hospitality forms an integral part of the culture, and the people have a welcoming attitude towards foreigners. Furthermore, the society's culture emphasizes ideologies and value systems, which attach great importance to individual achievement (Witt 1991). As the tourist policy followed by the Cyprus government and the CTO has aimed at the middle and high income groups (which in practice it is also a question of age; ie. middle age and elderly groups) and the tourists come mainly from Europe, tourism has not had as marked an adverse effect on the values and attitudes of Cypriot society as may otherwise have been the case. In certain areas such as Ayia Napa, however, the influx of large numbers of mostly young tourists has influenced social behaviour and social values, and caused a certain amount of antagonism. Bryden suggest that:

there may be a relationship between tourism density, expressed in the annual numbers of tourists as a proportion of the population... and the growth of resentment towards tourists... The inference here is that tourism density... is an indicator of the degree of confrontation between tourists and indigenes and that this confrontation give rise to resentment of tourists (Bryden, 1973: 92).

The concept of "tourism density" is thus used as a measure of "social carrying capacity" which Mathieson and Wall (1982: 21-22) define as "host peoples' levels of tolerance for the presence and behaviour of tourists". An alternative measure used by Andronikou is the "contact ratio", which is the inverse of tourism density that is the ratio of the local population to tourist population. Andronikou (1979) suggests that the minimum value that the contact ratio can fall to before the social impact resulting from tourist development becomes detrimental is about eight, but most authors now do not believe that a single specific value can be given for social carrying capacity. Mathieson and Wall (1982) point out that:

<i>Area</i>	<i>Contact ratio</i>	
	<i>Annual average</i>	<i>Peak day value</i>
<i>Limassol</i>	19.5	7.3
<i>Larnaca</i>	24.4	13.9
<i>Ayia Napa/Paralimni</i>	3.0	1.5
<i>Paphos</i>	17.7	10.8
<i>Hill Resorts</i>	43.0	16.6
<i>Total</i>	18.0	9.5

Table 3: Contact ratio values, 1985

Source: Andronikou (1979), and Witt (1991)

Carrying capacity remains an elusive concept, but the time when researchers and managers sought one mythical magic number, which could be approached with safety but exceeded at peril, has passed.

Nevertheless, inspection of Table 3 does suggest that it is highly likely that the social carrying capacity in Ayia Napa has been overreached. The extreme concentration of tourists here has resulted

in a modification of social attitudes among young people, especially towards sexual behaviour. This is part of the “demonstration effect” which introduces foreign ideologies and ways of life into societies that have had limited exposure to tourist lifestyles. The close and continued contact of Cypriot youth with young foreign tourists has resulted in them adopting different sets of values on morality, style of dressing, and so on, in comparison with prevailing traditional attitudes, and as a result the bonds of closely knit families are in some cases being loosened (Mavris, 1997).

Note: Table 3 refers to the ratio of the local population to foreign tourist population. It does not include Cypriot tourists involved in domestic tourism, as it is argued that Cypriots are generally having the same lifestyles, as well as, attitude and behaviour irrespective of their geographical location, due to the fact that Cyprus is a small island state with similar characteristics. It may be however a question to answer in future research (ie. as to whether Cypriot tourists make a difference on “Contact Ratio Values” when involved in domestic tourism).

Findings, Conclusions, and Recommendations of the Research Study and Suggestions for Future Work

Many of the economic and social goals have been achieved in Cyprus and despite the Turkish invasion in 1974, Cyprus managed to survive, won the recession, rebuild itself and achieved the so called second economic miracle. The Island’s special characteristics such as the good climate, culture, the people, and its history makes it one of the most attractive tourism resorts visited by thousands of people every year. Tourism in the final analysis was one of the most important factors, which contributed to Cyprus economic development after 1974, and the second economic miracle (Cyprus Background, Interned).

In order for Cyprus to continue attracting tourism and manage to have the smallest possible negative effects on it’s society and culture the following factors need to be considered which are the results of the research, specified above.

According to the interviews conducted, asking the local people if tourism affects or destroys the environment the reply was that destruction of the environment is caused largely by the Cypriots as opposed to just being the result of tourism. This was to the very high extent, the answer given by the people who lived near the coastal touristic resorts for example Ayia Napa, Protaras and Larnaca.

People, who build their facilities near the sea, including high-rise hotels, seriously damage the environment and as a result visual and aesthetic pollution is created. Further more noise pollution is caused from pubs, discos, and traffic congestion. The local authorities in the various local resorts with the help of the government must set limits and standards of construction (eg. two storey buildings) and implement a moratorium on building construction in certain areas, as well as, to apply strict control of touristic zones. Time limits to pub, disco and restaurant operations must be observed, in order to minimize the negative effects on local people created by noise pollution. Despite the introduction of different zones (ie. for tourism development, manufacturing, agriculture and

residential areas), in areas under development, it is still considered necessary to introduce time limits in the touristic zones, in order to keep the situation under control, and minimized the negative impacts of tourism development.

At the same time, with regulation, encourage the development of mountain resorts, as opposed to coastal development, through legislative and credit measures (ie. direct development to less developed areas). In this way relieve the pressure from already overdeveloped areas and at the same time diversify the Cyprus Tourism Product. Another very important conclusion relating to the social effects of tourism is the “host-visitor” relationship, especially in resorts that receive a lot of tourists ie. Ayia Napa-Protaras area is becoming less and less important culturally to the tourists. This is mainly because of the loss of traditional leisure, recreation and cultural heritage with it’s replacement with the new modern types of leisure and recreation facilities, for example, the traditional coffee shops were replaced by discos, and night clubs. In addition the increase in the number of patients with sexually transmitted diseases (eg. Aids) increases every year and especially in the summer season and drug and alcohol abuse increases, as well.

The social isolation resulting from tourism and people “corruption” must be prevented. The local authorities and all the people who are responsible for such villages or resorts, which have been affected by tourism, must encourage special programs, which will promote planned development (eg. local information offices providing information about Aids, drugs, alcohol and the introduction of tourism police to protect the people through community programs). Further, more community programs must bring people closer by creating places where people could spend their time, talk with co-villagers and in general have contact with other members of the village of neighbourhood, in order to preserve the local customs, culture, and their Cypriot social identity.

As the majority of Cypriots believe that tourism affects both negatively and positively Cyprus Society, it can be argued that there is a need to balance the positive economic effects with the negative sociocultural and environmental impacts of tourism. In other words the need of sustainable tourism development was concluded. The results of the survey showed that people in general believed that the negative effects could be overcome mostly by publicity, the creation of general awareness and to a lesser extent through school educational programs, and conferences. These results seem to be logical and one knowing the Island of Cyprus background could argue in favour for their implementation.

School education programs are the best way according to the surveys opinion, for students to be educated while they are young, towards cultural awareness (ie. for ten, twelve and eighteen years old is easier to implement such programs), to teach Cypriot customs, attitudes, good manners and in general the correct way of thinking. Conferences are valuable in inviting all the people from a village of all ages to have an open discussion concerning the problems of the village, which tourism creates and provide them with required information and the platform for discussing and overcoming such problems. However one can argue that this is also a question of power. More publicity is another method recommended which can be implemented through radio, TV, magazines etc. In addition the

organize action of frequent festivals in order to promote Cypriot customs (ie. games, dances, etc.) to teach the youth the Cypriot culture.

Although it is believed that tourism affected negatively to a large extent, the social and cultural attitude of Cypriots, Cypriots are still in favour of the Cyprus Tourism Organisation to continue promotion of the tourism development in Cyprus. It is obvious that the larger number of tourists visiting a resort the larger the likely impacts of tourism both negative and positive on the local culture. It is concluded from the research that Cypriots have not managed to escape from this sociocultural phenomenon and continue to be affected positively to a lesser extent and negatively to a larger extent.

The majority of Cypriots believe that family problems were created as a result of tourism in their community, including divorces, fights between couples and to a lesser extent fights between parents and children. The problem was identified to be applicable from the 1974 onwards (ie. after the Turkish invasion of Cyprus, forcing the relocation of one third of the population into the Southern part of the Island of Cyprus and mostly into the touristic coastal areas), where as in the 1960s it was believed that this problem did not exist. That was perhaps due to the fact that tourism at the time was at the initial stage of its development. It can be additionally argued that to a certain extent, this problem created after the 1974, was also due to the population relocation itself. (ie. creation of economic and social problems, as well as, loss of the local cultural identity and bonds, as village and town people from the Northern part of Cyprus were relocated to different geographical areas in the Southern part of Cyprus. This relocation meant the loss of mostly tourism business of Greek-Cypriots in the Northern part, having to start all over again, in the South). An interesting conclusion stemming from the findings of the research was the fact that 30% of the people believed that the hospitality of the Cypriots has change over the years and that Cypriots are less hospitable today than in previous years. This presents a setback as Cyprus hospitality was considered as part of Cypriot society and culture. A large portion of the population believe that tourism development affected the way Cypriots are communicating, getting dressed, think, as well as, their degree of politeness. The older generations were warmer but now people are more cautious with each other. People aren't, as polite as, they used to be, they have the tendency to be less respectful to other people. 14% of the Cypriots believed that there were fights between fellow-villagers as a result of tourism since 1990. This problem was presented at a much lower level in previous years, and non-existent in the 1960's and early 1970's. This is considered to be a statistically significant change to the worse.

A high proportion of Cypriots are middle to higher earners, university graduates, middle age society, with on average equal proportions of males and females, with a high proportion being married, and in full employment. This gives the picture of an affluent society, well educated and with high degree of educational awareness, able to assess the problems associated with tourism development, to a large extent. 24% of the people states that tourism affects our culture positively and 28% negatively. The majority of the people answered that tourism affects both positively and

negatively the culture. 44% believed that tourism destroys the environment, 70% that tourism affects the transfer of sexual diseases, and 54% that tourism affects adulthood way of thinking.

One must not ignore the positive effects of tourism. One of the positive effects is the cultural enrichment that Cypriot society gains through the contact with other people and vice versa. In addition Cyprus must emphasize Cypriot culture (ie. inform the foreigners about Cypriot culture) through festivals, advertising and demonstration of Cypriot customs and way of life. It is also argued that tourism had beneficial effects, by bringing local people into contact with other cultures, and in this way it enhanced awareness of their own traditions, as well as, their historical and archaeological heritage.

Tourism for the Cyprus economy is the “goose with golden eggs”. Cyprus Tourism must be protected through sustainable development approach whereby there would be a balance between positive between positive economic and negative sociocultural and environmental impacts. To do so it requires the coordinated effort of all the agents of tourism development, including the Government, the Cyprus Tourism Organisation, the Planning and Development, as well as, the Local Authorities, for planned development and management of the resorts. This is problematic case to be achieved and for this purpose, the C.T.O, tries to achieve the best possible results, through the implementation of a “Sustainable Strategic Tourism Development Plan”, for the overall benefit of the Island of Cyprus.

Holidays, which involve visits to archaeological sites, rambling holidays, mountaineering holidays etc, can all help to alleviate seasonality problems. A further

Benefit of such holidays is that they are not beach-based, and therefore visitors can be dispersed away from the overcrowded coastal region to the (low occupancy rate) inland resorts (Andronicou, 1986: 127-129). The CTO should actively market such holidays.

Tourism has been a major factor in the growth of economic prosperity in Cyprus over the last 30 years. The foreign exchange, income and employment generated by tourism have transformed the economy from an underdeveloped and mainly agricultural society to a modern European economy (ie. Cyprus is becoming a Regional Centre for provision of Services, including tourism, banking, insurance, shipping and gradually education and health services). However, the high growth in international visitor arrivals to the island has caused substantial damage to the environment particularly in terms of “architectural pollution” along the coastline. At the same time, tourism has stimulated the preservation of historic sites and building and also the excavation of archaeological remains. Where concentrations of foreign tourists have been particularly high, there have been marked changes in social behaviour and social values, which have caused stresses within the host community. However, many aspects of the traditional culture of Cyprus have been revitalized by tourism – handicrafts, drama performances, folklore dances and so on are now flourishing. By reducing the rate of growth of the construction of new tourist accommodation and by concentrating efforts on building high grade hotels, villas and apartments, the attractiveness of Cyprus as a holiday destination for medium and high-income earners should increase. Furthermore, by attempting to

obtain a more even seasonal and regional distribution of holidays, overall occupancy rates should increase without imposing further stresses at peak periods. Thus, the economic benefits of tourism should be maximized while minimizing the environmental, social and cultural costs (Witt 1991).

It has been argued that even though the sociocultural influence of tourism on the culture and tradition of many parts of the world it may be perhaps of great significance, it is believed that in the case of Cyprus, a society closely integrated with Europe, its impact is perhaps not so significant. The ex-Director General of the CTO argued that the impact of foreign values on the attitudes and behaviour of Cypriots through tourism is negligible, because of the already existing close ties between Cyprus and Europe (Andronicou 1986). However, the pursuit by some Cypriots of large speculative gains, and their effort to squeeze as much money out of the unsuspecting visitors are some worrisome traits that have to problematize the society in general. Nevertheless, the impact of tourism on the culture, tradition, and social fabric of Cyprus should be examined in a greater detail. Haphazard development and chaos will follow if greedy developers and speculators are left unregulated; and examples of unregulated tourism development are evident all over Cyprus (Kammas 1993). Recent studies showed that the rising tourism flows, had a negative impact on both the social and cultural heritage of the Island of Cyprus (Mavris, 1997).

Future work in this area should encourage conducting further interviews, asking local residents their opinions on tourism development in Cyprus. This could be carried out as a nationwide survey, to identify the opinions, attitudes and behaviours of the local population towards both the social and cultural impacts of tourism development in Cyprus, between 1996 and 2012. This approach will enable a comparative analysis to be made between the two periods, 1960-1996 and 1996-2012, while it will inform the debate of managing the social and cultural impacts of recent tourism development in Cyprus.

SUCCESSION – A WINDOW OF OPPORTUNITY FOR INTERNATIONALIZATION?

Meneses, Raquel¹; Coutinho, Ricardo²

Abstract

Internationalization and family business are two realities that stand out in the business tissue. Family businesses are very important not only in the wealth they are capable of generating, but also in the number of jobs they can create. One of the barriers this type of business has to face is the succession. This process is regarded as key stage in the life of a family business and, as a result of this importance, has been one of the topics most addressed in the literature.

Actually, the born-again global phenomenon has gained increasing importance. This concept refers to companies that, after many years focused on the domestic market, suddenly embrace in an internationalization process.

The present research aims to bring together the phenomenon of born-again global with family business reality. Thus, we seek to address the successor as a critical factor for a family business to internationalize, after years of a national scope of activity.

Using the grounded methodology we develop an exploratory study, analyzing six companies in which the successions lead to the beginning of internationalization. Data collected was coded and six new variables related to the successor emerged (prior significant involvement with the company; capacity to mobilize external factors; motivation for entry; internal path and other language speaker). We find a bridge linking succession and born-again global firms: the successor appears as a critical factor to the internationalization process.

Keywords: Succession, born-again global, entrepreneurship; internationalization

Introduction

Family businesses have traditionally acted in domestic markets although, as it happens with non-family enterprises they are being pushed to internationalize in order to survive in an increasingly competitive market (Kontinen and Ojala, 2010).

The intensification of research in internationalization is reflected in the diversity of concepts and theories that have emerged. The Uppsala Model (Johanson and Valhne, 1977, 1999) and the Born-Global concept (McKinsey and Co., 1993) are clear examples of that.

Bell et al. (2001) and Baldegger and Schueffel (2010) study companies that start their internationalization due to the occurrence of a particular critical incident (with a special emphasis placed on the process of replacement in management team. Although identified, the issue of succession remains with little depth in terms of analysis as a key driver of internationalization.

The entrepreneur's characteristics referred in the literature sometimes appear linked to the figure of successor. However, there is little correlation and evidence between these characteristics of "international entrepreneur" and the successor that starts the internationalization. Moreover, studies related to succession focus much more on successor characteristics rather than on other variables mentioned in the literature about managerial skills of international entrepreneur.

Even though, concepts of "family business", "born-again global" and "succession" have been receiving attention from researchers, these analysis are being carried out independently, with scarce interconnection between these three realities.

Taking into account this gap, this paper seeks a new approach, establishing a bridge linking these three variables. Applying the grounded theory, we identify successor characteristics causing domestic-based firms to foster a process of internationalization.

Theories of Internationalization

Based on a previous work of Johanson and Wiedersheim-Paul (1975) describing internationalization as a gradual process, Johanson and Vahlne (1977) seek to explore some of the assumptions previously discussed, adding a new element considered essential - knowledge. Initially, the company is established in the domestic market, and only later, and incrementally, it internationalizes. Objective and experiential knowledge plays a central role in the model presented by Johanson and Vahlne (1977). Experiential knowledge comes from experience, which constitutes the main source of information, detecting and formulating concrete opportunities. As deeper and more extensive the level of knowledge, the greater the commitment to the market and smaller the psychological distance.

Changes occurred in the economic environment and the recognition of some limitations of the Uppsala internationalization process led Johanson and Vahlne (2009) to review their previous considerations in light of the recognition of the importance of networks.

In turn, these networks allow the entry into foreign markets, being undoubtedly an asset which act as a facilitator of the process. The figure of the international entrepreneur can take on special importance in the Theory of Networks. Their social network may be central for the organization to turn to foreign markets. Nevertheless, they allow the manager advantageously positioned in social web to know quicker than others about potential opportunities. It is required that entrepreneur has intrinsic characteristics to take advantage and leverage them into an internationalization process.

The characteristics of top managers have been identified as factors making the difference between success and failure in these processes (Finkelstein and Hambrick, 1996). Among the most frequently mentioned by the researchers are professional and educational experience abroad, the history and vision with regard to internationalization (McDougall et al., 1994; Oviatt and McDougall, 1995; Bloodgood et al., 1996).

Fishcer and Reuber (1997) stress that changing jobs and drag experiences can be applied in a new context, accelerating the internationalization of some companies. Past experiences and knowledge that

will accrue to them play a key role. When an individual is confronted with a new stimulus, it always ends up being framed in the context of their past experiences, thus varying from individual to individual (Baron, 2004). Nohria (1992) points out that the experience of international entrepreneur can forward him more confidence to go abroad, facilitating the process of internationalization.

Knowledge (management, international and specific) is another important variable in this context. The specific knowledge refers to knowledge that manager already has on the business sector (Casson, 1982; Westhead et al., 2001). Westhead et al. (2001) develop a study that provides statistical support to the evidence that entrepreneurs who have specific knowledge of the industry have a higher probability of being exporters. They propose academic training as an important factor for the internationalization, but they did not find any statistical support to it.

Age comes out as other objective variable to consider in this context, although with conflicting theories.

Although less based on facts, subjective characteristics of the international entrepreneur constitute themselves as a pillar of significant importance such as the international vision, a pro-active attitude, innovative spirit and attraction to risk (Dess et al., 1997; Harveston et al., 2000; Knight, 2001).

The reputation, credibility, status and integrity of the entrepreneur are elements of their capital, whose existence and recognition influence how he is evaluated by the other agents. This evaluation could be extended to the company itself (Larson, 1992). Putting the hypothesis of a company with little credibility and reputation in the market, the presence of a new individual in the company that has high levels of social capital can lead to changes in how the company will be perceived. According with Hannan and Freeman (1989), individuals who have this capital have more legitimacy and possibility of internationalizing and getting the necessary resources.

Born and Born-Again Global Firms

The "shortening" of time and distances change the context of many companies. Instead of a gradual internationalization, access to foreign markets occurs abruptly, giving rise to the born global companies - organizations which "since its inception, seeks to draw significant competitive advantage through the use of resources and the sale of products / services in multiple countries" (Oviatt and McDougall, 1994, p.49). The focus in this approach is the age at which internationalize rather than size.

Instead, Bell et al. (2001) find firms that had adopted a model of internationalization that did not fit, neither in the traditional theory nor in the concept of born global. These companies are well-cemented in the domestic market without any intent to internationalize. The rapid internationalization process is the result of the occurrence of a particular critical incident. Since they represent a rebirth for international markets, companies are called born-again global.

Despite its well-defined structures, strategies and cultures, the born-again global firms adapt themselves to new environments and explore areas outside their core business. With the internationalization, these companies aim to obtain new sources of expertise and innovation abroad

(Baldegger, 2008). The change of attitude to foreign markets is the result of a particular critical incident amending the company's positioning in this context: change of ownership MBO, acquisition by another company, purchase by the administrator, acquisition of a company with international connections, internal technology transfer, distribution rights, follower of customers (Bell et al., 2001); and the external environment, including the small size of the internal market which ended up pushing some of these companies to foreign markets, on the other, the existence of an entrepreneur who can open a contact and active search for new opportunities (Baldegger, 2008).

Family Business

The definition of family business gathers a consensus among researchers: it is a company owned, controlled and operated by members of a single family (Merner and Malach-Pines, 2011, p. 113) the one more often reported in the literature, *ie* a family business "is a company where the family owns a majority stake and management exercises full control."

Family businesses are commonly described as having a lower propensity to internationalize due to some of its features (cf. Fernandez and Nieto, 2005, Graves and Thomas, 2006) such as reluctance to accept external knowledge; difficulties in hiring new managers with international responsibility; fear of losing control and the existence of underdeveloped control systems (Gallo and Sveen, 1991); a product geared solely to the domestic market; lack of financial resources and family members ready and willing to take internationalization; low willingness to form strategic alliances as well as internal power struggles (Gallo and Garcia Pont, 1996); the irregular monitoring of the international environment and non-integration of global developments in their household decisions (Okoroafo, 1999); the concentration of decision power in the hands of a single shareholder or small group, the delays in the processes of succession and their own aversion to internationalization (Gallo et al., 2004); the lower propensity to develop networks with links to other business areas (Graves and Thomas, 2004); and lack of resources (Fernandez and Nieto, 2005)..

The lack of significant resources is a factor that limits the growth of small and medium-sized family businesses, as well as psycho-sociological problems, cultural and political (Fernandez and Nieto, 2005, p.78).

On internal matters, Fernandez and Nieto (2005) advocate the involvement of generations as a facilitator. They state that the second generation has more information and is better prepared which encourages the development of an internationalization process.

Succession, a window of opportunity for internationalization?

Succession is "the passing of the leadership baton from the founder-owner to a successor " (Beckhard and Dyer, 1983, p.3).

The succession to the next generation may be a catalytic factor for family businesses following a path of born-again global (Graves and Thomas, 2008). Ibrahim *et al.* (1999), Ward (1987) and

Menendez-Requejo (2005) suggest that an appropriate succession opens an interesting window of opportunity that can lead to the internationalization of business.

The connection between the two spheres "succession" and "internationalization" is based largely on the skills and orientation to management that the subsequent generation features. The orientation to management of the successor may be composed of four variables - management skills, international experience, work experience outside the family sphere and professionalization of the successor (Segaro, 2010).

International experience refers to the degree of experience that top management will have with the entry of the successor. If he has lived or worked outside the home country he will have more capacity to support the organization's desire to internationalize (Cavusgil et al., 1993; Lages et al., 2008). Having a past work experience outside the family business influences positively the internationalization (Morris et al., 1997; Lambrecht, 2005). According to Segaro (2010), a previous external management role allow family members to develop as individuals and also become capable managers outside the family protection, solidifying its position once they join the family business.

Empirical results of Hall and Nordqvist (2008) indicate that formal education is not enough to ensure the success of the successor in its management functions, since they need to expand their cultural competences. This concept is "an understanding of the family's goals and meanings of being in business, that is, the values and norms underlying the reason for the family to be in business the knowledge of the objectives of the family and ways of being in business" (Hall and Nordqvist, 2008, p.58).

The successor appears as a possible catalyst for the company to internationalize; succession is one of the key steps (and inevitable) in the life of a family business, it appears as a window to international opportunities.

Methodology

The methodology adopted in this research is grounded theory (Glaser and Strauss, 1967). This work uses an abductive approach which Denzin (1978, p.110) describes as one that "combines the deductive and inductive models of development of propositions and theory building." Thus, the final result of this document is a consequence of interaction between successive frames relevant theoretical and empirical evidence.

Research Issues

As stated in Strauss and Corbin (1990, p.3) "the research question in a grounded theory study is a statement that identifies the phenomenon under study."

The succession in family businesses is not only a simple process of passing actions, wealth or position. It may represent a significant leap in the life of the company, leading it to previously untapped international markets. The characteristics of successors - objective and subjective - as well as

their social network, social capital and management skills are important vectors to catapult the company to new heights.

Objective Characteristics

- Formal Education
- Experience
- Technical/Specific Knowledge
- Age

Subjective Characteristics

- International Vision
- Pro activity
- Innovative Spirit
- Risk Attraction

Management Orientation

- Management Skills
- Professional Experience outside of the Family
- International Experience
- Professionalization

Social Capital

Social Network

Figure 1 – Main Characteristics from literature

Based on the research question some variables are identified in the literature of international entrepreneur and succession related to the successor as an individual capable to internationalize a family business previously focused only on the domestic market. The resulting set of variables are divided into five major groups - the objective characteristics, subjective characteristics, guidance for management, social networking and social capital (Figure 1).

Construction of the Sample

As Strauss and Corbin (1990) suggest, studies using the methodology of grounded theory should build a sample "relevant" to the phenomenon under study and that will be defined by the analysis itself. Our sample is composed of six companies since it was felt that theoretical saturation (Glaser and Strauss, 1967) has been reached and that the analysis of a new case is not relevant.

Tables 1 and 2 list the six companies selected for the sample respondents and their successors:

	BAKERY	CARPENTRY	BISCUIT FACTORY	GARMENT FACTORY	BUTTONS FACTORY	SHOES FACTORY
YEAR OF CREATION	1961	1968	1943	1975	1966	1939
YEAR OF INTERNATIONALIZATION	2001	2000	1992	1995	1992	1999
BUSINESS VOL. (2010)	1 M€*	750 t€**	26,5 M€	1,8 M€	13 M€	5 M€
Nº WORKERS (2010)	18	25	193	105	189	50
DIMENSION	Small	Small	Medium	Medium	Medium	Medium
EXPORTS (2010)	70%	12%	50%	80%	Entre 75% e 80%	93%

Table 2 – Successors

The selection of companies is made according to the requirements defined:

- Active for at least fifteen years in the domestic market prior to internationalize – born-again global company
- Family has full control in managing and holds the majority of of the capital
- Be based in Portugal – not biased from different origins
- With at least one process of succession, and, the successor is a family member.

To collect data, open interviews were conducted. To give greater support to all evidence, we have made triangulation of all information (interviews, newspapers, the Internet companies' sites and other information on the Internet).

All information concerning all cases was analyzed. Matches were made between aspects referenced and the "nodes" identified in the literature. When a variable mentioned was not identified in the literature, we proceeded to the creation of a "node" capable of being included in final conclusions. Through this process of coding, it was possible to develop concepts, categories and properties that were emerging from the data.

Results

By analyzing these open interviews, we identify variables acting as facilitators of this process. Thus, sections and subsections were organized into detailed: the route's successor, the process of entry into the company, its objective characteristics and subjective and, finally, the steps taken during the process of internationalization (Table 3).

Regarding the variables that emerged from the literature, only two are present across all case studies - the "international vision" and "innovative spirit" of the successor. Between these two, the fact that the successor has a global mindset was most often identified (11 times). Although it has been identified in all cases, the variable "innovative spirit" is less referred than the variable "pro-activity" (9 vs 10).

The "capital" and "management skills" of the successor seem to have little influence at the time these companies start a process of internationalization. Both variables are identified in only one of six cases. Variables such as "formal education", "age", "experience", "social network" and "professional experience outside of the family" have little impact when starting up the presence in international markets. All of them are referenced only in two cases.

Moreover, the analysis of interviews led us to identify new variables not listed in the literature:

- Significant prior involvement with the company: in all cases analyzed it is found that it increases confidence in their abilities and skills of the company. This psychological reinforcement turns out to be crucial to internationalization.
- External factor not attributable to the company: events whose origin can not be attributed to the company. These reference translates the skills of successors in the detection and recognition of international opportunities linked to these facts (some of them apparently negative)
- Motivations for entry into the family business: the entry of their own volition is a possible catalyst for internationalization, given the inherent motivation.
- Internal path followed: according to successor's route after being officially in the company, he will obtain different skills that facilitated the presence in foreign markets.

- Other languages speaker: being skilled and fluent in other languages is a facilitator of the internationalization process.

Table 3 – Results

Conclusion

This research aims to understand which variables related to the successor may facilitate the initiation of a process of internationalization in the context of a family traditional domestic business.

From analysis of open interviews, the variable "significant involvement with the company" is the only one identified in all cases. The fact that successors entered more fully in the life of the company before starting work there can lead to: an increase in confidence in their abilities and in the company; greater acceptance by employees; more specific knowledge about the business and the sector in which it operates; and better detection of opportunities for improvement in the company.

The degree of involvement with company before the moment of succession is mentioned in some articles (Handler, 1989; Mitchell et al., 2009). To our knowledge, no study exists on the topic of previous involvement as a variable facilitator to internationalization of born-again global.

External factors (such as difficulties of payment by customers, opening to the outside of Portugal, intensification of low-cost travel, fall of the Soviet Union, Express postal massification, emergence of stakeholder, widespread change in attitude, Internet evolution, disappearance of Chinese quotas and recession in the textile industry) act as drivers of internationalization, but it is noted that successors must have the ability to exploit the opportunities left by these factors.

In all cases, the successors demonstrated ability to spot opportunities in events that escaped the control of the company and that, in many cases, could be unfavorable. There are several studies linking external factors with global market approach (cf. Oviatt and McDougall, 1994). In a study with seven Swiss family businesses, Baldegger (2008) identifies the external environment as a decisive factor for the sudden internationalization. However, no connection is made to the role the successor can take from this context, namely the recognition of opportunities. The ability to recognize international opportunities has been mainly observed in the literature on international entrepreneurship. International opportunities are spread throughout the world and available to all, but only a few discover them (Ardichvili *et al.*, 2003).

The "internal path followed" it is also referred. The fact that his successor has been through several areas within the company allows them to get different skills that increase their level of confidence and ease, facilitating the start of presence in foreign markets.

Bridging the gap to the literature, the career of successors within the family business is addressed by several authors but in the context of the effectiveness of succession (cf. Handler, 1989). Also Kram (1985) addresses the career development of the successor, suggesting the role of counseling as an important factor in realizing the company going. Some authors (Chrisman *et al.*, 1998; Morris *et al.*, 1997; Sharma *et al.*, 2001) recognize the importance that learning within the company can have for a good succession. However, they leave aside the link with the beginning of internationalization.

Despite variables "motivations for entry into the business" and "other languages speaker" have been identified only in one case (referenced once), it seems important to put these variables for debate. Since this is an exploratory study, we mention all variables that emerged from case studies, making room for future work in this area.

The "motivation for entry into the company" has been identified in one case. The entry in the company of their own volition (not associated with any generational obligation) can act as a catalyst for internationalization because it may lead to greater motivation and thus facilitate the process.

Like what happened with the previous variable, the "other languages speaker" variable is identified in one case as a variable that facilitated the early presence in foreign markets.

At this point, it seems clear that, for the research of successor characteristics causing domestic-based firms to foster a process of internationalization, in addition to the variable identified in the literature, we propose new five variables that emerged from this study:

- Significant involvement with the company before the succession;
- External factor not attributable to the company;
- Motivation for entry into the company;
- Internal path;
- Other languages speaker.

Limitations and Recommendations

One of the limitations relates to the fact that companies are only from Portugal. It looks important to choose only one country to play with the same context in all case. All countries have specific issues related to internationalization and the use of different countries could introduce some bias to the analysis.

Another limitation relates to the sample size. Although it is justified by theoretical saturation, it would be interesting to test new variables identified from a larger universe of companies. It is an exploratory work that could be tested using a large number of companies and a quantitative analysis.

Among the many fields of activity that can be developed, two deserve special attention. It would be interesting, first, to relate the context of the successor entry in the company with the degree of internationalization of the company and second, to test the correlation between the presence of the founder in the company and the degree of freedom that successors feel to act proactively to globalization. Adding all the above, we believe that this research work allows interesting insights on a topic that remains unexplored.

In short, rather than responding solely to the research question that served as a starting point, we have contributed to intensify the study on the reality of internationalization of family businesses.

Abstract

It is very often necessary to compare two or more groups of “objects” or entities in general, which are characterized by a common set of attributes (variables), in relation to a “target” group. The variables’ values of the “target” group are either used as points of reference for comparing the other groups or form theoretical – ideal values which satisfy specific criteria, which are determined according to the theoretical framework of the study in question. In this case, it is useful to construct and use functions-indices, which measure the degree of proximity-convergence (similarity) or, in contrast, the distance-divergence (dissimilarity) of the groups from the “target” group. Thus, in the case of c groups of objects, which are described by matrices of the type “objects \times variables”, an attempt is made to construct a function-index that measures the degree of convergence (similarity) or distance (dissimilarity) of the $c-1$ groups from the “target” group t , based on the values of p parameters-variables, after having removed from them any effect caused by the grouping of the objects. In the present paper, we present a methodology for solving the above-mentioned problem based on the “Procrustes Orthogonal Projection or Rotation” method, which was applied as an example to the financial data of six sampled Agricultural Cooperatives in Greece. Through the application of this methodology, we attempt to examine the convergence of the agricultural cooperatives as regards a “target” group of ideal financial indices, and the progress of their economic status in time.

Keywords: “Procrustes Orthogonal Projection or Rotation” method, Financial Ratios, Financial status, Agricultural Cooperatives

Introduction

In many cases it is particularly important to compare groups of entities and to measure the divergence present either between them or in relation to a reference group. Thus, in several empirical studies, it is necessary to compare two or more groups of “objects”, which are characterized by a

common set of attributes or characteristics (parameters – variables), in relation to a “target” group (Dijksterhuis, *et al.*, 2005; Andrade *et al.* 2004). The parameters’ values of the “target” group are either used as points of reference for the comparison with the other groups or form theoretical – ideal values which satisfy specific objective criteria (or preconditions). These criteria are determined by the theoretical framework and the objectives of each study. In this case, it is useful to construct functions-indices, which measure the degree of proximity (convergence, similarity) or, in contrast, the distance (divergence, dissimilarity) of the groups from the “target” group. In the following sections, the relevant mathematical problem is formulated, specified and solved using the *Procrustes* distance. Finally, an example is presented of applying the proposed methodology on financial indices stemming from an analysis of the balance sheets of six sampled Agricultural Cooperatives in Greece. The application of the specific methodology in agricultural cooperatives is important because apart from the theoretical interest, it allows the comparison of their financial status.

Defining the Problem

Suppose we have c groups of objects, which are described using matrices of the type “objects \times variables”. The values of the variables correspond to the available measurements of the parameters, which concern either different attributes or the same ones under different situations in space and time, for each object. In case where these situations constitute different conditions, which have been selected according to a predetermined design, where the available measurements are considered to depend on known and controlled factors, then the whole process can be included in the frame of experimental designs. Without loss of generality, we assume:

- a) that each group consists of n objects, which are examined in relation to p common parameters – quantitative variables,
- b) that for each group, the values of the p parameters have been standardized so that in each case their mean column-wise is equal to 0 and
- c) that one of the c groups, e.g. group t , is considered to be the “target or reference” group. Thus, the groups’ data can be presented in a series of c in number $n \times p$ matrices X_i ($i=1, \dots, c$) with elements from the set \mathfrak{R} of real numbers.

Finally, the special problem that arises and must be resolved is:

To construct a function-index that will measure the degree of proximity (similarity) or distance (dissimilarity) of the $c-1$ groups to the “target” group t , based on the values of the p parameters-variables, after first having removed from them any effect arising from the grouping of the objects.

Proposed Methodology-The Procrustes Method

A solution to the above problem can be provided by the *Procrustes Orthogonal Projection or Rotation* method. According to this method, given two $\mu \times \nu$ matrices A and B , of which one, e.g. B , is considered constant, an $\nu \times \nu$ transformation matrix T is defined, of such a type that the matrix AT optimally

approaches B, in the sense of least squares (Gower and Dijksterhuis, 2004; Mardia, *et al.*, 2003, Golub and Van Loan 1989). Without limiting the generality, we consider that the columns of matrices A and B have a mean equal to zero. In correspondence with the problem at hand, what is required is that the column spaces of matrices X_i be optimally projected, after an orthogonal rotation, in a common *target* or *reference space*. Due to the fact that the X_i matrices have the same number of rows and columns, the corresponding spaces are of the same dimension. In addition, the columns of matrices X_i have a mean equal to zero and express the deviations of the corresponding points from their centre of gravity. Therefore, the coordinate systems of the spaces defined by the columns of X_i have a common origin. Thus, any of the c matrices X_i can be used as a reference space, on which the remaining $c-1$ spaces will be projected. More specifically, suppose \mathbf{X}_t and \mathbf{X}_w are matrices with elements from the target or reference group t and from group w respectively ($t, w=1, \dots, c$ with $t \neq w$). The problem lies in identifying a transformation matrix R, so that the matrix $\mathbf{X}_w \mathbf{R}$, i.e. the matrix with the elements of group w after the rotation through R, is as close as possible to matrix \mathbf{X}_t . According to the Procrustes method, the quantity needs to be minimized is the following:

$$D = \text{trace} \left[(\mathbf{X}_t - \mathbf{X}_w \mathbf{R})^T (\mathbf{X}_t - \mathbf{X}_w \mathbf{R}) \right],$$

where R is the required $p \times p$ orthogonal rotation matrix with:

$$\mathbf{R}^T \mathbf{R} = \mathbf{R} \mathbf{R}^T = \mathbf{I}_p.$$

In Annex, we prove that $D^{1/2}$ (and D therefore also) is a metric.

This is a problem of least squares and its solution is reached by following the process below (Andrade *et al.* 2004; Mardia, *et al.*, 2003; Krzanowski, 1987; Rao, 1980; Sibson, 1978)²⁴:

At first, the SVD method (Golub and Van Loan, 1989) is applied on matrix $\mathbf{X}_w^T \mathbf{X}_t$:

$$\mathbf{X}_w^T \mathbf{X}_t = \mathbf{U} \mathbf{D} \mathbf{V}^T.$$

Then, the rotation matrix R is calculated by the formulae:

$$\mathbf{R} = \mathbf{U} \mathbf{V}^T.$$

Through the application of SVD on table $\mathbf{X}_w^T \mathbf{X}_t$ it is possible to achieve a rotation, stretching and/or reflection of its elements (Weller and Romney, 1990). The transformation matrix $\mathbf{R} = \mathbf{U} \mathbf{V}^T$ rotates and/or reflects the elements of matrix \mathbf{X}_w in the column space of \mathbf{X}_t in order the minimization of the

²⁴ This process is based on the fact that the classical problem of least squares $\min \| \mathbf{A} \mathbf{x} - \mathbf{b} \|^2$ has two equivalent solutions (see Kalman, 1996): $\mathbf{x} = (\mathbf{A}^T \mathbf{A})^{-1} \mathbf{A}^T \mathbf{b}$ and $\mathbf{x} = \mathbf{V} \mathbf{D}^{-1} \mathbf{U}^T \mathbf{b}$.

quantity D . If the fit is perfect, then the elements of matrix $\mathbf{X}_t - \mathbf{X}_w \mathbf{R}$, which measures the lack of fit after the rotation, will be equal to zero, and consequently the metric $D = 0$. The quantity D is considered to be the distance or an index of goodness of fit and its natural meaning is that it expresses the degree of similarity of matrices \mathbf{X}_t and \mathbf{X}_w . A standardized version of the distance D is the index $D^{**} = D / \text{trace}(\mathbf{X}_t \mathbf{X}_t^T)$ (Sibson, 1978).

The elements of each column in matrices \mathbf{X}_t and \mathbf{X}_w are centered as regards their columns' means and, therefore, the coordinate systems of the corresponding spaces, which are determined by their columns, have a common origin. Thus, it is not necessary to transfer the coordinate system of the space that is defined by the columns of matrix \mathbf{X}_w . It is possible for the cloud of points in \mathbf{X}_w , during its projection in reference space \mathbf{X}_t , to present a different variability compared to the cloud of elements of \mathbf{X}_t , since each orthogonal transformation conserves the distances (Groenen and Frances, 2000; Peay, 1988). In order for the results to be comparable, we also need to take into account the different variation of the relevant clouds (Mardia, *et al.*, 2003, Sibson, 1978). A simple way to deal with this issue is for the elements of columns in matrices \mathbf{X}_t and \mathbf{X}_w , before the Procrustes Projection, to be transformed, so that their variance is equal to 1 (Krzanowski, 1993; Peay, 1988, Sibson, 1978). Alternatively, in the general case where the elements of matrices \mathbf{X}_t and \mathbf{X}_w have different measurement scales, the compatibility of the two solutions can be achieved by imposing a restriction, that the elements of \mathbf{X}_w after the rotation, satisfy the relation:

$$z \mathbf{X}_w \mathbf{R}, \text{ with } z > 0.$$

It can be shown (Mardia, *et al.*, 2003; Sibson, 1978) that the minimization of the quantity D is achieved by setting:

$$z = \frac{[\text{trace}(\mathbf{D})]}{[\text{trace}(\mathbf{X}_w \mathbf{X}_w^T)]},$$

where \mathbf{D} is the diagonal matrix whose elements are the singular values that emerge from the application of SVD on matrix $\mathbf{X}_w^T \mathbf{X}_t$. In this way, the measurement scale of the elements in \mathbf{X}_w is transformed into the measurement scale of the elements in \mathbf{X}_t . It should be noted that the transformations $z \mathbf{X}_w \mathbf{R}$ and $\mathbf{X}_w \mathbf{R}$ are not symmetrical relevant to the measurement scales of the elements of matrices \mathbf{X}_t and \mathbf{X}_w (Mardia, *et al.*, 2003, Sibson, 1978, Gower, 1975, Rummel, 1970). The elements of \mathbf{X}_t cannot arise from the reverse transformation of the elements of \mathbf{X}_w . The symmetry can be achieved through the definition of a common measurement scale, according to which the sum

of squares of the elements of \mathbf{X}_t and \mathbf{X}_w will be equal (Mardia, *et al.*, 2003). The following should be valid thus:

$$\text{trace}(\mathbf{X}_w \mathbf{X}_w^T) = \text{trace}(\mathbf{X}_t \mathbf{X}_t^T).$$

In practice, after the reference matrix \mathbf{X}_t is selected, the remaining $c-1$ matrices are projected in the space defined by the columns of \mathbf{X}_t , by using the proposed methodology.

The above process is repeated for the remaining groups. In the Application Example section, the results from the application of the proposed method on financial data matrices from Agricultural Cooperatives are presented. The analyses were carried out using the Procrustes v.1.0 software.

In the problem under study, the interest lies in the comparison of the n objects among the c groups, after removing their (potential) impact on the formulation of the results. The visualization of the whole process is achieved in a common space (with 1, 2 or 3 dimensions). The numerical results of the Procrustes projection can be enriched with the calculation of the following indices (Rummel, 1970):

a) *Pearson's* linear correlation coefficients between the columns in matrices \mathbf{X}_t and $\mathbf{X}_w \mathbf{R}$. A special interest, as regards the quality of fit, is presented by the correlation coefficients of the corresponding columns of group t (reference) and w after the rotation. Their values express the degree of *congruence* of the corresponding parameters-variables.

b) The correlation coefficients (*Pearson's* linear or *Spearman's* rank correlation coefficient) between the corresponding objects in group t and w after the rotation. The numerical values for the computations are found in the rows of matrices \mathbf{X}_t and $\mathbf{X}_w \mathbf{R}$. The values of these coefficients express the degree of similarity of the corresponding objects in the two groups. Low index values signify those objects which experienced the greatest effect from the grouping. Of course, the same can also be noted from an examination of the elements in matrix $\mathbf{X}_t - \mathbf{X}_w \mathbf{R}$, which includes the deviations or lack of fit per parameter-variable. The mean value of the correlation coefficients between the corresponding objects expresses an overall index of goodness of fit of the Procrustes projection.

c) The correlation coefficients (*Pearson's* linear or *Spearman's* rank correlation coefficient) between the corresponding parameters in group w , before and after the rotation - projection. In order to calculate the latter the columns in matrices \mathbf{X}_w and $\mathbf{X}_w \mathbf{R}$ are used. The very low values and negative sign of the coefficients show a change in the ranking of the objects and parameters after the rotation.

Some Remarks

A) With the Procrustes projection, the \mathbf{X}_w matrices are rendered as "similar" as possible to the reference matrix \mathbf{X}_t and to one another (Michailidis and De Leeuw, 2000). The variability introduced by the grouping of the objects is "smoothed" and the grouping effect is removed also from the parameters' values (Rummel, 1970).

B) The method we presented cannot be directly implemented if the matrices X_i do not have the same number of rows²⁵, i.e. if the groups do not contain the same number of objects. In this case if, for example, matrix X_w has fewer rows than X_l , then the remaining rows of X_w can be filled with zeros, so that in the end both matrices have the same number of rows (Mardia, *et al.*, 2003).

Discussion

Using the Procrustes projection-rotation, the objects in the groups are projected in a common space and their relative positions are comparable. Of course, the same is also valid for the values of the parameters-variables. The same rotation method is also recommended by Michailidis and De Leeuw (2000) in order to compare the results from the application of Homogeneity Analysis on c clusters of data, which have been collected using the *Multilevel* sampling design. In correspondence to the problem in question, the c clusters can be regarded as groups. In addition, this method is also used to compare the subspaces that arise from the application of Factor Analysis (Raykov and Little, 1999; Gruvaeus, 1970; Harman, 1967) and Multi-dimensional Scaling (Peay, 1988; Sibson, 1978) on two or more independent data sets. It can be used to test the external and internal stability of the results extracted from Multiple Correspondence Analysis, when the tests are carried out using resampling methods, such as *Bootstrap* (Greenacre, 2006; Markus 1994^a and 1994^b). It can be used to test the external and internal stability of the results of the Multiple Correspondence Analysis, when the tests are carried out using resampling methods, such as *Bootstrap* (Greenacre 2006, Markus 1994^a and 1994^b), and with methodologies for the selection of variables in Principal Components Analysis (Andrade *et al.* 2004, Krzanowski 1987). Generalizations and additional applications of Procrustes Projection can be found in Schönemann (1966), Rummel (1970), Gower (1975), Sibson (1978), Lebart, *et al.*, (2000), Gower and Dijksterhuis (2004) and Gardner, *et al.*, (2006).

In conclusion, with the proposed methodology we achieve the following results:

- 1) the effect of the objects grouping on the parameters' values is isolated and removed
- 2) the groups are homogenized, comparable and the differentiations among them are also graphically presented. As a similarity measure between the reference group and the groups projected upon it, we can use Procrustes distance D (or D^{**}).

Application Example

The proposed methodology was applied on five 6x6 data tables (sub-tables X1-X5 in Table 1). Each table corresponds to one year of the period 2002-2006, and for each year we calculated the Acid Test ratio (Υ_1), the Net Profit ratio (Υ_2), the Return on Total Assets ratio (Υ_3), the Fixed Assets to Total Assets ratio (Υ_4), the Return on Equity ratio (Υ_5) and the Total Liabilities to Total Assets ratio (Υ_6) for six Agricultural Cooperatives (6 objects) (Dickerson *et al.*, 1995; Penson and Lins, 1980; Oustabasidis *et*

²⁵ More specifically, the Procrustean Projection cannot be directly applied, since the matrices are not of the same size.

al.,2000). Furthermore, the above-mentioned indices were selected because they clearly define the financial status of the Cooperatives (Niarchos, 2004). The data (Table 1) was selected based on the end-of-year balance sheets that were obtained during on-site visits to the cooperatives, in order to collect general information regarding the cooperatives, their activities and method of operation, as well as the balance sheets and profit and loss statements for the years 2002 to 2006.

For the requirements of the application example, the ideal “target” matrix X_t (see Table 1) was defined as follows: for each index (Υ_1 - Υ_6), we initially calculated the corresponding mean value of all the cooperatives in the sector for the period 2002-2006 and, then, for each one of the six cooperatives, to the values of the means of the indices, we added “noise” from a Normal Distribution with mean equal to the mean of the corresponding index, and standard deviation such that the corresponding Coefficients of Variation (CV) ranged between 10% and 12%.

Table 2 presents the Procrustean distances of the five tables (X_1 - X_5) from the “target” matrix X_t . In Diagram 1, the convergence of the Agricultural Cooperatives to the “target” matrix is visualized. We also observe from Diagram 1 that the cooperatives under study were closer (convergence) to the “target matrix” X_t in the year 2006 (Table X_5) and further (divergence) in the year 2003 (table X_2). For the years 2004 and 2002 (tables X_3 and X_1 respectively), the cooperatives were relatively close to each other. For the period 2002-2005, we observe several changes in the relative positions of the cooperatives, rather than a specific trend toward achieving their goals. Based on the former findings, it seems that the best year for the cooperatives under study, in relation to the pursued financial results, was the year 2006, while the worst was 2003. Their financial status seems to improve in the years 2004 and 2002 but does not reach the level of 2006. However, a general estimate is that, if the same conditions (social, political, economic, and legislative) with those of 2006 prevail over the following years, the cooperatives will be expected to show greater convergence towards the desired financial results. After an analysis of the financial indices, it appears that in 2006 the Cooperatives under study present a relative adequacy in liquid funds in order to cover their current liabilities.

Furthermore, they present an increase in investments with a parallel increase of the profit margin and the existence of a higher overall velocity of circulation. The correlation coefficients (*Pearson's r*) between the corresponding columns in matrices X_t and X_wR ranged from 0.605 to 0.989 (Table 3). These values express a high degree of congruence of the relevant financial indices. The majority of the correlation coefficients between the corresponding rows in the above-mentioned matrices ranged from 0.511 to 0.983. The lowest correlation coefficient ($r=0.128$) was observed for cooperative E3 for the year 2002. This result shows that, compared to the others, this cooperative was most affected by the particular conditions or changes (social, political, economic, and legislative) that prevailed in the year 2002. In general, the above-mentioned numerical results display a satisfactory degree of congruence of the variables (financial indices) and the objects (cooperatives) in the five tables, after the rotation. From a study of the correlation coefficients of the corresponding columns in matrices X_w and X_wR , it was observed that the negative correlations systematically appear for indices Υ_3 (Return on Total Assets ratio) and Υ_6 (Total Liabilities to Total Assets ratio) for all the years in this period (Table 3).

Y1: Acid Test ratio, Y2: Net Profit ratio, Y3: Return on Total Assets ratio, Y4: Fixed Assets to Total Assets ratio, Y5: Return on Equity ratio and Y6: Total Liabilities to Total Assets ratio.

Table 1: Financial indices (Υ_1 - Υ_5) of the six Agricultural Cooperatives for the period 2002-2006

This result shows that the values of indices Υ_3 and Υ_6 are those that were most affected by the predominant conditions in the period 2002-2006, a fact that requires further study. More specifically, if we examine these specific ratios for the period 2002-2006 in detail, we can observe a significant increase in fixed asset investments among the selected sample of cooperatives, accompanied by low equity participation by the cooperatives and a high Total Liabilities to Total Assets ratio, which greatly increases the financial risk.

Conclusions

This paper presents a methodology for comparing groups of entities with different characteristics, and calculating the divergence either between them or from a target group. With the application of the proposed methodology based on “*Procrustes Orthogonal Projection or Rotation*”, a function-index is constructed that measures the degree of proximity (similarity) or distance (dissimilarity) of specified groups with the “target” group, based on the values of specific parameters-variables, after first having removed from them any effect related to the grouping of the objects.

The proposed methodology was applied on the financial data of 6 Agricultural Cooperatives. More specifically, the methodology was applied on five 6×6 financial data tables. Each table corresponds to one year of the period 2002-2006. From the analysis of the results it appears that the best year for the Cooperatives under study, in relation to the pursued economic results, was the year 2006, while the worst was the year 2003 (in comparison with the reference values of the target data table). Their financial status appears to have improved for the years 2004 and 2002, but still presents a significant divergence from the financial results of 2006. From the inspections of the correlation coefficients, negative correlations were observed for the Return on Total Assets ratio and the Total Liabilities to Total Assets ratio, for all years during the period under study. Furthermore, it seems that the lowest correlation coefficient was observed for the cooperative E3. This result shows that this particular Cooperative, compared to the rest, was most affected by the particular conditions or changes (social, political, economic, and legislative) that prevailed in 2002.

In general, the proposed methodology constitutes a reliable tool for comparing groups of cooperatives, in relation to specific characteristics, and their “convergence” to a “target” group, characterized by optimal values or their pursued values. More specifically, this methodology can be used in financial management as a tool for conducting a rational evaluation of the financial course of cooperatives.

Annex A

Proof that $D^{1/2}$ is a metric

1st Axiom

Obviously, $D^{1/2} \geq 0$, as the positive square root of the sum of squared differences.

2nd Axiom

Suppose we have two $n \times p$ matrices X_1 and X_2 . Without loss of generality, we can consider that the np elements in each table are ordered in relation to the columns of the matrix and that they constitute the coordinates of a point in a Euclidean np -space. Thus, the two matrices X_1 and X_2 are represented by two points, Q_1 and Q_2 respectively. The Euclidean distance Δ (not necessarily the minimum distance) between the two points Q_1 and Q_2 is the positive square root of the sum of the squared differences of their coordinates and constitutes a measure of goodness of fit (or distance) between matrices X_1 and X_2 . If matrix X_1 has been rotated (through the Procrustes method) so that it has the highest possible similarity to matrix X_2 and matrix X_2 has been rotated so that it has the highest possible similarity to matrix X_1 , then the quantities $D_{12}^{1/2}$ and $D_{21}^{1/2}$ correspond to the distances $\Delta(Q_1, Q_2)$ and $\Delta(Q_2, Q_1)$. However, the following is valid:

i) $D_{12}^{1/2} \leq D_{21}^{1/2}$ (because matrix X_1 cannot be rotated in a better way than that of the Procrustes method so that the quantity D_{12} is minimum)

ii) $D_{21}^{1/2} \leq D_{12}^{1/2}$) (because matrix X_2 cannot be rotated in a better way than that of the Procrustes method so that the quantity D_{21} is minimum)

From i) and ii) and given that $D_{12}^{1/2}, D_{21}^{1/2} \geq 0$, it arises that:

$$D_{12}^{1/2} = D_{21}^{1/2} .$$

3rd Axiom

Suppose we have three $n \times p$ matrices X_1, X_2 , and X_3 . Without loss of generality, we can consider that the np elements in each table are ordered in relation to the columns of the matrix and that they constitute the coordinates of a point in a Euclidean np -space. Thus, the three matrices X_1, X_2 , and X_3 are represented by three points, Q_1, Q_2 , and Q_3 respectively. The Euclidean distance Δ (not necessarily the minimum distance) between any two points Q_i and Q_j ($i, j=1, 2, 3$) is the positive square root of the sum of the squared differences of their coordinates and constitutes a measure of goodness of fit (or distance) between matrices X_i and X_j . The quantities $D_{13}^{1/2}$ and $D_{23}^{1/2}$ correspond to the distances $\Delta(Q_1, Q_3)$ and $\Delta(Q_2, Q_3)$ with respective rotation matrices $R_1=R_2=I$. If the matrices X_1 and X_2 have been rotated (through the Procrustes method) so that they have the highest possible similarity with matrix X_3 , then the quantities $D_{13}^{1/2}$ and $D_{23}^{1/2}$ correspond to the distances $\Delta(Q_1, Q_3)$ and $\Delta(Q_2, Q_3)$ with rotation matrices $R_1 \neq R_2$. Since this is taking place in a Euclidean space, the following is valid:

$$\Delta(Q_1, Q_2) \leq D_{13}^{1/2} + D_{23}^{1/2} .$$

However, $\Delta(Q_1, Q_2) \geq D_{12}^{1/2}$, because X_1 and X_2 cannot be rotated in a better way than that of the Procrustes method so that the quantity D_{12} is minimum. Therefore the following inequality is valid:

$$D_{12}^{1/2} \leq D_{13}^{1/2} + D_{23}^{1/2} .$$

FISCAL PRESSURE IMPACT ON BANK LABOR IN THE EUROZONE

Abstract

The recent economic and financial crisis provided ardent debates on the causes, solutions, but also new effects of the panacea to this latest crisis. Consequently, this paper produced detailed analysis on a strong link: the money thread, the link between what both people’s and governments’ needs during financial crisis. Since, both want money and both try to show how important their share is in the global economy, despite strong interlinks. Altogether, this paper tries to show how fiscal policy impacts the labour in the banking sector in European Union, not neglecting the regulatory bank environment and the connection with the monetary policy and other economic and financial theories. The paper’s first dilemma is whether to tax the banks’ profits thus affecting the pricing of their products as well as their economic growth. The second dilemma consist in either taxing the banks indirectly by asking to hold higher capital adequacy ratios or in taxing their borrowing and then bail them out and then recover the money from the taxpayers, including making profit thereafter from the resale of the bailed out bank to the private sector. The lack of harmonization of the E.U. fiscal policy seems to separate from today’s fiscal federalism concept, modifying also the E.U. banking system’s regulatory environment and moving towards a fiscal union as a fast answer in confronting the current economic downturn.

Keywords: bank employment, budget deficit, bailout, capital adequacy, fiscal policy, monetary policy, taxation

Introduction

In the wake of the financial and economic crisis, the unemployment rate in the OECD area has risen from 6.1% in 2008 to 8.2% in 2011 (OECD, 2011). Tax reform came then as a solution to help reduce long-term unemployment. At the same time tax policy makers in many countries are also worried about how to ease the strong work disincentives that tax systems can often create. The higher the tax wedge the stouter the disincentive to work. In Europe, Ljungqvist and Sargent (1998, 2008) argue that the rise in European unemployment can be attributed to the increase in the depreciation rate of labour upon job displacement interacted with more lavish unemployment protection. Taxes on labour income, including social security contributions, account for around one half of total tax revenue, on average, in OECD countries. Also, in OECD countries, tax revenues from employment incomes account for around half of total tax revenues (OECD, 2011). So, country budget equilibrium becomes essential in running a healthy employment level in country.

Under the traditional optimum currency area theory, fiscal flexibility, together with budgetary discipline and co-ordination, has come to be seen as a central pillar of fiscal policy. The Stability and Growth Pact (SGP) (Brunila et al., 2001) has been the operational response of EU countries to the quest for budgetary discipline in EMU. Because, fiscal policy should not be separated from monetary policy, according to the Mckinnon criterion on optimal currency area, when two countries A and B do not share the same currency, they each have their own exchange rate compared to the rest of the world (Baldwin and Wyplosz, 2009). Applied to the banking industry, which is very open and trades intensively currencies, along with the financial products, it means that competition will equalize the prices of most good and services when expressed in the same currency.

In the E.U. under the same currency, a depreciation of the Euro triggered by the Greek debt crisis would have enhanced the E.U. competitiveness, and allow in the reduction of unemployment or job scarcities. When, apart from the government labour and tax reform for mitigating further negative effects of the crisis on both population and the state in the long run, the banks have an important role to play in sustaining these efforts, still.

That is that a healthy bank environment sustaining properly the monies circulation and trade together with a robust reform could weather the long term effects of the competitiveness, despite a depreciating the Euro. Consider for instance that since prices and wages are sticky (Baldwin and Wyplosz, 2009) and most EU countries' balance of trade are negative, countries try to make their exports cheaper through enhancing competitiveness, they try to do so through depreciating their currency first. However, the for those belonging to a wider currency area, obtaining lower prices would be done through lower production costs, hence wages in those labour intensive industries.

Hence, the banking industry which supports these actions should find a different way to stimulate X-efficiency within (i.e. managerial efficiency) in the context of a new deadline for implementing regulatory capital adequacy as per the new Basel III agreement (e.g. Austria set up their deadline for January 2013). Another way of keeping though costs low in the banking sector, where pay for performance is a must, is rather linked to paying benefits and salaries at the same level if not even more, while reducing the headcount. This cannot be done easily, unless mergers and acquisitions are involved and regulations provide sufficient room for them. This is why in the latest couple of years, EU has experienced, especially in the South and Central-East Europe a new wave of M&A in the banking sector, despite the sector dynamics in this area anyway.

Differences in the banking and financial markets or in the size of the firms and their ability to borrow may result in asymmetric effects as well as include symmetric shocks with asymmetric effects (Baldwin and Wyplosz, 2009) which under labour mobility (Mundell, 1973) means that a country undergoing unemployment could interact with a country facing inflationary pressure. This relocation is operated through exchange rates, price and wage changes until the real exchange rate is delivered in equilibrium. Within the banking industry this happens to be faster due to close or similar organizational structures, job descriptions and results targets, which aim at supporting an improved

quality borrowing and money making. Yet, under sticky prices, floating exchange rate and with capital inflow as a solution, the nominal appreciation results in real appreciation, a loss of external competitiveness and a deterioration of current account, which is not desired during today's EU recession. Demand for domestic good declines, interest rates (the price of money) in the economy support the shrink in the supply curve; hence an expansionary fiscal policy will be completely offset by the exchange rate appreciation and the automatic equilibrium of the economy.

Coming back to the country reform, currency depreciation and wages, another levy in this respect is an indirect one, the taxation. Now, the question would be which type of tax are we talking about? Is it income tax, value added tax, social security insurance, borrowing tax, capital adequacy level for banks or something else. The multitude of tax charges is too large to comprehend and they should be included in a special model for specific simulation based on sensitivity analysis. In this respect the EU tax harmonization could be a step forward towards a better competitiveness with the U.S. first of all, and then towards supporting a stronger Euro. Also, fiscal policy has the advantage of being faster to implement (6 to 12 months) compared to changes in the monetary policy (12 to 24 months).

In connecting taxation with bank productivity and employment, we need to analyze further intermediary possible intercepts; monetary policy, migration, X-efficiency, information asymmetry and other economic aspects of aggregate demand and supply. Yet, many economists argue that taxes can have a significant effect on the intensity with which people work and their overall efficiency and productivity, but there is a lack of empiric support to that. Overall, there are quite a few factors contributing to improving productivity – tax changes can play a role - but isolating the impact of tax cuts on productivity is extremely difficult, because of other subsequent effects tax has in the economy.

The Tax-Economy relationships

Empirically, Prescott (2004), among others, proves that the increase in tax rates is accompanied by an increase in aggregate productivity (most notably in France and Germany) relative to productivity in the U.S. Furthermore, the skill premium operating within the banking industry, the X-efficiency, in the relative productivity of college and high school graduates, is strongly negatively related to the tax wedge.

Under the Keynesian school of thought, much used in EU by France and Italy, but less by Germany, it is argued that fiscal policy can have influence aggregate demand, output and employment when the economy is runs well below full capacity and where there is a need to provide a demand-incentive economy. Keynesian economists ascertain that there is reasonable role for the government to make active use of fiscal policy measures to manage the level of aggregate demand.

The Fiscal - Monetary Policy tandem

In the E.U. there is a similarity in the way in Euro Zone countries run their monetary policy and the way U.K. does. In the U.K. the Chancellor of the Exchequer runs the operation of fiscal and monetary policy was compared to the Central European Bank in the E.U. Even though the Bank of England

(BoE) has independence that allows it to set interest rates, the decision belongs to the Monetary Policy Committee (MPC) which takes it with the approval of the Government's fiscal policy stance. In the European Union, the European Central Bank regulates the interest rates under the attempt to regulate the inflation target below 2% and in a non-symmetrical way. Within the ECB, the votes are split between countries which each have representation on the ECB Council and are signatory of the Stability and Growth Pact (SGP). In the U.K. the Treasury has a non-voting representative at MPC meetings, where nine members MPC meet monthly to cast one vote each, where the BoE governor has a casting vote. The government informs however the MPC of the fiscal policy decisions affecting the budget, while the BoE sets up the Consumer price (inflation) of 2%, where there is a permitted band of fluctuation equal to +/- 1%.

Now, any impact on regulating inflation targets has also an effect on unemployment level, especially depending on how the two policies have been used. Considering the comparison within E.U, between U.K. and the Euro Zone, one can notice in the following three figures presented a lower unemployment level of U.K. compared to the Euro Zone (referring to the demand deficient unemployment). Keynesian economics defines demand deficient unemployment the level of unemployment beyond the natural rate which is most likely due to insufficient demand in the overall economy. During a recession, caused or not by a financial crisis or a debt crisis (high budgetary deficit of a country or group of countries), aggregate expenditure is scarce causing the underutilization of inputs (including labour). Aggregate expenditure (AE) or GDP (gross domestic product) can be increased, according to Keynes, by increasing consumption spending (C), increasing investment spending (I), increasing government spending (G), or increasing the net of exports minus imports (X-M). { $AE = C + I + G + (X-M)$ }.

Thus, it means that for the Euro Zone economic protection and inflation reduction one may consider that all of the above components of GDP growth can be satisfied. Yet, in the long term increasing consumption means more loans to cater this need which may a need for personnel and technology in the banking sector. Increasing investment needs safer investments in tier one assets or higher yield government bonds. But, this means an increase in government borrowing/deficit. Also, increasing government spending means issuing further bonds to finance the spending, hence further deepening of the balance of payments deficit. Otherwise lowering the tax level would encourage the support of a weak economy and create economies of scope from leaving more retained profits to companies. Then the net export minus imports increase (X-M) is based on a currency depreciation, which brings back inflation and rebalances labour underutilization. However, some actions, like increase in (C) vs. increase in (I) will neutralize (immunization) the GDP growth due to mixed effects.

Rational Expectations and Tax cuts

Under the concept of 'rational expectations' within the economic school of thought, one thinks that the government aims to sell debt (e.g. Greek governmental or bank bonds) in order to provide funding for a tax cut or an increase in expenditure. U.K. is the only country in E.U. which has prompted their economy towards tax cutting, but by relying on reducing tax to first time buyers of interest free loans to get a house and on corporation tax cuts, looser planning laws and 20 low-tax 'enterprise zones' (<http://www.dailymail.co.uk>).

Suppose a rational person will recognize that in the future and he/she will face higher tax due to pay for the interest repayments on those bonds or cheaper loans. Thus, the person should increase her/his savings as there has been no increase in related permanent income. Therefore, any change in fiscal policy would have no impact on the economy if all individuals were rational. Fiscal policy in these circumstances becomes inoperable. In part, it is because of the limitations of fiscal policy as an instrument for managing aggregate demand; many governments have turned to fiscal policy for using it to expand aggregate supply in order to support sustainable economic growth, as we will show further.

Certain economists employ the 'adaptive expectations' model (Lodhia, 2005), but then complement it with ideas based on the rational expectations theory. For example, an anti-inflation campaign run by the central bank is more effective if it convinces people that it will not undershoot its forecasts. The bank can convince people to lower their inflationary expectations, which show less of a feedback into the actual inflation rate. (A supporter of Rational Expectations would think, rather, that the statements of central banks are details that must be incorporated into one's forecast because central banks can act independently). Simply put, in the financial markets the efficient-markets hypothesis (Fama, 1970) will be a better off option, but exceptions are accepted.

The Fiscal policy, output, economic growth and debt deficits

While the monetary policy is often seen as governmental policy tool affecting all sectors of the economy in different ways and depths, the fiscal policy changes can be mostly targeted to affect certain groups (e.g. usually tax cuts for corporations and increase taxation for SMEs and population to raise government budget). Consider the effects of using either monetary or fiscal policy to achieve a given surge in national income because actual GDP is below its potential.

- Monetary policy expansion: Lower interest rates will lead to an increase in both consumer and business capital spending both of which increase economic growth. Then, from investment spending results more of a larger capital stock, then revenues in the future will also increase and hence bring a higher volume of tax to the state.
- Fiscal policy expansion: An expansionary fiscal policy (i.e. an increase in government spending or lower taxes) adds directly to aggregate demand but if this is financed by higher borrowing costs, this may result in a hike in interest rates and lower investment. The net

result (by adjusting the increase in government spending) is the same increase in current income. However, since investment spending is lower, the capital stock is lower than it would have been, so that future incomes are lower. On the other side of the coin, heavy borrowing by a country to finance unsustainable public debt is a sign of fiscal indiscipline that automatically will trouble the international financial markets. These will see the Euro weakening due to capital outflow towards safer areas, maybe the Swiss franc or the sterling as a potential source of spillover.

- The connection with the Taylor rule for the ECB, there is a set interest rate in reaction then to deviations of both inflation and output. So, that Begg et al., (2002) found that Taylor rule holds up pretty well: $i=i^* + a(\pi-\pi^*)+ b(\gamma-\gamma^*)$, Where i^* is the equilibrium interest rate, π is the inflation rate, π^* is the inflation objective, γ is the GDP growth rate and γ^* is the GDP growth trend, $a=0.2$ means the relative dislike of inflation and $b=0.8$ represents cyclical fluctuations. Also, under Fisher's principle $i^*=r^*+ \pi^*$, where r^* is the equilibrium real interest rate.

Barro (1990) and King and Rebelo (1990) studied the effects of fiscal policies, such as government spending and taxation, on economic growth. In general they found that taxation adversely affects long-run growth performance and that the quantitative impacts are much larger than those found in exogenous growth models. Van der Ploeg and Alogoskoufis (1994) and Chari *et al.*, (1995) found reasoning for inflation being inversely related to long-run growth. Then, since inflation is triggered by higher prices possibly triggered by increased taxation, it seems that long-run growth is supported by an optimum employment in the economy and hence lower taxation and lower inflation, methods that seem to be more often employed by the British people rather than the mainland Europeans. This, of course, considers Phillips theory that inflation is inversely related to unemployment.

Economists have studied hence more the dynamic general equilibrium approach to the theory of price level that is often called the fiscal theory of the price level (FTPL). The FTPL says that if government solvency is not guaranteed, monetary policy will not be able to control the price level, but fiscal policy will be employed in order to react sufficiently strongly to a rise in the interest rate in the event of inflationary pressures by increasing the primary surplus. In other words, monetary policy aiming at keeping inflation in check – as the ECU is mandated to behave – has to go hand-in-hand with a fiscal policy obeying a solvency constraint. Once the FTPL is applied to the EMU institutional set-up, however, seemingly different conclusions are drawn.

Regarding government deficits and public debt, the European rule for fiscal convergence of 3% of deficit debt and 60% ceiling of the GDP, except for the 'Belgian clause', is arithmetically supported as follows: Consider: $B_t - B_{t-1} = D_t$, (i.e nominal debt for end of year $t-1$ and t respectively equal annual deficit (D_t)). The two fiscal convergence criteria of the Maastricht Treaty refer not to the debt and deficit levels, but to their ratios to nominal GDP (Y), denoted as b_t and d_t , respectively, then divided by current year GDP, we obtain:

$$[(B_t - B_{t-1}) / Y_t] = D_t / Y_t \text{ or } (b_t - B_{t-1} / Y_t) = d_t, \quad (1)$$

Then, $(B_t - 1) / Y_t = [(B_{t-1}) / Y_{t-1}] \times (Y_{t-1} / Y_t) = [b_{t-1} / (1 + g_t)]$, where g_t is the growth rate of GDP in year t and it is equal with $g_t = (Y_t / Y_{t-1}) - 1$. Then we can rewrite the debt growth equation (1) as

$$(b_t - b_{t-1}) = [(1 + g_t) \times d_t - (g_t \times b_t)] \quad (2),$$

and since the debt of GDP ratio b is to remain constant, then we need to have $b_t = b_{t-1}$, which from equation (2) implies:

$$d_t = (1 + g_t) \times b_t / g_t \quad (3)$$

Thus, the fiscal convergence criteria sets $d_t = 3\%$ and $b_t = 60\%$, if nominal GDP grows by 5%, equation (3) is approximately satisfied. Hence from the Fisher effect, the implicit assumption is that the real GDP annual growth is about 3% and the inflation is 2%, hence the nominal GDP growth rate of 5%. Hence any debt increase, and implicit some deficit is compatible with a constant debt/GDP ratio and the tolerable deficit is larger the faster nominal GDP grows. (Baldwin and Wyplosz, 2009)

Obviously, the GDP will be also dependent on the government budget through the tax level set according to Laffer curve. Yet, Laffer curve is also too simplistic in that it accepts a single tax rate and a single labor supply, when systems of public finance are more complex and then it looks (Trabandt and Uhlig, 2009).

Effectiveness of Monetary and Fiscal Policies

One report by a group of officials from 16 developing and developed countries was particularly influential in spelling out what was needed in addition to improved banking supervision - work on the quality of the legal framework, macroeconomic policies, and the way other parts of the financial system were regulated (Draghi *et al.*, 1997).

When the economy is in a recession, monetary policy may be ineffective in increasing spending and income. In this case, fiscal policy might be more effective in stimulating demand. Other economists disagree, they argue that changes in monetary policy can impact quite quickly and strongly on consumer and business behaviour. However, there may be factors which make fiscal policy ineffective aside from the usual crowding out phenomena. Consumption theories based on the future-oriented concept of rational expectations sustain that people 'translate' government fiscal policy through changes in their own behavior (e.g. if government spending and borrowing surges, people may expect an rise in the tax burden in future years, and therefore increase their current savings in anticipation of this). In practice, a lower tax on SMEs, small and medium sized enterprises, which represent the mass employers of the most numerous in the economy compared to large corporations, makes SMEs keep more profits. Keeping more profits and hence increasing cash flow and retained earnings, strengthen SMEs eligibility for increasing borrowing. Eventually, this move provides potential at the same time for savings and economizing, hence also making a sound safety buffer for bank deposits.

Time Lags in Monetary vs. Fiscal Policies and the Euro life scenarios

Monetary and fiscal policies differ in the promptness with which each takes effect, while the time lags are variable. Monetary policy in the UK is flexible since interest rates can be changed by the Bank of England each month and emergency rate changes can be made in between meetings of the MPC, while changes in taxation take longer to bring together and implement. Because capital investment requires planning for the future, it may take some time before decreases in interest rates are translated into increased investment spending. Typically it takes six months, one year or longer before the effects of changes in UK monetary policy are felt. The impact of increased government spending is felt as soon as the spending takes place and cuts in direct and indirect taxation feed through into the economy pretty quickly. Still, substantial time may pass between the decision to adopt a government spending programme and its implementation. In recent years, the government has missed its planned spending target, partly because of problems in attracting additional employees into key public services such as education, health and transportation. Yet, the banking sector was not an issue, due to its high perceived X-efficiency and technical efficiency. However, few recent studies found empirical support on this topic. An important paper by Desai *et al.*, (2007) analyzes the interaction among corporate taxes, tax avoidance, corporate governance, and corporate market value. They provide evidence that increased tax enforcement can increase (rather than decrease) a company's market value, generally supported by intellectual capital, but also by retained earnings.

Cost wise, if we consider the WACC (weighted average cost of capital) (Eiteman *et al.*, 2007): $WACC = K_d \times (1-T) \times D + K_e \times (1-D)$, where K_d = cost of debt, K_e = cost of equity, D = debt to total assets and $(1-D)$ = equity in total assets of a company. Then, one can easily notice that if tax increases, then the WACC decreases, when all other costs and weights remaining constant, making thus altogether cheaper for firms and banks at the same time to finance their activities. Even in reality, due to tax increase, demand may grow and hence becomes dearer, that will change the financial structure of firms and rebalance the K_d and K_e costs, again in time.

Regarding many attempts in avoiding economic and financial failures during the last couple of centuries, one can notice that there are possible solutions such as the breaking the monetary unions: the case of the Austro-Hungarian Union before the 1st World War, the case of the U.S. (1929-1930 financial crisis), the case of the Russian crisis of 1992 and now the Euro currency demise. Unfortunately, regarding the last one, the effects or the premises of Euro elimination are much more severe and complicated and they relate to possible unexpected large exchange rate fluctuations with only few economic entities would be hedged against them. Such an action may result in wealth and income transfers would be chaotic. This means that it is likely that the losers would cut their spending by more than the gainers would increase their spending, so that aggregate demand could fall again, without sustaining the economic stance of dropping the Euro currency, contrary to what is mentioned on point 2.1 previously.

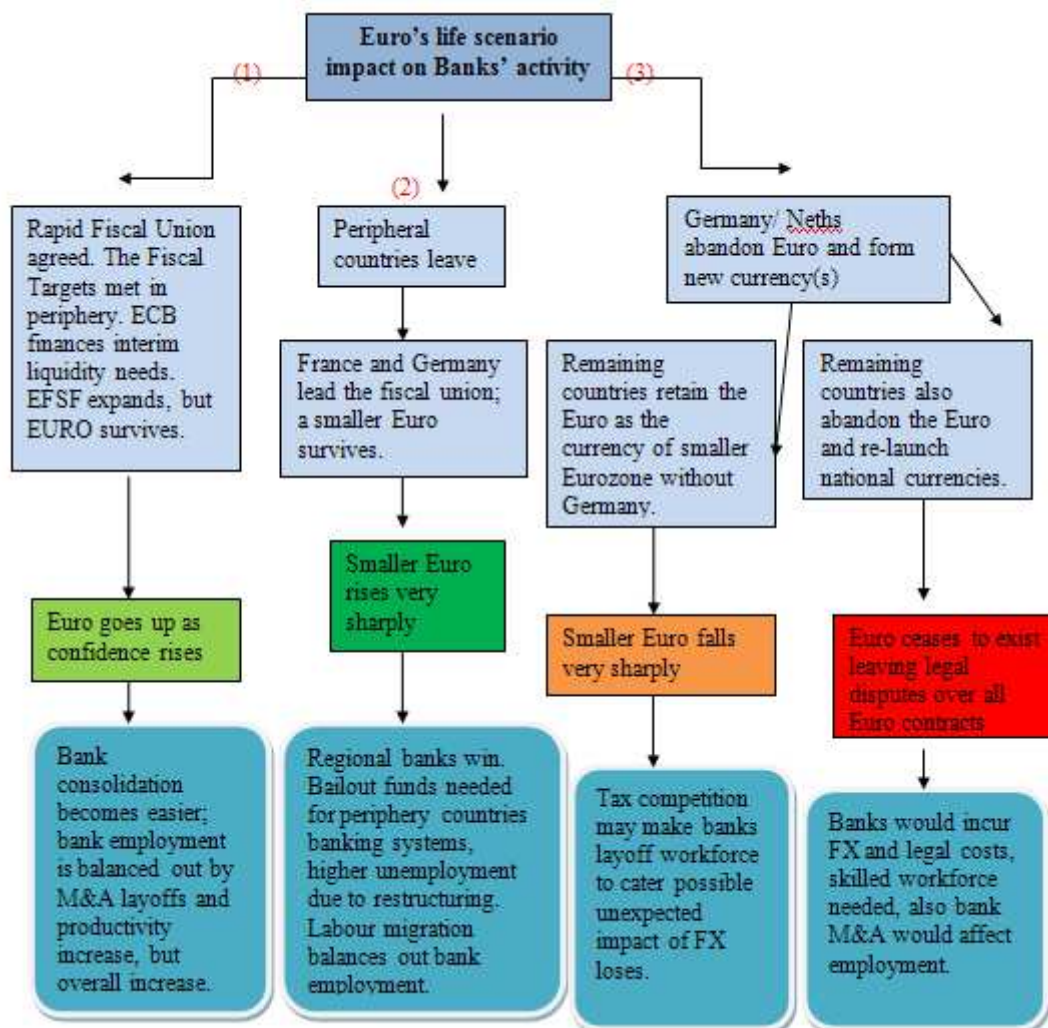

Fig. 4. Euro's Life Scenario and impact on Banks' activity Source: Adapted and improved from Davies Gavyn (2011) (<http://blogs.ft.com/gavyn davies>)

Besides, among the main losers would be the banks in the revaluing countries, including Germany and France, which would see the value of their foreign assets, such as the newly financed Italian bonds by EFSF (European Financial Stability Facility), suddenly plummeting. Such a banking shock would not be exactly welcome in the present circumstances as it will mean not only redundancies for the banking system, but also a new wave of bailouts, which require further tax funding by the taxpayers, including further collateral industries bailout. Eventually, the maximum complication of the Euro withdrawal may reside in a legal trap regarding the contracts denomination, which would take many years to resolve, meanwhile the financial markets and international trade could collapse for an unknown period of time.

Fiscal policy and bank bailouts tandem

Regarding the banking sector unemployment, there is a tendency that many E.U. banks may be absorbed by other Euro Zone banks, but very few by U.K. banks, due to possible future exposure to further demand deficient unemployment. Overall, as show in the first previously shown three figures,

the U.K's unemployment is better off than the Euro Zone ever since the 1990's and also after the 2007-2008 financial crises and so does seem to be the banking sector and the new jobs opening, hence the bank employment. Then, should this be triggered by the tax cuts and lower interest rates in the U.K. compared to the Euro Zone or a totally different component in the industry output and competitiveness? This is hard to say. But, let's continue our analysis, including the tax element, the economic output and introduce further an externality specific to banking industry: the bailouts, and then decide.

For example, under certain market conditions, Hagedorn *et al.*, (2010) found a semi-elasticity of the overall unemployment rate of 9:5% for sales taxation, 8:6% for labor taxation and 1:2% for capital taxation. They also found that unemployment rate of highly skilled workers is also highly volatile, despite the fact that the accounting profits firms make on them are relatively large, is due to the higher volatility and the higher persistence of their marginal product relative to the representative worker case.

Looking at corrective tax policy in relation to the banking sector, as a highly skilled workers firm and the impact of it to the bank employment has roots in the fact that the bank loans to private sector as a percentage of GDP in the EU member countries, exceeds on average 100%, while in the U.K. it exceeds 140%, (BIS Papers No 28 (2006). hence the importance of financial intermediation and of its employment efficiency. The reason for taxing banks directly and indirectly lays with the social welfare effects.

Basically, governments wanting to avoid bank runs, social and economic distress try either to bailout the too- big- to-fail banks or tax them a priori in order to avoid such bailouts. My paper connects now with the second part of a proposed solution which is a direct corrective tax policy that regards the charge on the bank's borrowing (or equivalent tax on loans or subsidy on the capital ratio), which are though interrelated. Before the announcement of the bank bailout, during and after the bailout there is an increase in the voluntary and involuntary redundancy, however with most of the skilled employees leaving within the industry and with increase social cost evasion (Mihai-Yiannaki, 2011). These changes concern especially those systemic financial institutions.

An introduction of an optimal tax has an additive property and an exponential effect when the capital ratio drops under the Basel II or now Basel III levels, bringing in a possible systemic failure. In effect, any increase in the core capital under the new Basel III agreement will mean financing tier one capital banks, governments, by considering their top AAA rating, hence forcing the support of strongest economic countries in the EU and not those at the periphery.

Some may say that the required capital increase would bring also further employment possibilities in keeping up with the financing of the new aggregate demand. Others may consider this effect offset by other direct taxes on borrowing or by the fact that the governments will have to bailout only those banks that are in deep financial distress or have no portfolio diversification. Again, the quantification

of these factors in the entire equation would be rather a simplistic assumption, but may be open to further research.

Otherwise, in order not to bailout further the banks in financial distress, the government can introduce a tax on borrowing that will actually replace the future fiscal cost of a possible bail out. Nevertheless, this corrective fiscal policy relies on the government existing ability to bailout. Hence, when the government will be in impossibility of bailout payment, which will be because of lower tax levels and the other way around. In spite of the no-bailout clause, it stays that, if needed, some arrangement could still be found to bailout a bankrupt government, such as for example an easing of the ECB monetary policy to make credit more abundant and cheaper, hence at lower interest rates, bringing in thus inflation despite its time lag in implementation. Furthermore, since it is thought that sovereign default would negatively affect the Euro and undermine its strength, these spillovers seem not to rely on the fiscal policy income but rather on the risk of excessive deficit.

Yet, defining this optimal corrective tax raises question of whether the same objectives might not be best served not by taxation, but by requiring certain levels of capital adequacy for banks in order also to keep an optimum level of employment in the industry. The fact that banks offer a non-convex payoff function means that one possible solution could be the regulatory approach towards the banking environment itself in making it less uncertain and less plausible for systemic failures, reducing thus the high social costs for both the government and the banking system.

Things are less straightforward when the bailout externality is the dominant concern: but it seems likely that regulation will again dominate all else being equal, if expected bailout costs are high enough.

The other is asymmetric information. This likely requires that policy be more subtle than either linear taxation or a simple capital requirement. In the scenario examined here, the first-best cannot be implemented by either, but can be achieved by allowing banks to hold less than some prescribed amount of capital contingent on paying an additional tax. This, in turn, can be thought of as a nonlinear tax with marginal rate increasing in the amount of bank borrowing. The bankers though would readily rationalize a progressive tax on bank borrowing and will try to choose the best of the choice if given.

But these seem in several respects likely to reinforce some of the main conclusions drawn here. One such consideration is the existence of preexisting tax distortions, the most immediately relevant of these being the prejudice that most corporate tax systems create towards the use of debt finance. A tax of the kind analyzed here could be seen indeed as tending to compensate for this bias in the banking sector, where it may prove particularly damaging, as a second-best alternative to the politically more difficult reform of the extensive corporate tax. Then, the practical question then is whether bank borrowing should be taxed more heavily than the analysis here implies, to redress the preexisting non-neutrality.

Another key consideration is that in practice any bank tax will not operate in the absence of any capital requirements anyway, but in tandem with them. To the extent that the capital requirements bind, a (small) tax would have no impact on banks' behavior. In practice, however, banks generally seek to hold buffers above the minimum capital required by any regulation, unless the banks are indeed in critical distress and hence are close to bankruptcy or bailout, in which case a tax on borrowing will affect their borrowing decisions just as above (though their responsiveness to taxation may be weakened by their concern to avoid falling short of capital requirements). By choosing tax against capital requirement, banks would not avoid neither future bankruptcy nor future redundancies, hence risk adjustment and capital requirement become a stronger part within regulating banks.

The results here, suggesting a marginal tax on borrowing that increases steeply at low capital ratios, point to possible merit in a strategy of combining both a capital requirement as protection in the most dangerous circumstance and a progressive tax on borrowing at higher capital ratios that meets banks' diversity and echoes the presence of tail risk even in more normal times. This, in turn requires banks to support these tail risk activities by employing a sufficient number of professional staff to deal with observing regulations, developing risk models and tailored structured products to obtain higher returns in order to pay off their liabilities and satisfy shareholders' returns.

Eventually, to keep an optimum level of employability, banks have to think on one hand of the relationship between tax and the capital requirements and on the other hand of the relationship between tax and pricing bank products.

Conclusions

We have seen that tax burdens discourage employers from hiring, but protect banks from defaulting and laying off their personnel. However, taxes also reduce the incentives for the unemployed to look for a job, and for those in employment to work longer or harder. Reducing these tax burdens is difficult especially when many countries try to reduce budget deficits during recession time. This suggests there is little maneuver space for cross-country tax reductions, unless this is done under a fiscal union, which we saw it supports a faster implementation (6 to 12 months) as well as it can protect a country or a Union's currency, making thus new room for monetary policy further implication in economic recession recovery. However, there may still be scope for targeted reforms or even fiscal unions.

Overall, we saw the relationship under rational and adaptive expectations on how people and companies perceive tax, how tax is involved in the support of companies and countries economic growth, output and budgets, and how it can help alleviate inflationary and unemployment waves.

Generally, we also found taxation in the corporate sector as adversely affecting long term growth performance, but if progressively introduced in the banking sector and if corroborated with the capital requirements and regulatory supervision benchmarks, it can protect the bank and its employees from

bankruptcy and the government form overwhelming bailing out expenses that affect entire communities.

At the same time a reduction in the corporate tax would make room for liquidity coming from firms profits and from further easier access to borrowing, leaving thus banks in the market freely competing for good customers and with their prices and hence requiring skilled workforce to increase shareholders' value. We have also seen that income tax reduces in general cost of funds, but tax enforcement can increase a company's market value.

Essentially, it is about the type of tax that the government has to introduce to each category of corporate, individuals, banks and financial institutions that matters and the cooperation with other policies and measures, such as the monetary policy, the Central bank interventions, the availability of bailout funds and the psychological effect or rational expectation on their utilization.

Regarding labor-market specific tax policies, it may seem more important to reduce structural rigidities in the banking labour market, in terms of both wage determinations, labor mobility and indirect taxation, so that that will lead to growth.

CITIES AS CORPORATE ENTITIES (IN INTERNATIONAL MARKETS)

Mišič, Katja Udir¹; Podnar, Klement²

Abstract

‘Place’ is considered as a complex, dynamic, multifunctional system with a complex organizational mechanism discussed in terms of cultural planning, urban and regional studies, human geography, philosophy, tourism, destination marketing, environmental psychology, and sociology etc. and also ‘place marketing’ which, as a young discipline, currently considers place more or less from the management point of view. This paper aims to encompass all the above-mentioned approaches in order to establish a conceptual framework for the formation of a ‘place’ marketing mix to correspond with current global changes, the demands and requirements of a place’s complexities, and contribute to the basic demands of ‘place marketing’ discipline. For this purpose, we conducted research where the classification elements of the above-mentioned disciplines were included and combined, for the purpose of creating a marketing mix for ‘place’. This could then be used as an accomplished tool for an effective ‘place marketing’ approach that satisfies the needs of a place’s residents which must be identified as the most vulnerable and also valuable source of success of the place. ‘Places’ have many-faceted entities with great pretentious organizational mechanisms regarding their marketing. Due to the complexities of this problem more complex model of marketing mix is proposed by taking into account all the possible elements that occur at all levels of a ‘place’, for effective and sustainable urban development.

Keywords: city marketing mix, residents, city, identification, conceptualization

Introduction

Places are complex, kaleidoscopic, fuzzy (Warnaby, 2009), dynamic, multi-scalar socio-spatial constructs, which can be understood as meeting-places (Antonsich, 2011) or the location of an intersection of particular bundles of activity spaces, of connections and interconnections, of influences and movements (Massey, 1991). Places are not frozen in time and they do have single, unique “identities” (Massey, 1991). Places have to visualize clearly the roles they play within the local, national, and global economy, examine their histories, adventures and attractions, and answer the question as to who would want to live and work here, under what conditions, and with what expectations (Kotler, 1999)?

Cities have long-felt a need to differentiate themselves from each other, but the opening of new markets has further accelerate this competition, due to the free movement of goods, mobility of the people and flexibility of employment. Places on the one hand compete for a limited and valuable resource regarding economic, human, social, and cultural capital (Anholt 2007, Kotler *et al.*, 1999)

whilst, on the other hand, deal with changing demographics, the rapid ageing of their populations or rapid urbanization, the vanishing urban-rural divide with no capacity for absorbing the high-levels of new population influxes (Hoornweg *et al.*, 2006) or with the lack of national "citizenship" or "inhabitation", which is an abstract status associated with 'urban belonging' (Smith and Guarnizo, 2009).

However, according to Simon *et al.* (2010), people feel a greater need to embed themselves within a secure and stable environment that is often the place they call 'home'. Home, is a metaphor for a sense of local rootedness, familiarity, security, and collective identity (Antonsich, 2011). Identity as a source of pride, which rises in humans and influences people's perceptions and sense of belonging (Braun, 2008), their future communication and decisions, that are instinctively daily shown through conversations and actions (Anholt, 2007). Intellectual capital has become one of the more important factors in place development. And attracting talented people is therefore, according to Kolter *et al.* (1999), a strategic place investment.

Cities have to identify distinctive and essential elements they can manage and combine them within a marketing programme as an essential step within the whole marketing effort (Kavaratzis, 2008), to create such a creative environment that people want to stay in, move to, feel attached to, or even identify with. Identifying these elements can also help significantly in the process of identifying and choosing a vision and the goals for the place, and for achieving cooperation and agreement from as broad a range of stakeholders as possible (Kavaratzis, 2008). But some specialists or politicians understand place marketing as, first and foremost, a tool for promoting the attractiveness of a locality for tourism purposes (Hospers, 2011) and, therefore, a lot of attention is paid to the visual representation of the place by means of pictures, logos, and slogans (Hospers, 2011). But a place's visual representation is only the outcome of the whole city's marketing effort.

In the past, attempts have been made to articulate a place marketing mix of elements equivalent to the traditional 4Ps, but these models did not consider the whole complexity of the place's problem or were mainly designed for use in tourist destinations, regarding travel and hospitality (Deffner and Metaxas, 2008). Therefore through the study of various disciplines and perspectives the first part of this paper tries to introduce the importance of place marketing and the second part, through analyses of existing place marketing mixes and other research, suggests a place marketing mix that is, according to Kavaratzis (2008), a necessary, difficult, and complex task.

Theoretical Background

Places are considered over the range of different disciplines such as Cultural Planning (Bianchini, 2004), Urban and Regional Studies (Ward, 1998), environmental sociology (Park *et al.*, 1968; Flanagan, 1993) and philosophy (Speller, 2000), humanistic geography and environmental psychology (Relph, 1976; Tuan, 1974; Proshansky, 1978; Lalli, 1992; Lewicka, 2008; Pol *et al.*, 2002). Also tourism marketing (Ashworth and Voogd, 1988; Gunn, 1988; Leiper, 1990; Lew, 1987), destination marketing (Jansen-Verbeke, 1986), which considers a city from the supply-side of the functional tourist system

and place/city marketing (Kotler, 1999; Rainisto, 2003; Kavartzis, 2004, 2008; Seisedos, 2006; Braun, 2008; Anholt, 2007; Kavartzis, 2004, 2008; Freire, 2005), a young discipline that currently considers city marketing more or less from the management point of view or can be more or less traced especially in the context of branding cities and nations.

According to Inn (2004) place marketing consists of two parts, 'place assets making' and 'place promotion'. Place asset making is the process of creating a place-specific advantage or attractiveness, and place promotion is the process that makes it noticed. More specifically, city marketing can be described as: *»a process whereby urban activities are, as closely as possible, related to the demands of targeted customers so as to maximize the efficient social and economic functioning of the area concerned in accordance with whatever goals have been established"* (Ashworth and Voogd 1988). According to Braun (2008), city marketing is a coordinated use of marketing tools, that support the consumer common user-oriented philosophy for designing a place to satisfy the needs of its target markets, and it succeeds when citizens and businesses are pleased with their communities, and the expectations of visitors and investors are met (Kotler, 1999). City marketing mix can, therefore, help to achieve a competitive advantage in terms of investment, tourism, and community development in terms the residents identifying with their city and through the promotion of local identity (Kavartzis, 2004). Identifying these elements of city marketing mix can therefore, help significantly in the process of identifying and choosing a vision and certain goals for the city, by achieving cooperation and agreement of as broad a range of stakeholders as possible.

More attention should therefore be dedicated to those mechanisms through which a place is perceived, and its image either created or changed (Sainz, 2012). Therefore, it is more useful not to invest in so called "cold" marketing or external place marketing to attract new residents and firms, but to focus on "warm" internal marketing that tries to retain rather than attract place customers (Hospers, 2011).

People who feel connected or even identify with a city can meet the expectations of visitors, tourists, and investors and may become the most effective ambassadors for their city (Braun, 2008; Kavartzis, 2004; Freire, 2005). Preference towards identify with the city, group or community, as a bonding agent through the urban structure, quality, or symbolic value of the city, can foster the creation of social identity, thus creating better conditions for sustainable urban development (Pol et al., 2002). Therefore further knowledge of inner cities and the functioning of the system are needed in order to establish a firm basis for the future promotion policies of the city (Jansen-Verbeke, 1986).

Importance of Place Marketing Mix and New Place Marketing Mix Conceptualization

The consumer is not a passive but an active factor, who with his/her status, buying habits, preferences, requirements and communication always »secretly« expresses a clear marketing mix (Jančič 1999). In order to develop a place marketing mix and according to different perspectives, this our study tried to design a place marketing mix that is general enough to correspond with current

global changes and complexities of the problem, yet specific enough to set the basics of an effective marketing approach. Its classification, therefore, includes the above-mentioned classification of the Wall and Mathieson concept (2006), Kotler's hard and soft attraction factors of the place in terms of attracting new businesses, investors, new labour (Kotler *et al.* 1999) and Kotler's ten major type attractions (Kotler *et al.* 1999). It also includes also general categories of attractions and composite cognitive tourist attraction typology (Lew 1987), Gunn's touring circuit attraction shorter-stay and longer-stay attraction (Gunn 1988), and Jansen-Verbeke's inner city elements (Jansen-Verbeke 1986) but, according to Lew (1987), all these attraction factors, consist only those elements of a "non-home" place, from the supply-side of tourism (Gunn 1988), that draw discretionary travellers, who are outsiders, away from their homes and to achieve satisfaction there (Gunn 1988). It also includes elements of *Quality of Life Survey (2010)* by Nielsen (partnership between Eight New Zealand City Councils) which measured the impact of urbanization and its effects on the well-beings of residents, and explored the quality of life issues in New Zealand, *perception survey on quality of life in European cities: analytical report by The Gallup Organization (Eurobarometer) 2009*, *The Global City Indicators Facility* (Hoorweg *et al.* 2006) where the World Bank proposes an initiative for the development of a set of standardized city indicators for allowing a global, cross-city comparison of city performance and third-party verification. It also considers the *Quality of Living Survey* by Mercer Consulting and *The Economist Intelligence Unit's liveability survey 2011*, which assesses which locations around the world, provide the best or worst living conditions in the sense of looking at test-locations against others to see those general areas where liveability can differ. But the characteristics of these studies are concerned with comparisons between cities and ranking them on scales such as "Best Places to Live" and "Top Business Cities" to seduce businesses and residents to come and experience cities for themselves, which is always good for a place and according to Hospers (2011) by offering free publicity. But on the other hand, Hospers (2011) also debates, whether this strategy really works for attracting residents, because many places fail to think about their uniqueness vis-à-vis other areas. Location choice is, according to Pred (as cited in Hospers 2011) a process that is far from being rational.

The goal of this paper, however, is not to compare a place with any other, but to create a model - marketing mix of a place that would help municipal governments to analyze a place's position in relationship to the place's residents themselves, to define the elements of a place/city marketing mix, which then can be controlled by marketing managers, and upon which they can make decisions in order to create perceived values by generating positive responses and helping to enhance awareness, bonding, and identification with a place.

Adaptation were from other fields of marketing discipline, such as from the traditional modelling marketing's 4ps (product, price, place, promotion), Berg's *et al.* model, that adopted a service marketing mix (Karavatzis 2008), Morrison's 8Ps model, which includes product, partnership, people, packaging, programme, place, price and promotion (see also Deffner & Metaxas 2006, 2008) which is criticized mainly as being applied to tourist destinations, (Deffner *et al.* Metaxas 2008).

There is also the Ashworth and Voogd (1990) and Kotler *et al.* (1999) categorizations that define a five component process, as an investment that a place can make in order to improve its livability, investibility, and visibility, and came closest to defining a place marketing mix:

- Design - place as character,
- Infrastructure improvement - place as fixed environment,
- Basic services - place as service provider,
- Attractions - place as entertainment and recreation,
- People.

For developing our conceptualisation of a place marketing mix, Kotler's *et al.* (1999) four from five component model was used as the basis the presented model. When proceeding, all the possible sub-elements of the different surveys mentioned in this paper where analysed and included within the detailed structure of a place marketing mix. These four components are *place as service provider*, *place as fixed environment*, *place as character*, and *place as people* - which are often understood in different ways as indicated by Kotler, such as *attractions – place as entertainment and recreation*, which the presents as one of the elements of the “place as service provider” component. This paper identifies and understands slightly differently when following place components (see table below). Namely:

- *City as a service provider*; not just basic services such as police, fire, and education, but also as a service place provider at different levels such us general information, home, culture/art, shopping, sports, entertainment/recreation, eating environment, etc. and also infrastructure environment.
- *City as a fixed environment*; as tangible facts, objects, buildings` architecture, environment, and institutions, as the physical space (designed or given), as a physical body, a scene for providing a successful delivery of the above-mentioned services and functions.
- *City as a character*, not just in the sense of aesthetic quality and values, as Kotler et al. claimed (1993), but also in the sense of other non tangible qualities, such as behaviour, emotional expressions of the place regarding everyday experiences that gives a place a specific living character (see table 1).
- *City as an event*, a place of rare experiences, a spectacle, an occurrence, a happening as a rare occasion, which also affects the identity of the place and its individual's identification with the place.
- *And a City as people*, their hospitality, reliability, competence, credibility, pleasantness, friendliness, and accessibility at all levels of communication.

An element of marketing mix – ‘place as a service provider’, this paper is therefore futher divide into 17 subcategories and each category is futher analysed within the next four mention categories:

place as a fix environment, place as a character, and place as an event; each with their associated sub-elements (see table below).

Summary and Discussion

Given the wide-variety of disciplines dealing with the field of the place, such as cultural planning, urban, and regional studies, human geography, philosophy, tourism, destination marketing, environmental psychology, and sociology etc., and place marketing all seeking to create a list of elements with important impacts on the place and its development. Only a few of them, at least partly, take into account the residents' perceptions of the place, although for tourism or promotion purpose, as do Jansen –Verbeke (1986), Wall and Mathieson (2006), Kotler *et al.* (1999) and also the range of Quality of life and Quality of livability surveys for creating the scales of No.1cities within various rankings.

Due to the complexities of the analysed problem, actual determination of what the marketing mix should include in the context of place marketing is a challenging task, also recognized by Kavaratzis (2008). This paper, therefore, tried to consider all the possible perspectives/disciplines and took into consideration a place marketing mix that could be used as an accomplished tool for an effective place marketing approach, not to rank and compare one place with another, but to satisfy the needs of the residents, specially for the purpose of identifying those elements of the place marketing mix that affect the residents' positive identifications with the place. The result of this analysis is a place marketing mix, not in terms of 4 or 8P, but in more complex terminology, which better reflects the complexities of the discussed problem.

Even though all the possible specific sub-elements of all the above-mentioned analyses were identified, some could still occur and be added, due to more accurate and specific analysis. The best possible place marketing mix, therefore, supports the identifying of those elements of marketing mix influences more significantly or does not influence at all, the residents' identifications with the city they live in and therefore affect future decision process regarding effective and sustainable urban development, when considering residents as one of more valuable elements of the city.

Table 1: Suggested place marketing mix

PLACE AS SERVICE PROVIDER	PLACE A BUILT STRUCTURE	PLACE AS A CHARACTER	PLACE AS AN EVENT	PLACE AS PEOPLE

Abstract

The literature of Technology Management (TM) is growing fast in recent decades on developing models for TM processes. Management of Technology could be considered as a second order capability which can aid organizations to enhance and improve their technological capabilities. We reviewed extensively Dynamic Capability (DC) literature and figured out that TM can be explained as a DC. For this purpose, we first propose a framework for identification of DC in an organization, and then we explain TM processes based on Gregory's model. Through matching TM processes to our proposed framework, we argue that TM could be considered as a DC. At the end, the applicability of the proposed framework is illustrated through investigation of TM processes in Hyundai case study.

Keywords: Dynamic Capability, Management of Technology, Organizational Learning, Process-based Approach.

Introduction

Many authors contributed to DC literature (for example Teece, 1997, 2007; Daneels, 2002), but a few scholars have been focused on the methods for identification and investigation of DCs at a firm. Following Daneel's classification of organizational changes (Daneel 2010) regarding the Pavlo (2011), the first author who had a pragmatic view to DC, integrated the literature and developed a process based model (Figure 1). Although this model is a great contribution to operationalization of DC in an organization, as the author claimed, , indeed, it doesn't clarify the type of capability changes needed for DC creation and enhancement. The aim of this paper is to propose a practical framework for DC identification and improvement based on Pavlo's model.

s model of dynamic capabilities (pavlo, 2011)

The applicability of proposed framework has been illustrated through investigation of TM as a DC. Technology plays more and more a major role in the firms' competitiveness. Every firm needs some technological capabilities for product/process innovation and/or performance improvement. In spite of the last decades when the value of a company was assessed largely on the basis of its capital and physical assets, today, the real value of a company is rather based on the set of technologies embodied in its products and processes.

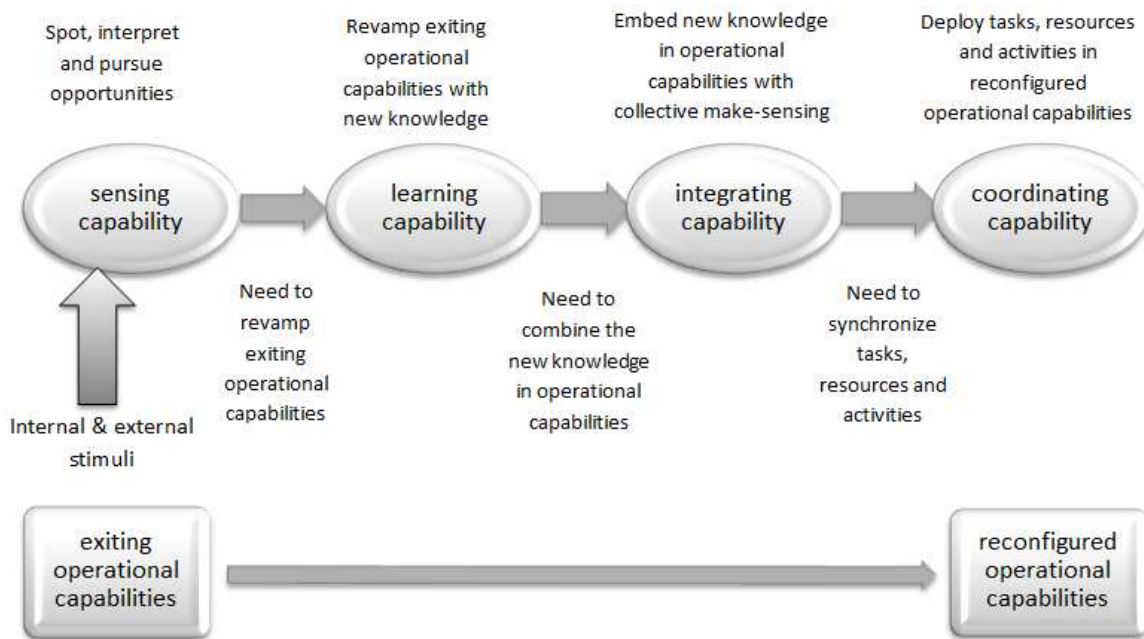

Figure2- A process-based approach to DC (Pavlo, 2011)

Technology, like others assets, needs to be managed. Management of Technology (MOT) deals with planning, development and implementation of technological capabilities in an organization. It could be thus considered as a second order capability (DC) which can help organizations to enhance and improve their technological capabilities (first order capabilities).

In the next section, the literature of DC is reviewed. The main concentration would be on Pavlo and Daneel's works. Next, a framework for identifying DC in an organization is presented which is a combination of Pavlo and Daneel's models. Finally, the applicability of proposed model is illustrated. For this purpose, TM processes are investigated and matched to the proposed model in order to show how TM capability could be identified in an organization and how this capability could be considered as a DC.

Pavlo's model

Pavlo (2011) has developed a model based on Teece (1997) framework. He describes the process of DC including four stages: sensing, learning, integrating and coordinating (Figure2). Similar processes have been mentioned by other scholars (see for example Eisenhart, 2004 and Zahra, 2002).

Table 1 presents a brief description of four stages. For each stage, basic routines have been also extracted and identified from the literature.

Table 1 definition of a dynamic capability parts (Pavlo, 2011)

Capability	Definition	Basic Routines
Sensing capability	<i>The ability to spot, interpret, and pursue opportunities in environment.</i>	Generating market intelligence (Galunic & Rodan, 1998) Disseminating market intelligence (Kogut & zander, 1996) Responding to market intelligence (Teece, 2007)
Learning capability	<i>The ability to revamp exiting operational capabilities with new knowledge.</i>	Acquiring, assimilating, transforming, and exploiting knowledge (Zahra & George, 2002)
Integrating capability	<i>The ability to embed new knowledge into the new operational capabilities by creating a shared understanding and collective sense-making.</i>	Contributing individual knowledge to the group Representation of individual & group knowledge Interrelation of diverse knowledge inputs to the collective system (Grant, 1996)
Coordinating capability	<i>The ability to orchestrate and deploy tasks, resources and activities in the new operational capabilities.</i>	Assigning resources to tasks (Helfat & Peteraf, 2003) Appointing right person to right tasks (Eisenhardt & brown, 2000) Identifying synergies among tasks, activities, and resources (Eisenhardt & Galunic, 2000) Orchestrating activities (Henderson, 1994)

Daneel's Model

Daneels (2010) classified changes which could occur within an organization through an in-depth case study (Table 2). Depending on the nature of changes, all influential variations in an organization can be included in one or a combination of these subgroups. To simplify the interpretation of DC in an organization, it is certainly useful to look at Daneels's framework.

Table 2 Classification of organizational changes (Daneel, 2010)

<i>Core concepts</i>	<i>Related concepts with key references</i>	<i>Empirical phenomena</i>
<i>Resource alteration</i> <i>Mode: leveraging existing resources</i>	<i>Fungibility</i> <i>Brand extension</i> <i>Customer understanding (Danneels, 2003)</i>	<i>Smith Corona identified brand and distribution as its key resources that would be enable it to enter 'small office/home office' product categories</i> <i>Smith Corona brand was not fungible due to dominant product category association</i> <i>Independent office stores were displaced by large retailers</i> <i>Shallow customer understandings did not help to develop superior products</i>
	<i>Second-order R&D competence (Danneels, 2002)</i> <i>Exploration/exploitation</i>	<i>Smith Corona developed electronic competence (set up electronics R&D facility in Connecticut in 1976-- developed electronic manufacturing expertise and facilities in late 70s/early 80s)</i> <i>Electronic competence formed the basis of entry into new product categories (introduced its first electronic typewriter in 1980, and its first personal word processor in 1985)</i> <i>Did not develop any new technology after electronics—R&D became exploitative (moved R&D facilities next to manufacturing plant in New York in 1982)</i> <i>Did not have proprietary technology to enhance other product entries</i>
<i>Resource alteration</i> <i>Mode: creating new resources</i>	<i>Alliances</i>	<i>Smith Corona relied on sourcing alliances to enter the product categories outside of typewriters (labeled sourced product with its brand)</i> <i>Smith Corona's tried to access external complementary technically related resources through alliances (alliance with Acer to introduce Smith Corona branded PCs)</i> <i>Smith Corona's market-related resources (brand and distribution) did not have value for alliance partners or potential acquirers</i>
<i>Resource alteration</i> <i>Mode: accessing new resources</i>		

<i>Resource alteration mode: releasing resources</i>	<i>Asset divestment</i>	<i>Reduced workforce in early 1980s and throughout the 1990s Smith Corona sold off manufacturing assets (moved manufacturing from New York to Mexico starting in 1991_sold Singapore facility in 1995)</i>
<i>Resource cognition</i>	<i>Schema Evaluation of brand extension Product category substitution</i>	<i>Identified as key resources its brand and customer understandings, but not its manufacturing skills and equipment. Did not recognize lack of fungibility of the brand and superficiality of customer understanding. Failed to learn from failed brand extensions Dismissed PC as a substitute product</i>

Theoretical Framework

Pavlo’s model cannot help organizations to interpret DC in their real changes and Daneel’s model is a classification of changes. Thus, the combination of two models could help in developing a comprehensive framework (Table 3).

Table 3 A theoretical framework based on Daneels and Pavlo’s Models

	<i>Sensing</i>	<i>Learning</i>	<i>Integrating</i>	<i>Coordinating</i>
<i>Leveraging</i>				
<i>Creating</i>				
<i>Accessing external resource</i>				
<i>Releasing</i>				

Sensing

Based on Pavlo (2011) and Teece (2007) point of views, this concept is defined as an ability to identify, select and follow opportunities. Any organizational change should have a stimulus inside or outside the organization. Internal stimulus can be increased when more effort is put into finding a new application (Shaker a.zahra, 2002; Barbara Levitt and James G. March, 1988). Indeed, if the quality of the search in an organization increases, the possibility of finding a new application consistent to environmental changes would also increase. Furthermore, the rate of investment that organizations put in R&D is another effective internal factor (Wesley M.Cohen, 1990). Investment in a nonrelated field can have negative effects on sensing opportunities for change. Therefore, selection of right field to invest is an important factor in opportunity sensing.

Beside the internal sources of sensing, there are some external sources. Every industry has a different rate of technological changes and a different rate of spill over. In order to survive, organizations should use stronger mechanisms for identifying these changes vis-à-vis their competitors (M.Cohen, 1990). One of these external factors is the ability of analyzing and applying market information for sensing suitable opportunities (Pavlo's 2011). Market information helps organizations to decide whether to use their current capabilities, create a new suitable one or access necessary external capability. Thus, according to the Senge (1990), all these options make a creative tension which is needed for leveraging or building the capabilities.

- It should be noted that if the organization wants to release a capability, the sensing process would be interpreted differently. In this case sensing would mean doubting systematically about current beliefs and methods (Starbuck W. H, 1996). In some cases the organization may fail to release due to the nature of capability (level of abstraction, level of codification, frequency of use and the extension of capability in the organization, etc). Releasing or unlearning (Niri & Mehrizi, 2010) is thus a complex process.

Learning

In this phase, conceptual learning occurs regarding the capabilities sensed (identified) in the previous phase (Crossan, and etc 2003). This learning can differ from a type of change to another one. If an organization wants to use its exiting capabilities to create a new application, the flow of information within the organization (HUBER, 1991) and the organization's readiness for change (ARMENAKIS, 2009) are crucial. Indeed, employees do not need to have new knowledge in this case and they should only accept the new application and have correct and complete information about required knowledge.

In the case that a capability should be created in an organization, the most important factor is team learning. The success of teams depends on team structure and the quality of dialog within the team.

The conceptual learning will increase if the team structure is correct and the team members are selected appropriately based on the necessary expertise (Edmondson, 1999).

The organization ability to learn a new capability is important when the organization wants to acquire a capability. In this case, effective factors on the organizational learning are:

- The ability of identifying the common knowledge parts correctly between the transferor and the transferee (LANE, 1998): For an effective transfer, the two organizations should have common knowledge parts for transferring the target capability.
- The alignment between the decision making method of the transferee and the transferor (LANE, 1998): another effective factor on learning is the compliance between decision making structures.

- The ability of creating a common language and knowledge (LANE, 1998): two organizations, with different culture of learning, need to create an appropriate common language to transfer knowledge correctly. This ability increases the probability of learning.
- Type of the transferred information (Inkpen, 2000)
- The ability of motivating the transferor to transfer capability (Inkpen, 2000): learning reduces if the organization cannot motivate the transferor.

When an organization wants to release and lay away a capability the knowledge and capability are not learnt conceptually. This process is called unlearning. There are four ways to bring about the unlearning process:

- Stop developing capability (Mehrizi, 2011)
- Stop using capability (Howells, 2008; Klein, 1989; Starbak, 1996)
- Isolation (Prahalad, 1986)
- Discard the capability completely

The Organization should have some mechanisms for releasing the capability through four stages mentioned above.

Integrating

In general, integrating occurs when the organization implements the new application. The kind of learning in this stage is behavioral (practical) learning which is called Institutionalization (Crossan, 1999). Integration is composed of the three main parts including business design²⁶, system design and implementation (Kobayashi, 2003) which are briefly explained below:

- Business design: this part is to clarify the boundaries and limitations for implementing the new application. It has two main parts consisting of designing business processes and making them consistent to the other organizational processes and next to coordinate the data needed for implementing the new applications.
- System design: designing the organizational processes and their inputs and outputs and also deciding whether the current processes should be used or new processes should be designed and how to direct the information flow.
- Implementation: based on the previous stages, the new processes should be implemented to create the new application.

The concept of integration and its related processes may vary from one kind of organizational change to another. For example, leveraging current resources and capabilities needs a different type of

²⁶ In this case business design can be the new application.

integration vis-à-vis creating or external sourcing of new capabilities. Integrating is meaningless for releasing.

Coordinating

Coordinating deals with resource allocation and control process (pavlo, 2011). Three important aspects of this stage enclose planning, control and leadership.

According to Garvin (2008), the leadership style demonstrates willingness to entertain alternative viewpoints, signaling the importance of spending time on problem identification, knowledge transfer, and reflection, and engaging the organization in active questioning and listening. This capability has the same construal when organizations leverage their existing capabilities or create the new ones.

Another important aspect in coordinating, as was mentioned above, is control. Simons(1995) has studied the influence of management control systems on implementing strategic changes. The organization uses these systems to receive feedback from processes and to coordinate them. The organization can change the capabilities and create a new application if it uses a mechanism to coordinate inputs and outputs of the processes, to control and allocate resources accurately and appropriately, and to control the alignment between employees' capabilities and their duties (Pavlo, 2011).

When organizations want to acquire capabilities,they should use the following elements in their control system:

organizational expertise in making contract and other legal issues related to capability transfer, ability to create control systems to implement correctly the contract, ability to solve eventual conflicts (Dyer, 1998), capability to plan relationship between the two organizations, having proper systems to share information, capability to create trust in capability transfer (Mohen, 2003).

Beside the control systems, proper momentum and guidance are important to allow individual creativity in change process and to create required resources, motivation and information within the organization (Simon, 1994).

Since, releasing is an organizational command and does not need any coordination, it seems that the coordination has no meaning for the releasing stage.

Matching Technology Management (as a Dc) to the proposed framework

As mentioned earlier, Technology, like others resources, needs to be managed. Management of Technology (MOT) is defined as "an interdisciplinary field concerned with the planning, development and implementation of technological capabilities" (NRC 1987). Dankbaar (1993) used the term of Technology Management (TM) as synonymous of MOT and defined technology management as "all managerial activities associated with the procurement of technology, with research and development, adaptation and accommodation of technologies in the enterprise and with exploitation of technologies for the production of goods and services".

MOT functions have been largely discussed in the literature (see for example Cetindamar 2009, Rush et al. 2007, Khalil 2000, Cotec 1998, Gregory 1995, Edosomwan 1989, Morin 1985). From a process-based view, there is a consensus among different scholars that MOT consists at least of five Processes:

- Identification
- Selection
- Acquisition
- Exploitation
- Protection

Identification involves developing a list of technologies which are, or may be, incorporated in the company's products or processes. **Selection** deals with the choice of important technologies. Among technologies identified in the last step, those ones which have a significant influence on the operational or strategic objectives of organization, are chosen. These are the organization's priorities of investment. **Acquisition** concerns acquiring selected technologies. Technologies may be acquired internally through R&D activities or externally through technology transfer. **Exploitation** includes activities for commercialization of acquired technologies. One aspect of exploitation is related to production of new products/services or improving the current products/services by embedding the acquired technologies effectively in the organization's product or processes. The second aspect of exploitation is related to the concept of technology licensing-out. Each technology may gradually lose its importance to competitiveness of company. It can be sold to others companies –partners or competitors- who are interested in implementing technology in their products or processes. The last process deals with **protection** of technological capabilities across the organization and along the time.

TM could be considered as a second order capability which can help organizations to enhance and improve their technological capabilities (first order capabilities). Therefore, TM could be explained as a DC.

As follows, we will try to match four processes of TM (identification, selection, acquisition and exploitation) with the proposed framework (section 4) in order to illustrate how TM can be considered as a DC.

Identification

As mentioned before, identification deals with awareness of technologies which are or may be incorporated in the firm products or processes. (Gregory 1994). According to Phaal (2004), identifying technologies includes not only technological changes but also all changes in the market.

Selection

In this stage, the organizations should focus on their technological priorities. In order to select the most appropriate technologies, all alternatives (candidate technologies) should be evaluated. This

evaluation consist of technology attractiveness assessment and firm's capability auditing (Arasti 2004, Chiesa 2001).

Acquisition

In this phase, organizations should decide on the most relevant mode of technology acquisition. Technology may be developed internally through in-house or indigenous R&D or externally through technological alliance, joint venture, licensing-in or firm take over (Chiesa 2001).

Exploitation

This phase deals with value capturing from the firm's technological capabilities. It may be possible with exploitation of technologies for the production of goods and services and/or technology licensing-out (Tidd 2009). For making money from an assimilated technology, organizations need to completely understand the application of technology. Then in this stage along with integrating, aligning process, and coordinating which are absolutely necessary, organization should distribute needed knowledge to its people.

Table 4 compares the sub-items of TM processes to the elements of DC processes. As shown, both literature are analogous and contain similar or very near concepts. This comparison illustrates analytically 1) that TM could be certainly considered as a DC, 2) the applicability of proposed framework and 3) the main elements required for identification of a DC in an organization.

Hyundai technology absorption to produce Korean Car, Kim(1999)

In his paper Kim describes a roadmap following which Hyundai transfers from a fully depended company to a leading manufacturer in the world. In this paper because of the space limitation we just describe the second step of Hyundai road map which in becoming a national automobile manufacturer.

- Identification: After the announcement of Korean Government about producing a Korean Car, Hyundai was the first company starting to search among automobile producing technologies, In fact who was the only company who had really good response to the environmental changes. That announcement was a market change in that time could help Hyundai's growth. And in DC Hyundai viewed market information, analyzed market information and apply it.
- Selection: In this stage it actually identified its technology needed and select companies have those technologies. Hyundai selected to import these technologies form different sources.
- Acquisition: Then it decides to sign a contract with each of those chosen companies to transfer its needed technologies; also it had a great coordination system to orchestrate all knowledge company acquired from several different companies. In this phase as we describe learning capability when organization wants to import knowledge, Hyundai sent

its engineers who were familiar with transfer technology, and then they could perfectly absorb the knowledge. Also because Hyundai absorb knowledge from different sources it faced no resistance form transferor. After that Hyundai hired an expert in system integration who was able to integrate its engineer's knowledge.

- Exploitation: In this stage Hyundai put some personal initiatives for its personnel to transfer their knowledge to other staff; this stage is a part of learning with which organization can use its acquired knowledge. Also, with the help of Korean government Hyundai put appropriate resources for this change. At the end with good leadership and control and feedback systems it could achieve Korean Car.

Conclusion

Although many scholars contributed to DC literature, but the majority of them discuss the conceptual aspect and a few publications have focused on practical aspect of DC. The aim of this paper is to propose a practical framework for DC identification and improvement based on Pavlo's model. Pavlo (2011) is the first author who had a pragmatic view to DC. By reviewing and integrating the literature, he developed a process based model which helps organization to identify their DC.

DC provokes radical or incremental changes in an organization. According to Daneels (2010), there are different sources for any organizational change (the fact which has been ignored by Pavlo). Daneel classified the nature of changes in four categories: leveraging the current capabilities, creating new capabilities (internally), external sourcing of new capabilities and releasing/unlearning old capabilities.

By combining two models (Daneel and Pavlo's models), we proposed a new and comprehensive framework for identification and evaluation of DC in an organization. The applicability of proposed framework is also illustrated by matching TM processes to Dc processes. Through this illustration, we argued that TM could be considered as a DC and showed the main elements required for identification of a DC in an organization.

<i>Processes</i>	<i>Management of Technology</i>	<i>Dynamic Capability</i>
<i>Identification</i>	<i>Developing an awareness of all technologies which are or may be incorporated in products or processes.</i>	<i>Making effort in search of new application(Cohen, 1990)</i> <i>Identifying, selecting and following opportunities (Teece 2007, Pavlo 2011)</i>
	<i>Systematic scanning of existing and emerging technologies (Geregory 1995)</i> <i>Searching for all changes, including changes in market place (Phaal, 2004)</i>	<i>effort done in the organization to find a new application (Shaker a.zahra, 2002; Barbara Levitt and James G. March, 1988)</i> <i>positioning the gatekeepers within the organization(Cohen, 1990)</i> <i>ability to analyze market information and apply it, to sense suitable opportunity (Pavlo 2011)</i>
<i>Selection</i>	<i>Evaluation of Technologies (Arasti, 2004)</i> <i>Selecting the most appropriate technologies (Codama 1992, Chiesa 2001)</i>	<i>Identifying, selecting and following opportunities (Teece 2007, Pavlo 2011)</i> <i>Market information, ability to analyze market information and apply it, to sense suitable opportunity (Pavlo 2011)</i> <i>Retaining information internally or with market research to decide how to use its current capabilities, create new suitable capability or access necessary external capability to use opportunity. (Senge, 1990)</i>
	<i>Deciding on the method of technology acquisition internal/inhouse/indigenous R&D(Tidd, 2009)</i> <i>Organizational learning(Tidd, 2009)</i> <i>External sourcing of technology(Tidd, 2009; Chiesa, 2001)</i> <i>Being explicit about the rationale of particular acquisition method and detailed processes needed to execute the selected method</i>	<i>How to flow information within organization (HUBER, 1991) and preparing organization to change (ARMENAKIS, 2009)</i> <i>Team learning and dialogue process (Isaacs, 1993)</i> <i>identify common knowledge parts of two organizations- in case organization accessing the knowledge (LANE, 1998)</i> <i>Alignment with decision making method and structure of organization which delivers capability (LANE, 1998)</i> <i>Ability to motivate transferor to transfer the capability (Inkpen, 2000)</i> <i>Making plan to allocate resources and controlling the change with the means of management control systems.(Simon, 1999)</i> <i>Ability to Find the correct transferor and making a proper contract to transfer the information (Mohan, 2003)</i>
<i>Exploitation</i>	<i>Technology value capturing(Tidd, 2009)</i> <i>Systematic conversion of technologies into the marketable product/services(Tidd, 2009)</i>	<i>A method for transferring information between two parties (Dyer, 1996)</i> <i>Having a system to assign right person to the right task to achieve marketable product/ service (Mohan, 2003)</i> <i>Having a good leadership to coordinate the processes (Garvin, 2009)</i>

CONCEPTUAL FRAMEWORK FOR CORPORATE ACCOUNTABILITY IN THE CONTEXT OF SUSTAINABILITY – A LITERATURE REVIEW

Mohammed, Munif¹

¹ Business School Lausanne, Rte de la Maladière 21, P.O Box 73, CH-1022, Chavannes, Switzerland. Email address: munifmohammed@hotmail.com

Abstract

This paper reviews the literature that forms the basis for future research on a framework for corporate accountability. The current framework for corporate accountability is failing the environment, society and business. This paper aims to show that current accountability frameworks forces companies to focus on a narrow source for value creation based on imperfect economic theories. The current conceptual accountability frameworks are dramatically inadequate in the context of escalating sustainability issues and needs of both society and business. The business responses, through Corporate Social Responsibility (CSR) initiatives, are only a poor attempt to address the fundamental sustainable development challenges. A meaningful corporate accountability framework in the context of sustainable development can connect social progress to the economic value of the firm's strategy. The recent proposal for Creating Shared Value (CSV) moves this debate in the right direction; it lacks, however, a specific framework to measure shared value creation. By re-defining corporate value in the context of sustainability through the conceptual framework of a balance sheet, this article proposes to show that a new accountability framework provides strong ethical incentives for corporate accountability. This paper proposes a direct valuation and formal accounting of externalities on the corporate balance sheet, with an offsetting appraisal of the social licence to operate for the corporation, thus creating a meaningful and integrated basis for accountability.

Keywords: Corporate Accountability, Externalities, Sustainability, Corporate Social Responsibility (CSR), Creating Shared Value (CSV), Balance Sheet

Introduction

Society and business are faced with a predicament where important decisions have to be made for the sustainability of the planet and the competing needs for economic growth and social development (Brundtland Report, 1987; Zadek, 2006; Jackson, 2009, Meyer and Kirby, 2010; The Economics of Ecosystems and Biodiversity (TEEB), 2010; Porter and Kramer, 2011). On the one hand, businesses need to gain back trust and legitimacy; indeed, over the past few decades, businesses have been increasingly seen to profit from social, environmental and economic problems at the expense of society's needs and concerns (Porter and Kramer, 2011). On the other hand, society needs businesses to help solve major global problems (Porter and Kramer, 2011). At this cross-road, there are common interests for both the society and business.

The problem is one of negotiating a new social contract between business and society based on mutual transparency, accountability and trust in the context of substantial social and environmental

injustices. This social contract needs to be defined within a new corporate accountability framework which can clearly account for the mutual obligations of both the business and society and demonstrate progress towards shared goals.

Literature Review

The objective of this article is to review the literature and provide support for future research on the framework for corporate accountability in the context of sustainable use of all resources within a market economy. The thesis for my future research project is that current accountability frameworks do not hold companies accountable for environmental, social and human externalities of their activities. As a result many companies are unaware of new sources of value and, consequently, are sub-optimising both the economic value of the firm and value to society. This article intends to establish a theoretical basis in literature for a new corporate accountability framework.

The three main areas of research that are relevant to the above thesis are sustainability, corporate accountability and corporate valuation. This review is narrowed down to the literature that is directly relevant to the topic of corporate accountability and valuation of externalities. Economic theory and social accounting literature provides information on the conceptualisation and valuation of externalities. Corporate Social Responsibility (CSR) literature is reviewed to provide a broad definition of corporate accountability.

The remaining sections of this paper review the literature on definitions and conceptualisation of accountability and externalities. This is followed by a discussion on the limitations of CSR and why a minimum standard for corporate accountability must include valuation and formal accounting of externalities. Concluding comments, limitations and future research are noted in the final section.

Corporate Accountability – a definition

A key challenge discussing the literature on corporate accountability is the apparent lack of agreement on the definition of accountability (Cooper and Owen, 2007). While the concept of accountability is widely used in business and sustainability reporting, a search of the Global Reporting Initiative (GRI) and AccountAbility websites do not provide a clear definition. Gray *et al.*, (1996) provide the most direct definition of accountability as “the duty to provide an account (by no means necessarily a financial account) or reckoning of those actions for which one is held responsible”. Cooper and Owen, (2007) add to this definition a normative standpoint, by including a requirement for “purposeful communicative action” and “empowerment, in terms of facilitating action” by stakeholders. In recent years, there seems to be an increasing convergence of corporate governance and sustainability reporting which is enhancing accountability (Kolk, 2008).

This article proposes to conceptualise corporate accountability as “the duty to provide an account” (Gray *et al.*, 1996) to society, as a result of the social licence to operate. This definition is consistent with Ruggie (2008), which calls for a positive duty of due diligence on companies in their discharging of the responsibility to respect human rights.

Externalities and Accountability - early economics and how we got started on the wrong foot

This section discusses the literature on the importance of externalities to both corporate value and social progress. Externality is an important ontological economic concept that is pervasive in everyday individual relationships however; it has managed to elude proper accountability. Early economic theory focused on explaining the role of governments, markets and human behaviour. These explanations were positivist, focused on rational choice, individual liberty and the innovation potential of the individual. At the firm level, theories focus on efficient resource allocation and, through the mechanism of market price, lead to optimum results at all levels; individuals maximise utility, firms maximise profits, markets achieve clearing prices and society achieves maximum welfare. This is the mathematical result of perfect competition and the theory of general equilibrium. To achieve such an appealing model, the early economist assumed away scarcity and the limitations of nature's resources. This simplifying assumption in hindsight is the beginning of our problems. This model meant that there is no limit to growth; markets priced all important resources; firms optimised profits and, at the same time, maximised social welfare while the individual had a limitless choice to pursue personal well being.

Lagueux (2010) provides an interesting account of externalities over the history of economic literature, characterising externalities as a "residual" concept relative to the market. Externalities, which this article aims at highlighting, hold the key to corporate legitimacy and sustainability, were reduced to a semicolon (;) (Scitovsky, 1954 as cited in Lagueux, 2010) and referred to as factors to the "right of the semicolon" in the economic production function (Mishan, 1965 as cited in Lagueux, 2010)). A very different emphasis is placed on externalities by Buchanan with his work starting in the early 1950's. To Buchanan (Marciano, 2011), externalities were the main subject of economic studies and not just a market failure of no consequence that can be ignored. During the neo-classical period, the focus shifts from perfect competition to Laissez-faire (Freidman, 1970). Externalities were not seen as signals of market failure but as part of the normal market operations. Coase's (1960) seminal contribution to explain "why the firm and not the market" in terms of transaction costs was later conceptualised to show that, at zero transaction costs, markets would find the optimal allocation of resources and that there were no externalities that a fully developed market could not internalise (Marciano, 2011).

The conceptualisation of externalities by Heal (2005) is a most useful one; indeed, in one of his remarkable papers, he presents a very clear exposition of the importance of the "resource-allocation role for CSR." The contribution of this paper is that externalities are conceptualised and operationalised in a different way to most other studies. Heal's focus on social cost has allowed him to see externalities and market failures as a source of value. This new conceptualisation of externalities does not need to explain away the impact of externalities but brings it to the centre of business strategy and value creation. Heal (2005) also calls for CSR initiatives to deal with distributive justice

issues related to exploitation of workers mostly noted in the extended global supply chains of multinational corporations. It is about time that the business world puts to practice the management mantra of “people are our greatest asset.” Strategically, the value of people is well recognised in concepts such as key core competencies (Prahalad and Hamel, 1990); this concept is true for a very large number of companies and becoming increasingly important as commerce moves toward the convenience and efficiency of the digitalised economy. To date, this ‘asset’ has not been recognised and recorded on any corporate balance sheet within the standard accounting framework. This is not just a fact that can be explained by lack of agreed accounting standards, it also represents a serious failure of strategic management to not recognise a true source of value creation. Social exploitation continues both of the disfranchised workers and the talent pool that has the most potential to create future value.

Externalities are the main source of most of the intense conflict between business and society (Heal, 2005). The implicit driver for corporations to act responsibly, as summarised by Heal in the Coasian tradition, is that there is an implicit contract: “society accepts the legal status quo provided that the corporation does not exploit it to society’s disadvantage” (Heal, 2005). In recent times, this contract seems to have been disregarded in most countries as a result of the increased economic power of the corporations and the hollowing of the state authority and power over economic activities. The result is that corporations have been able to extend boundaries of this social contract, together with the corresponding increase in social costs, with no contra increase in private cost, thus resulting in higher levels of private profit at the expense of society.

There is wide agreement with Heal’s views that CSR initiatives could have an important role to play, “as substituting for missing markets, if we see external effects as arising from missing markets or as taking what Friedman sees as the government’s place in addressing external effects and distributional issues” (Heal, 2005). However, other scholars have argued that the firm does not have the legitimacy (Freidman, 1970; Vilanova *et al.*, 2009; Jensen, 2010) to undertake some of these roles.

One of the traditional roles of government is to provide regulations for effective governance and efficient operations of markets; however, as we see the state of markets and particularly recent market failures and financial crises, it is clear that this role has not been sufficiently fulfilled. The current regulatory structure in most western democracies is based on a conceptual framework of rule-making by state legislators seeking to create rules to control economic behaviour and enforce them, through complex administrative institutions and structures, on a business environment that is expanding and evolving at a faster rate than ever before. This situation is further aggravated by the rapid globalisation and outsourcing trends of the last 20 years. This is not a tenable situation, especially in the context of the sustainability challenge that requires strong state institutional frameworks able to cope with the rapidly emerging social and environmental issues in creative ways. What is the right conceptual framework is difficult to determine; however, a principles-based, rather than a rules-based approach, to accountability seems to offer more scope for innovation and is less open to systemic

exploitation. It seems that, perhaps, it is time for a more principles-based approach to market regulation, with strong financial incentives that are based on global ethics.

One such situation is regulations required to deal with market failures and externalities, where there is a need for a principles-based framework with ethically strong incentive structures to encourage innovative business behaviour. For a number of externalities, by definition, there is no market and, hence, no market price to value these externalities. In these situations, there is a need for society to be directly involved in these critical decisions on the use and/or preservation, for future generations, of our most scarce resources. This social and political interaction is essential to the functioning of markets and would make the broader society a true stakeholder, bringing social legitimacy for corporations and a real role for governments to provide political leadership.

Emerging limitations of CSR – failure of corporate accountability

Corporate social responsibility can be seen as a business response to businesses' failure to account for externalities (Heal, 2005). This section of the literature review maps the vast and growing literature on CSR, with a particular focus on corporate accountability, its conceptual framework, attributes important to its successful implementation, and recent proposals in the literature to refine corporate accountability frameworks.

Shareholder theory provides a standard account of the nature, purpose and responsibilities of business. In this respect, business is seen as accountable to the shareholders for maximising profits and returns to shareholders at the exclusion of all others. Corporate responsibility of the business and its executives, in this view, is limited to obeying the law, not engaging in fraud or deception and pursuing open and free competition (Friedman, 1970; Jensen, 2002, 2010; Cosans, 2009). These views can be seen as a normative statement of corporate behaviour. In this view, externalities cannot exist, as "good citizens", being also "good business professionals", are "sensitive to the duties, desires, and understanding of the others' perspective" (Cosans, 2009). This definition of the good citizen, or that of the perfect market or the perfect government, has never been a reality and is not likely to be a reality on which we can build a society. Shareholder theory has only a limited appeal as a useful basis for CSR, particularly in respect to broader corporate accountability. It defines the primary duty of a corporate executive as maximising shareholder wealth. This is the basis of legitimacy and accountability to the shareholder.

Stakeholder theory provides an alternative view on corporate governance and business ethics. Stakeholder theory informs us that managers should take account of the interests of all the stakeholders in a firm when making decisions. Stakeholders include all individuals or groups who can substantially affect, or be affected by, the welfare of the firm. This definition of stakeholders includes not only the financial claimholders, but also employees, customers, communities, and governments. Business ethics literature is richly covered with many different notions of this idea (Freeman, 1984; Clarkson, 1995; Donaldson and Preston, 1995; Mitchell, 1997; Freeman *et al.*, 2004; Bradley, *et al.* 2008).

Following the initial debate in the literature between shareholder and stakeholder theory, there has been a number of attempts to refine and elaborate both these major theories. Carroll (1979) triggered this debate by defining CSR as a hierarchal framework, with economic responsibility at the base of the pyramid and, for the first time, the explicit requirement of ethical behaviour standing above the economic and legal ones. Following Castello and Lazano (2011), the domain of CSR research can be categorised into a number of themes that have advanced this debate, including social performance (Carroll, 1979); social contract (Freeman, 1984; Donaldson and Preston 1995); accountability (Elkington, 1999; Valor, 2005), corporate governance (Freeman *et al.*, 2004), business ethics (Solomon, 1993), corporate citizenship (Waddock, 2001; Zadek, 2006), and bottom of the pyramid concept (Prahalad and Hammond, 2002).

According to the literature, there are four important motivational factors for CSR initiatives, namely, business case (Freeman, 1984; Money and Schepers, 2007), strategic (Vilanova *et al.*, 2009), legitimacy (Mathews, 2000), and business ethics (Carroll, 1999; Donaldson and Preston, 1995). From the literature review, it is clear that a lot of effort has been expended into creating a clear *ex ante* business case for CSR initiatives based on the benefits for such actions; however, businesses have not widely accepted these justifications while, where businesses have implemented CSR programs, the stakeholders and civil society seem not to be satisfied. In conclusion, attempts to address externalities through the short-cut of CSR initiatives have failed both the society and business.

Accountability for Externalities – a measure of shared value creation

A recent paper by Orts and Strudler (2010) is very critical of stakeholder theory and calls for research in business ethics to move “beyond stakeholders”. This adds to the chorus of critical voices from scholars demanding a more considered effort to meet our sustainability challenges (Zadek, 1998; Mathews 2000, 2008; Gray, 2006, 2007; Hahn and Figge, 2011). In addition, a number of multi-stakeholder professional organisations and practitioners have been engaged in refining the CSR reporting frameworks (GRI, TEEB, and Tomorrow’s Company).

Meyer and Kirby (2010) specifically call for corporate accountability for externalities. This is an important departure from the traditional view of externalities seen as a problem to be minimised to an opportunity to learn from and create value. Meyer and Kirby (2010), note that companies have long prospered by ignoring externalities and now they must learn to embrace them. The authors argue that, as a result of changes in the scale of operations and the resulting impact of corporate activities on social and environmental amenities, the rapidly advancing innovation in technology to measure this impact and the elevated “sensibility” of environmental and social issues mean that corporate accountability of externalities is “unavoidable” (Meyer and Kirby, 2010). The contribution of this paper is the call for direct action by business to “take ownership” of externalities that are part of the core business and can be directly measured. This is similar to the conceptualisation, within the creating shared value framework, of opportunities within the supply chain (Porter and Kramer 2011). A second area of opportunity for the company to contribute to society while addressing the external

cost, exists wherever there is an indirect spill-over impact that the company has “particular problem solving competences” (Meyer and Kirby, 2010). This is also similar to the opportunities identified by the CSV framework for new products and markets (Porter and Kramer 2011). In the interest of positive engagement, the company is also encouraged to manage the most “distant ripple effects”, where the company does not have any “special competence to ameliorate” the negative effect of externalities by directing the company’s “efforts through trusted channels” (Meyer and Kirby, 2010). Again, this is supported by the CSV framework with a call to create “clusters” of expertise (Porter and Kramer 2011).

Corporate accountability, framed on the basis of valuation and formal accounting of externalities, has to be considered in terms of the strategic imperatives of the firm and the ability to create long term value. The concept of CSV provides a very useful strategic framework for firms to analyse their value chain in order to discover new markets and products, increase productivity in the extended supply chain and consider opportunities to leverage suppliers and competitors to create solutions for global problems (Porter and Kramer, 2011). This article illustrates a number of case studies where inspired business leaders were already using and deploying elements of this framework to create shared value. The example of Nestlé is particularly interesting, in the sense that the company clearly selected three strategic areas which have the greatest potential to create both long-term value for the company and enormous benefits for the broader communities within which the company operates. Here, we find the solution to a number of issues raised in the shareholder-stakeholder debate pertaining to the identification and management of stakeholders, balancing of priorities, and managing for the long-term. In this specific example of CSV, the solution for Nestlé is an internal strategic priority, not an externally imposed program. This approach overcomes a number of design issues of specificity and legitimacy noted in a recent review of international accountability standards (Rasche, 2009).

However, current financial and non-financial reporting systems neither recognise nor report this value creation. A new accountability framework which includes corporate externalities and a contra entry which represents the firm’s social licence to operate could provide a basis to measure the creation of shared value. This form of social accounting could free companies from the narrow focus for value creation to finding solutions in broader environmental and social problems.

Conclusions, limitations and further research

The extensive literature on externalities encountered in economic theory and the vast literature on CSR provides support for my suggested conceptual framework for corporate accountability. Corporate accountability defined as the duty to provide an account to society as a result of the social licence to operate and the positive duty of due diligence to discover and report their obligation to society. In this view governments have an important role of creating principles-based regulations which are grounded in ethics and provide financial incentives for corporate behaviour. My research proposes a direct valuation of and formal accounting of externalities to re-define corporate value. This is defined as the minimum standard for a meaningful and integrated corporate accountability.

The views of Buchanan, Heal and Meyer and Kirby on externalities seem to provide support to including externalities into the corporate accountability framework. Buchanan provides strong theoretical support to include externalities in a framework for corporate accountability. Heal calls for externalities to be at the centre of business strategy and value creation. As a generalised conclusion, firms can create shareholder value and resolve market failures by focusing not on “private cost” and trying to explain this but recognising “social cost” as a source of value. From these case studies, it is also clear that strategically picking specific CSR initiatives and implementing them in a holistic way, taking into account all stakeholders can be the critical difference between the extraordinary success and the demise of the firm, there is no short-cut solution for corporate accountability. Meyer and Kirby (2010) conclude that corporate accountability of externalities is “unavoidable” calling for corporate action to learn and thus create value directly in the extended supply chain, through new products and positive engagement in CSR initiatives.

The literature on CSR is less conclusive. While there has been an expansive effort in creating a clear *ex ante* business case for CSR initiatives, businesses however have not widely accepted these justifications and where businesses have implemented CSR programs stakeholders and society seem not to be satisfied. Scholars in social accounting have in recent times been calling for a re-definition of role of business to include externalities. In this view proper account is given to the impact of business on the environment and society, and advocates new forms of corporate governance.

Corporate accountability matters. It plays an important role in the provision of basic needs of our society, the quality of our living planet, the level of trust in businesses and the creation of a sense of shared meaning and common purpose. The context of corporate accountability has changed dramatically in the last 20 years. The human kind is consuming planetary resources faster than the ecosystems’ ability to regenerate, poverty is becoming more widespread, trusted financial institutions have failed us, our governments have less fiscal and social capital to fix problems and traditional macro-economic solutions of consumption-led growth seem less plausible.

The recent proposal for creating shared value provides a strategic framework for partnership between business and society. However current financial and non-financial reporting systems neither recognise nor report this value creation. A new accountability framework which includes corporate externalities and a contra entry which represents the firm’s social licence to operate could provide a basis to measure the creation of shared value.

In conclusion, attempts to address corporate accountability through the short-cut of CSR initiatives which excludes externalities, have failed both the society and business. In this sense, the corporate accountability framework is not fully developed and this should be the objective of further research.

Abstract

In recent years, significant attention has been given to high performing organizations — those companies that consistently out-perform their competitors — in an attempt to determine what factors contribute to their success. The challenges of market saturation, slow uptake of new services, and the economic downturn in telecommunication sector of India may require companies like BSNL to adopt human resource management practices capable of improving the company's performance. Adopting the validated scale of Sun et al., (2007) and an adapted scale of Chand and Katau, (2007) , a sample of 100 employee from a state of India were surveyed to ascertain the best HR practices capable of high performance of the company. The result of the survey suggested that clear and transparent job description, incentive based reward, promoting internal mobility, encouraging team work, and assuring employment security can enhance company's performance. However, the bureaucratic organizational culture along with the expected role of a 'model employer' for both employees and consumers will make the journey of the company towards designing a HPHRP more difficult and challenging.

Keywords: High Performing Human Resource Practices; Organization Performance; Telecommunication Sector In India; Clear Job Description; Incentive Based Reward

Introduction

The Indian telecom industry has witnessed tremendous growth in the last 20 years due to the liberal policies of the government and the extensive need for communication. The conducive business environment, favorable demographic outlook and the political stability enjoyed by the country have contributed to the growth of the industry. The number of telephone subscribers in India increased from 787.28 million in December 2010 to 846.32 million at the end of March 2011 (Krishnan& Sethuramasubbiah, 2012). However, recently the companies in the telecommunications industry face a number of challenges such as market saturation, slow uptake of new services, and the economic downturn which has increased pressures to cut costs and improve efficiency. To succeed in this

environment, telecommunications companies are making efforts to adopt new workplace practices that can help in maintaining a High-performance level in the form of improved quality and increased efficiency, and enhanced relationships with customers and partners.

In recent years, significant attention has been given to high performing organizations — those companies that consistently out-perform their competitors — in an attempt to determine what factors contribute to their success. Although high levels of performance are due to a number of factors, human resource practices are a significant contributor to on-going success in these organizations (Wienclaw, 2008). Further, the impact of HPHRPs on firm performance has received considerable attention in recent years (Godard and Delaney, 2000). Although there is evidence that high-performance human resource practices are associated with organizational performance (Appelbaum et al., 2000), little consensus exists among researchers regarding the specific practices to be included in the configuration of high-performance human resource practices (Collins & Smith, 2006; Datta, et.al., 2005). Further, Most of the studies examining the relationship between High-Performance Human Resource Practices and organization's performance have been conducted in developed countries, and that only a few researchers have measured high-performance human resource practices and organizational performance in India more specifically in Telecommunication industry. To fill this gap and to further examine the existence of such a relationship, the research is viewed as important.

In the above context, the paper aims at exploring the HPHRPs in Bharat Sanchar Nigam Ltd. (BSNL), the largest public sector telecommunication company of India. Further, the paper aims at examining the impact of the HPHRPs on the company performance.

Profile of the Company

Bharat Sanchar Nigam (BSNL) is an India-based public sector telecommunications company offering global system for mobile communications (GSM) mobile and code division multiple access (CDMA) mobile based wireless communications, wireline, satellite service, telegraph, data and internet services, broadband, carrier service, voice over internet protocol services (VIOP) and managed network services. The company primarily operates in India. BSNL has about 46 million line basic telephone capacity, eight million Wireless Local Loop (WLL) capacity, 52 million GSM capacity, more than 38,302 fixed exchanges, 46,565 Base Transceiver Station (BTS), 287 satellite stations, 614755 Rkm of optic fiber cable (OFC), 50430 Rkm of Microwave Network connecting 602 districts, 7,330 cities/towns and 5.6 lakhs villages (Datamonitor, 2010)

BSNL is engaged in planning, installation, network integration and maintenance of switching and transmission networks. It offers landline services including subscriber trunk dialing (STD) services, international subscriber dialing (ISD) services, voice virtual private network (Voice VPN) services, manual trunk calls, and public telephone services, among others. It also offers third generation (3G) mobile services as well as wireless in local loop (WLL) services that connects customers to the BSNL landline network using radio frequency signals. The company's managed network services include

enterprise broadband, internet and multiprotocol label switching (MPLS)-virtual private networks (VPN) services (Datamonitor, 2010).

Bharat Sanchar Nigam Limited (BSNL) is the leading player in the Indian fixed line telecoms market, generating a 48.8% share of the market's value(Figure 1).

Conceptualisation

High performing organizations those companies that consistently out-perform their competitors. Although high performance is the resultant of a number of factors including work flow designing, HR practices, leadership and technology, HR practices are found dominating the creation of high performing organizations. Wienclaw, (2008) has interestingly explained the relationship between HR practices and High performance oriented HR practices as 'fundamental functions of human resource management – recruitment and placement, training and development, compensation, and employee relations – are the same in every organization, research has found that there are significant differences between human resource functionality in low performing organizations and those in high performing organizations. In high performing organizations, human resource departments tend to operate at a higher level; generating more candidates for job openings and screening them more effectively, offering more and better training opportunities for employees, linking pay and other incentives directly with employee performance, and providing a safer working environment for employees at all levels within the organization. Not only do the processes and outcomes of human resource activities differ in high performing organizations, but so do their goals'. In general, in high performing organizations, human resource activities are at the heart of the organization's functioning rather than on the periphery, with the goal of maximizing the potential, utilization, and commitment of all employees at all levels in the organization (Wienclaw, 2008).

High-Performance Human Resource Practices

According to Bamberger and Meshoulam (2000: 67) an integrated measure of human resource or high-performance human resource practices should assess selective staffing, extensive skills training, broad career paths, promotion from within, guaranteed job security, results-oriented appraisal, extensive and open-ended rewards, broad job description, flexible job assignment, and encouragement of participation. Sun *et al.*, 2007 commented that High-performance human resource practices are therefore defined by their combination of single practices that collectively affect organizational performance. High-performance human resource practices, such as provision of job security, extensive skills training, promotion from within, results-oriented appraisal, and broad career paths, signal an organization's intention to establish a long-term exchange relationship with its employees. Schneider and Reichers (1983) noted that interactions among organization members lead to shared perceptions of an organizational environment. High-performance human resource practices foster employees' shared perceptions of a supportive organizational environment that motivates discretionary behaviors that contribute to organizational performance (Sun *et al.*, 2007).

Organisational Performance

In SHRM models, generally company performance is measured by some profit or market-value-related measures. So far, researchers have been more eager to use market-based measures of financial performance because accounting-based profitability indicators seem to be subject to numerous biases (Huselid, 1995; Huselid *et al.*, 1997). In order to test the impact of human resource practices on a company's performance, Kalleberg and Moody (1994) suggested eleven variables (Investment payback, Larger dividends, Company capitalization, Financial return, Economic return, Product quality, Increase in market share, Innovation, Strategy success, Customer loyalty, Capacity to attract/retain talented personnel) as a subjective performance measure.

Based on an extensive literature survey, Katou and Budhwar (2006) concluded that organizational performance indicated through the following indices:

- Effectiveness: if the organization meets its objectives. (Dyer and Reeves, 1995; Ostroff and Schmitt, 1993).
- Efficiency: if the organization uses the fewest possible resources to meet its objectives (Dyer and Reeves, 1995; Rogers and Wright, 1998).
- Development: if the organization is developing in its capacity to meet future opportunities and challenges (Phillips, 1996).
- Satisfaction: of all participants – stakeholders, employees, customers (Delaney and Huselid, 1996).
- Innovation: for products and processes (Guest, 2001).
- Quality: percentage of products of high quality (Delaney and Huselid, 1996; MacDuffie, 1995; Richardson and Thompson, 1999).

Thus, on the basis of the above literature survey, we accepted the following indices as indicator of organizations performance:

- Profit Maximization
- Market Leadership
- Improved Productivity

High-Performance Human Resource Practices and Organizational Performance

Organisations achieve a wide variety of outcomes from high performance human resource practices. The impact of HPHRPs on firm performance has received considerable attention in recent years (Godard and Delaney, 2000). Ichniowski *et al.* (1997) have shown a positive relationship between configurations of “high performance” human resource (HPHR) practices such as extensive formal training programs, employee empowerment, and performance-based compensation and organizational performance. Sun *et al.* (2007) study revealed high-performance human resource

practices to be related to the organizational performance indicators of turnover and productivity. For example, HPHRP when mediated with service-oriented OCB tend to enhance the productivity of organizations (Sun *et al.*, 2007). High performing organizations tend to have lower turnover (20.87%) than low performing organizations (34.09%)(Wienclaw, 2008).

Methodology

Sampling:

The sample comprised employees working in Bharat Sanchar Nigam Ltd., Rajasthan, India. The number of sample respondents selected for the study was 100. The respondent were selected from various units of Rajasthan circle of the company.

Measures

The survey instrument consists of HPHRPs (29 items), and Company performance (7 items).

High-performance Human Resource Practices

High-performance human resource practices should assess selective staffing, extensive skills training, broad career paths, promotion from within, guaranteed job security, results-oriented appraisal, extensive and open-ended rewards, broad job description, flexible job assignment, and encouragement of participation. (Bamberger and Meshoulam, 2000: 67). Sun *et al.*, (2007) commented that High-performance human resource practices are therefore defined by their combination of single practices that collectively affect organizational performance. HPHRP were measured through an adapted scale derived by Sun *et al.*, 2007. All twenty nine items were measured on a Likert-type scale ranging from (5) highly satisfied to (1) very dissatisfied. Responses were reversely coded, so higher values indicate higher perceived effectiveness

Organizations Performance:

Chand and Katau, (2007) used multiple organisational performance variables such as sales growth, productivity, profitability, goal achievement, and good services to measure the organizational performance of a service based industry. The researcher measured organizations performance under the philosophy of a perceived rating of the organisation's performance on a Likert-type scale ranging from 1 ¼ very bad to 5 ¼ very good. Following this work, executives were asked to provide perceptual performance data via 5-point Likert scales, where 5 represents the highest score in the item. We have adopted the following three variables for measurement of organizational performance:

- Profit Maximization
- Market Leadership
- Improved Productivity

Statistical Analysis and Discussion

For the purpose of analysis of data, descriptive analysis, correlation analysis and multiple regression analysis were used on a standardized data set using SPSS version 18.0.

Table II, III-a and III-b presents the descriptive statistics and zero-order correlations among variables in the study. As shown in the table, HPHRP related variables such as Clear job descriptions(.580), Internal Mobility(.563), Incentive Reward (.551), Participation (.537), Flexibility(.514) and Team work(.459) are strongly related with Organisational performance. This means that the high organizational performance of BSNL is the result of ensuring Clear job descriptions, facilitating Internal Mobility in the form of promotion, transfer etc, adopting Incentive based Reward system, promoting active Participation of staff in the decision making process, supporting a Flexibility based culture and encouraging Team work. HPHRP adopted by the organization.

Multiple regression analysis was done to investigate the individual contribution of selective staffing, extensive training, internal mobility, employment security, clear job description, result oriented appraisal, incentive reward, participation, flexibility and team work to organizational performance. Table VI-a summarizes the results of multiple linear regression analysis and illustrates that values of unstandardized coefficients (see the section headed "coefficients") provide the regression equation that could be used for forecast purpose. From the column labeled "unstandardized coefficients," the constant term was 1.888.

In Table VI-b, the beta coefficients are listed in the column headed "standardized coefficients." R^2 was equal to 0.573. This means that 58 percent of the variance in the dependent variable could be attributed to changes in the independent variables.

The Beta value indicates the relative influence of the entered variables, that is, clear job description has the greatest influence on the company's performance (Beta=0.307), followed by incentive reward (Beta=0.291), internal mobility (Beta=0.202), team work (Beta=0.181), and employment security (Beta=0.120).

Clear and transparent job description has the highest contribution to the performance of BSNL(Beta=0.307). In other words, any attempt to improve the performance of BSNL should start with the development of a solid job description based on an objective, thorough job analysis. The development of an objective, empirically-based job description can help BSNL to better determine what knowledge, skills, and abilities are needed for employees in each job. Good job descriptions and their concomitant performance standards can also help employees to know what kind of behavior will be rewarded (or not rewarded) by the organization.

The result of the survey also emphasizes the importance of Incentive based reward for ensuring a performance oriented company (Beta=0.291). The finding is perfectly matching with the finding of Wienclaw, (2008) where the researcher observed that in the high performing companies, pay increases and incentive pay are tied to performance for 87.27% of the employees; in contrast, only 23.36% of

such remuneration is tied to performance in low performing companies. This means that if BSNL wants to attend the heights of high performance, the organization has to recognize that if employees are required to be motivated to greater performance, they are to be rewarded for their efforts by giving them something of value.

Agreeing with the finding of Dessler (2005) the study also acknowledges the importance of Internal mobility (Beta=0.202) is promoting a climate of high performance in BSNL. For example, when hiring new employees, Dessler (2005) observed that high performing companies are more likely to promote from within (61.46%) than are their low performing counterparts (34.90%). This difference is accountable in part because of the fact that high performing organizations tend to groom their employees for advancement. High performing companies also tend to be systematic about their approach to hiring new employees.

The research also support the proposition that team work (Beta=0.181) and employment security (Beta=0.120) is essential for promoting a high performance based climate in BSNL.

Conclusion

A high performance based human resource practices is inevitable for the companies in the telecom sector which are already mired with market saturation, slow uptake of new services, and the economic downturn leading to pressures on cost cutting and improving efficiency. The companies in the sector has to adopt selective staffing, extensive skills training, broad career paths, promotion from within, guaranteed job security, results-oriented appraisal, extensive and open-ended rewards, broad job description, flexible job assignment, and encouragement of participation. Designing and implementing a high performance based HR practices can be more challenging for a public sector company like BSNL. The bureaucratic organizational culture along with the expected role of a 'model employer' for both employees and consumers will make the journey of the company towards designing a HPHRP more difficult. However, the empirical finding that clear job description (Beta=0.307), followed by incentive reward (Beta=0.291), internal mobility (Beta=0.202), team work (Beta=0.181), and employment security (Beta=0.120) can have the greatest influence on the company's performance will certainly motivate the leaders of the company to cross all the barriers and embrace the high performance human resource practice in the company.

**MISMATCHES OF SUPPLY AND DEMAND OF SKILLS AND QUALIFICATIONS IN THE
TRANSITIONAL ECONOMY: THE CASE OF BUSINESS AND MANAGEMENT
QUALIFICATIONS IN LITHUANIA**

Nazelskis, Eugenijus¹; Tütlys, Vidmantas²

¹ International Management School Vilnius University

² Vytautas Magnus University Centre for Vocational Education and Research

Abstract

The purpose of this paper is to explore the factors influencing mismatches of supply and demand of skills and qualifications in the economy of Lithuania.

Approach of research consists of the overview of the economic, political-economic and socio-cultural dimensions of the mismatches of skills and qualifications in the transitional economy. The case study provides in depth analysis of the different factors influencing quantitative mismatches of the demand and supply of qualifications in the field of business and management and looks into the qualitative mismatches of demand and supply of skills and competences by comparing the needs and enterprises and contents of the profiles of business and management qualifications and degrees provided by the higher education institutions. Methodology of research consists of the analysis of scientific literature, contents analysis of the applications of enterprises outlining their skills needs, contents analysis of the profiles of qualifications and degrees, quantitative survey of students studying in the programme of business and management.

The paper discloses, that the mismatches of supply and demand of skills and qualifications in the transitional labour market of Lithuania are influenced by the wide range of external factors related to the economic, political economic and socio-cultural specificities of transitional economy. These mismatches of skills and qualifications concern not only quantitative disbalance of supplied and demanded qualifications, but also differences between the requirements of employers to skills and contents of qualifications provided by the educational institutions.

Keywords: Qualifications, skills, competences, mismatches of skills and qualifications, Lithuania, management skills and competences, transitional economy.

Introduction

One of the most contradictory and paradoxical features of the labour market of Lithuania is the effect of the mismatches of demand and supply of skilled workforce. Statistical data about the job vacancies and job vacancy rates indicate, that currently in Lithuania the highest demand is for professionals (having higher and/or higher vocational education), plant and machine operators, assemblers and craft and related trades workers. In the context of the increasing supply of workforce with higher education there exist rather big structural unemployment and enterprises face huge

difficulties in finding suitable skilled workforce seeking to solve this problem by 'import' of needed workforce from the other countries. The factors influencing this problem have several dimensions:

- Economical dimension, that contains different economical reasons of these mismatches, such as difficulties and failures of local enterprises in creating the attractive workplaces and job offers in order to compete for the skilled workforce.
- Political-economical dimension, that focuses the attention on the performance and effects of the different policy measures undertaken by the state government and different stakeholders. Here one of the explanations of existing mismatches of supply and demand of skilled workforce in the labour market is the weakness, failure or even absence of the purposefully directed initiative and measures of state policy, as well as human resource development strategies of enterprises to improve the coherence between the demand and supply of skilled workforce.
- Socio-cultural dimension focuses on the impact of specific attitudes and approaches of the secondary school leavers, students, job-seekers, employers and other actors in the fields of education, employment, job search and career development. From this perspective the existing mismatches of the demand and supply of skilled workforce in the labour market of transitional economy can be explained by the specific opportunist and short-term oriented behaviour of the involved participants of 'positional competition' (Brown, Hesketh, 2004) in the market of education and labour market. Such behaviour has developed in the conditions of the specific socio-economic transformations. For example, the cultural attitude of families and youth favouring the choice of higher education pathway as the only possible way to decent employment and career, has been shaped by many factors. There can be mentioned the low status of vocational education and training inherited from the Soviet period, as well as objective limited capabilities of VET providers to offer attractive qualifications and competences. Other important factor was the attractive image of the newly emerged degrees and qualifications in the higher education (such as management and business administration) promising the bright prospects for owners of these qualifications in the newly established market economy.

This paper seeks to explore the above mentioned dimensions of the existing mismatches of the supply and demand of skills in the labour market of Lithuania. To achieve this goal there are analysed above mentioned dimensions (economical, political-economical and socio-cultural) of the mismatches of supply and demand of skills in the labour market of Lithuania and executed the case study of the mismatch of supply and demand of the skills and qualifications in the field of business management.

The main applied research methods are literature review, analysis of available statistical data, contents analysis of documents and quantitative survey of the students.

Economical dimension of the mismatches of supply and demand of skills and qualifications in the labour market of Lithuania

Mismatches of demand and supply of skills and competences in the transitional post-communist economies and societies are shaped by the sets of specific economic and social factors.

The study of P. Brown and H. Hesketh *Mismanagement of Talent* (Oxford, 2004) examines the current mismatches between the demand and supply of high skilled human resources in the international enterprises. There are discussed different outcomes of these mismatches and introduced the concept of 'opportunity trap' as a mechanism created by the opportunistic behaviour of families, young people, providers of education and qualifications and employers. The study of P. Brown, H. Lauder, D. Ashton *The Global Auction. The Broken Promises of Education, Jobs, and Incomes* (Oxford, 2011) provides analysis of the implications of economic globalisation to the new models and divisions in the skills formation and usage. Different authors (Smallbone D., Welter F., 2001, Uhlenbruck K., Meyer K. E, Hitt, M. A., 2003) discern various specific factors of transitional economies which shape *the workforce demand*: (1) institutional legacy of the centralized planned economy, (2) high instability of market situation, (3) restructuring of economic sectors, (4) low productivity leading to predominant choice of the competition strategies based on price and high polarization of earnings.

Institutional legacy of the centralized planned economy was shaped by the different features of the Soviet economy, such as strict centralization and planning of economy and human resources, low workforce mobility due to narrow specialization, poor external possibilities to change the qualification and field of occupation, etc. Planned economy could not facilitate the development of experience and know-how in the analysis and forecasting of the supply and demand of skills and qualifications due to the absence of market relations.

Instability of transitional economic situation forced many enterprises to expand the range of provided products and services avoiding narrow specialization. Due to the small size of domestic market and intensifying competition on the national and European markets many enterprises have faced important challenges of survival and development. Most of the strategies of survival of enterprises in such market situation have been based on the widening of the range of products and services and seeking to expand the portfolio of their activities in many different fields. Such strategy of survival increased the demand of more universal and multi-skilled workforce with wider qualifications. From the other side, instability of transitional market and quickly changing needs of the skills and qualifications in the survived and newly established enterprises created very important difficulties and challenges for the providers of training to respond to these needs. The shift to market economy, changed economic and ownership status of enterprises (privatisation) and restructuring of economy led to the important structural changes in the sectors of economy - closure or restructuring of the big enterprises, development of the smaller businesses, decline of industry and growth of the tertiary sector based on the small and medium enterprises. As a consequence, the system of the state orders for provision of skilled workforce with defined qualifications, as well as tight relationships

between the providers of training and (state owned) enterprises, that were typical for the Soviet planned economy were disrupted and the providers of training had to find the new references for orientation of the provision of training and to establish the new ways of communication with private businesses. The restructuring of economy enhanced expansive development of new occupations in the tertiary sector in the last decade of the XXth century, especially in the fields of retail trade, services to persons, health, leisure and entertainment, etc. These important and radical changes naturally caused the big structural mismatches between the available skills and qualifications and the new skills needs.

Low productivity, caused by the outdated technologies and work organization, as well as by the **mismatches of existing skills profiles to the needs of market economy** led to the domination of the competition strategies based on price and low labour costs and enhanced increasing polarization of the earnings of workforce. In longer perspective it has led to development of comparatively low demand of high skills and slow development of employment quality. In turn, low employment quality decreased the attractiveness of the job offers of local enterprises and became one of the important factors of increasing emigration of skilled workforce.

Looking to the *workforce supply related factors*, which influence the existing mismatches of supply and demand of skills and qualifications in Lithuania there can be mentioned comparatively big share of employed workforce with post-secondary and higher education, significant over-qualification of employed workforce and high rates of emigration of high skilled and skilled workforce.

	2004	2005	2006	2007	2008	2009	2010	2011
<i>Unemployed total, thousands</i>	184	132,9	89,3	69	94,3	225	291	248,8
<i>Unemployed graduates of higher education, thousands</i>	19,6	12,4	9,6	7,9	13,3	24,4	35,5	30,7

Table No.1. Unemployment of graduates of higher education comparing to total unemployment.

Source: Statistics Lithuania (<http://www.stat.gov.lt>)

In many post-communist countries there can be found comparatively **big share of highly educated and skilled workforce**. Statistical data on the structure of the workforce and employed according to their achieved education in Lithuania show constant increase of the supply of the workforce with higher education – from 377,2 thousands (13,41% of the total workforce) in 1998 to 616,6 thousands (22,45% of the total workforce) in 2011 (Statistics Lithuania, <http://www.stat.gov.lt>). This increase of supply is accompanied with the constant increase of employment of the workforce with higher education - from the 300,9 thousands (20,2% of the total employed workforce) in 1998 to 495,1 thousands (36,11% of the total employed workforce) in 2011 (ibid.). This comparatively high share of highly educated and skilled workforce can not be effectively exploited due to the slow development of employment quality and domination of competition based on the low labour costs. It leads to the high level of workforce over-qualification and creates specific opportunity trap, which enhances emigration of high and medium skilled workforce and graduates. The recent surveys executed by the Institute of Public Policy Research disclosed, that almost one quarter of the graduates of higher education institutions are employed in the job positions, that require initial vocational qualification without

higher education: almost half of the graduates of studies in the fields of engineering and processing production and about 60 percents of graduates of agricultural studies work in the jobs, that require only vocational qualifications. High rates of over-qualification are accompanied by increasing unemployment rates of graduates (Table No.1):

There can be noticed quite important disbalance between the current state of employment and enrollment of youth in the initial vocational education and university level higher education - the employment of low and medium skilled workers in the labour market is by 2 times higher than the employment of high skilled specialists, while in the same time the share of students in the vocational education and training is more than 2 times lower than the share of students in the universities (Centre for Development of Qualifications and VET, 2010). The vacant workplaces are not attractive for youth in terms of economic rewards and prospects of personal and professional development. Such situation enhances the growth of **workforce emigration**, especially amongst the medium and highly skilled graduates and specialists. Statistical data evidence high rate and speed of emigration growth in the years of recent economic decline: only in 2010 the total number of emigrates reached 83157 (Statistics Lithuania, 2011). Emigration of skilled workforce reduces general skills potential of workforce, creates sharp skills needs in the different sectors, especially in the sectors demanding higher skills (engineering, machinery production, chemical industry, etc.).

Political-economical dimension of the mismatches of supply and demand of skills and qualifications in the labour market of Lithuania

One of the typical features of the transition from the Soviet planned economy to the market economy is a radical approach of shift to the market relationships leading to the domination of shareholder capitalism model. It can be explained by the different reasons, beginning from the objective necessity of the survived and newly established enterprises to accumulate the capital in the shortest possible terms in order to acquire competitive positions in the market and ending with the ideological attractiveness of liberal market economy and strong influence of catching-up approaches both at the level of the whole national economy and economical policy and on the level of enterprise management (Gyls, 2008). Seeking to reduce the economical backwardness and to catch-up with the economies and enterprises of the Western Europe enhanced application of the 'neoliberal' approaches in the management of enterprises and in the policy of economical development.

How this situation influenced the development of demand and supply of high skilled workforce? First of all, it increased the influence of reactive approaches and cultures in the field of human resource management and development, when the enterprises run their activities related to the search of workforce, recruitment and training of employees orienting to the current short-term needs. It does not favour the development of mutual trust and cooperation between enterprises and providers of education and training. Besides, there is a lack of strategic and proactive approaches and initiatives of such enterprises towards the planning of human resource needs. It creates the situation when many enterprises do not plan and know their future human resource needs, creating obstacles for the

medium and long-term forecasting of skills needs in the sectors and on the level of national economy. When enterprises use the short-term approaches in human resources planning and management, they avoid to invest in the long-term oriented cooperation with the VET and higher education providers and look for the easiest ways to solve the current shortages of skilled workforce, such as permissions to 'import' the needed workforce from abroad.

Socio-cultural dimension of the mismatches of supply and demand of skills and qualifications in the labour market of Lithuania

Socio-cultural dimension of the mismatches of supply and demand of skills in the economy of Lithuania consists of different patterns of attitudes and behaviour of individuals and stakeholders involved in the processes of employment and education.

One of such important mental patterns is a specific attitude to higher education studies as the essential pathway to the social and economical promotion. The roots of this attitude can be traced back in the mentality of peasants and farmers of the XIXth century, when seeking to ensure better possibilities of social promotion of their children they invested in their education and, particularly, in the education that would helped them to acquire credentials in the respected intellectual professions, such as priest, medical doctor, lawyer etc. This approach was also strong in the first half of the XXth century, during the period of the independent state of 1918-1940. The pathways towards higher education and vocational training played important role in the social structuring of society in this period, causing disbalances in the enrollment of youth to the higher education and vocational education and training. Here is a quotation from the press of that period illustrating this problem:

Our youth seeks for education and science. It is evident from the overly big rush and congestion of youth to the gymnasiums and other schools of general education. Maybe also the craft schools could be similarly congested, maybe there would be even bigger possibilities to choose the education, if there would be established suitable schools specialised in (vocational) education. Today in the crafts schools of Kaunas learn mostly the children from the poor families, while normally crafts schools should attract also the children from the middle class families (Andriūnas, 1935, own translation).

In the Soviet system the provision of education and qualifications was totally subjugated to the requirements of centrally planned economy. One of the roles of education system was to prepare, sort and distribute the human resources according to the needs and requirements of economy. The official propaganda and certain cult of workers' work and occupations, as well as wage policy favouring skilled workers did not significantly changed the traditional attitude to the higher education and vocational training. The pathway to higher education was still considered as the one leading to more decent and perspective employment and occupations. However, the Soviet period has more serious impact on the abilities of people to analyse own possibilities in the system of occupations, because these functions were undertaken by the mechanisms of central planning of the passive masses of workforce. One of the legacies of the Soviet period is negative cultural attitude to

the idea of planning and forecasting of the needs of skills and qualifications, as an intervention of state to the freedom of choice of individuals.

Collapse of the Soviet system and transition to the free democratic society and market based economy facilitated significant increase of the consideration of individual freedom and market needs in the fields of education, employment and human resource management. Discredited approaches of centralised planning and forecasting of human resources were replaced by the idea of the respect of individual preferences and needs of market economy. Higher education again became to be considered as a more secure and prospective pathway to more promising jobs and careers. Transition to the market economy nurtured a lot of different expectations and promises of higher employment quality and career in the certain fields of training and studies and sectors of activities. The typical example here is the fast increase of popularity of business and management studies. Provision of these studies facilitated the promises and expectations, that these studies and their provided credentials would open the possibilities for the independent business or career, what was particularly attractive to the post-soviet youth (Aleksandravičius, 2010). It led to the highest enrollments of the youth to the studies of business and management comparing to other fields of studies and, subsequently, to the biggest quantitative and qualitative disballances between the demand and supply of high skills and qualifications. For these reasons the demand and supply of skills and qualifications in the field of business and management was selected for the case study aiming to explore different factors, that influence the disballances.

Case study – demand and supply of skills and qualifications in the field of business and management.

The case study consists of two main parts:

- Research of the quantitative aspects of the supply and demand of managerial skills and qualifications based on the analysis of statistical data and survey of students.
- Research of the qualitative aspects of the supply and demand of managerial skills and qualifications based on the comparative analysis of the contents of provided qualifications and the needs of enterprises.

Quantitative aspects of the supply and demand of managerial skills and qualifications

Statistical data evidence, that management studies has attracted the biggest numbers of students in the all levels of higher education (see table No.2). It results into excessive supply of graduates into labour market and the over-qualification in their employment.

Comparing these data to the statistics of the employment in the positions of managers and professionals (table No. 3) there can be noticed important disproportions between the supply of graduates in the field of business and management. The ratio between total cohort of students in 2010-2011 (50567) and the total number of employees in the positions of managers and professionals is 12,7%.

Years	2005-2006	2006-2007	2009-2010	2010-2011

<i>Employees by major group of occupations and economic activities 2011 Q4</i>	<i>Total all NACE branches, thousands</i>	<i>Percentage</i>
<i>Total by occupation</i>	1231,8	100
<i>Managers</i>	97,1	7,9
<i>Professionals</i>	300,6	24,4
<i>Technicians and associate professionals</i>	153	12,4
<i>Clerical support workers</i>	52,8	4,3
<i>Service and sales workers</i>	165,2	13,4
<i>Skilled agricultural, forestry and fishery workers</i>	13,5	1,1
<i>Craft and related trades workers</i>	179,2	14,5
<i>Plant and machine operators, and assemblers</i>	162,3	13,2
<i>Elementary occupations</i>	104,7	8,5
<i>Armed forces occupations</i>	3,5	0,3

Table No.3: Number of employees and their share by major groups of occupations and economic activities 2011 Q4. Source: Statistics Lithuania (<http://www.stat.gov.lt>)

Despite of that, there is still the job vacancy rate in the employment positions of managers, although it is one of the lowest compared to other occupations (table No.4). The reasons of this job vacancy rate in the positions of management consist of the socio-economic factors (such as lack of attractiveness of certain managerial jobs in the national labour market due to the low rewards or career possibilities), as well as of the inconsistencies and mismatches between the acquired skills and competences and the needs of labour market.

There was executed survey of the 4th year bachelor degree students of one University Business School in Lithuania by surveying 133 students studying international business and management. The

goal of survey was to explore the present and future relationships of students with the national labour market.

This survey disclosed the following factors influencing supply of qualifications in the field of business and management:

1. Strong attachment of students to the national labour market and rather low intentions to establish and develop own business. Bigger share of surveyed students (90,2%) expressed their intention to search for employment in Lithuania after the graduation, but 43,6 % of respondents indicated, that they are ready to search for the job abroad, if they will not find the satisfactory employment position in Lithuania according to their acquired qualification. 44,4% of respondents indicated, that if they will not find the job according to their acquired qualification, they will be ready to accept any employment position in Lithuania, but not to look for more suitable job abroad. Only 1,5 % of respondents expressed firm intentions to establish their own business. These factors are favourable for the further development of disproportions between the demand and supply of business and management qualifications by increasing supply of business and management graduates seeking for employment.

<i>Job vacancy rates 2011</i>	<i>Total by employees</i>
<i>Total by occupation</i>	<i>0,9</i>
<i>Managers</i>	<i>0,4</i>
<i>Professionals</i>	<i>0,8</i>
<i>Technicians and associate professionals</i>	<i>0,7</i>
<i>Clerical support workers</i>	<i>0,6</i>
<i>Service and sales workers</i>	<i>0,8</i>
<i>Skilled agricultural, forestry and fishery workers</i>	<i>0,2</i>
<i>Craft and related trades workers</i>	<i>1,3</i>
<i>Plant and machine operators, and assemblers</i>	<i>1,6</i>
<i>Elementary occupations</i>	<i>0,6</i>
<i>Armed forces occupations</i>	<i>0,5</i>

Table No.4: Job vacancy rates by major groups of occupations in 2011

Source: Statistics Lithuania (<http://www.stat.gov.lt>)

2. Mismatch between the intentions of international career of students and the trends of industrialization of Lithuanian enterprises. Those respondents who did not rejected the possibility to search for the job abroad were asked about their preferences of target countries for job search. Their responses indicate, that the most preferred target countries for job search abroad are the United Kingdom, Norway, the USA, Germany, Australia and Denmark. Only very few respondents indicated the neighbouring countries (Russia, Estonia, Bielorrussia) where the Lithuanian enterprises are the most active in the international expansion of their activities. Today only in the neighbouring Latvia we can find about 1300 Lithuanian enterprises. The enterprises of Lithuania expand their activities to the neighbouring countries (Latvia, Poland, Kaliningrad District of Russian Federation), as well as Ukraine, Bielorrussia, Georgia, Kazakhstan. Here we notice important differences between the

directions of international development of Lithuanian enterprises and the geography of the intentions of employment of the future graduates of international business management. Only 10,5% of respondents indicated, that they would be interested to work in the Lithuanian enterprise abroad (63% of respondents indicated that they never considered such possibility).

3. Uneven spatial distribution of skilled specialists in the field of business management. Majority of the surveyed students (65%) indicated that they intend to work only in the capital city Vilnius. Only 9,7% of respondents (13) indicated, that the wage level for them is more important factor than the location of enterprise and only 5,2% of respondents indicated that the interesting work would be more important for them than the location of enterprise. These intentions can be explained by the concentration of international enterprises in Vilnius and can provide one of the explanations of the existing job vacancy rate in the positions of management – enterprises in the smaller cities and towns face important difficulties to attract young management specialists. It also contributes to the stagnation of the mismatches between demand and supply of managerial skills and qualifications in the labour market, because the competition for the employment is concentrated in one or several cities and the employment, career and independent business opportunities in other regions are not used.

Qualitative aspects of the supply and demand of managerial skills and qualifications

This part of case study presents the results of the following researches:

- Research of the management skills needs and requirements of enterprises based on the analysis of the data on the applications of enterprises sent to the career centre of one University Business School searching for the specialists of business and administration.
- Comparative research of the descriptors of degrees and qualifications provided by the higher education institutions and requirements of enterprises disclosed in the previous research.

Analysing of the data on the applications of enterprises sent to the career centre there can be distinguished the following structure of demanded qualifications in business and administration (in terms of qualifications levels):

- assistants of managers or business specialists (trainees);
- specialists and functional managers;
- advanced level managers and specialists.

The contents of these qualifications can be analysed by grouping the requirements to competences of selected qualifications in the categories of knowledge, skills and key skills and competences. Such grouping of the requirements of qualifications reflects currently dominant grouping of the learning outcomes and the structure of the European Qualifications Framework for Lifelong learning (Winterton, 2009). Further there are presented the results of this analysis.

Assistants of managers or business specialists (trainees)

<i>Fields of activities and qualifications</i>	<i>Description of level requirements</i>		
	<i>Knowledge</i>	<i>Skills</i>	<i>Key skills and competences</i>
<i>Insurance Assistant of insurance broker</i>	<i>Basic knowledge of internal audit.</i>	<i>To be able to perform the basic functions of internal financial audit.</i>	<i>Search of information and data. Fluent written and oral communication in native and foreign language. Basic PC skills.</i>
<i>Distribution of electric energy Assistant in debt management</i>	<i>Basic knowledge of financial management.</i>	<i>To control the payments. To analyse the data about payments. To perform other auxiliary functions in the pretrial recovery.</i>	<i>Analytical skills. Communication skills.</i>
<i>Tourism services Assistant of the organiser of international tourism services</i>	<i>Basic knowledge of tourism services and their management.</i>	<i>To manage of provision of outgoing tourism services. To work with the groups of tourists in the foreign resort cities (in Greece and Turkey).</i>	<i>Communication skills. Problem solving skills. Foreign languages.</i>
<i>Production of food and beverages Assistant of production manager</i>	<i>Basics of management and administration. Knowledge of performance assessment.</i>	<i>To analyse the data of production performance. To systemise and compare different criteria of assesment. To prepare the presentation of results of analysis.</i>	<i>Analytical thinking. Creativity.</i>
<i>Retail trade Assistant of human resource manager</i>	<i>Knowledge of human resource management and development.</i>	<i>To search for potential candidates. To administer the data of recruitment and training of staff. To search for the training suppliers.</i>	<i>Communication skills. Foreign language skills. Problem solving.</i>
<i>Transport services Assistant of department manager</i>	<i>Basics of management.</i>	<i>To assist the management of technical department. To work with the accounting system.</i>	<i>Problem solving. Analytical thinking.</i>
<i>Construction Assistant in the financial analysis department</i>	<i>Marketing knowledge. Management knowledge. Knowledge of financial management.</i>	<i>To collect information about markets, products, competitors. To apply the data of analysis in seeking to increase effectiveness of performance of enterprise. To prepare and analyse business plans. To execute the management accounting to analyse the activities of enterprises and prepare reports. To prepare the budgets, control and analyse the deviations. To control processes and procedures. To control the usage of assets.</i>	<i>Analytical thinking. Problem solving skills. Communication skills.</i>

<p><i>Construction Assistant in the marketing and sales department</i></p>	<p><i>Real estate marketing. Market research and forecasting. Commercial law</i></p>	<p><i>To look for new customers to the projects of real estate (sale of appartments, rent of appartments). To prepare commercial offers. To organise marketing projects in Lithuania, Latoia, Ukraine. To analyse the costs and benefits of marketing measures. To analyse the data on the real estate market, sales results and forecasts. To prepare and manage the sales and rent documents .</i></p>	<p><i>Analytical thinking. Problem solving skills. Communication skills</i></p>
--	--	--	---

According to the level of requirements to knowledge, skills and key skills this group of demanded qualifications is not homogenous. The main feature that is common to all these qualifications is that they refer to work under the certain supervision and (sometimes) with the assistance of higher qualified and (or) more experienced managers and specialists in order to get practical know-how, skills and experience. For this reason the requirements to knowledge in many cases are focused on the application of basic (background) knowledge of related field and required skills concern very concrete and clearly defined work tasks and functions. However the level of requirements to knowledge and skills, the complexity of work objectives and the level of autonomy and discretion of performance is rather diverse and depend on the type of activity. In some cases the requirements are more focussed on the application of the different key skills and competences (assistant of the organiser of international tourism services), while in others the main focus is on the complex special knowledge and skills application (assistant in the financial analysis department, assistant in the marketing and sales department). The analysis of the applications of enterprises disclosed increasing demand for the assistants (trainees) of managers and business specialists. There can be proposed several assumptions for the explanation of this trend. Big supply of the graduates of business and management in the labour market enhances the enterprises to apply different measures in order to ,filter' this supply and to find the best suitable cadidates. Offering the position of assistants and trainees is one of such ,filtering' measures. In some cases (for example, in cases of the small and medium enterprises) this way of recruitment of graduates is preferred, because it permits to economise the wage costs, or to ,prepare' the specialists according to specific requirements of the enterprises.

Specialists and functional managers

<i>Fields of activities and qualifications</i>	<i>Description of level requirements</i>		
	<i>Knowledge</i>	<i>Skills</i>	<i>Key skills and competences</i>
<i>Transport and logistics Sales manager of transport services</i>	<i>Basics of management. Basic knowledge of business organisation.</i>	<i>To search for the new customers in the Western Europe and/or Russia. To present the offered transport services. To communicate with the customers and partners. To cooperate with colleagues and customers in solving the problems arising during the transportation.</i>	<i>Communication skills. Problem solving skills. Pro-activeness.</i>
<i>Transport and logistics Manager of expedition services</i>	<i>Basic knowledge of business organisation.</i>	<i>To search for the transport companies (forwarders) for the transport of ordered cargo's. To negotiate and order the services of freight. To organize international freight deliveries. To control the work of forwarders.</i>	<i>Communication skills. Problem solving skills. Pro-activeness.</i>
<i>Production of CD and DVD discs Sales manager</i>	<i>Basics of marketing. Basics of business law.</i>	<i>To search for new customers in Lithuania and abroad. To analyse the customers' needs. To conclude and execute the contracts.</i>	<i>Communication skills. Analytical skills.</i>
<i>Shipping services Operations manager</i>	<i>Basic knowledge of shipping business. Shipping documents and legal regulation.</i>	<i>To organise and coordinate consolidated cargo shipping. To work with the shipping documentation and applied information systems.</i>	<i>Foreign languages. Problem solving skills. Information search skills.</i>
<i>Information management and archiving Sales manager</i>	<i>Knowledge of business management.</i>	<i>To search new customers. To work with the current customers. To analyse the customers needs. To conclude the contracts and control their execution.</i>	<i>Communication skills. Analytical thinking. Problem solving skills.</i>
<i>Rent of real estate Sales manager</i>	<i>Business management</i>	<i>To manage the tenants of shopping centres and search for the new tenants. To administer and manage the concluded contracts. To intermediate by concluding the agreements on rent and sale of the commercial property.</i>	<i>Communication skills. Negotiation skills. Problem solving skills.</i>
<i>Law consulting Manager</i>	<i>Business management Business law</i>	<i>To execute recovery of debts. To execute acquisition and selling of debts. To execute the acquisition and selling of enterprises. To search for new customers.</i>	<i>Communication skills. Negotiation skills. Problem solving skills.</i>
<i>Radio station Publicity sales manager</i>	<i>Publicity and public relations. Marketing. Business administration and management.</i>	<i>To organise the projects of publicity. To sell and coordinate provision of publicity. To maintain long-term relationships with business customers. To search for the new customers. To negotiate with customers To plan and organise the sales of publicity and</i>	<i>Communication skills Abilities of management of information and data Problem solving skills.</i>

		<i>promotion services.</i>	
<i>Commercial bank Insurance consultant</i>	<i>Knowledge of insurance business. Financial management.</i>	<i>To search for the new customers. To sell the services of life insurance. To maintain long-term relationships with customers.</i>	<i>Communication skills. Problem solving. Openness. Persuasiveness.</i>
<i>Railway transport and logistics Accountant</i>	<i>Financial accounting knowledge</i>	<i>To communicate on the issues of accounting with the customers in Lithuania and abroad. To control the accounts and to administer the debts. To issue the invoices. To manage the accounting documents. To prepare the reports.</i>	<i>Problem solving. Communication skills. Information management skills.</i>
<i>Insurance Accountant</i>	<i>Financial accounting Knowledge.</i>	<i>To register the insurance contracts to the database. To scan the contracts of insurance. To prepare the reports. To account the insurance installments by working with cashier and Navision programme.</i>	<i>Search of information and data. Fluent written and oral communication in native and foreign language. PC skills.</i>

The requirements for the specialists and functional managers are related to autonomous execution of the different functions of commercial and business management activities. However, looking to the requirements for the application of knowledge and skills, there can be noticed, that the activities of these specialists require specific functional know-how and skills, as well as different sets of key skills and competences. This knowledge, skills and competences are focused on the functions and tasks of organising of business activities, search of customers, communication with customers and partners, etc. The focus on the function specific know-how creates high requirements of the practical experience for the candidates wishing to occupy these positions. However, it also provides more possibilities to apply for these positions to the candidates, who acquired required knowledge, skills and competences in the informal or non-formal ways (through work experience). Some qualifications requirements of this category can be satisfied by the knowledge, skills and competences provided in the higher vocational colleges or even in the initial vocational schools and training centres. There can be presumed, that the 'overqualification' of candidates is quite typical for this level of job-positions and qualifications requirements in the field of business and management.

Advanced level managers and specialists

<i>Fields of activities and qualifications</i>	<i>Description of level requirements</i>		
	<i>Knowledge</i>	<i>Skills</i>	<i>Key skills and competences</i>
<i>Lighting technologies Sales manager</i>	<i>Knowledge of advanced marketing methods and techniques. Business and management knowledge.</i>	<i>To organise the export of the LED lighting technologies for publicity. To cooperate with the producers of publicity materials and agents. To ensure continuing growth of the market share. To search for the new customers. To search for the new product niches and channels of sales. To prepare the offers and contracts for tenders.</i>	<i>Communication skills, foreign languages, problem solving and decision making skills.</i>
<i>Sales of health and beauty products Marketing manager</i>	<i>Comprehensive knowledge of marketing processes. Business and management knowledge.</i>	<i>To organise and coordinate the introduction of new product in the market. To design the marketing strategy of the enterprise. To take care of the corporate image. To write promotional articles. To participate in the international exhibitions. To survey local and foreign markets. To organise marketing events.</i>	<i>Communication skills, foreign languages, problem solving and decision making skills.</i>
<i>Real estate agency Broker</i>	<i>Real estate management and marketing knowledge.</i>	<i>To assess the value of real estate. To design and implement the strategy of sales of real estate objects. To organise and perform negotiations. To organise the inspection of real estate.</i>	<i>Analytical thinking Communication skills. Problem solving skills.</i>

This category of the needed qualifications discerns itself by focus on high skills in the field of business management. The work requirements concern the strategic work processes and objectives in the enterprises. The work objectives are wide and multifunctional, requiring to apply knowledge and skills from the different fields of business management, commerce, marketing and other fields.

Qualitative features of the supply of specialists in business management can be disclosed by analysing the descriptors of degrees and qualifications provided by the higher education institutions. For this reason we have selected several descriptors of the degrees and qualifications from the national on-line database of qualifications, training and study programmes - Open Information Counselling and Guidance System (in Lithuanian - *Atvira informavimo konsultavimo ir orientavimo sistema*) that can be found on the web-site <http://www.aikos.smm.lt>.

For this analysis there were selected descriptors of degrees and qualifications of the three levels:

- qualification provided by the higher vocational education colleges (universities of applied sciences) referenced to the level 6 of the Lithuanian Qualifications Framework (LTQF) and the level 6 of the European Qualifications Framework for Lifelong Learning (EQF);
- bachelor degree provided by the universities and referenced to the level 6 of the LTQF and the level 6 of the EQF;
- master degree provided by the universities and referenced to the level 7 of the LTQF and the level 7 of the EQF.

These descriptors are compared to the above analysed descriptors of the requirements of enterprises seeking to detect the match (or mismatch) of the level of required and provided competences. This level is defined by the complexity of work processes and their required competences, scope of work processes and applied competences in terms of their width (wide, inter-sectoral work processes, application of interdisciplinary knowledge and skills versus narrowly specialised work tasks requiring specialised knowledge and skills) and level of work objectives (operative, workplace, strategic).

The comparison is made by grouping the descriptors of qualifications and requirements of employers in the following way :

- Descriptors of employers' requirements for assistants of managers or business specialists (trainees) are compared to the descriptor of qualification of the specialist of international management provided by the higher vocational education institutions (vocational bachelor qualification).
- Descriptors of employers' requirements for functional (middle level) managers and specialists are compared to the descriptor of competences from the bachelor degree in business management provided by the universities and universities' business schools.
- Descriptors of employers' requirements for advanced level (higher level) managers and specialists are compared to the descriptor of competences from master degrees in business and international business.

The comparison in the each of groups is structured in three parts: comparison of cognitive competences (knowledge application), functional competences (skills) and general competences (key, extrafunctional skills and competences).

Comparison of the qualification descriptor of the specialist of international management provided by the higher vocational education institutions (vocational bachelor qualification) with the descriptors of employers' requirements for assistants of managers or business specialists (trainees)

Cognitive competences (knowledge application)

<i>Descriptor of qualification of the specialist of international management provided by the higher vocational education institutions (vocational bachelor qualification).</i>	<i>Employers' requirements for assistants of managers or business specialists (trainees)</i>
<p><i>To discern the specific features of international business.</i></p> <p><i>To apply the knowledge of the trends of development of Lithuanian economy.</i></p> <p><i>To apply the knowledge of legal acts regulating the chosen field of activities, general legal order of establishment of enterprises in Lithuania and requirements of labour law.</i></p> <p><i>To apply the knowledge of the design of business plan of international company or it's department.</i></p> <p><i>To apply the knowledge of the methods of market research.</i></p> <p><i>To apply the knowledge of designing of strategy of activities.</i></p> <p><i>To apply the knowledge of marketing and international marketing.</i></p> <p><i>To apply the knowledge of quality management standards, work safety requirements.</i></p> <p><i>To apply the basic knowledge of human resource management, motivation theories, remuneration forms.</i></p> <p><i>To apply the knowledge of economically useful funding sources, types of financial analysis.</i></p> <p><i>To apply the knowledge of the principles and forms of business development in the foreign markets, rules of international trade, principles of inter-cultural communication and ethical norms.</i></p>	<i>To apply the basic knowledge of the different fields of business and management (business organisation, management, business law, audit, financial management, marketing, etc.)</i>

This comparison discloses, that the scope of knowledge foreseen in the profile of qualification of business and management in the higher vocational education institutions is much wider than the employers requirements for assistants of managers and business specialists. The knowledge foreseen in the profile of qualification cover wide range of business and management processes, some of them even on the strategic level (eg., the knowledge of the design of business plan of international company or it's department, the knowledge of designing of strategy of activities, etc.), while the employers requirements to cognitive competences of assistants of managers or business specialists are more focused on the concrete methodical and instrumental knowledge used in dealing with the different tasks. It can have several implications to the mismatches of qualifications and skills in this field. Acquisition of the wide, comprehensive and systemic knowledge can foster effective further development of the tacit knowledge acquired in the practice of the management assistance activities. It also contributes to the higher self-confidence of the young employees and enhances their creativity. Recent researches disclosed, that the employers notice increasing creativity and initiativeness of the graduates of higher vocational colleges (Nazelskis, Tütlys, 2011). However, there can be the cases, when the employers' requirements for the knowledge of assistants of managers or business specialists are considerably lower than foreseen by the profile of qualification of business and management in the higher vocational education institutions and such workplaces can be occupied by the graduates of vocational schools and training centres. Looking to the profiles and curricula of the vocational schools and training centres in Lithuania there can be noticed quite big attention to the provision of

knowledge of business and management and there are provided many vocational qualifications which include managerial competences (for example, organiser of the small and medium business).

Functional competences (skills)

<i>Descriptor of qualification of the specialist of international management provided by the higher vocational education institutions (vocational bachelor qualification).</i>	<i>Employers' requirements for assistants of managers or business specialists (trainees)</i>
<p><i>To establish the international enterprise.</i></p> <p><i>To design the organisational management structure of international business enterprise.</i></p> <p><i>To prepare and implement the business plan.</i></p> <p><i>To plan and execute the research of international market.</i></p> <p><i>To use the IT in processing and interpreting the business information.</i></p> <p><i>To plan the activity of enterprise or its department.</i></p> <p><i>To monitor and assess the performance of enterprise activities.</i></p> <p><i>To react to the changes of international market by making managerial decisions.</i></p> <p><i>To manage and rationally exploit available resources.</i></p> <p><i>To organise continuous process of enterprise's (department) activities.</i></p> <p><i>To control the quality of activities, to manage the staff.</i></p>	<p><i>To be able to perform the basic and auxiliary functions of the different management activities in the enterprise (internal financial audit, auxiliary functions in the pretrial recovery).</i></p> <p><i>To manage and control separate relatively simple processes of enterprise activities (to control the payments, to search for potential candidates, to search for the customers and suppliers).</i></p> <p><i>To collect and analyse information needed for the performance of concrete activities in the enterprise (to analyse the data about payments, production performance, markets, products, competitors, recruitment and training of staff, etc.)</i></p> <p><i>To execute different functions related to communication (with customers, providers, colleagues, employees etc.).</i></p>

The skills foreseen in the descriptor of qualification of the specialist of international management provided by the higher vocational education colleges significantly differ from the employers requirements for assistants of manager and business specialists. Skills outlined in the profile of qualification are oriented to the execution of more complex managerial and business activities demanding higher responsibility of performer, than just assistance to managers and business specialists by executing different routine functions of auxiliary tasks. For example: *to establish the international enterprise, to plan and execute the research of international market, to react to the changes of international market by making managerial decisions, etc.* Again, it can have different implications. Having in mind the temporary status of assistants, it might happen, that the orientation to the acquisition of rather narrow practical skills and practical knowledge will positively contribute to the overall individual skills profile of the graduate. However, if the work status and contents of the assistants of managers or business specialists in terms of the complexity of tasks and discretion in their execution remains unchanged after the period of traineeship (the employed graduates continue to work in the same position for the long period of time) it will lead to the over-qualification. Similar problems can occur if the graduates after the period of assistance are fired and seek for the new employment in the other institutions. If in the previous work position they could not apply the knowledge and skills acquired in the study process and developed only some narrowly specialised practical skills, there is a

high risk of de-qualification and getting into a track of career that demand lower skills and knowledge.

General competences (key skills and competences)

<i>Descriptor of qualification of the specialist of international management provided by the higher vocational education institutions (vocational bachelor qualification).</i>	<i>Employers' requirements for assistants of managers or business specialists (trainees)</i>
<i>To organise the own work autonomously and responsibly.</i> <i>To communicate with customers.</i> <i>Strategical thinking.</i> <i>To evaluate flexibly the phenomena.</i> <i>Communication skills.</i> <i>Fairness.</i>	<i>Analytical skills</i> <i>Search of information and data</i> <i>Fluent written and oral communication in native and foreign language.</i> <i>Problem solving skills</i> <i>Basic PC skills.</i>

There are no significant differences between the general competences prescribed in the descriptor of qualification of the specialist of international management and the employers' requirements for the general competences of assistants of manager and business specialists.

Comparison of the descriptor of competences from the bachelor degree in business management provided by the universities and universities' business schools with descriptors of employers' requirements for functional (middle level) managers and specialists.

Cognitive competences (knowledge)

<i>Descriptor of bachelor degree in business management provided by the universities and universities' business schools</i>	<i>Employers' requirements for functional (middle level) managers and specialists</i>
<i>To identify and analyse the business problems.</i> <i>To choose suitable methods of quantitative and qualitative research and to apply them in identifying business problems.</i> <i>To collect, analyse, evaluate and interpret the business information.</i> <i>To apply the subject knowledge to solve management problems in the enterprise.</i> <i>To choose the tactical actions of problem solving.</i> <i>To forecast the financial results of activities.</i>	<i>To apply the basic and systemic knowledge of the different fields of business and management (business organisation, management, business law, audit, financial management, marketing, publicity, etc.).</i>

The descriptor of bachelor degree in business management provided by the universities and universities' business schools outlines wide range of cognitive competences oriented to the analytical and creative work in the field of management or to development of the own business. The employers requirements are more focused on the application of the different basic and systemic knowledge for work in concrete fields and execution of concrete tasks of business organisation, management, marketing, financial management, publicity, audit, etc. It could foster the employability of the bachelor degree graduates and to increase their adaptability to the changing requirements of enterprises.

Functional competences (skills)

<i>Descriptor of bachelor degree in business management provided by the universities and universities' business schools</i>	<i>Employers' requirements for functional (middle level) managers and specialists</i>
<p><i>To evaluate managerial decisions from the ethical, social, legal and economic perspectives.</i></p> <p><i>To analyse and evaluate the main economic indicators.</i></p> <p><i>To execute representative empirical research by adapting it's outcomes in the decisions of the enterprise activities.</i></p> <p><i>To plan the decisions of commerce and marketing in the national and international markets.</i></p> <p><i>To plan and organise material, financial and human resources.</i></p> <p><i>To apply managerial thinking and analytical logical thinking in the practical activity.</i></p>	<p><i>To execute different technical functions of business management in the organisation (to search for new customers, to sell the products and services, to conclude and registre the contracts etc.)</i></p> <p><i>To organise and manage different work processes and projects in the organisation (organize international freight deliveries, organise and coordinate consolidated cargo shipping, to organise the projects of publicity, etc.).</i></p> <p><i>To establish and develop different business communication and public relations processes in the organisation (to communicate with the customers and partners, to manage the tenants of shopping centres and search for the new tenants, to cooperate with colleagues and customers in solving the problems arising during the transportation, etc.).</i></p> <p><i>To execute complex commercial and sales tasks (to execute acquisition and selling of debts, to execute the acquisition and selling of enterprises).</i></p>

There can be distinguished the following differences between the functional competences (skills) outlined in the descriptor of bachelor degree in business management and the employers requirements for functional (middle level) managers and specialists:

- Different levels of skills requirements: the desriptor of degree focuses on the competences related to higher level and highly skilled management activities (research skills, planning of decisions in the international markets, etc.), while the requirements of employers more concern the skills applied in the different functional work tasks typical for middle level managers and specialists (executing technical funtions, organisation of work processes, communication, commercial tasks etc.). It could be favourable in cases when graduates start and develop their own business, but in case of low entrepreneurship and increased competition for high level workplaces on the field of busines and management there is a high risk, that such skills will not be used, when the graduates have to work in much lower qualified position.
- Differences in the skope of functional competences: the desriptor of degree focuses on more transversal functional competences, that can be applied in the different business and management situations, while the requirements of employers are more focused on concrete functional competences needed for the solution of the concrete tasks (*search for new customers, conluding the contracts, organising deliveries, acquisition and selling of debts, etc.*).

General competences (key skills and competences)

<i>Descriptor of bachelor degree in business management provided by the universities and universities' business schools</i>	<i>Employers' requirements for functional (middle level) managers and specialists</i>
<p><i>Analytical thinking, problem solving skills.</i></p> <p><i>Autonomy of performance and action.</i></p> <p><i>Ability to concentrate.</i></p> <p><i>Communication and teamworking skills.</i></p> <p><i>Learning skills.</i></p> <p><i>Abilities to communicate and cooperate with the professionals.</i></p> <p><i>To evaluate critically the results of work.</i></p> <p><i>To adapt to the constant changes in the field of activities.</i></p> <p><i>To define the training needs and to learn.</i></p>	<p><i>Analytical skills</i></p> <p><i>Information management skills</i></p> <p><i>Communication in native and foreign languages.</i></p> <p><i>Problem solving skills.</i></p> <p><i>Learning skills.</i></p> <p><i>PC skills.</i></p>

There are no significant differences between the general competences prescribed in the descriptor of of bachelor degree in business management and the employers requirements for functional (middle level) managers and specialists. Comparison of the descriptor of competences from master degrees in business and international business with the descriptor of employers' requirements for advanced level (higher level) managers and business specialists.

Cognitive competence: knowledge

<i>Descriptor of master degrees in business (and international business)</i>	<i>Employers' requirements for advanced level (higher level) managers and business specialists</i>
<p><i>To apply the knowledge of theoretic models explaining the contents and dynamics of the processes of international business.</i></p> <p><i>To apply the theoretical backgrounds of the interactions between enterprises and markets and corresponding marketing methods.</i></p> <p><i>To apply the methods and measures for further development of skills of international business management.</i></p> <p><i>To apply the forefront disciplinary and interdisciplinary knowledge of economy and management science.</i></p> <p><i>To apply the new knowledge of management acquired through the implemented applied research.</i></p> <p><i>To evaluate the forefront knowledge of business and management and to apply it in practice.</i></p> <p><i>To discover the new facts by executing the applied research in the field of business and management .</i></p> <p><i>To apply the theoretic knowledge and results of scientific research in the constantly changing professional environment.</i></p>	<p><i>Comprehensive and advanced knowledge of the different business and management processes, techniques and methods (marketing, commerce, management, real estate marketing etc.)</i></p>

The main differences between the cognitive competences indicated in the descriptor of master degree descriptor in business and management and employers' requirements for advanced level managers and business specialists concern the orientation to the application of knowledge. The

cognitive competences outlined in the descriptor of master degree in business and management are oriented to the application for research and knowledge based development of business and management in the organisation (discovering new facts and knowledge through applied research, evaluation and usage of the forefront knowledge of business and management, etc.). The employers requirements are more focused on the application of advanced methodical knowledge in solving different complex problems and making decisions in the concrete cases of business management.

Functional competences (skills)

<i>Descriptor of competences from master degrees in business and international business</i>	<i>Employers' requirements for advanced level (higher level) managers and business specialists</i>
<p><i>To analyse the state of international business environment and the trends of it's changes.</i></p> <p><i>To evaluate the possibilities of the company to perform in the international markets.</i></p> <p><i>To design and implement the strategies of international development of enterprises.</i></p> <p><i>To research the markets of other countries and to apply the corresponding marketing actions.</i></p> <p><i>To consult in the field of business organisation and management.</i></p> <p><i>To coordinate the projects of human resource development and implementation of innovations.</i></p> <p><i>To analyse the results of activities and to present them to the audience of different interest groups.</i></p> <p><i>To evaluate interdependent and changing variables of the effectiveness of company performance.</i></p> <p><i>To define the standards of performance.</i></p> <p><i>To make innovative decisions based on the analysis of the activities and management of enterprise by considering the alternative solutions, as well as the social and ethical consequences of activities.</i></p>	<p><i>To implement different technical functions of business management (to search for the new customers, to prepare the offers and contracts for tenders, to participate in the international exhibitions, to organise marketing events, to assess the value of real estate, to organise the inspection of real estate, to organise the export of the LED lighting technologies for publicity, etc.).</i></p> <p><i>To manage the processes of communication in the enterprise (to cooperate with the producers of publicity materials and agents, to organise and perform negotiations, etc.).</i></p> <p><i>To prepare and execute strategical business decisions and processes (to organise and coordinate the introduction of new product in the market, to design the marketing strategy of the enterprise, to design and implement the strategy of sales of real estate objects, etc.)</i></p> <p><i>To manage long-term processes of enterprise performance (to ensure continuing growth of the market share, to search for the new product niches and channels of sales, to take care of the corporate image, etc.).</i></p>

The functional competences outlined in the master degree descriptor are more focused to the exploration (applied research), strategic management, consultancy and project management functions in the enterprises and organisations. The requirements of employers for functional competences are more focused on the execution of the management tasks and enterprise performance processes of different complexity, including the strategic tasks and processes. The functional competences indicated in the descriptor of degree are of wider focus (eg., *international business environment, international markets, social and ethical aspects of business decisions*).

General competences (key skills and competences)

<i>Descriptor of competences from master degrees in business and international business</i>	<i>Employers' requirements for advanced level (higher level) managers and business specialists</i>
<p><i>Analytical, systemical, creative and critical thinking.</i></p> <p><i>Initiativeness, problems solving and teamworking skills.</i></p> <p><i>Ability to cooperate with the representatives of other organisations and to learn from their experiences.</i></p> <p><i>Critical assessment of new ideas, social norms and relationships.</i></p> <p><i>Ability to adapt to constantly changing situations of activities.</i></p> <p><i>Independent and planned learning abilities.</i></p> <p><i>Skills development and continuing learning abilities.</i></p> <p><i>Self-organisation.</i></p> <p><i>Goal-orientation.</i></p> <p><i>Readiness to accept responsibility.</i></p>	<p><i>Analytical thinking.</i></p> <p><i>Communication skills.</i></p> <p><i>Foreign languages.</i></p> <p><i>Problem solving and decision making skills.</i></p> <p><i>Pro-activeness and initiative taking abilities.</i></p> <p><i>Creativity and open mindedness.</i></p>

The general competences outlined in the master degree descriptor are more oriented to the independent development of skills and competences of managers and adaptation to the changes of business environment and processes, while the requirements of employers to general competences are more focused on the performance of managers activities.

In concluding this comparative analysis there can be stated, that:

- The competences foreseen in the descriptors and profiles of qualifications and degrees of business administration are more holistic, transversal and oriented to wider fields of activities, than the requirements of employers, that are more focused on the execution of the concrete tasks and objectives of management and business development.
- The differences between the competences foreseen in the descriptors and profiles of qualifications and degrees of business administration can have different impacts to the over-supply of graduates with the different degrees of business and management in the labour market. Wide and extra-functional cognitive and functional competences increase the employability of the graduates and help to find employment in the different fields. Successful acquisition of the specialised practical know-how and skills in the beginning of career in the enterprises and their integration with the competences acquired in the study institutions can lead to the successful career of future managers and improvement of the business performance of the enterprises. However, the over-supply of candidates enhances the enterprises to apply different human resource selection and recruitment measures and techniques for the selection of the best – the example can be the increasing demand assistants (trainees) in the different positions related to business and management.

Conclusions

The mismatches of demand and supply of skills and qualifications in the transitional economies are shaped by the complex combinations of factors related to the specificities of economic development, political economy of skills demand and supply and socio-cultural attitudes to skills and qualifications in these economies. Institutional legacy of the centralized planned economy, instability of transitional economic situation, low productivity, inherited big share of highly educated and skilled workforce, and the processes of workforce emigration create the complex combination of economic factors enhancing the existing disbalances between the demand and supply of skills and qualifications. Domination of shareholder capitalism model, short-term orientation of the enterprises to human resource planning and development can be regarded as important political-economical factors contributing to the mismatches of demand and supply of skills in Lithuania. Mental approaches to the acquisition of skills and qualifications are influenced by the above mentioned factors, as well as by the specific influences of the different historical conditions.

The case analysis of mismatches of demand and supply of skills and qualifications in the field of business and management disclosed several important issues:

- Continuous big flow of youth to the business and management studies together with low level of entrepreneurship and orientation only to the most attractive workplaces and careers result into “opportunity trap” and high volumes of de-qualification. These phenomena deserve to be explored in more detailed and comprehensive way.
- The orientation of the descriptors and profiles of qualifications and degrees of business and management to wide and extra-functional cognitive and functional competences can have different implications to the development of existing mismatches of qualifications and skills in this field. It can have positive effects to the employability of the graduates helping them to find employment in the other fields of activities. However, it does not permit to youth to understand the real needs of enterprises in the competences of business and management and cope with the stereotypes leading to the expectations of managerial careers, that have nothing in common with the realities of labour market.

Abstract

Innovation and Entrepreneurship are considered as the most significant processes for economic growth, productivity and employment. While knowledge becomes an increasingly important part of innovation, the accumulation of knowledge through learning constitutes a driving force in the development and growth (Penrose, 1959; Spender and Grant, 1996). In this view regions and countries function as collectors and repositories of knowledge and ideas and provide an underlying environment or infrastructure which facilitates the flow of knowledge, ideas and learning. Therefore in understanding the dynamics and the potentialities of regions and countries to promote innovative entrepreneurship, it is essential to envisage the knowledge based assets of countries that represent the source of competencies and capabilities that are deemed essential for economic growth and competitive advantage (Malhotra, 2001). The purpose of paper is to assess those knowledge assets that could contribute in the creation of innovative entrepreneurship in Balkan countries. The assessment is based on a conceptual framework in which the intangible knowledge assets comprise three main sub-components that include human capital, social /market capital, structural and renewal capital.

Keywords: Innovative Entrepreneurship. Knowledge assets, Economic development.

INTRODUCTION

Innovation and Entrepreneurship are considered as the most significant processes for economic growth, productivity and employment. They are currently the most discussed areas by researchers, academics and politicians for the regional development policies. Most policymakers and academics agree that entrepreneurship and innovation are critical to the development and well-being of society thanks to their contribution related to jobs creation, to speeding up structural changes in the economy as well as to contribute indirectly to productivity through the introduction of new competition (GEM 2010). Entrepreneurship is thus a catalyst for economic growth and national competitiveness (GEM, 2010) and it represents also the main development priority fixed by the EU agendas, such as Lisbon agenda which aims to redouble innovative entrepreneurship in Europe. Also other international organizations and associations, such as World Economic Forum, the Babson College with global entrepreneurship monitor, highlight the role of entrepreneurship for economic growth and competitiveness of regions.

The Balkan countries recognize the important role of entrepreneurship and innovation for competitiveness and development but the kind of policies required to encourage innovation and its integration in a wider policy setting have not yet been adequately implemented or understood in the region. The entrepreneurship activity in these countries is mainly efficiency driven, while there is low rate of innovative driven entrepreneurship (GEM, 2010). This could be justified with the fact that most approaches and policies do not fully integrate in a unique policy approach growth, entrepreneurship and innovation.

Integration of innovation policy and entrepreneurship policy is indispensable for realizing high value added growth. The combination of entrepreneurship and innovation results in an holistic framework (Lundström and Stevenson, 2005) that combines entrepreneurship, innovation, science and technology, education/university and regional policies which addresses a range of issues', such as societal support for an entrepreneurship culture; promotion of entrepreneurship; entrepreneurship education in the schools; general administrative, regulatory and legislative barriers to business entry; flexible labour markets; seed and start-up financing; and business support measures for the development of nascent entrepreneurs in their pursuit of any manner of business idea.

Therefore, promoting innovative entrepreneurship is a central concern for government and industry and especially in the Balkan area that is called to reinforce the social and financial structures of its countries and by this to reach the goal of whole integration with the EU and to be able to answer at the challenges of the dynamic and complex environment. This is a priority for the governments that currently have to look for remedies of the economic crisis and methods to safeguard the long-run viability national economies. Most researchers and practitioners converge on the fact that the central set of resources that appear to be key to the success is the ability to turn knowledge, skills and competencies into sustainable advantage. Therefore in understanding the dynamics and the potentialities of regions and countries to promote innovative entrepreneurship, it is essential to envisage the knowledge based assets of countries that represent the fount of competencies and capabilities that are deemed essential for economic growth and competitive advantage (Malhotra, 2001). In the subsequent section we provide an overview of the framework and metrics that we adopted in this study for analyzing the dynamics of knowledge assets in the Balkan countries.

THEORETICAL BACKGROUND

Creating the appropriate environment in which innovative entrepreneurship can occur requires a complex mix of policies and the consideration of a myriad of interlinking of economic, social and legal issues. Isenberg (2011) proposes 6 main components of such an entrepreneurship ecosystem that range from a conducive culture, enabling policies and leadership, availability of appropriate finance, quality human capital, venture-friendly markets for products, and a range of institutional and infrastructural supports. This accounts for the growing need to consider innovative entrepreneurship as a complex process that needs to consider the interaction among social, cultural, economic and technological factors that take place at the local, national levels as well as transnational level.

However, as Venkataraman (2004) argues, most researchers have focused on the tangible elements such as legal systems, telecommunications, transportation etc. While favorable legal systems, capital markets and other infrastructure facilities are *necessary* ingredients of transformative entrepreneurship, more important is a change in the set of interrelated intangibles (Venkataraman, 2004). He, also, argues that while governments, in different regions and countries, try to change tangible things such as legal framework, capital markets, seed capital, in order to promote entrepreneurship and development just some flourish and prosper. Large number of studies and research had focalized on understanding the failure of different regions around the world to replicate the Silicon Valley experience, even after ensuring free flows of capital skilled labor and technology (Saxenian, 1990). Most researchers and practitioners converge on the fact that the central set of resources that appears to be key to the success is the ability to turn knowledge, skills and competencies into sustainable advantage. Knowledge becomes an increasingly important part of innovation and the accumulation of knowledge through learning constitutes a driving force in the development and growth (Penrose, 1959; Spender and Grant, 1996). Therefore, in understanding the dynamics and the potentialities of regions and countries to promote innovative entrepreneurship, it is essential to envisage the knowledge based assets of countries that represent the fount of competencies and capabilities that are deemed essential for economic growth and competitive advantage (Malhotra, 2001). Boisot (1998) notes that knowledge assets are manifested in terms of technologies, competencies and capabilities. Furthermore, social networks and strong patterns of collaboration among industry consortia, university linkages and government agencies emerge to be as key factors to improving the conditions for innovation, productivity, and wealth in a Knowledge-based society (Campbell, 2005; Campbell, Koski, & Blumenthal., 2004, Etzkowitz, 2003). Saxenian (1990) demonstrate the importance of social networks and relationships for fostering the recombination of skills, competencies and technologies in new enterprises (e.g Silicon Valley case). The collaboration with universities and R&D laboratories is essential as they are incubators of knowledgeable individuals which could bring novel ideas for development (Venkataraman, 2004). The importance of these patterns of collaboration is highly demonstrated with the high level of innovation and entrepreneurship that had flourished around Silicon Valley and some regions in the USA and other parts of the world with extraordinary universities at their core (Venkataraman, 2004).

Following this, we aim to provide a set of data that sketches out the main dynamics of these issues for Balkan countries in order to grasp out the progress done toward the creation of favorable environment for innovative entrepreneurship.

FRAMEWORK OF RESEARCH

Using the dataset of World Economic Forum, we focalize on those indicators that represent the knowledge assets of countries. Since 2005, the World Economic Forum has based its competitiveness analysis on the Global Competitiveness Index (GCI) which has as the primary objective to provide insight and stimulate discussion among all stakeholders on the best strategies and policies to

overcome the obstacles to improved competitiveness. The GCI is a comprehensive tool that measures the microeconomic and macroeconomic foundations of national competitiveness by measuring 12 pillars of competitiveness: Institutions; Infrastructure; Macroeconomic environment; Health and primary education; Higher education and training; Goods market efficiency; Labor market efficiency; Financial market development; Technological readiness; Market size; Business sophistication; Innovation.

We aim to provide a snapshot of the state of the art of knowledge assets of Balkan countries and their dynamics in time (2008-2011), by focalizing on three main elements: human capital, social capital and structural capital in a time horizon of 4 years from 2008 to 2011.

Human capital is defined as the knowledge, education and competencies of individuals in realizing national tasks and goals (Bontis, 2004). It includes knowledge, wisdom, expertise, intuition and the ability of individuals to realize national tasks and goals. Human capital is the property of individuals, it cannot be owned by the [organization or] nation (Malhotra, 2001). It comprises the educational system, the quantity and quality of a nation's educated people. The measurement of this factor is essential as the innovation and competitiveness of countries requires a strong contingent of highly educated people as well as qualified research scientists and engineers, recruited primarily from universities, to maintain an internal ability to assess and absorb scientific knowledge. These highly trained scientists and engineers bring not only a strong knowledge base and research skills, but also a network of formal and informal academic contacts acquired during their training. Therefore educational system and quality of research and training in universities are essential for creating the required human capital. Educational systems do not only produce codified knowledge and human capital, but also participate actively as important institutional actors in building and sustaining local networks and flows of knowledge, and in linking them with global ones. While the presence of a leading research university in a community is a critical asset for regional economic development, its precise contribution is a function of the way in which it interacts with and responds to the needs and interests of local industry (Doutriaux, 2003). However, formal education is not sufficient, instead ongoing training and lifelong learning are essential for coping with a rapidly changing environment (Bontis, 2004). A number of recent studies have begun to identify the finding and retaining of existing talents as a critical factor influencing the growth of dynamic regional economies, and universities are emerging not only as key generators, but also as attractors of talent (Florida, 1999; Betts and Lee, 2005). Florida (2002) found that experienced Executives will locate where other highly skilled people are. Therefore, the brain drain measure is important for understanding the retention rate of skilled people in the country, as a necessary condition for new ventures.

Based on these the measurement of the human capital in our study consist in the following measures, extracted from the WEF dataset:

Quality of the educational system; Quality of math and science education; Quality of management schools; Local availability of specialized research and training services; Quality of scientific research institutions; Extent of staff training; Brain drain.

Social capital is broadly defined as an asset that inheres in relations and networks (Leana and Van Buren, 1999). Because the acquisition and exploitation of knowledge are predominantly social processes (Kogut and Zander, 1992), social capital is a critical element in creating difficult to imitate capacities embedded in dyadic and network relationships (Dyer and Singh, 1998). At national level this is named the market capital and is similar to external relational networking and social capital in a micro setting in that it represents a country's National intellectual capital. Social capital encompasses many aspects of a social context, such as social ties, trusting relations, and value systems that facilitate actions of individuals located within that context (Tsai and Ghoshal, 1998). The locus of innovation is found in a network of interorganizational relationships (Zajac & Olsen, 1993; Powell, Kogut & Smith-Doerr, 1996) allowing firms to access other's resources, increase the possibility of firms to acquire new knowledge and as result to develop new products, services, new distribution and production methods etc. Larson (1992) and Ring and Van de Ven (1994) note that social interactions develop over time in dyadic relationships as exchange partners become comfortable with each other's competence and reliability in economic exchange. In turn, the more these social interactions build, the greater the intensity, frequency and breadth of information exchanged.

McEvily and Zaheer (1999) argue that network ties aid in the development of competitive capabilities by broadening and deepening market knowledge. They also point out that a greater number of such links means exposure to a broad set of opportunities for further learning. Besides enhancing technological learning (Zahra et al., 2000), developing a broad set of customer network ties should also enhance the young firm's ability to manage its external relations.

Therefore, the relationships within and across industries enhance the ability to create knowledge and also provide a greater ability to extract value from the knowledge (Sullivan, 2000).

One major factor that ascertains for technology transfer and human capital development is the collaboration with universities and research institutes. Academia is increasingly involved with industry, and becomes a key element of the innovation system both as human capital provider and seed-bed of new firms and creation/diffusion of an enterprising culture (Etzkowitz et al. 2000, OECD, 2009, Leydesdorff & Etzkowitz, 2001).

Therefore, an alternative channel for technology transfer and human capital development are represented by international trade and collaboration. In particular, FDI are regarded as one of the most practical and efficient means by which industrial development and upgrading can be promoted (Narula and Dunning 2000). Indeed, through their linkages with domestic institutions foreign firms may transfer knowledge and know-how to workers in domestic institutions, as well as influence on local suppliers and technology sales (World Bank, 1999). International market linkages foster the development of technological capabilities in developing and least-developed countries because they

integrate global value chains through exports, the import of machinery and equipment, transfers of technology, the spill-over effects of foreign direct investment and licensing GCI; (2011).

The variables used in this study to report the social or market capital of countries, include:

University-industry collaboration in R&D; FDI and technology transfer; State of cluster development; Value chain breadth.

Structural capital is the non-human storehouses of knowledge which is embedded in its technological, information and communication systems and which sustain and externalize the output of human capital (Bontis, 2004). It comprises the related infrastructure for creation, sharing, transmission and dissemination of knowledge for contributing to individual knowledge workers productivity (Malhotra, 2001). Undoubtedly Internet access, telecommunications and progress in ICT contribute to advance of the knowledge and information systems of societies, allowing the creation, accessibility and dissemination of current data, information and knowledge (Bontis, 2004).

This variable is measured through corporate competitiveness, government efficiency, intellectual property rights protection, the availability of capital, the number of computers per capita, the ease with which new firms can be established, and the number of mobile phone subscribers (Lin, Edvinson, 2011).

As our interest is to capture the dynamic variables that could contribute in creating high innovative entrepreneurship basis, we include in our evaluation the following indicators:

Internet access in schools; Availability of latest technologies; government procurement of advanced technology products.

Despite the availability of latest and advanced technologies it is also important to evaluate the absorptive and renewal capability of firms and individuals in the country. The renewal capital, is defined as a nation's future intellectual wealth and the capability for innovation that sustains a nation's competitive advantage (Lin and Edvinsson, 2008).

Industry observers have remarked that companies can accumulate a large stock of valuable technology assets and still not have useful capabilities. Lane and Lutbakin (1998) indicate that the ability to develop sustainable competitive advantage depends on a ability to convert knowledge into capabilities to meet environmental demands. The ability of a firm to recognize the value of new, external information, assimilate it, and apply it to commercial ends - is named by Cohen and Levinthal as the "Absorptive Capacity". Absorptive capacity (Cohen and Levinthal 1990; Zahra and George 2002a) is described as the dynamic learning process of acquiring, assimilating, transforming, and exploiting knowledge. The variables used in this study to report the renewal capital of countries, include:

Company spending on R&D; Firm-level technology absorption; Capacity for innovation.

RESEARCH METHODOLOGY

The purpose of paper is to assess those knowledge assets that could contribute in the creation of innovative entrepreneurship in Balkan countries. The assessment is based on a conceptual framework in which the intangible knowledge assets comprise three main sub-components that include human capital, social /market capital, structural and renewal capital.

We assess these three sub - indexes through 17 metrics in a time horizon that goes from 2008-2011 for the six Western Balkan countries. The aim is to have a portrait of these variables as well as to explore the dynamics of these important elements for growth in these developing economies, in order also to see the progress done by them toward a knowledge based economy. It is important to qualify this section by stating that it is not an exhaustive use of all available measures. In fact we tried to incorporate also some specific indicators from the global innovation index such as the indicators related to Knowledge workers, knowledge absorption, innovation linkages, creative outputs etc, but we didn't consider them in this study as we missed the data from Montenegro and the values for this indicators are reported in percentage, instead of likert scale as used by WEF. Therefore, we present here a necessary exploratory exercise, however a more comprehensive set of indicators data would be useful for a better validation of the portrait of the countries considered.

RESEARCH RESULTS

For measuring the dynamics of human capital sub-index 7 metrics were available. Table 1 outlines a summary of these metrics. We also calculated the average index of all the measures considered, giving the same weight to all the metrics.

Country	quality of educational system				quality of math&science educ				quality of mngmt schools				ability of research and trainin				extent of staf training				brain drain				quality of scientific research

Table 1: Metrics and data for measuring human capital

This way of calculating the metric is open to academic debate, but the research team agreed in using the same weight for the objectives of this research. A total of 4 metrics were extracted for assessing the social/market capital. Table 2 outlines the data of this subcomponent.

COUNTRY	FDI and technology transfer				stateof cluster development				value chain breadth				university industry collaboration

Table 3: Metrics and data for measuring structural and renewal capital

As it could be easily noticed by the tables, the Balkan countries perform below the global average in almost all metrics. Montenegro seems to be the country with the best performance among all Balkan countries with indicators that are in the same line with the global average, and in some cases higher than that.

By analyzing in detail the dynamics in last 4 years of each indicator of the three sub-components it could be noticed that Montenegro, Croatia and Albania show a positive growth in almost all indicators of knowledge assets. While a different perspective characterizes the dynamics of Serbia and Bosnia. These countries shows unstable dynamics with some points of growth and some decreases during last years.

Albania and Montenegro register a positive constant growth in the quality of education, quality of management schools, and extent of staff training. While Serbia, Croatia, Macedonia and Bosnia follow unstable growths. Croatia seems to be the country with highest availability of local research and training services with values that are above the global average. It also performs well in brain drain indicator with high levels for retaining and attracting talented people in last year (2010).

For what concerns the structural and renewal capital all countries are in line with the global mean for the internet access, with high level of growth in last years. Balkan countries are, also, doing good progress in using latest technologies, in procuring technologies (government procurement) and in increasing their capacities for technological absorption. However their capacity for innovation and the spending done in R&D remains in low levels.

Despite the progresses done in increasing the human capacities and the possibilities for innovation, the social capital of these countries remains the one where major efforts are still required to be done. It seems that in these countries the culture of collaboration is yet very low. Especially, the collaboration industry - university, that is being echoed as one of the major factors in developing a knowledge economy and in promoting innovative entrepreneurship, is very low. Low rates of growth are registered also in state of cluster development and value chain breadth variables which indicate that these countries are basing their competitiveness in efficiency driven factors, primarily involved in individual steps of the value chain (e.g., resource extraction or production). Also the data shows low propensity of these countries toward the creation of cluster and networks among the different local

and international firms. Instead a good perspective seems to be offered by foreign direct investments. The data shows as all countries are registering significant growths in years in terms of technology transfer.

IMPLICATIONS AND CONCLUSIONS

While innovation performance is not homogeneous across the Balkan countries with some countries performing better than others, all countries underperform in most variables to the global average.

Especially it emerges from these data, as while innovative entrepreneurship is a high priority and the most important driver of local economic development how Balkan countries are still characterized by weak culture for innovation, lack of that favorable conditions necessary to bridge together research, education and business and by a low diffused propensity at the cooperation that is enabling factor to increase the innovation performance. Good progress and emphasis is being devoted to increasing the level and quality of human capital as well as for the advanced technologies to use, the Balkan countries lag still behind in their capacity to boost innovation.

They should invest more and better in innovation as well as develop environments that are more conducive to it. Major efforts are required in reinforcing the type of collaboration among business, universities and governments. The role of academia for entrepreneurships is confirmed by a noteworthy increase in last 40 years of university institution that offers entrepreneurship curricula. The best cases on entrepreneurship education are represented by: MIT Massachusetts Institute of Technology with its initiatives on "Entrepreneurship Center", "Deshpande Center for Technological Innovation" and "Entrepreneurship Development Program" and the Stanford university with its programme on 'Entrepreneurship corner and Technology venture program (Byers, Dorf and Nelson, 2008). Universities and research institutes also provide consulting assistance to a new venture and opportunities for continuing education for professional employees (Reams, 1986; Saxenian, 1994). In the long run, the collaboration enables new ventures to recruit high-caliber researchers. Personal ties between the start-up and university personnel are also conducive to the migration of human capital to the new venture (Powell, Koput, and Smith- Doerr, 1996). The quantity, quality and density of the social and economic connections that the business and government leaders of the aspiring region have with the leaders of gateway cities and their willingness to use it on behalf of the local citizenry will dictate how successful the region is going to be in achieving its growth aspirations (Venkataraman, 2004).

In order to enhance the innovation potential of countries it is compulsory to direct more investments in increasing the interactions and depth of ties and links between different actors of value chain. Through interactions with others, firms get access to external knowledge and can combine it with existing knowledge. Further, such relationships create a context within which newly created knowledge can be applied and exploited (Dyer and Singh, 1998; Lane and Lubatkin, 1998). More in general, major improvements are necessary to be done by firms in order increase their role and engagement in innovation activities to differentiate their product or service offering as well as; to

foster the development of networks and markets which enable the creation, circulation and diffusion of knowledge.

**PRIVATE INVESTMENTS IN HUMAN CAPITAL:
THE PROBLEM OF EFFICIENCY VALUATION**

Nedospasova, Olga

Abstract

The global economic crisis has made topical the question of financial resources structure for higher education (HE). At the present time, Russian HE is highly commercialized, and a half of all resources are private. It testifies that this sphere is poorly financed by the state and HE must be an investment sphere in Russia by law. But now it remains “a black hole”. There is no basic model for the economic efficiency valuation and investments diversification in Russian HE. So it is highly important for Russia to study the opportunity of applying Cost Sharing Conception, which shows the necessity of advantageous usage of private financial resources for HE more than of state ones. According to this conception there are possibilities for the cost sharing proportionally to an expected profit from the investments for public or private investor.

The investigation is to value numerically the economics efficiency of private investments in HE and take into account time’s factor. The results can be regarded as a theoretical basis for developing and introducing the Cost Sharing Concept in Russia.

Keywords: Higher education, costs, salary, Net Cash Flow, investments, efficiency.

Introduction

The necessity of impartial valuation of investments in human capital is caused not only by research interest towards this issue, but also by objective external factors. Active formation of human capital and transition to a knowledge-based economy required the inclusion of human capital into the aggregate indicator of national wealth that is widely practiced nowadays. Besides, the transition to the international system of national wealth calculation attracted additional attention to a country’s national wealth efficiency valuation and to the problem of efficiency valuation of investments in human capital as a significant national wealth component.

According to research data, only not more than 25% of the total amount of Russia’s huge resource potential has been developed. At the same time, the developed potential of human resources in Russia is about 15% [1]. The low coefficient of labour resources development in Russia not only testifies that these resources are not in-demand enough, but also proves their low investment attractiveness. Under conditions of creating an innovation economy in Russia, the investments in human capital are declared to be acquiring the highest priority.

In order to analyze the emerging situation in this realm, a research has been conducted aimed at comparing the dynamics of investment in human capital and that in physical capital as exemplified by Tomsk region (being one of the leaders in per capita investment dynamics in Russia). The results of the research are presented in Table 1. The data in Table 1 suggest that in Tomsk region the share of education costs is invariably higher than in other directions of investment in human capital, however,

it was only in 2005 that this share reached $\frac{1}{4}$ of investments in fixed assets in Tomsk region. All investments in human capital in Tomsk region at best (year 2005) slightly exceeded $\frac{1}{2}$ of the corresponding volume of investments in fixed assets. Even if the initial statistic figures of Tomsk region are doubled [2], the conclusion that human capital in Tomsk region is underinvested still remains unchanged due to the fact that today almost a half of investments in education are private [3].

<i>Sphere</i>	2001	2002	2003	2004	2005	2006	2007
<i>education</i>	10	14	13	17	25	18	12
<i>healthcare and physical training</i>	6	7	7	9	15	10	7
<i>social policy</i>	5	5	5	6	13	9	6
<i>Total</i>	21	26	25	32	53	37	25

Table 1: The correlation of investments in human capital to investments in fixed assets in Tomsk region
(% to investment in fixed assets)

Passing on to the direct efficiency evaluation of private investment in higher education (HE) and personal human capital, it is necessary to note that in our country during the pre-reform period the salary level of an employee with HE hardly correlated with his educational level and other individual features. Furthermore, the distinctive feature of HE system of that time was a preferential orientation to the material production sector including narrow specified professional fields. As a result, the system of narrow specialization of employees with HE was created, which tied them to a concrete job within the scope of the chosen profession.

The general level of HE and professional training attained within the command economy in our country is impartially estimated as a high one. On the basis of the latest studies in this sphere, it was concluded that employees of new private enterprises in Russia have comparatively higher return rate of investment in education and lower return rate of professional experience and length of service [4].

From the economic point of view, investments in HE will be justified for private investors only if their payback period is short enough. When analyzing individual decisions concerning educational investments, one should remember that such investments, as all other types, have the following important characteristics:

- they presuppose *significant* financial costs;
- benefits from investments can only be received *in future*;
- the forecasts concerning investments results are carried out under *the conditions of risks* and uncertainty.

As the most general formulation of the term "*investments*" says that these are expenses that are paid "*today*" with the consideration of profit "*in future*", then, using the cost estimation model to assess private educational investments made with this aim, the total costs of HE acquisition can be compared with the expected income that a person with HE will have in future. Within the scope of the cost

estimation model for educational investments it is possible to suggest the following approach to the valuation of their efficiency: *total future income* conditional on HE availability should substantially exceed *total costs* related to HE acquisition. Then, from the point of view of a person with HE, these investments are effective. Application of this approach also enables to evaluate a *payback period of HE investment*.

The analysis of educational investments efficiency can be divided into 3 stages:

- identification of total additional incomes caused by HE acquisition and its cost valuation with time factor taken into consideration;
- identification of costs related to the acquisition of the HPE and their cost valuation;
- comparison of costs and income (conditional on the presence of HE) by a certain point of time.

The emphasis on the dynamics of Net Cash Flow formation, that is characteristic to the investment analysis in general, implies the usage of discounted criteria. Discounting is known to be based on the statement that future monetary income has lower cost at present. An interest (discount) rate serves as a numerical expression of time value of money and shows relative changing in the value of money per time unit. When trying to estimate the practical value of education, one faces the problem of defining a discount rate. It is obvious that one of the basic economic rates (for instance, rate of return on government securities or consumer price index (CPI)) can be accepted as the first feasible value. In this research CPI was chosen as a discount rate because it is a more conservative valuation of alternative investment return.

An additional income from HE is a stimulus for people to do the private investments in human capital [5]. For many people additional incomes from the higher education is an incentive to invest in education. That is why total additional incomes related to the received education (taking into consideration discounting that decreases the amount of future incomes when counted on the basis of the present time) should substantially exceed preceding investments in HE acquisition. Therefore, investment in HE is profitable if Net Present Value (NPV) from educational investments calculated as the sum of discounted Net Cash Flows during all the regarded period is non-negative.

$$NPV = D_0 + \frac{D_1}{1+r} + \frac{D_2}{(1+r)^2} + \frac{D_3}{(1+r)^3} + \dots + \frac{D_n}{(1+r)^n} - C \geq 0, \quad (1)$$

Where: C is total costs related to HE acquisition;

D_n – current value of future additional income flows calculated as a discounted sum of exceeds of university graduates' salaries over high school graduates' salaries;

r – discount rate;

n – period of analysis, years.

In order to evaluate economic efficiency of individual investment in HE acquisition, one should start with the calculation of *total additional incomes*. Their cost estimation requires taking into account the distinctions in salaries between categories of employees that have different educational levels. The efficiency analysis of private investments in HE presented in this paper is based on the fact that today the level of a person's income in Russia depends directly on educational level. To evaluate additional incomes originating from HE, an average nominal salary in Russia (adjusted to the coefficient of a salary increase due to educational level) is compared with a living wage as a conservative valuation of a potentially possible salary level of people without higher education.

First of all, the analysis of differences in salary levels of people without HE (who have working professions) and those with HE (who are specialists in the main branches of industry) was carried out [6]. The analysis results demonstrate that in spite of essential differences in various industrial branches, correlation between salary and a person's educational level is quite stable in Russia on the whole. At present, a salary increase, in accordance with educational level, varies from 118% to 161% in different branches of industry, and an average increase is 32% (Table 2). This figure was taken for the further efficiency valuation of individual investments in HE in the part of income identification of people with higher education (Table 3).

Calculation procedure for total additional incomes from HE is presented in Table 3. The calculations were based on official statistical data [7]. In rows 1-4 there are calculations of expected potential salary of university graduates that rely on average nominal salary adjusted to a salary increase in accordance with educational level. Salary of high school graduates is defined at the level of a living wage in the respective period (Table 3, rows 5-7). Further, on the basis of these calculations, corresponding values of exceeded salaries of university graduates over high school graduates' salaries were found (row 8), after which the results were discounted and their expected sum was defined by progressive total for 2009-2012. (rows 9 and 10).

Valuation of *total costs* related to HE acquisition includes not only explicit costs (contractual price of the paid educational services rendered by the university or, in a more general case, the university's norm of budget financing per student), but also *opportunity costs* that characterize: potential incomes lost because students study and don't work, and lost profits from alternative investments of households.

<i>Sphere of economic activity</i>	<i>Specialists</i>	<i>Workers</i>	<i>Salary increase in accordance with educational level (No. 1 : No. 2), %</i>
	1	2	3
<i>Mining operations</i>	33,725	22,476	150
<i>including fuel and energy minerals</i>	37,688	24,711	153

<i>Average</i>	17,607	13,307	132

Table 2: Average salary of employees in different spheres of economic activity in 2007 (according to a selective survey data, roubles)

The approaches to the valuation of opportunity costs should be examined in detail. According to foreign researches, the income "lost" during the years of studying at university can reach a half of the total costs related to higher education. In the USA (as some assessments show) this share varies from 50% to 60% of total costs spent on higher education [3].

No	Indicators	2004	2005	2006	2007	2008	2009	2010	2011	2012

4	Expected annual income of a person with HE after graduation, since 2009 (considering differences in educational levels) (No.3 x1,32)						287,569	301,947	317,046	332,897
5	Living wage (conservative forecast since 2009) **	2,376	3,018	3,422	3,848	4,559	5,165	5,865	6,631	7,513
6	Dynamics of living wage, % to the previous year (conservative forecast since 2009) **	100	127	113.4	112.4	118.5	113.3	113.3	113.3	113.3
7	Expected minimal income of high school graduates (No. 5 x 12 months)	28,512	36,216	41,064	46,176	54,708	61,980	70,380	79,572	90,156
8	Additional incomes from HE *** (No. 4 -No. 7)						225,589	231,567	237,474	242,471
9	Discounted values of additional expected incomes from HE, roubles ****						225,589	204,384	185,527	168,383
10	The sum of discounted expected additional incomes from HE by progressive total						225,589	429,973	615,500	783,883

Table 3: Calculation of expected incomes from HE acquisition considering the differences in educational levels and discounting (roubles)

* Calculated on the basis of conservative expectations of 5% annual increase of average salary during 2009-2012.

** Calculated on the basis of conservative expectations of living wage increase at the level of actual value of consumer price index (CPI) in 2008 equal to 113.3%.

*** Calculated as an annual disparity in salaries of qualified specialists and high school graduates (the latter is defined at the level of a living wage of the respective year).

**** Calculated on the basis of a discount rate $r=1.133$ (at the level of actual CPI in 2008).

Due to the absence of reliable data about "lost" incomes of students in Russia and the fact that a student as a yesterday's schoolchild has no special education or qualification, in this paper a living wage of the respective periods is taken as an indicator that characterizes students' lost incomes during their studying period. It is important to note that such valuation will be considerably conservative because it doesn't take into account, for example, the opportunities of successful combination of studying and working by senior students, income earned during vacation that can be significantly higher than official living wage.

Lost investment profits of households as an element of opportunity costs, in its turn, can be evaluated as potential interest yield from money spent on university education. In agreement with conservative valuations, minimal payback of alternative investments can also be estimated at the level of CPI of respective periods.

The main individual costs related to HE acquisition are presented in Table 4. The data of Table 4 and all subsequent calculations concerning the efficiency of private investment in HE and personal human capital were carried out on the example of a high school graduate who was going to get higher education in Seversk Technological Institute (STI NRNU MEPhI) for full payment of tuition fees.

Thus, the final value of NPV is positive. It means that private investments in HE are really effective, i. e. the flows of additional future incomes (considering discounting) will substantially exceed investments in HE, and an expected return rate of investments exceeds the current value of CPI.

Let us calculate *payback period* for private investments in HE. Divide total costs of university education (the total sum of Table 4) by additional annual income of an employee with HE for his first working year (Table 3, row 7). As a result, we have a number of years for which investments in HE will be paid back entirely. This figure is 1.8 years. Add the duration of the investment period (five years of full-time education at university) to this figure to get the full payback period of educational investment, i. e. the number of years in which investments will be completely paid back (about 7 years after entering the university).

To sum up, economic efficiency of private investments in HE and, consequently, personal human capital is proved by the following facts:

- total additional incomes from HE significantly *exceed* total costs of its acquisition;
- the entire *payback period of investments* in HE (exemplified by STI) doesn't exceed 7 years and allows to regard this kind of investments as medium-term and, consequently, low-risky in comparison with investments in more long-term projects;
- as in Russia about a quarter of the GNP is produced in the shadow economy, and a significant part of a real salary is not registered officially, the real educational investment efficiency can be much higher than the received conservative valuations, and a payback period can be shorter.
- as the length of service of a specialist with HE is usually about 40 years, he (she) will have worked for himself for more than *30 years* enjoying the fruits of his studies at
- university and appropriating an *NPV from educational investments*.

<i>Indicators</i>	2004	2005	2006	2007	2008
<i>Explicit costs</i>	27,000	30,000	34,800	38,300	46,000
<i>Living wage (calculated per year)</i>	28,512	36,216	41,064	46,176	54,708
<i>CPI (% to the rate of the previous year)</i>	111.7	110.9	109.0	111.9	113.3
<i>Lost income from alternative investments (No. 1 x No. 3)</i>	3,159	3,270	3,132	4,558	6,118
<i>Opportunity costs (No. 2 + No. 4)</i>	31,671	39,486	44,196	50,734	60,826
<i>Total costs (No. 1 + No. 5)</i>	58,671	69,486	78,996	89,034	106,826
<i>Total costs by progressive total</i>	58,671	128,157	207,153	296,187	403,013

Abstract

Cycling and other forms of nature-based tourism are expanding fast due to the rise of health and environmental concerns of many tourists. Although more conventional operators and students of the tourism industry still regard these groups as members of budget conscious back pack travellers, there is a growing awareness that this view may be misplaced.

This study is the first comprehensive analysis and profiling of regular bike users in Portugal. We use the data base of FPCUB, the Portuguese leisure and transport cycling federation to assess the age, gender, residence location and professional pattern of bike users. Our results confirm that the typical biker is a male, in his mid-40s and middle or high income.

Keywords: Cycle tourist; bike usage; nature-based tourism; network routes; demographics; profiles.

Introduction

Cycle Tourism can be considered a form of tourism-based nature, because it contributes to reduction of pollution, traffic congestion and to the local economies as well. It can bring some benefits to the practitioners, such as better health, or a personal valorisation through cultural and leisure visits. Cycle tourism also promotes local businesses that protect the environment and cultural heritage, hence, improving the wellbeing of the visited communities. Overall Cycle Tourism is a relatively small market, albeit the fact that this market appears to become increasingly popular as a niche tourism segment. Keeling (1999, p. 13) covers several studies of European cycle tourism that this is a small but quickly expanding form of tourism-base nature: Cycling Holidays - where cycling is the main pursuit and the main form of travel - now account for 2-4% of total holiday trips in some European countries, and this is predicted to double or treble within the next decade to 6-12% of all European holidays. This is the dedicated cycling market, on short breaks or longer cycling holidays. An even larger market is Holiday Cycling, cycling as an extra pursuit whilst on holiday. This is estimated to be twice the size of the dedicated cycling market. Ireland estimates that already 7% of visitors cycle whilst on holiday. The German figure quoted above is nearly 25%. However, a few case studies provide useful hints about the participants in this activity. Cope and Doxford (1998) analyse the users of C2C (Sea to Sea) Cycle Route, a 140-mile cycle route on minor roads and traffic-free cycle paths running across Cumbria and Northumbria, from the Irish to the North Sea, for a two year period. They found that 73% of users were male, 70% aged between 26 and 55, most cyclists took between 3 and 5 days to cycle the C2C and

63% stayed overnight in bed and breakfast accommodations. Also Mehmetoglu's work (2007) highlights that the groups oriented for activities-base nature, case in point, the bike riders, have high incomes, and in general are male. It is relevant for the main players interested in the future of the tourism industry to acquire more knowledge about this type of traveller as well as, which types of tourist experiences they seek.

The objective of this paper is to elaborate a profile of the members of the Portuguese Federation of Cycle Tourism. This research has some limitations: the study is focused on a specific sample, thus the results obtained, should be contrasted with those of other international cycle tourism organisations.

Ascertaining the main characteristics of these travellers is a valuable contribution to the tourist professionals, since it enables them to develop infrastructures, for instance, with adequate safety measures, more effective signalling, informational products, or a more cyclist-friendly culture within the tourism industry.

Cycle Tourism has enjoyed little attention from tourism researchers despite the relevance of this kind of tourism for a sustainable tourism. Yet this a rising practice together with other forms of sustainable tourism based on activities-based nature such as walking and horse riding. This may be a physical, cultural and even spiritual experience that attracts a rising number of practitioners. One example is the visit to Santiago de Compostela, with several well established paths such as the "French Route" that is over 1,000 km long attracting both walking and bike riding visitors. Wide acknowledgement of this new phenomenon is being proved by the private sector offering new organized tours, associations providing new types of tours and competitions and even politicians, providing several infrastructures. Keeling (1999, p. 1) provides an overview of concerted efforts by several European Governments to enhance the offer of good biking infrastructure: Denmark opened 2,000km of national cycle route in 1997, and now attracts tourists from Germany and elsewhere. Cycling accounts for 18% of all journeys in Denmark. In Germany there are nearly two hundred long-distance cycle routes and cycling is the fastest growing leisure pursuit. One in four Germans cycle whilst on holiday. In Münsterland, on the One Hundred Castles Route, cycle hire has increased tenfold in the decade to 1990, from 431 to 4,200 cycles available for hire. The Bourgogne area (France) alone receives well over half a million cycling visitors per annum. In Austria, the Danube Cycle Route runs for 250km from Passau on the German border to Vienna, largely traffic-free and largely downhill. This spectacular route attracts over 1.5 million cyclists every year, and in typical towns on route the majority of overnight visitors are cyclists. Holland has developed a network of national routes making use of its existing high-quality local cycle routes, and cities such as New York, Paris and Barcelona also have strongly invested on a bike friendly environment, as part of a goal of being defined as green cities.

Cycle Tourism can use conventional roads or special bike paths or take advantage of simple, unpaved country roads including mountainous regions, if cycle tourists are equipped with BTT bikes. This can be an individual or collective experience, with the family or with a larger group of friends.

An increasingly popular holiday consists of accessing a distant destination by train or airplane (Dolnocar et.al., 2010) and then discovering the region, urban or countryside, only by bike. The abovementioned authors also note that in some countries like Switzerland, the professionals of tourism and the entities in charge for the means of transports do regular agreements 'partnerships with some neighbours' countries, for offering cycling tours or hiking trails.

From the supply side, it is widely accepted that the Tourism Industry needs to develop and offer alternative tourism products, beyond the traditional sun & sea, because it must have the ability to satisfy expanding traveller needs. Probably because of that, Eurovelo (an event promoted by the European Cyclists' Federation that aims at crossing this continent in safety by bike), the Munda Biddi Trail or the Murray to the Mountains Rail Trail, in Australia (Lamont, 2009), are good examples of alternative initiatives for tourist destinations.

The present study is based on Portugal and the National Association of Cycle Tourism and Bike Users – FPCUB: Federação Portuguesa de Cicloturismo e Utilizadores de Bicicleta. This is one of the largest Portuguese associations, with about 25.000 affiliates. This association promotes several activities, such as thematic cycling projects and BTT raids. It also organizes forest fire prevention campaigns and destination promotion activities to try to increase the awareness of cycle tourism as a form of sustainable tourism and cultural exchange.

The cycle tourism seems to be an interesting offer in the context of attractiveness of some tourist destinations, and may also contribute to the feasibility of tourism in the long term – a very relevant fact given that the tourism industry is the world's largest industry and the fastest growing, despite the current global economic crisis. In this context it is relevant to enhance the knowledge about the "players" who act on the arena of cycle tourism and to what extent they should constitute an important niche in the panorama of Portuguese tourism.

This article is divided into four sections: the second reviews the literature, emphasizing the main theoretical framework of the relationship between cycle tourism, nature-based tourism and sustainable tourism, and discusses the relevance of socio demographics for identifying distinctive tourists as well; section three addresses the methodology, specifying the data base that is explored next; the profile of FPCUB members, by their socio-demographic characteristics is given in section four; finally, section five presents the summary and conclusions, including suggestions for future research in the topic of sustainable and cycle tourism.

Cycle Tourism, Ecotourism and Nature Based-Tourism

We can define cycle tourism as a new form of tourism which is part of respect for responsible tourism development, through an environmentally friendly tourism and a demand-oriented enjoyment of remarkable experiences connected to nature, of physical and psychological well-being and as personal valorisation and social

interaction as well. The cycle tourism can include the philosophy of ecotourism described by Sharpley (2006) and Eagles (1992). These authors highlight three key dimensions of ecotourism: (1) the environment that does not undergo significant changes with the enjoyment of tourists; (2) the development as a form of encouraging participation of local communities, and (3) the experience related to the fun, learning and interaction between ecotourists, to the landscape context and cultural communities and to residents as well. The very definition of tourist experience (Li, 2000) involves multifunctional leisure activities such as fun and / or learning by one individual. The cycle tourism and ecotourism can thus be seen as an experiment that requires sensitivity, pleasure and cognitive development. Put another way, both show a relationship of fusion between the natural and cultural environment that defines an individual, where the experience is never forgotten and ultimately, can transform him significantly (Lequin, 2009: 197). In turn, either the cycle tourism or the ecotourism make optimal use of environmental resources, helping to conserve natural heritage, respect the socio-cultural authenticity of host communities, and providing socio-economic benefits to all. Cycle tourism shares some similarities with other forms of eco-tourism such as horse based tourism. Helgadottir and Sigurdardottir (2008) underline the strong passion of horse riding tourists that makes them look for ideal conditions for the practice of this activity – horses as well as landscape and integration in the rural environment. Also cycle tourism as a tourism product seems to be linked to nature-based tourism (Table 1).

Authors like Dolnikar *et.al.* (2010) highlight that bicycling and mountain biking live up to green means of transport and physical activities which privilege the nature contact. In this line of reasoning, Valentine (1992) incorporates recreational activities in nature-based tourism definition, underlining three types of experiences: the ones which depending on nature, the ones emphasizing by nature and the experiences where the nature is merely accidental like cycle tourism. Laarman and Durst's points of view (1987) focus on the difference between hard and soft tourists-based nature, depending on their levels of interest and physical energy, and Lamont (2009), Jackson and Morpeth (1999), and Ritchie (1998) see bike usage as an adventure's tourism sub-segment, where an active or passive participation, should be regarded as a component of the tourism experience. However, Weber (2001) disagrees with this stance. He refers that nature-based tourism cannot be considered a type of adventure tourism in the way that the tourist doesn't need be involved with the nature itself. For the mentioned author, this tourist should be defined according to the risk level associated with their experiences at the destination. Pomfret (2007) and Swarbrook *et.al.* (2003) note that adventure tourism, which consists of a battery of activities on land, case in point bicycling, must interact with other components of the tourist destination.

Table 1 – Definitions of nature-based tourism

On the other hand, Zografos and Allcroft (2007), and Dunlap and Heffernan (1975), segment tourists according to their social and environmental attitudes. The former authors classify the nature-based activities in consumerists (hunting and fishing), contemplatives (camping and photography) and abusive activities (mountain bike and BTT). Mehmetoglu (2007) prefers to highlight the relevance of classifying the nature-based tourists according to the performed activities, because tourism industry needs adequate its offer to the wants of the tourists. Lang and O'Leary (1997) assert that any person which travels to nature-based areas or destinations should be considered a nature tourist. Also Weaver *et. al.* (2007) point out that like the ecotourism, the tourism based- nature must be founded on a defined set of dimensions, including conservation and sustainability, values and learning as well. However, Wurzinger and Johansson (2006) in a study with the aims to distinguish nature tourists and eco tourists, they reveal no differences for green behaviours, despite recorded differences in terms of environmental attitudes. The study by Kim *et.al* (2006) shows there are strong relationships between motivational factors and preferences for specific areas or sites. Finally, Enable and Gatersleben (2005) highlight the bicycle as a preferred means of transport during holidays.

The theoretical framework of cycle tourism is, therefore, based on a set of dimensions that facilitate an interpretive lens of architecture tourism product (Figure 1).

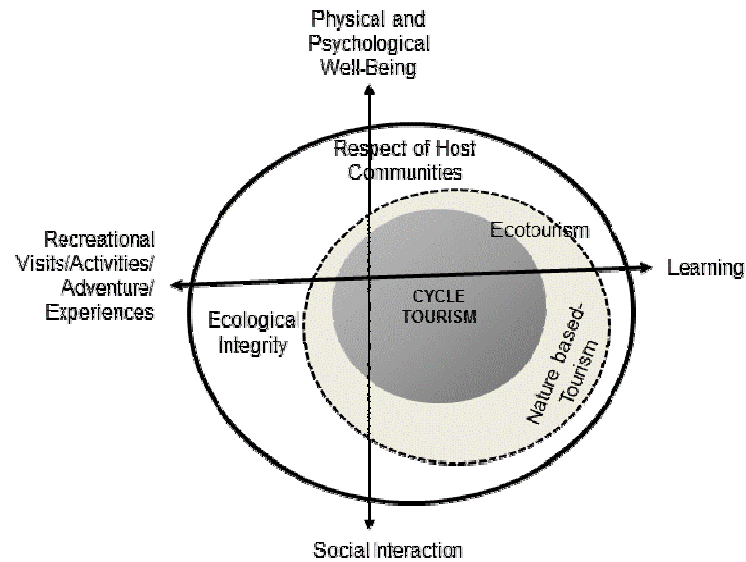

Figure 1- Cycle Tourism Concept

Source: Authors' systematisation

From the standpoint of cycle tourists themselves, adherence to this type of supply is associated with the possibility of holding a series of visits and recreational activities outside of their habitual residence, involving leisure cycling as a significant part of the visit (Keeling, 1999). In this context, the attraction for nature and landscape of the visited areas is closely tied to the enjoyment of their culture and heritage, using a means of movement focused on ecological and nature-based tourism concerns, revealing a kind of accountability by the concrete visitor in favour of minimizing negative impacts on destinations. This is a perspective based on new ideas, new values and practices, reflecting how individuals identify themselves with the visited area. Also the physical and psychological well-being resulting from this practice, appears not only in line with modern trends of the "cult of the body", the need to escape and relax, but also contributes to the preservation of natural resources and the perpetuation of several heritages (Farago, 2000). Like other ecotourism practices (Voase, 2002), a planning visit allows the cycle tourist to enjoy an experience of great autonomy accessing to imagery, as well as a variety of activities and challenges in loco. Moreover, cycle tourism also allows a high level of socializing and a greater spirit of cooperation among its practitioners, especially since this activity involves sometimes, intense physical effort, and long periods of travelling under diverse and sometimes challenging weather conditions. It also represents a privileged space for strengthening the relationship among travellers themselves, local communities or even with tourism professionals. Concerning the Learning, it is recognized as essential in the ecotourism experience, and this means knowledge, emotions and interpretation established among the places visited and the traveller himself (Weiler and Ham, 2001). The bike trip is in fact special to value the individual himself, his experiences

and several images with full respect for socio-cultural authenticity of host communities, living cultural heritage and traditional values, contributing to inter-cultural understanding and tolerance.

Bike riders and socio demographics

There isn't broad consensus among the authors about the relevance of socio demographics in the differentiation of the tourists and in particular the nature-based tourists (Table 2). For example, the results of Luo and Deng's work (2008) show that the majority of the respondents are male, aged between 18 and 35 years old, holding high education level (more than 70% undergraduate and 6% postgraduate degrees), high income brackets, and living mainly in urban areas. Weaver et.al (2007) and Hevnegaard and Dearden (1988) report that individuals holding high levels of income and education are more active and more motivated to enjoy nature.

Authors/date	Gender	Age	High Income	Mode of Travel	High Education	Public Sector's Employees	Socio demographics not relevant
Luo and Deng (2008)	✓	✓	✓		✓	✓	
Zografos and Allcroft (2007)							✓
Weaver et.al. (2007)					✓		
Mehmetoglu (2007)			✓				
Wurzinger and Johansson (2006)							✓
Formica and Uysal (2002)							✓
Wearing et. al. (2002)							✓
Uysal et.al. (1994)	✓						✓
Hevnegaard and Dearden (1988)			✓		✓		

Table 2 – The influence of socio demographics on distinction of nature-based tourists

Source: Authors' systematisation

According Mehmetoglu (2007), the level of current income can be used as a way of targeting nature-based tourists, contrary to gender and age. Uysal et.al. (1994) note that demographic characteristics, excluding the gender, are not relevant for identifying travellers with environmental sense. In this line of thought, Zografos and Allcroft (2007), Wurzinger and Johansson (2006), Formica and Uysal (2002), and Wearing et.al. (2002) also confirm that demographic characteristics of the respondents are not significantly related to environmental attitudes, then, they should not be used as a way to differentiate eco tourists or nature-based tourists.

Research Methodology

This study is based on the data base of the FPCUB members in May 2010. FPCUB has its head-quarters in Lisbon, but has many delegations around the country. Both the head-quarters and those delegations organize many rides, often with police assistance. Legal permission has to be requested in advance. These activities face the competition of both ad hoc organizers of smaller events or

professional firms who usually charge a fee to each participant. To protect the confidentiality of each associate member, the names were not disclosed. However, data provided by the individual files could still provide useful information on a number of key parameters including: residence; gender; profession; age and marital status.

FPCUB provided complete information on 23 480 associates. Although it is one of the largest associations in the country, FPCUB does not count on the adhesion of all the Portuguese bike riders. The annual fee of €24 may prevent lower income and younger bike users from joining as they may be less keen on joining the events organized by the federation and the access to the insurance provided to all associates. This data base may be biased towards more motivated and frequent users who value joining an active organization and collective rides. So, these data may not be adequately extrapolated to the general population of bike users, for leisure and daily commuting. However, it provides relevant information on the more organized frequent bike riders. Personal interviews with both the President of FPCUB, José Manuel Caetano, and individual associates of FPCUB also confirm that they tend to share environmental concerns, and strong adhesion to what they regard as healthy life styles. The data base has not previously been object of a statistical analysis serving the sole propose of individual registration of the associates. After obtaining the information in Excel format, we excluded the members whose data were not complete. Next, we identified the information about the above parameters and compared it, when possible with the general information on the Portuguese population. Several striking differences could be identified.

Pattern of Associated Bike Users

The first pattern identified is based on the postal codes of the associates' addresses. They are more concentrated in the great Lisbon, followed by the Centre region.

Figure 2 – Regional distribution by the main regions (NUT III)

The comparison with the overall distribution of the Portuguese population can provide an interesting insight:

Besides a slightly larger concentration, there is a small bias towards the Southern part of the country, as Algarve and Alentejo have a larger share of FPCUB members relatively to its share of

population. On average there are about 452 Portuguese per FPCUB associate. This ratio lowers to only 190 and 185 in Alentejo and Algarve. By contrast, there are about 1,180 people per FPCUB member in the Northern region. The number of associates in the archipelagos of Madeira and the Azores is residual showing that there is very little influence of FPCUB in these distant regions although both enjoy some down-hill and other off road biking. It may be no coincidence that Lisbon and the Algarve region have above average incomes, especially as measured by the income at purchasing power parity (ppt) suggesting that organized bike riders tend to enjoy above average incomes.

<i>Distribution by Region</i>	<i>% (Portugal)</i>	<i>% (FPCUB)</i>	<i>Difference</i>
<i>Alentejo</i>	7,12%	16,9%	9,75%
<i>Algarve</i>	4,05%	9,9%	5,81%
<i>Center</i>	22,43%	20,6%	-1,85%
<i>Lisbon</i>	26,53%	39,0%	12,42%
<i>North</i>	35,24%	13,5%	-21,77%
<i>Madeira</i>	2,33%	0,1%	-2,27%
<i>Azores</i>	2,30%	0,2%	-2,10%
<i>Total</i>	100,00%	100,0%	
	10,627,250	23,541	

Table 1 - Regional distribution

	<i>Average monthly income (€)</i>	<i>Per capita income at ppt</i>
<i>North</i>	832,6	86,24
<i>Center</i>	826,8	83,76
<i>Lisbon</i>	1245,3	136,85
<i>Alentejo</i>	862,9	87,33
<i>Algarve</i>	848,6	103,65
<i>Azores</i>	864,3	83,62
<i>Madeira</i>	961,7	95,46

Table 2 - Regional income distribution

This income analysis can be complemented by the information on professional activities carried out by FPCUB associates (Table 3).

Although manufacturing workers are the largest individual group, there is a high proportion of leaders of both the private and public sector and skilled professionals. This is consistent with the finding, by Oliveira and Pereira (2008), in the context of Madeira Island that more educated visitors tend to have a higher preference for scenic landscapes. Another interesting characteristic regard the gender of regular bike riders. This is definitively a male activity as is portrayed in Figure 3.

Although women are slightly more numerous in the Portuguese population, they make up less than 3.5% of the FPCUB associates. Anecdotal evidence suggests a higher proportion of women in bike rides, suggesting that the percentage of women riders may be higher but they tend to be less regular than men. This observation also has significant implications for bike tourism in general, as less female

practice may hamper the rise of family tourism, a practice that is rising in many countries. It is also important to analyse the age pattern of federated bike riders.

<i>Profession</i>	<i>#</i>	<i>%</i>
<i>Army</i>	452	1,92%
<i>Public administration officers and high ranking executives</i>	788	3,35%
<i>Scientists and intelectual workers</i>	2057	8,74%
<i>Technical and other skilled professions</i>	1269	5,39%
<i>Administrative personnel</i>	2108	8,95%
<i>Personal services, private security and sellers</i>	2280	9,69%
<i>Agriculture and forest workers</i>	212	0,90%
<i>Manufacturing workers</i>	4376	18,59%
<i>Machine operators</i>	1893	8,04%
<i>Unskilled workers</i>	976	4,15%
<i>Other</i>	7130	30,29%
<i>Total</i>	23541	100,00%

Table 3 – Professional activities

<i>Age group</i>	<i>% (Portugal)</i>	<i>% (Sample)</i>	<i>Difference</i>
<i>0 - 14 years</i>	15%	0,9%	-14%
<i>15 - 24 years</i>	11%	5,5%	-6%
<i>25 - 64 years</i>	56%	84,4%	29%
<i>65 - 74 years</i>	9%	6,9%	-3%
<i>75 or more years</i>	8%	2,4%	-6%
<i>Total</i>	100%	100,0%	

Table 5 – Age comparison between Portugal and FPCUB

Very few people, younger than 15 are associated, as they may still lack the physical conditions for relatively long rides – most of the FPCUB organized rides range in the 30-60 kms long, and some are challenging, such as the “Lisboa Antiga de Bicicleta” that goes through the old parts of Lisbon where some of the steepest slopes in town can be found in a city that is also known for its seven hills. Some

rides can be even longer as the traditional Sesimbra- Algarve that yearly takes over 1000 bike riders for more than 200kms in a single day. Some people in the 15-24 age groups do join these rides, but they may prefer shorter, high adrenaline off road rides. Were we find a relatively high proportion of associated riders is in the 25-64 age range, followed by a decline for older age groups. Although bike riding has been shown to be an easy sport that can be practiced till an advanced age, some older people may avoid the more organized type of this activity where a relatively fast pace may be the norm. These data alone do not allow for spotting a trend as we cannot compare with earlier observations. Although the FPCUB has been expanding the number of associates it would be useful to compare the age groups of more distant periods in order to detect the trend and extrapolate for the future. It would be important to measure the evolution of the 15-24 age groups to be able to predict the relative size of this activity in the future, given the demographic trends of the population in general. Finally, the civil status of the associated bike riders provides interesting information. Although bike riding can be done alone, organized rides are a social event in which conversation can easily involve people without previous acquaintance. Figure 4 provides information on the civil status:

Figure 4 - Civil status

The high proportion of single associates, given that few of them are in the very young age groups suggests that married individuals may be under represented, suggesting that family life may reduce the time available for collective bike riding.

Summary and Conclusions

Despite the rising interest in nature-based tourism and the acknowledgement of the high expansion of bike tourism there is little knowledge of the demographics of this practice. Lack of specific data has made that much of our knowledge of the patterns of this activity is based on assumptions and extrapolations from fragmented data and a limited range of case studies. This study uses a large data set, obtained from the Portuguese federation of bike users and cycle tourism to present a pioneering pattern of federated bike users. Although cultural, economic and demographic specificities reduce the potential of extrapolation to other countries some significant patterns could be found and should be confirmed in replicating studies. The most striking observation is that women are much less active in collective biking than men. The second is that mature adults are the age group most attracted by an

activity that harmoniously mixes environmental sustainability, contact with nature and landscapes and health concerns. We also found evidence that collective bike users tend to be more educated and wealthier than the average. Finally families may face some limitations in the practice of this activity. Long duration activities and asymmetric capacities – especially of younger children and less experienced wives – may reduce the participation of whole families in this activity and explain the relatively high proportion of single associates. Being based on federated bike users this study does not portray the full universe of bike riders. Many people practice bike riding and do bike tourism without being associated with FPCUB.

This may affect some age (especially younger adults) and income groups (lower income) more than others. Still most of the above conclusions should hold for the population at large. Anecdotal evidence shows that lower income first generation car users value this means of transportation more. By contrast, highly educated professionals with an international experience tend to attach more value to bike riding for transportation and leisure.

These findings are most valuable to tourism operators who have an opportunity to service an expanding market segment and to tourism offices that should provide information and organization fitting different needs and requests.

THE PUBLIC PARTNER IN PPP CONTRACTS

Nikolopoulou, Marina¹

¹ Civil Engineer, University of Patras, Greece, Project Manager, M. Sc., Hellenic Open University, Greece.
E-mail: mnicolopoulou@gmail.com

Abstract

The attempt of this paper is to approach the newly introduced institution of PPPs from different angles retaining a, as much as possible, neutral position towards the idea and the main concept.

PPPs, is a new institution in law order, appear to be a positive legislative evolution so much in infrastructure works as well as in the provision services. The main objective of these partnerships is to increase the productivity and improve the quality of the life of the citizens and in general to service the public interest.

The PPPs inspired by the New Public Management brought a new trend in the system of public administration giving the private sector leeway as to the way in which they are implicated in the design and completion of a project. The contracting authority seizes to act as the originator of the project procedures and becomes a close and immediate partner with the private entity.

However, the fact that there is not a unique contract model of agreement within the PPP contract but is defined by the conventional terms and the Ancillary Agreements brings us to the conclusion that the detailed drafting of the terms of the partnership agreement, which are negotiable during the conclusion, define in the largest part the nature, the extent and the success of a project. The PPPs should always be subjected to thorough control in order to acquire a socially oriented nature which they lack because of their financially profitable nature.

Keywords: Public Private Partnership (PPP) Contracts, Public partner, Private partner, Public control, Conventional terms, New Public Management

Introduction

The Public Private Partnership (PPP) contracts are complex collaboration schemes between public and private sector that aim at improving the quality of the public services, providing private sector expertise to the public sector, reinforcing productive investment and to create new job opportunities.

In the - usually long-term - PPP contracts, citizens obtain the greatest benefits of the collaboration between the public and private sector regarding an infrastructure implementation or service provision. Besides resources placed from both, as appropriate, each party allocates the risks and the future rewards / benefits.

PPPs emerged mostly from the public sector urgency for private financing due to budgetary constraints faced by European Union (EU) member states and the need to modernize the public administration system.

There is no clear specific legal European framework for PPP. Any contract, through which a public entity entrusts the provision of an economic activity to a third party, is subject to the rules and principles of the EU. These principles include mainly the rules of transparency, equal treatment, proportionality and mutual recognition.

According to the hypothesis of the present paper, should exercise various aspects of control over PPPs in order to preserve the public interest, which they anyway institutionally represent.

A COMPARATIVE APPROACH TO THE PPPs

Public authorities have often concluded PPP contracts in order to implement infrastructure projects, particularly in transport, health and public utilities. A long term goal is the PPPs expansion to the construction of trans-European transport networks, a domain that demands high investment activity.

Definition

PPPs are schemes of cooperation between public authorities and private sector companies with long-term commitments that are designed to ensure the design, financing, construction, management, operation, renovation or maintenance of public infrastructure and services in various domains of national economy.

The private sector is rewarded, depending on the results obtained, either by the public sector either directly by the citizens-users of the infrastructure and services.

The European Commission has announced the publication of a Green Paper on PPP that aims at finding the optimum way that will ensure the development of PPPs within a framework of effective competition and legal clarity.

<i>PPP</i>	<i>TRADITIONAL PROCUREMENT</i>
<i>The repayment is distributed over a long term period</i>	<i>The payment allocated during the constructive period</i>
<i>The payment is made either directly by the contracting authority or by the citizens or by both</i>	<i>The payment burdens the state budget</i>
<i>The private sector becomes a partner</i>	<i>The private sector is just a contractor</i>
<i>The contract focuses on Output Specifications</i>	<i>The contract focuses on the technical specifications</i>
<i>The risks are allocated between the parties</i>	<i>The risks are mainly assumed by the public sector</i>

DIFFERENCES BETWEEN PPPs AND TRADITIONAL PROCUREMENT (Kakaris, 2006)

Principles of PPPs

The two basic principles of PPP are the ensurement of the efficiency of the financial resources of the Public Sector and the conveyance of business from the public to the private sector.

- Economic Efficiency (Value for money)

A PPP is considered advantageous to the State only if the private partner funding is beneficial compared with a hypothetical alternative State financing (Public Benchmarking). The greatest economic efficiency of a project results from the optimal combination of the lifetime cost, the benefits and risks involved in the whole process.

- Risk allocation

The effective risk allocation is a critical success factor of PPPs, as well as a differentiation parameter from other forms of cooperation. The private sector assumes the risks associated with the construction, financing, operation, management and ongoing maintenance of the project, while the government assumes risks such as changes in government policy and legislation.

According to EU directives the major categories of risk are:

- Construction or technical risk
- Availability and management risk
- Demand risk

PPPs in Europe

Although the private entity participation is not a new phenomenon in history, the origin country of this type of contracts is considered to be the United Kingdom, (UK).

United Kingdom

Since 1980 the British government, recognizing its inability to allocate large sums of money on carrying out technical works with high costs began to seek ways of funding from private companies.

Commission on UK PPPs (2001) describes PPPs as '*sustainable cooperation between public and private factors in which joints and/or services are developed and in which risks, costs and profits are shared*' (Klijn and Teisman 2000 and 2005) and as '*a risk-sharing relationship between the public private - including voluntary sector to bring about a desired public policy outcome*' (Commission on UK Public Private Partnerships, 2001, p. 2).

A commonly concluded type of contract in United Kingdom is 'Private Finance Initiative - PFI', which is a method of providing funds for major capital investments where private firms are contracted to complete and manage the projects. These contracts are typically given to construction firms and last a long time, sometimes up to 30 years. The public services are leased to the public and the government authority makes annual payments to the private company.

PPPs are used across a wide-range of sectors in the UK, including health, education, transport, defence, leisure, waste, culture and housing sectors.

In February 2009, the current pipeline of PPP projects in the UK included:

- **Education – around 50 “Building Schools for the Future” (BSF) projects**
- **Emergency services – 5 police and fire station projects**
- **Waste – 20 projects**
- **Transport – 6 street lighting projects and 3 highways maintenance projects**
- **Defence – 3 projects including the procurement of Research and Air Rescue helicopters.**

France

Inspired by the British PFI contracts, France institutionalized in 2004 a new type of partnership and especially a new type of administrative contract, the PPP contract (Maniatis, 2011). PPP has been recognised as a method that offers far greater benefit than any previous arrangement. While the first PPP projects in France were typically about buildings, the model is now being adapted to deliver new street lighting and large railway infrastructures. The sheer size of the latter, along with very stringent law that applies to the rail sector, means that the risk allocation has to be monitored very closely throughout the life of the project.

Aiming at boosting economic growth and minimizing the effects of the financial crisis, the Government of France adopted a large stimulus package «Plan de reliance» in the beginning of 2009. The Plan is particularly geared at supporting investments in public infrastructure and comprises a State guarantee for PPPs (the “Project guarantee”), which the French Ministry of Economy can award under certain conditions pursuant to Article 6 of the Law Amending the French Finance Law of 4th February 2009.

The powers specifically granted to public authorities are limited and the project risks are now shared on a more equal basis among parties, thus strengthening legal certainty for private enterprises.

Germany

The coalition agreement between the political parties of the federal government, dated 26 October 2009, explicitly mentions that the government will promote PPP. It is anticipated that investment in PPP in Germany is likely to continue to grow as a result of this support.

In 2008 the 100th PPP project was concluded in Germany. The German projects database lists 161 projects, 143 of which have closed since 2002. The majority, 48 in total, of these projects are located in the Federal State of North Rhine-Westfalia. These projects cover a number of different sectors in the German market:

- Accommodation (26)
- Culture and sport facilities
- Defence (2)
- Education (59) (schools have been procured mostly in a municipal level)

- Healthcare (7)
- Leisure / Sports (42)
- Prison Justice (6) (the first prison project funded by project financing was the Burg prison one in 2006),
- Roads (14)

Greece

In Greece, the legal framework for PPPs was introduced by Law 3389/2005 that specifies the minimum context of the partnership contracts and simplifies the procedures providing incentives to both public and private entities for the implementation of the constructions or provision of services.

The law addresses a number of risk allocation issues that had previously caused difficulties in financing projects in Greece. To protect the private sector's interests, the PPP Law also provides incentives that offer substantial security to entrepreneurs engaged in long-term contracts with public authorities. It also sets out the minimum content of a PPP contract and deals with issues such as taxation, the granting of permits and licenses, protection of the environment, treatment of archaeological findings and expropriation. Legal issues related to these partnerships, such as the transfer of claims, validity of security granted to banks, bankruptcy and resolution of disputes, are clearly defined.

A positive evolution for the further development of the institution is the definition of a clear fiscal framework for special purpose vehicles (SPV), which relates mainly to the income acquiring time, the total cost of implementing the partnership agreement and the time for VAT repayment. The aim is to promote PPP to a more effective tool that will enable private initiative and will aid development.

Upgrade of the Private Sector Through PPPs

A significant innovation of the PPP institution consists in some advantages provided to the private sector, contrary to the traditional legal frame work public administration contracts. These are summarized as follows:

Innovation - Save time and money

The expertise and experience of the private sector in similar projects allows the development of innovative solutions that reduce cost and time, improve functional design as well as construction and management process. The procedures developed can be models for later works. As private operator will not be paid until the operation of the infrastructure, has a strong motive to complete the construction soon.

A clear commitment to customer / citizen

In partnership with the private sector, the public body seeks the provision of services to citizens (end users). The infrastructure is only one prerequisite for the provision of services and, therefore, the

standards set by the Public Entity is the performance and / or function specifications. The private partner will be paid either by the public sector, either by end users with the launch of the project or service, after the delivery of infrastructure. The payoff is segmental, within the life span of the partnership, which is long, and depends upon the quality of the services.

- Broader economic benefits

By developing and integrating a large number of projects while there are constraints on government budgets, the development of PPP contracts can be an incentive for the private sector to contribute to increased employment and economic development.

- expertise

These new methods achieve knowledge transfer to the public sector through its collaboration with the private sector while the expertise and flexibility of private sector is available not only during construction of an infrastructure project, but also throughout the duration of the partnership. So people can take advantage of the Private Sector in the long-term.

- Sponsorship

The sponsors -usually private companies- should obtain a new institutional role in the PPP. The private entity may be funded by a sponsor to complete the project by providing the recipient with money, services, tangible or intangible assets in order to support this particular objective. The cooperation with a private company contributes to the marketing of the project by applying marketing techniques, for example advertising, and makes it easier to deal with problems related to the implementation of the project.

- Arbitration

The PPP Law specifies that Greek law will be applicable in the resolution of disputes as for the interpretation, application or validity of partnership contracts. Regarding the resolution of disputes, Article 31 provides that "*Any dispute arising with regard to the application, interpretation or execution of the Partnership Agreements ... shall be settled by arbitration.*"

In comparison with state courts, the arbitration provides to the involved parties the option to choose specialized personnel in the particular dispute issue. However, that could be in direct contradiction with the Greek Constitution as long as state trials are fully excluded.

Public Control on PPPs

The upgrade of the private operator and the general philosophy of the PPP contracts brought a new trend in the system of public administration, the New Public Management.

PPPs and New Public Management

The New Public Management also known as 'Entrepreneurial Government' aims at efficiency, effectiveness and economy in performance of public sector by employing modern managerial tools,

techniques and procedures to fine tune the public administration so that it can effectively achieve its goals in the changing environment of globalization, privatization and liberalization. For this purpose, it borrows methods, practices and procedures from business administration and advocates the adoption of the same in public administration.

Some features of this School of thought are:

- Client approach to the citizen
- Quality of provision services.
- Effectiveness (qualitative and economic).

In accordance to the New Public Management:

- The rivalry and competition are promoted between public and private entity
- Marketing techniques are applied to the public sector
- Financial criteria are used for the management of public assets
- The private entity becomes the direct associate in a business cooperation level with the public entity and there is no distance, like in public projects.
- The private entity is engaged for 25 years in the function of the project according to the given terms, which in fact seals the concept of New Public Management.

Terms of PPP contract

There is not a unique type of agreement within the PPP contract model, each project is unique and is defined by the conventional terms and Ancillary Agreements. Thus, the detailed drafting of the terms of the partnership agreement, which are negotiable during the conclusion define in the largest part the nature, the extent and the success of a project.

According to Law 3389/2005, in order to successfully achieve the public purposes of a partnership and the public needs and interest, the Joint Ministers' PPP Committee and the Special Secretariat for the PPP have been created. Their basic competence is the choice of the way to cooperate with the private entity, the correct affiliation to the applied legal provisions of Law 3389/2005 as well as the general supervision of the correct conduct of the partnership.

Before a contract renegotiation, it would be wise to try resolving some of the problems within the present contract terms and conditions. It could be useful for the Authority, at the outset of the process, to hire an independent consultant to assist in the planning of all technical assistance that will be needed throughout the process (e.g. prepare terms of reference and contracts for the advisers).

A PPP Review Panel could be established as an independent body respected by all parties that could be consulted to resolve issues. The panel would be consulted before resorting to arbitration or other legal measures that could take years to decide, time in which the PPP could fail. The project management team requires different types of advisers for different phases of the PPP project

preparation. When the procurement phase begins, a comprehensive plan needs developing for how advisers will be used. The exact nature of the broad advisory team depends on the project and the in-house resources available but the core team of advisers for the procurement phase usually consists of financial, technical and legal advisers.

The public partner should have the right to renegotiate and the ability to do so if special circumstances arise, such as if revenues are substantially off target (too low to cover costs), or if a constructing problem is discovered by the provider, which was not considered in the original bid. In such cases, both the public and private parties should follow the mechanisms to request renegotiation and to renegotiate and settle the issue as described in the contract.

Government intervention should be based on preliminary monitoring, giving to the controlled party the general idea to operate in a free manner without delaying the implementation of the project through bureaucratic procedures. The public entity should supervise and not intervene, unless the intervention proves to be indispensable.

In addition, the contract should foresee in detail the repayment of the contractor as well as the penalty clauses for any delays or failures during the contract period.

The terms of the partnership must comply with the principle of uninterrupted function in order to foresee in any case the treatment of possible problems during the partnership without endangering the partnership and its purpose. The negotiation could and should be done for that purpose so that the stakeholders could readjust the terms for the common welfare.

Additionally, in a PPP contract the principle of protection of the rights of private individuals' principle should be abided by promoting the respect to the rights of the citizens and the obligation their project.

Besides, contractual arrangements are submitted to the equal treatment principle defining that the scope of the partnership and the use of it should be accessible and feasible to all the citizens. Everyone should have the right of equal access to the scope of the partnership.

Furthermore, during the process of the partnership the protection of the public interest principle, the transparency principle, as well as the protection of the environment and sustainable development principle should be applied.

In any case, in a PPP contract some suggested mechanisms could be included, such as the following ones:

- The Court of Auditors could exercise precautionary controls to the PPPs in order to immunize the transparency principle and to avoid the public fund embezzlement.
- The United Independent Authority for Public Contracts could control the efficiency, consistency, monitoring, harmonization and execution of PPP contracts in accordance with National and European law.

- The Hellenic Technical Chamber, a Legal Entity under Public Law, as enacting the role of advisor of the State as for PPP projects.

- The Bar Association, a Legal Entity under Public Law, as a Legal Advisor of the State could assist by submitting proposals and draft regulations for the resolution of pending problems of institutional interest.

Failed PPP Cases

The eminent need for public entity intervention to the conventional terms is sealed by the presentation of some failed PPPs projects.

The case of the British Hospital Branch

Empirical data from the decennial implementation of PPPs in the British hospital branch converge to the conclusion that public-private sector did not offer value for money, since the cost was relatively high compared to the provided result.

The following conclusions have been emerged:

- The sale of National Health System real property with favorable terms to the private sector.
- The reduction of capacity of new hospitals to 30%, dictated by financial rather than clinical needs, thereby negatively affecting the clinical activity of new hospitals and disabling them to cover the health needs of local populations.
- The reduction of up to 16% of the payroll budgets and proportional reduction especially of nursing staff.
- The shift of the financial burden on patients through increased private clinics and their contribution to the cost.

The case of the Royal Armouries Museum

Another failed PPP project consists in the Royal Armouries Museum, in Leeds of the United Kingdom, in 1996.

The basic issue was the over optimistically prediction of visitation, hence failure because of the private sector's denial to reduce the price of the ticket. Another cause was the delay on behalf of the contracting authority to reform the nearby docks with the intention to increase visitation numbers (National Audit Office, 2001)

Based on the original agreement and because of the failure of the project the risks should have been passed on to the private entity (something that the PFI stands for), though the shareholders following the renegotiation of the contract, maintained their profit merge by holding on profitable activities of the museum such as restaurants, car parks, etc

In the United Kingdom the question rises whether the PPPs should be of overall character and assume the design of the scope from scratch.

The case of the Castle of Versailles

Another example is the case of the castle of Versailles, which is the first case of failed PPP contract in France. In 2008, the administration of the competent organization decided to terminate the contract signed, between its former president and a telecommunication services company, for the reason that in the fifteen (15) months of execution of the contract, the partnership was marked by numerous failures on behalf of the private operator.

Among the failures was that the software ticketing system was unstable, particularly slow and unsatisfactory, causing problems such as lengthening the queue of the visitors. PPP contract model would have had as an attraction showcase Versailles, whose gardens exemplify natural heritage and have been included in the "List of World Heritage" by the Convention for the Protection of World Cultural and Natural Heritage, signed in Paris in 1972. (Maniatis, 2011).

Finally, the delay on behalf of the competent Ministry, the withdraw of the executives from the private company involved when it was acquired by another private company, and of course the technical inability of the private party proved to be some of the additional causes for failure.

PPP, a contract in contact with the public interest

PPPs, as a new institution, appear to be a positive legislative evolution in infrastructure works as well as in the provision of services. On the one hand, the State eludes the traditional practices and becomes a partner and informally a "student" in a management group, in favor of the common welfare. The contracting authority ceases to act as the originator of the project procedures and becomes a close and immediate partner of the private entity. The state supervision on the other hand, is limited to the degree of a prevented and flexible control intending to maximize the efficiency that can be achieved through a PPP project.

However, the fact that there is not a unique model of agreement within the PPP contract but the agreement is defined by the terms of the contract and the Ancillary Agreements raises questions related to regulations.

It is observed that in the contract, each contractor has means and methods for the common objective but not necessarily equal access to the profits. Private entities may well be the partners that mostly reap the benefits from scopes the partnership, to cover their expenses and their profit margins.

It is to pay attention to the fact that PPP contracts are not initially dedicated to scientific research, for example, in health, but mostly to scopes that yield financial gains. This can be attributed to certain failures of the capitalist system, whose ideology are the PPPs that come from neo-liberal regimes.

In PPP projects that concern delicate social domains, such as hospitals, schools and correctional facilities, whose infrastructure is especially modern, well structured and environment friendly, not only financial criteria but also humanistic ones should be followed.

On account of the current analysis, the hypothesis of the present paper has been fully confirmed as the private partner may be a valuable partner of the public one, always under the continuous control of a well coordinating system of various public competent authorities and entities in compliance with a legal and ethical commitment to society.

Abstract

This paper aims to review relevant literature on interpersonal and technology-based buyer-seller interactions in hospitality sector. Also highlighted is the extent to which technological interface that enables customers to produce a service outcome, independent of a direct service employee involvement, is used by hotels of various categories in France. An e-mailing action that encompasses sending a typical room-booking request to 240 hotels spread out in 120 cities located in France constituted the empirical setting. One-way ANOVA testing differences between means was used to assess the impact of the hotel category (independent variable) on response time (dependent variable) among hotels. Findings show that there is significant variation in responsiveness across hotels categories. A major implication of the findings for management is the fact that the speed of response to enquiries from current and potential customers is most likely a prelude to providing good quality technology-based buyer-seller interactions. The main contributions of this study are the review of relevant literature and it builds on interpersonal and technological interface literature.

Keywords: Information and Communication Technology, Buyer-seller interactions, E-mail, technology-based service encounter.

Introduction

Bitner, et al. (2000); Parasuraman, et al. (2005); Osarenkhoe and Bennani (2007) highlight the vital role that technology play in the delivery of services and will continue to be a crucial component in the customer-firm interactions. There has been unprecedented resurgence of academics as well as practitioner interest in the salient features and dynamics of interpersonal interactions between service providers and customers (Osarenkhoe et al 2006; Cheng et al. 2011; Wiengarten, 2011). Customer interactions with technological interfaces, on the other hand, are under-researched (Bitner, et al. 2000). Bitner et al demonstrated in their study that self-service technologies are indeed increasingly changing the way customers interact with firms to create service outcomes. The globalization of markets and production has enhanced e-mails adoption by the actors operating in the hospitality business sector that enables their guests to book and/or to buy a stay thus bypassing travel agencies (Osarenkhoe and Bennani, 2011). Consequently, e-mailing has altered sales practices and provided hotels with the

opportunity to differentiate themselves from competitors. This change has driven hoteliers to use e-mail features efficiently for the benefit of their guests and their business.

It is postulated in extant studies (Chen, 2007) that the main empirical contributions to the performance issue have focused first, above all, on the industrial sector and on some segments in the service sector (banks, retail, insurance), but have neglected the hospitality travel and tourism sector, with a few exceptions. Moreover, emphasis in the academic literature and extant studies on hospitality sector in particular (Sahadev and Islam 2005; Sigala, 2003; Yilmaz and Bitici, 2006; Morrison et al, 2004) has focused almost exclusively on the interpersonal interactions between service providers and customers, there is more to be learned about buyer-seller interactions with technology-based self-service delivery options (Meuter, et al 2000; Cheng et al., 2011).

The basic premise of this paper is that there may be significant variations in the response time when using e-mails to communicate with customers. This paper investigates these variations on the basis of an e-mailing action that encompasses sending a typical room-booking request to French hotels. Prompt Response to room-booking request via e-mails is a legitimate issue in marketing that warrant to be investigated because it is demonstrated in extant literature that response time to customer requests is one of the episodes that have a positive effect on customer satisfaction (Wang and Wang, 2010; Osarenkhoe and Bennani, 2007 & 2011).

Highlighted in this paper is the extent to which technological interface that enables customers to produce a service outcome, independent of a direct service employee involvement, is used by hotels of various categories in France. The main contributions of this paper are its treatment of relevant literature. A further contribution is that approach taken in the paper encompasses reviewing the relevant literature

The rest of this paper is as follows: first, we introduce the theoretical and conceptual foundation. This is done by reviewing literature related to the use of information and communication technology and Internet in the hotel industry. This is followed by a description of the research methodology; findings will be revealed and analyzed before the conclusion and implications are highlighted at the end of the paper.

Thoretical and Conceptual Background

Technology-based service encounter

The world is becoming increasingly characterized by technology-facilitated transactions (Cheng et al., 2011). Growing numbers of customers interact with technology to create service outcomes instead of interacting with a service firm employee (Meuter et al 2000). Thus, phenomenon of the Internet has forced businesses and organisations to examine their existing business practices and adopt new methods of working, both for existing and potential customers. According to Shiels et al (2003), the characteristics of the firm and industry sector are, however, contributory factors to the extent of adoption and exploitation of information and communication technology (ICT) by firms, to

support business processes. The use of Information Technology and Communication (ICT) has been growing fast in the worldwide hospitality industry. Hoteliers are increasingly adopting Internet, mainly the e-mail, to interact with their guest and provide easier access to customized service. According to Meuter et al (2000), understanding customer need and preferences with technology-based service encounters self-service technologies are increasingly changing the way customers interact with firms to create service outcomes.

Buyer-seller interactions during service encounter have historically taken place on an interpersonal basis (Osarenkhoe et al 2006; Cheng et al. 2011 ; Wiengarten, 2011). Recent academic researchers have recognized the critical importance of technology in the delivering of services (Parasuraman, et al 2005; Bitner et al, 2000, Meuter, et al 2000 & 2005, Sahadev and Islam, 2005). The increasing competition among territories forces tourism industry to define new strategies in order to improve the position of each area, thus attracting more tourism flows (Dwyer et al., 2009) and enhancing economic advantages (Zhang et al., 2009; Bornhorst et al., 2010). Current researches in information and communication technology (ICT) considerably affect the tourism sector, by providing innovative tools capable on the one hand of supporting consumers in organizing their holidays, and, on the other one, of supplying fast and efficient information on consumer behaviour. These innovations compel the sector to develop new marketing and managerial strategies (Egger and Buhalis, 2008).

Information and communication technology in the hospitality industry

According to Wang and Wang (2010), the lodging industry has, historically, distributed information through print-based media such as brochures, travel planners, or regional guides, and received reservations by mail, phone, and fax. More recently, hotel rooms have been made accessible for booking through global distribution systems (GDS) and through direct access to hotels using central reservation systems (CRS). However, such technologies have been inadequate as customers have traditionally not had access to these systems and travel intermediaries have experienced difficulties and delays in finding and booking appropriate hotels. Some suggests that the traditional marketplace interaction is being replaced by a market space transaction (Bitner, et al, 2000). In this context, e-mail technology is an example of market space interactions in which no interpersonal contact is required between the buyer and seller during the process of creating the service outcome.

E-mail offers a promising tool to help marketers keep in touch with their customers on a regular basis at low cost (Egger and Buhalis, 2008). The benefits of an active marketer are described in considerable detail in the customer relationship management (CRM) literature, which suggests that marketers could enhance customer loyalty by being active and in regular contact with their customers (Osarenkhoe and Bennani, 2007).

It can be deduced from the preceding review that Information and communication technology (ICT) improves the quality of customer-oriented, personalized service, allows the delivery of e-service and enhances customer relationships (Newell, 2000; and Wang, 2010). Some questions such as the

relationship between the client and the supplier emerge due to the integration of Internet in company strategies. Because of Websites and the e-mail use, some researchers have reservations about the lack of physical and direct contact between the service provider and his customer. It challenges the traditional way of doing business in which customers are served either face to face and/or over the telephone. It allows one-to-one interaction and makes online relationship possible (Wang and Wang, 2010).

How the Internet Helps the Hotel Industry

Level: Basic PLUS

An avid writer, Kelvin Kong is a successful "Brick-and-Mortar" Entrepreneur and Internet Netpreneur. He loves people, and enjoys sharing his expertise and knowledge of marketing ...

Previous studies show that the firms providing Electronic Data Interface (EDI) service were offering more services to their customers than firms not providing EDI service (Sawabini, 2001; Ngai and Gunasekaran, 2004; Parasuraman et al. 2005; Leonard and Clemons Davis, 2006). With global and local hotel brands turning to the World Wide Web in order to boost sales and facilitate customer relations, it is easy to see how the industry is evolving along with the Internet (Shiels et al., 2003; Patano and Tavernise, 2009). Social networking sites, led by the Facebook phenomenon, are proving to be more and more important for not only hotels but for other businesses as well (Egger and Buhalis, 2008; Bornhorst et al., 2010). With the prevalence and influence of user-generated content such as reviews and other forms of feedback, hotels get the benefit of plugging by way of word of mouth (Lo et al., 2010). Maintaining relationships with previous clients also becomes easier to handle with a variety of online tools at the hotels' disposal (Lo et al., 2010; Osarenkhoe & Bennani, 2011). There are also web sites dedicated to bringing travel services and accommodations straight to the consumers' monitors whether it is through standard personal computer access or through the exponentially growing number of mobile phone internet users (Kim et al, 2011). There are also other utility web sites that aid consumers by providing aggregate information, reviews and feedback from numerous sources (Osarenkhoe & Bennani, 2011).

The use of ICT in business has enhanced productivity, encouraged greater customer participation, and enabled mass customization, besides reducing costs (see Zheng Zhou et al., 2005). Increasing competition has pressurized hoteliers into adopting the technology in U.S. (Siguaw et al., 2000), Hong Kong (Lo, 2010), Taiwanese (Chen, 2007b), Thailand (Sahadev and Islam, 2005 a&b), Australian (Van Hoof, 1999), UK (Sigala, 2003) luxury class hotels. Frey et al. (2002) found in their research that e-service is more effective in higher-rated Swiss, Austrian and Italian hotels. Hotels in France, particularly luxury class hotels, should therefore make better use of e-mailing and should provide their customers with a high-quality and professional e-service. Responsiveness is the most likely first step in providing this quality e-service using the Internet/e-mail. Hence the following hypotheses:

H1: E-mail responsiveness is proportional to the number of stars of hotels, the more stars they have the quicker they respond.

H2: The response richness has a significance impact on the response time.

Research Methodology

Data collection process encompasses three steps: firstly, some hotels located in France were identified on the Internet. Secondly, hotels that have “.com”, “.fr” or “.net” in the domain name of their e-mail addresses and those having their own Domain Name Server (DNS²⁷) were browsed. Finally, the replies received within a two-month period were analyzed. A population of hotels with an e-mail address on the French Tourism Websites was selected. Exhaustive samples of 240 hotels located in France constituted the target group. The hotels have operations in 120 cities in France. Majority of the hotels in the sample were of two-star category (Table 2). The second largest hotel category was three-star category. They both accounted for 86% of the overall target population. Also the limited number (around 4%) of one star hotel was noted. E-mails with an attached booking request were sent to four, three, two and one star hotels. The mail was written in French. They were asked about room availability and prices for two adults and two children (16 and 10 years old) for one week in July, as well as local tourist attractions and excursion possibilities and their prices. The e-mails were sent to the selected hotels. The Bcc²⁸ function enabled us to send multiple e-mails simultaneously while masking this mass mailing for recipients. E-mails that failed to arrive due to wrong addresses or to any other problem were not re-sent.

<i>Hotel Category</i>	<i>1 star</i>	<i>2 star</i>	<i>3 star</i>	<i>4 star</i>	<i>Not specified</i>	<i>Total sent</i>
<i>France</i>	4%	62%	24%	6%	4%	100%

Table 2: Sample breakdown of hotel categories

The e-mails replied were followed-up over two-month period. On a weekly basis, the received e-mails were analyzed one by one and the information included in them was recorded into a database.

<i>Hotels Category</i>	<i>1 star</i>	<i>2 stars</i>	<i>3 stars</i>	<i>4 stars</i>	<i>Not specified</i>	<i>Total replies</i>
<i>France</i>	3%	55%	31%	7%	4%	100%

Table 3: Hotel replies of hotel categories

Research Findings

As far as errors are concerned, globally 10% of the sent e-mails were returned due to a wrong address. Compared to the entire sample (240), 107 hotels replied the delivered e-mails. More than one

²⁷ For example, the DNS included in www.reims-ms.fr Website address is “reims-ms”. This one is the property of Reims Management School. While in www.wanadoo.fr/company Website, the DNS is “wanadoo”, which belongs to France Telecom.

²⁸ Blind carbon copy

in two hotels belongs to the two-star category (Table 3). This shows the domination of this class. It was also noted for this category that the return rate almost corresponded to that of the e-mails sent.

Among the replies, one star and four-star hotels were under-represented. It also appeared that only few hotels did not mention their category (around 4%). 66% of the hotel replies were received within a week (Table 4). Two and three-star categories are over-represented (55% and 31%) while one star (3%), four star (7%) are under-represented (Table 3). Analysis of total replies in one day (36) (Table 5), shows that almost 47% (17/36) of two-star hotels, almost 39% (14/36) of three-star hotels and only 5% (2/36) of one and four-star hotels reply in one day.

	1 star	2 stars	3 stars	4 stars	Not specified	Replies/ period
1 day	6%	46%	39%	6%	3%	30%
2 days		70%	24%		6%	15%
3 days		66%	17%	17%		5%
4 days		80%	20%			5%
5 days				100%		1%
6 days		67%	33%			3%
7 days		100%				2%
< 4 hours	2%	71%	14%	9%	4%	39%
Replies/ category	3%	58%	27%	9%	3%	66%

Table 4: e-mail replies within a seven-day response time period.

Note that 71% of two-star hotels react in less than four-hour (Table 4). Also only 2% of one star hotel replied within four-hour time period. These results show evidence that the hypothesis that higher category hotels in France show better responsiveness than the lower category ones is not confirmed. This hypothesis should thus be rejected even if the four-star hotels panel is under-represented in the global sample. Above all, both the two-star and the three-star hotels (to a lesser extent) appear to reply promptly to the e-mails received from customers. This could be because of the fierce competition within the market segment covered by these categories. The higher category hotels probably assume that their customers belong to the business segment that doesn't use e-mails to make reservations. Rooms are more likely to be booked by secretaries over the telephone.

On the other hand, five binominal variables relating to e-mail responses were created. These variables (room availability, nature of service (half board, full board), local tourist attractions, price of the additional activities, and forward to web) were coded yes or no and classified into one factor: response richness. The results indicate that more than 93% of hotels provided information about their availability, while only 37, 4% specify the nature of service offered (half board or full board). Few hotels (29,9 %) provided activity description, and 28% provided information relating to forwarding to

the Web. Only five hotels provided information about the price of the extra activities. In sum, almost 48% of hotels provided information regarding forward to web.

	<i>1 star</i>	<i>2 stars</i>	<i>3 stars</i>	<i>4 stars</i>	<i>Not specified</i>	<i>Replies/ period</i>
<i>1 day</i>	2	17	14	2	1	36
<i>2 days</i>		12	4		1	17
<i>3 days</i>		4	1	1		6
<i>4 days</i>		5	1			6
<i>5 days</i>				1		1
<i>6 days</i>		2	1			3
<i>7 days</i>		2				2
<i>< 4 hours</i>	1	32	6	3	2	45
<i>Replies/ category</i>	3	79	28	8	9	137

Table 5: e-mail replies within seven-day and less than four-hour time period.

One-way ANOVA testing differences between means was used to assess the impact of the hotel category (independent variable) on response time (dependent variable) among hotels in France. The results of ANOVA analysis are presented in Table 6. They indicate that no differences were found for response time. Hotel category does not have a significant impact on response time (the value is more than 0.05). However, the results in Table 7 suggest a significant impact of the response richness on response time ($p < 0.05$).

	<i>F ratio</i>	<i>P prob</i>	<i>Significance</i>
<i>Response time</i>	.843	.501	<i>Insignificant</i>

	<i>F ratio</i>	<i>P prob</i>	<i>Significance</i>
<i>Response time</i>	4.168	.044	<i>Significant</i>

Table 7: One – way ANOVA between response richness and response time

Analysis

Our findings shed light on the use of e-mails at customer contact points in hotels in France. It found significant dissimilarity in responsiveness across hotels categories located in France. A study conducted by Frey et al (2002) on how website features and email responses by Swiss hotels reflect evolving Internet adoption. The study confirms that Internet adoption evolves from static to dynamic use, as organizations add website features and provide quality responses to customer e-mails. While these previous studies found that highly rated hotel category have a high adoption level of technology-based service encounter tools, thus e-mail usage, they also found that hotels failed to give

much concern to improving customer service. Contrary to previous findings, our findings show opposite results for the lower categories, mainly two and three star hotels.

Our findings show that, the low level of responsiveness to e-mail technology (an example of market space interactions in which no interpersonal contact is required between the buyer and seller) is demonstrated by hotel of higher categories included in our sample is surprising. There seem to be anomalies in our findings especially when the findings by Parasuraman, et al (2005) are taken into consideration. They found that firms providing electronic data interchange (EDI) services and technology-based service encounter tools to their customers were found to be better able to accommodate selected customers' requests than firms not providing EDI services and technology-based service encounter tools. Firms providing technology-based service encounter possibilities appear to be more flexible and more responsive to customer requests. This view is in agreement with viewpoints by Kim et al (2011); Leonard and Clemons Davis (2006). Technology-based service encounter tools offer significant potential for helping firms to gain competitive advantage and enhance customer responsiveness (Leonard and Clemons Davis (2006). In contrast to previous studies, our findings show low level of responsiveness to e-mail technology by hotels of higher category. A possible explanation to why our findings are inconsistent with extant findings is that those who patronise five star hotels or hotels of higher categories belong to a higher income stratum. Consequently, they may have direct telephone contacts with the hotel when checking for availability. Moreover, their secretaries who usually contact the hotels via telephone instead of via e-mails.

The magnitude of e-service that we experienced with high category hotels in France, when e-mailing a typical room-booking request, could be explained by their lack of interest in the Internet/e-mail user market segment. These findings seem to be in line with that reported in Sahadev and Islam (2005) that the factors that influence a hotel's propensity to adopt ICTs are broadly divided into location-related and firm-related. The findings also reconcile with the idea shared in extant literature (Meyronin, 2004) that electronic intermediation tends to "impoverish" service relations, insomuch as the technological interface can by no means replace the wealth of human interactions on which the creation of value and differentiation of services are based. The objectives that can be expected from the use of e-mailing - a concrete outline of e-service- in the hotel industry have to be formulated in terms of good communication, fine responsiveness, high-quality information and competitiveness.

Our findings in France are probably culturally grounded. Elsewhere, the use of the ICT in the lodging industry is growing exponentially and this enables hotels to reconsider the way they are doing business (Wang and Wang, 2010). Although the lodging sector overall has been slow to use ICT as compared to other industry sectors (Kim et al 2011) many hotel managers are becoming increasingly aware of the potential distribution, promotion, and interactive marketing advantages of technology. ICT offers several advantages for hotels of all sizes (Wang and Wang, 2010). One of the advantages is increased effectiveness due to cost reduction and revenue growth. Another advantage is higher quality customer relationships due to the possibility of personal contact services and dialogue with the customer (Wang & Wang, 2010). For example, customers can answer questions about their

personal preferences for rooms, and based on this information, a customer receives services at the hotel that are adapted to his/her preferences.

Concluding Remarks and Limitations

This paper has many limitations. Some of them are that our research objective is too narrow and the analysis and conclusion has been done through evaluation of response time of an e-mail of room booking request only. Moreover, we are aware that ICT is a much broader topic, but we have focused mainly on electronic communication/interaction tool (e-mailing) which does not require interpersonal buyer-seller interaction in the contact point. Despite these limitations, there is consensus in extant literature that the speed of response to enquiries from current and potential customers is most likely a prelude to providing good quality technology-based buyer-seller interactions to create service outcomes. E-mail is not an exception.

Another major weakness of this study is the sampling and survey. However, the main contributions of this study are its treatment of relevant literature. A considerable literature review has been done with research rigor. A further contribution is that approach taken in the paper encompasses reviewing the relevant literature and focusing on the key themes most important for future research on hospitality industry. The basic premise of this paper is that there are large variations in its use across hotels categories. This paper studies these dissimilarities on the basis of an e-mailing action that encompasses sending a typical room-booking request to French hotels. It analyses the response time to see how promptly hoteliers reply; which hotels categories (one- star, two-star, three-star, and four-star) make use of e-mailing to answer their customers rapidly. It is highlighted in the theoretical and conceptual development section presented earlier in this paper that e-mail has altered sales practices and provided hotels with the opportunity to differentiate themselves from competitors. This change has driven hoteliers to use e-mail features efficiently for the benefit of their guests and their business. However, our findings, presented and analyzed in the previous sections, show that there are significant dissimilarities in the response time when using e-mails to communicate with customers.

That notwithstanding, responsiveness is most likely the first step in providing quality e-service using the Internet/e-mail. One of the major concepts in customer relationship management is speed at which firms respond to questions and problems during the service encounter (Wang and Wang, 2010). Customer relationship management (CRM) and direct marketing literatures (e.g. Osarenkhoe and Bennani, 2007) suggest that regular contact with customers help marketers enhance customer loyalty. Direct mail is used to cross-and up-sell, to increase customers purchasing frequency, and to induce customers to respond and to become involved in a dialogue (Egger and Buhakis, 2008).

Technology, particularly information and communication technology (ICT), is becoming an important strategic asset for hospitality organizations to improve their organizational performance and strategic competitiveness (Wang and Wang, 2010). As a matter of fact, ICT use in the hospitality industry has been changing at a speed faster than at any other time in history. As the younger

generations become more adept at the use of technology, they want to bring that into their lodging and dining experiences. The decision to adopt and use new technology or technology systems has become so important that many hospitality organizations are transforming their corporate or organization structure to include functions and positions such as creating a technology. While this study is exploratory, it provides a valuable foundation for further work. For example, there is a need to further analyze the cross-cultural differences of the global travel market and cross-national perception of service encounters. In addition, consumers also differ globally due to their individuality and ethnic background, which is an important direction for future research.

Abstract

This paper contributes to the entrepreneurial team formation literature by applying the Theory of Planned Behaviour (TPB) to predict entrepreneurial team formation intentionality. Adopting the Skills Brokerage Business Model as a framework facilitating entrepreneurial team formation, this paper conceptualises skills investment intentions prior to entrepreneurial team formation as the intention to invest various forms of capital in a new or already identified venture. Using a sample of 401 individuals, the relationship between the TPB antecedents and intention are examined. Our findings suggest that skills investment subjective norms and behavioural control are positively related to skills investment intentions. This study provides partial support to the application of the TPB on an entrepreneurial team formation context and contributes to our understanding of entrepreneurial team formation intentionality, by validating the factors affecting intentions.

Keywords: entrepreneurial team formation, skills investment, intentions, Theory of Planned Behaviour (TPB), psychological factors

Introduction

As entrepreneurship may be seen as a collective action of individuals leading to team formation inside or outside an existing organisation and research on entrepreneurial team formation intentionality is scarce, we turn our focus on the skills brokerage business model (or simply skills brokerage) (Papagiannidis and Li, 2005) as a framework facilitating entrepreneurial team formation. Entrepreneurial team formation may be of high importance, especially in an extremely competitive environment characterised by resources scarcity. Following the call by Krueger *et al.* (2000) for more research on Theory of Planned Behaviour (TPB) (Ajzen, 1991) this paper's research objective is to study psychological factors affecting intentions to form entrepreneurial teams by adopting the TPB. Our main research question is whether positive attitude, subjective norm and perceived behavioural

control positively affect individuals' intentionality to engage in skills brokering activities and subsequently in entrepreneurial team formation.

This paper is structured as follows. We first review the relevant literature and form our hypotheses by adopting TPB constructs so as to refer to individuals' intention to participate in entrepreneurial team formation. We then present our sample, measurements and descriptive statistics. Following this, our hypotheses are tested via using the structural equation modelling and findings are discussed in the context of the literature. The last section summarises our conclusions and highlights implications for theory and practice.

Literature Review

Entrepreneurship may be approached as a collective action based on team formation (Reich, 1987, Cooney, 2005), rather than an individualistic fact by locating the entrepreneurial function within a single person (Harper, 2008). In this sense, new venture creation or adding value to an existing organisation is based on entrepreneurial teams. By combining core aspects of previous definitions (Kamm et al., 1990, Ucbasaran et al., 2003, Tihula et al., 2009, Cohen and Bailey, 1997, Iacobucci and Rosa, 2010, Forbes et al., 2006, Cooney, 2005) entrepreneurial teams refer to two or more individuals or organisations who jointly and actively participate in the creation, management and development of a venture, by offering their capabilities (e.g. human and social capital, financial resources or other resources), contributing to interdependent tasks and responsibilities, sharing risks and having a financial interest (equity or profit sharing). Considering the value of different forms of capital in entrepreneurial team formation, Papagiannidis and Li (2005) proposed skills brokerage as a business model overarching philosophy that could facilitate more effective and efficient application of one's total capital and may serve as a practical framework leading to entrepreneurial team formation by bringing skills in-house and locking in these skills for a period of time

Skills brokerage business model

The underlying philosophy of the skills brokerage business model is the accumulation of ideas, skills, access to networks and resources that derive from the cooperation of different parties willing to offer their skills, the skills investors and the entrepreneur who acts as a skills broker by offering an idea (Papagiannidis and Li, 2005). Skills investors are individuals or organisations with a high level of skills or social interactions or available resources, who exchange them in order to receive equity or direct access to the returns on the venture, or alternatively a combination of both. They are assumed to be entrepreneurial in nature, identifying and exploiting opportunities to invest their skills in the identified opportunities. Such an outlook is in alignment with Shane's and Venkataraman's (2000) definition of entrepreneurship as the identification and exploitation of opportunities that lead to the creation of future goods and services either outside or inside an existing organisation. All actors involved are actively searching to invest their resources and engage with multiple projects, effectively diversifying their portfolio and maximising their return on their resources, especially the intangible ones and those that can be reused with no cost. A business support version of the skills brokerage has

been proposed, illustrating how this may work in practice on a wider scale (Papagiannidis et al., 2009).

The term "*business model*" should not be considered in its typical interpretation, but more holistically, as each time one invests resources this may be in the context of a project that has a different business model. Also, although "*brokering*" does take place typically with the leading entrepreneur negotiating with potential skills investors, "*investment*" may be a more appropriate term to describe this process. As in the rest of the paper we are considering brokering mostly from an investor's vantage point we will use the term "*skills investment*" to refer to their involvement in a project by investing human, social and other forms of capital.

Considering that Papagiannidis and Li (2005) work was mostly concerned with electronic businesses that are predominantly service-oriented, a service-based philosophy (Vargo and Lusch, 2004) could extend the applicability of the model, encapsulating any venture that relies heavily on skills, information and technology. As the model promotes the sharing of diverse forms of capital that can typically be duplicated at no cost, entry barriers for service-based ventures could potentially be lowered.

Skills investment behaviours for entrepreneurial team formation have received limited empirical support. Beyond the initially examined case studies as exploratory work reflecting the applicability of the model on a firm level, further empirical research is needed in order to better understand skills investment behaviours. As relevant research questions in this context remain to be answered, it is important to fill in this gap by primarily evaluating the factors that may affect skills investment intentionality.

Entrepreneurial intentions

Instead of predicting behaviours by analysing attitudes (Wicker, 1969) a more integrated approach reveals that research focus should be turned on additional determinants of behaviours such as intentions (Olson and Zanna, 1993, Krueger, 2007). Entrepreneurial intentions may represent desires, preferences, plans or behavioural expectancies of entering entrepreneurship (Van Gelderen et al., 2008). Previous research indicates that entrepreneurial intentions can be considered as the most reliable and effective predictor of entrepreneurial activity (Krueger et al., 2000, Bird, 1988, Carsrud and Brännback, 2011, Boyd and Vozikis, 1994, Jenkins and Johnson, 1997, Shaver and Scott, 1991). Based on previous definitions of intentionality (Thompson, 2009, Krueger et al., 2000, Bird, 1988, Ajzen, 1991), skills investment intention is conceptualised as an individual's attention to try hard and put effort in investing different forms of capital in a new or already identified entrepreneurial team, at some point in the future. Given that skills investment intentions are prior to entrepreneurial team formation, this paper is primarily focused on the individual level, instead of the team level.

A number of models have been proposed to explain entrepreneurial intention (Fitzsimmons and Douglas, 2011). One of the most widely researched models is Theory of Planned Behaviour (TPB) (Ajzen, 1991) an extension of the Theory of Reasoned Action (Fishbein and Ajzen, 1975, Ajzen and

Fishbein, 1980) that explains intentions by means of attitudes, subjective norms and additionally perceived behavioural control (Armitage and Conner, 2001). In addition, Shapero's model (1975, 1982) exploits perceived desirability, perceived feasibility and the propensity to act to predict entrepreneurial intentions. The two models overlap to a large degree where perceived desirability and feasibility corresponds to positive attitude and perceived behavioural control (Van Gelderen et al., 2008). The main difference lies in the fact that propensity to act is replaced by subjective norms and conclusively TPB may put more emphasis on social norms (Autio et al., 2001).

Research in diverse disciplines broadly confirms the ability of attitudes, subjective norms, and perceived behavioural control to predict intention and explain a wide range of human behaviours (Segal et al., 2005, Armitage and Conner, 2001). In general they have been shown to explain approximately 50% of the variance in intentions (Ajzen, 1991). In the entrepreneurial domain, Krueger *et al.* (2000) conclude that both models provide satisfactory predictions.

The reason why this paper adopts the TPB in predicting skills investment intentionality is two-fold. Acknowledging entrepreneurship as a societal phenomenon, a model that contains clearly social influences is considered to be more appropriate. The theoretical specification of the TPB is more detailed and consistent (Van Gelderen et al., 2008). Based on TPB the core antecedents (Ajzen, 1991) namely attitude, subjective norm and perceived behavioural control influencing intentionality within the entrepreneurial concept on a theoretical and empirical level are discussed in detail.

Theory of planned behaviour

The Theory of Planned Behaviour (TPB) explains intentions by means of attitudes, subjective norms and additionally perceived behavioural control (Ajzen, 1991). In others words, the psychological factors that directly affect intentionality are the so called three "antecedents" (Ajzen, 1991).

In the entrepreneurial context, Personal (positive/negative) attitude (PA) towards starting a business or participating in an existing one refers to the degree to which a person holds a favourable/unfavourable evaluation of becoming an entrepreneur (Ajzen, 1991, Ajzen, 2001, Autio et al., 2001, Kolvereid, 1996b). Attitude is the general feeling reflecting evaluative considerations about the perceived costs and benefits of being an entrepreneur and affective considerations about positive or negative feelings derived from being an entrepreneur (de Jong, 2011). Attitude should not be confused with generalised states of feeling with no specific target or cognitive structures with no feelings attached (Fini et al., 2010).

Subjective norm (SN) refers to the perceived social pressure of being an entrepreneur (Ajzen, 1991). Subjective norms are internally-controlled by combining what the individual thinks about engaging in entrepreneurial activities and *what* one's "reference" people think about entering entrepreneurship (Fini et al., 2010, Ajzen, 2001). Family, relatives, friends and/or business partners' expectations and opinions of becoming or not an entrepreneur may influence individual's intentions to engage or not in entrepreneurial activities (Liñán and Chen, 2009, Ajzen and Fishbein, 1980).

Perceived behavioural control (PBC) refers to the perceived ease/difficulty of performing a given behaviour (Ajzen, 1991). The concept is quite similar to Bandura's (1977, 1980, 1982) self efficacy and in particular entrepreneurial self-efficacy as "*the strength of an individual's belief that he or she is capable of successfully performing the roles and tasks of an entrepreneur*" (Chen et al., 1998). In other words, it is not about possessing certain skills but it is specific judgements of what can be done with those skills and the degree of confidence that potential entrepreneurs feel about their skills in order to participate in venture creation activities (Fini et al., 2010). Ajzen (2002) refers to PBC as a construct entailing both self-efficacy and control. PBC includes not only the feeling of being able to enter entrepreneurship, but also the perception about controllability of engaging in entrepreneurial activities (Liñán and Chen, 2009).

The more positive an individual's evaluations of engaging in entrepreneurial/self-employment activities are, the more support gained from strong ties and the more capable one feels about engaging in entrepreneurial/self-employment activities, the stronger the intention to engage in entrepreneurial/self-employment activities (Kautonen et al., 2011, Souitaris et al., 2007, Kolvereid, 1996a).

Empirical findings indicate that there is a positive relationship between all three antecedents and entrepreneurial intention (Autio et al., 2001, de Jong, 2011, Liñán et al., 2011, Souitaris et al., 2007, Iakovleva et al., 2011). Interestingly, the relationship between positive attitude towards entrepreneurship and intentions continuous to exist even when attitude is strictly measured by means of evaluative considerations. In this sense, positive attitude is highlighted as the importance of a variety of instinct and extrinsic motivation such as Economic opportunity, Authority, Autonomy, Self-realisation, Challenge, Independence, Work load avoidance (Kautonen et al., 2011, Kolvereid, 1996b, Liu et al., 2011, Tkachev and Kolvereid, 1999, Van Gelderen et al., 2008). A positive relationship between PBC and intention exists even when PBC is measured only as self efficacy (Engle et al., 2010, Krueger et al., 2000, Moriano et al., 2012, Siu and Lo, 2011). The degree to which the three antecedents influence entrepreneurial intention also varies from study to study (Moriano et al., 2012). On average, attitude, subjective norms, and perceived behavioural control typically explain 30%–45% of the variance in intentions (Kautonen et al., 2011).

Previous research also indicates that there has been no single measurement of attitude and perceived behavioural control used. Therefore, obstacles occur when findings have to be compared in a general context, in a national level or multi-national level. The combination of diverse and poor measurements, especially when referring to the subjective norm construct, may lead to controversial results (Armitage and Conner, 2001). Scholars have reported insignificant relationships between positive attitude (Siu and Lo, 2011), subjective norm (Autio et al., 2001, do Paço et al., 2011, Fini et al., 2010, Krueger et al., 2000, Liñán and Chen, 2009, Moriano et al., 2012, Wu and Wu, 2008), perceived behavioural control measured as self efficacy (Kolvereid, 1996b) and entrepreneurial intention. It should be noted that no single research has rejected simultaneously the effects of the antecedents in entrepreneurial intention. At least one factor proposed by TPB has been confirmed.

Krueger *et al.* (2000) call for further research on entrepreneurial intentionality by using TPB constructs. Understanding intentionality based on TPB constructs contributes to our capacity to better understand and predict not only entrepreneurial activity (do Paço *et al.*, 2011), but also entrepreneurship-related phenomena (Raguz and Matic, 2011). Considering that the definition of entrepreneurship entailing opportunity recognition and exploitation (Shane and Venkataraman, 2000) does not exclude entrepreneurial team formation and conceptualising skills investment phenomenon as a way of entering entrepreneurship, we argue that antecedents and intention are significantly related when the behaviour under investigation refers to skills investment.

Hypothesis 1: A positive attitude towards skills investment is positively related to skills investment intention.

Hypothesis 2: Skills investment subjective norm is positively related to skills investment intention.

Hypothesis 3: Skills investment perceived behavioural control is positively related to skills investment intention.

Methodology

Procedure and participants

The present study was conducted during the last quarter of 2011 as part of a broader study in the UK and Greece. Part of the rationale for selecting Greece was to examine the effect of the financial crisis on entrepreneurial intentions. Data was collected via an online questionnaire. An online covering letter was attached explaining the purpose and value of the study, the time required for completing the questionnaire and emphasising that participation in the study was voluntary and anonymous. The questionnaire and covering letter were also translated into Greek. The main distribution of the questionnaire's web address was based on face to face contacts. The survey was also posted online in social networking sites and relevant email lists, while participants were asked to forward the online questionnaire to their acquaintances. Finally, the questionnaire's web address was e-mailed to target groups of professionals and unemployed people (mainly students).

In total, 603 individuals took part in the study. The main aim of the present study was to understand skills investment intentions by targeting those who had never been engaged in skills investment activities. In order to meet this criterion, one of the questions included in the online questionnaire asked participants whether they had ever invested their skills, resources or access to networks in order to build or participate in certain projects (e.g. start up a new business plan). Based on this question we excluded participants who were already involved in skills-investment activities and defined our final study group.

The final study group consisted of 401 participants (66 % of the initial sample), 153 men (3%) and 248 women (62%), whose mean age was 29 years ($SD=8.6$). The vast majority of participants were highly educated, with 48% holding a university degree and 30% a master's degree. Participants that responded to the question regarding their employment status were almost equally employed ($n=176$) and unemployed ($n=168$). Finally, 78% of the participants were single (never married), 19% were

married or cohabiting while the remaining three percent was married at some point in the past. Our sample characteristics, especially the fact that they are in their early stages of their career and are highly educated, is of interest as young unemployment can be a significant issue.

Measurements

The main TPB constructs were measured based on previous work of Van Hooft and De Jong (2009) and were accordingly adapted so as to refer to participants' positive attitude, subjective norm, perceived behavioural control and intention to invest their skills.

Skills Investment Positive Attitude was measured with three items. Participants were asked to rate their level of agreement/disagreement (response options ranging from (1) strongly disagree to (5) = strongly agree) to three statements: "It is wise for me to engage in skills brokerage activities", "It is useful for me to engage in skills brokerage activities" and "I think it is interesting to engage in skills brokerage activities". The reliability of the scale was acceptable (Cronbach's $\alpha=.93$).

Skills Investment Subjective Norm was measured with two items. Participants were asked to rate whether the most important person to them and most people important to them think that they should engage in skills brokerage activities with the following statements: "The person most important to me thinks that I should engage in skills brokerage activities" and "Most people who are important to me think that I should engage in skills brokerage activities" (response options ranging from (1) strongly disagree to (5) = strongly agree). The reliability coefficient for this scale was $\alpha=.91$.

Skills Investment Perceived Behavioural Control was measured with five items. Participants were asked to rate from (1) strongly disagree to (5) = strongly agree five statements: "Overall I feel confident about being able to engage in skills brokerage activities", "I can overcome any obstacles or problems that could prevent me from engaging in skills brokerage activities", "Brokering my skills is within my personal control", "Skills brokerage is easy" and "I think that I possess the abilities that are needed to be able to engage in skills brokerage activities". The scale showed good reliability (Cronbach's $\alpha=.86$).

Skills Investment Intention was measured with three items. Participants were asked to rate whether they intend and expect to engage in skills investment activities within the next three months with the following two statements: "I intend to engage in skills investment activities within the next three months" and "I expect that I will engage in skills investment activities in the next three months" (response options ranging from (1) strongly disagree to (5) = strongly agree). Participants were also asked to indicate the time that they intend to spend on skills investment activities with the following question: "How much time do you intend to spend in skills investment activities during the next three months?" (response options ranging from (1) = no time at all to (5) = very much time). The reliability coefficient for this scale was $\alpha=.84$.

Strategy of analysis

The complexity of entrepreneurial intentionality and the aim of the present study to explain the structure among a set of latent constructs, requires a more upgraded research technique than

hierarchical regression analysis (do Paço et al., 2011, Iakovleva et al., 2011, Fini et al., 2010). Hypotheses were examined by means of structural equation modelling techniques (Chin, 1998) using AMOS 20.0. The model was composed of four latent variables: PA with three indicators, SN with two indicators, PBC with five indicators and Intention with three indicators. The goodness-of-fit of the model was evaluated by using eight indices: a significant p-value and p-close value, Normed Fit Index (NFI>.09), Tucker-Lewis index (TLI>.9), Comparative Fit Index (CFI>.95), Goodness of fit in index (GFI>.85, GFI =1 perfect), Adjusted goodness of fit in index (AGFI>.8) and Root Mean Square error of Approximation (RMSA<.1 acceptable, RMSA <.08 reasonable, RMSA <.05 perfect fit) (Hair et al., 2010, Byrne, 2001, Kline, 2011).

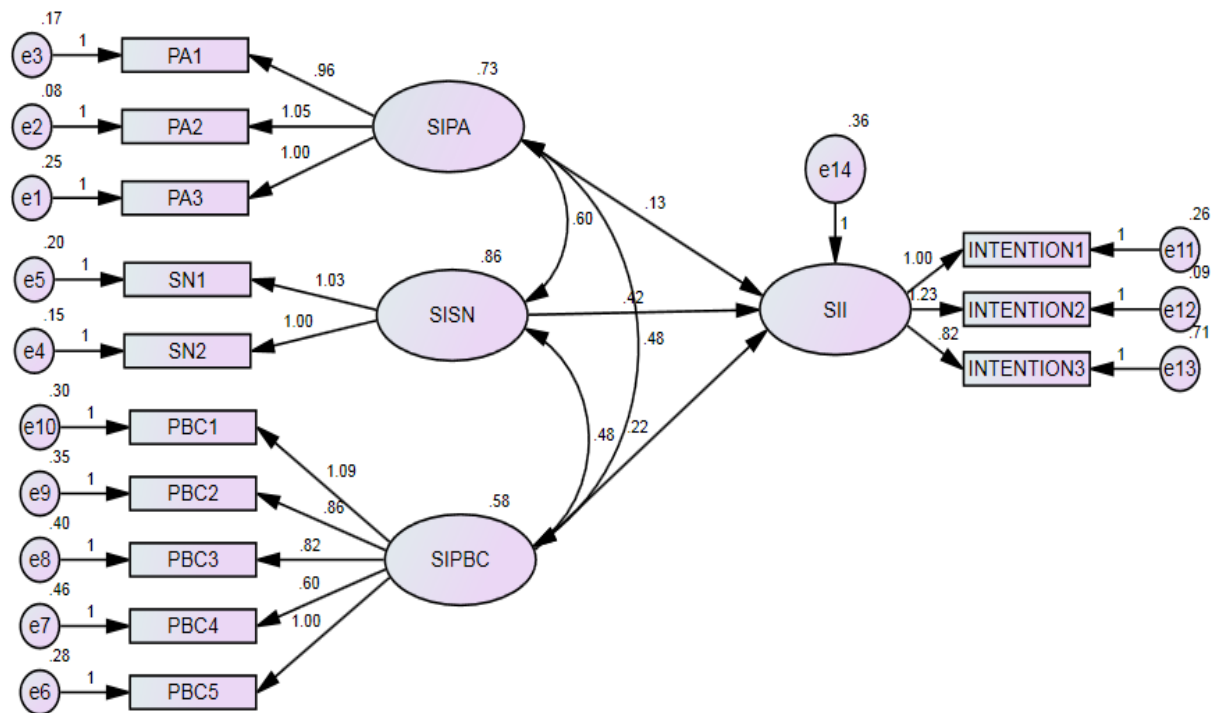

Figure 1: Structural Model

Results & Discussion

The structural model showed good fit. The model indicates p-value=0.000 ($p < 0.001$) and p-close value=0.001. The Normed Fit Index (NFI=0.954), Tucker-Lewis index (TLI=0.958) and Comparative Fit Index (CFI=0.968) indicating that the model can not be improved substantially by exceeding the recommend minimum value of 0.9 and 0.95. The Goodness of fit in index (GFI=0.930) is close to the recommended value of 1 (perfect fit) although slightly lower than 0.95 while Adjusted goodness of fit in index (AGFI=0.893) score is above the recommended minimum value of 0.8. The Root Mean Square Error of Approximation (RMSEA=0.072) score is below the recommended maximum value of 0.08 indicating a reasonable error of approximation. The overall model, regression weights, co-variances and variances are illustrated in the figure below (insignificant paths are included).

The path coefficients show that skills investment social norms (0.42, $p < 0.05$) and skills investment subjective behavioural control (0.22, $p < 0.05$) exert a positive significant effect on skills investment intention with $p = 0.001$ and $p = 0.04$ accordingly. This is not the case for positive attitude towards skills investment. When skills investment positive attitude goes up by 1 standard deviation, skills investment intention may go up by 0.132 standard deviations, but the effect is not considered significant as $p = 0.87$ ($p < 0.05$). Hence, results support H2 and H3, while H1 had not been verified. The model explains 51% of the variation in skills investment with subjective norms toward skills investment (standardized beta estimate = 0.45) having the strongest predictive strength (b of SIPBC = 0.22) on skills investment intention.

Considering skills investment intentionality within the general entrepreneurial domain our findings are in line with previous research (Autio et al., 2001, de Jong, 2011, Liñán et al., 2011, Souitaris et al., 2007, Iakovleva et al., 2011, Kautonen et al., 2011, Kolvereid, 1996b, Liu et al., 2011, Tkachev and Kolvereid, 1999, Van Gelderen et al., 2008, Engle et al., 2010, Krueger et al., 2000, Moriano et al., 2012) indicating that individuals' intention to engage in skills investment activities is positively affected by the degree of supportiveness they receive from individuals that matter to them, their level of self-confidence and their beliefs about being able to control diverse parameters in their life. An individual's positive evaluations of skills investment do not contribute to intention to invest diverse or specific forms of capital in order to participate in venture creation. This is consistent only with Siu's and Lo's (2011) previous work. This point warrants further investigation.

Conclusions & Future Research

Our work has applied the TPB by examining the role that three factors, namely PA, SN, and PBC may play in predicting individuals' intention to invest diverse forms of capital and consequently participate in an existing or new venture. The effectiveness of TPB in predicting skills investment intentions is partly supported as only skills investment subjective norms and perceived behavioural control had a significant effect. Conceptualising the skills brokerage business model as a framework for entrepreneurial team formation our findings contribute to theory and practice by providing evidence on the applicability of the model and on the factors affecting entrepreneurial team formation intentionally.

Since research on entrepreneurial team formation intentionality on an individual level is in a preliminary stage, further research is needed to complement our findings. Future research could apply the skills brokerage business model and study TPB constructs in a wider context in terms of sample size. This study may be extended by focusing on entrepreneurial team formation intentionality on a national or regional level. Possible differences or similarities could be highlighted based on diverse cultural contexts or on a comparative economic basis (developed and developing countries). Future research could potentially expand the TPB model by adding constructs such as the main forms of capital described in the skills brokerage business model and study which of these factors may affect or not antecedents.

Abstract

The present study investigates the situation that was formed 18 months ago in Greek wood and furniture enterprises after the economic crisis, benchmarks it to the corresponding situation of the Cypriot enterprises, and also compares the ways of confronting the crisis in both countries.

In total, 151 specially formed questionnaires for the purposes of the study were gathered in early 2010 from 60 Greek wood and furniture enterprises and 91 in late 2011 from relative Cypriot enterprises. The questionnaires were processed using the statistical package SPSS ver 17.0 and all the relative statistical tests were made, such as descriptive statistics, correlation analysis, analysis of variance, T-test, content validity and factor analysis, in order to achieve the purposes of the study, to extract useful conclusions and formulate relative proposals.

In their majority, Greek and Cypriot wood and furniture enterprises have been affected from the economic crisis negatively or very negatively in a percentage of over 70%, while there is a very small percentage showing positive effects. The situation in related enterprises of both countries, which have economic and trading linkages, is similar, showing a time lag of 18 months approximately. That means that what has been happening in Greece 1,5 years ago is happening now in Cyprus. Hence, statistical significant variations in the basic marketing strategies that the enterprises apply do not seem to exist, and these are mainly focused on better quality and better customer service. Finally, the evaluation of the proposed initiatives in confronting the crisis by the Cypriot wood and furniture enterprises has highlighted as most important the: better and more efficient monitoring in all of the departments of an enterprise, emphasis on innovation and technology, and furniture certification according to European norms.

The results of the present study could help especially the Cypriot wood and furniture enterprises, while following the results and the initiatives of the Greek ones they could avoid negative consequences of economic crisis, taking under consideration these measures that could lead to their survival and growth. On the contrary, for the Greek enterprises the present study

contributes in the direction of determining the miscalculations of the past 2 years that have led many of them to economic recession and of ensuring that they are going to implement more effective strategies in order to return to viability.

It is the first time that we benchmark the consequences and ways of confronting the economic crisis between economically linked countries in two significant sectors such as the wood and furniture sectors.

Keywords: Economic Crisis, Furniture & Wood Products Enterprises, Effects of crisis, cross-country contagion, Marketing Strategies

Introduction

During the few past years, there has been a lot of discussion between academics and politics, about the causes and the effects of the recent global financial crisis across countries and emerging markets. Although, the causes of the crisis are well known, there is a turbid opinion on the channels of transmission of the latest crisis across national borders and the role of country differences in how the economies were affected (Claessens et al., 2012). From a first point of view this may reflect differences in exposure and vulnerability of cross countries economies, banking systems and stock exchange markets to the real and financial jitters emanating from the financial centers, but also heterogeneity in the macroeconomic and institutional frameworks as well as in the policy responses (Chevallier, 2012; Cetorelli and Goldberg, 2011; Berkmen et al., 2009). The Euro zone debt crisis and more specifically the Greek problem, reveals structural and political weaknesses in the response of European Union to the global financial crisis and endogenous problems of the Greek economy that have accelerated the impacts in national level (Kouretas and Vlamis, 2010; Berglöf et al., 2009).

Focusing to sectors' economic activity, researchers argue that financial crises have a negative impact on sectors' development (Berkmen et al., 2009; Kroszner et al., 2007). On average, a country experiencing a banking crisis, would experience a 1.6% greater contraction in growth in value added between the crisis and pre-crisis period (Kroszner et al., 2007) and an overall mean decline in growth of 3.5% between these two periods. Similar are the results concerning at a firm-level (Kroszner et al., 2007), with trade channels to be important factors determining how crises are transmitted internationally, among firms (Forbes, 2004).

Transmission Channels of Economic Crises

At the present globalized markets, no open economy can insulate itself from what is happening in the rest of the world. In order to prevent contagious financial crises countries may need to adopt regionally or globally coordinated measures. But the specific measures that should be taken to prevent the spread of financial crisis presuppose knowledge of the relevant contagion channels (Haile and Pozo, 2008). Understanding the transmission of financial crises is the subject of a rich literature (Rose and Spiegel, 2012, 2011; Chevallier, 2012; Claessens et al., 2012; Berkmen et al., 2009; Balakrishnan et al., 2009; Haile and Poszo, 2008; Forbes, 2001, 2004; Kaminsky and Reinhart, 2003; Eichengreen and Rose, 1999). The main two channels of transmission identified in the literature are trade and financial

channels while several researchers emphasize also on common shocks, macroeconomic similarities, neighborhood effects and business cycle channels (Claessens, 2012; Haile and Pozo, 2008).

Transmission through these channels can be common and affect multiple countries at the same time or it can be country specific. The latter is often thought to depend on country-specific financial and trade linkages, structural characteristics, and vulnerabilities or policies, such as current account and budget imbalances (Balakrishnan et al., 2009). The related literature on trade transmission channels is more limited in theoretical modeling of the transmission than the empirical literature testing this importance (Forbes, 2001), aiming to the explanation of how crises could spread globally (Corsetti et al., 2000; Gerlach and Smets, 1995). Most researchers use empirical data in order to test the theoretical explanation of economic crises contagion, since specific characteristics of trading channels could play a significant role in the volume of crises transmission.

The question that rises from these studies is, whether these transmission channels could be used as a tool for predicting and preventing crises expansion across countries and more specifically across the same industrial sectors namely. Furthermore, studies focusing on firm's level data could act as revealing mechanisms regarding the gamut and the severity of the consequences of financial and economic crises contagion across countries in specific economic activities, such as the manufacturing sector. Under this framework we will be able to study the real impacts of the recent economic crisis in firm – level performance and the role of global and regional linkages in transmitting the crisis as well as to compare these impacts among markets.

From a first point of view it may seem unlikely that crises become predictable using a systematic approach with any degree of accuracy however using a set of data on a cross section panel, such as country and firm – level performance data, we can foretell whether crises are sufficiently similar across countries and over time to allow generalizations (Berg and Pattillo, 1999).

Under this framework, several researchers (Claessens, 2012; Forbes, 2004, 2001) argue that when examining the role of country level linkages, including trade and financial linkages, trade linkages play a significant role in the spill over of crisis, with financial channels being less important. For instance, if a country competes in the same industries as a crisis country, or exports directly to the crisis country, then the country will have significantly lower stock returns during the crisis. Country-specific effects, although important determinants of company performance, are generally less important than firm-specific characteristics, although the way a country responds to a crisis is an important determinant of how the crisis impacts other economies (Forbes, 2001).

Cypriot and Greek Economies Shaking Hands.

Macroeconomic and sector's similarities

The effects of the recent economic crisis are presented in a dramatic way in the national accounts in both Cyprus and Greece, with the latter one to suffer the most dramatic changes in its recent economic history. The Cypriot economy seems to show better resilience to these effects, mainly because of its

small size and flexibility in fiscal adjustments. According to the national statistical services (2012) of both countries, for the period 2005 – 2010 the Greek G.D.P. suffers from a reduction up to -1.2% in constant prices of 2005, while the Cypriot G.D.P. shows an increase of 1.1%. Cyprus has an extrovert economy because of its geographical location considering its access to markets as a very significant factor for development. As a consequence external trading constitutes one of the most significant sectors of the Cypriot economy. During 2009, the total exports of the country constituted approximately the 6% of the national GDP (Cypriot Statistical Service, 2012). Comparing the Greek Consumer Prices Index of April 2012 to the corresponding one of April 2011, occurs an increment of 1.9%, in relation to an increment of 3.9%, that has occurred during the same period of 2011 and 2010, while it's increment between April and March of 2012 reached 0.8% in relation to a 0.6% during the same period of the previous year and finally the increment for the period May 2011 – April 2012 has reached a percentage of 2.5% (Greek National Statistical Service, 2012).

Furthermore, the Retail Services Value Index in the furniture sector during February of 2012, compared to February 2011, has shown a decline of -19.3% and this one of Retail Services Volume a decline of -16.6% for the same period. Regarding Cyprus, Consumer Prices Index of 2010 shows an increment of 2.4% to the corresponding one of 2009, occurs an increment of 1.9%, while the Retail Services Value Index of the furniture sector shows a decline up to -4.3% during May 2011 in relation to May 2010 (Cypriot National Statistical Service, 2012).

Figure 1: Total wood and wooden products Industry's Producers Prices Index from 1/2010 – 6/2011. (Source: Processing of statistical data of national statistical services).

According to figures 1 and 2, comparing the Total Producers Prices Indexes in wood and furniture sectors of the two countries for the period 1/2010 till 7/2011 (in constant prices of 2005), we can conclude that Greece shows a decline in both wood and furniture sector, while Cyprus shows an increment keeping the related indexes in a positive course. Thus, wood and furniture sectors in Greece are trying to become more competitive and that is a significant factor that the related Cypriot industries should take under consideration in order to avoid negative impacts in their performance.

The common course of wood and furniture industries in both countries is also presented in the next figures 3 and 4, regarding the time series of their Total Production Volume Index referring to the

period 1/2010 – 6/2011. As we can notice, wood and furniture industries in Cyprus and Greece are converging regarding their production volume during the recent period, a fact that highlights similar problems in the demand of wood and furniture products, mainly because of the dramatic decline of the construction sector in both countries and especially in Greece.

Figure 2: Total furniture industry's producers prices index from 1/2010 – 6/2011. (Source: Processing of statistical data of national statistical services).

Figure 3: Time series of Total Production Volume Index in wood sector (Source: Processing of statistical data of national statistical services).

Trading linkages

The consequences of the global economic crisis in global trading have also not left Cyprus unaffected. During 2009, it is estimated that they have forced the reduction of Cypriot total external trading up to 22% in relation to 2008 (Cypriot Statistical Service, 2012). More specifically, total exports have been reduced up to 17% reaching €963 million in relation to €1.167 million in 2008. Total imports have also been reduced up to 23%, reaching €5,654 million from €7,349 millions in 2008. According to the Cypriot Trade Central (2012), the exports of industrial products constitute the majority of the Cypriot domestic exports with a percentage of 61% of the total. In 2009 they have declined to €291 millions from €318 millions in 2008. European Union stands as the main exporting market of Cypriot

economy. During 2009, E.U. countries have absorbed the 59% of the domestic exports of €282 millions in value. Germany, Greece, United Kingdom and Italy are the main trading partners. The furniture sector has reached in 2009 exports up to €5 millions in value.

Figure 4: Time series of Total Production Volume Index in furniture sector (Source: Processing of statistical data of national statistical services).

More specifically, regarding the bilateral trading range between Cyprus and Greece we can say that it has been developed dynamically reaching €1.450 millions in 2010. Greece strengthens its position, mainly after 2004 (Figure 1), and in 2010 reaches its exports towards Cyprus up to €1,218.7 millions booming up to a percentage of 75.8% in relation to the €693 million of 2004. Regarding Cypriot exports Greece has absorbed during 2010 imports of €241 millions marking an increment of 117.6% in relation to 2004. Finally, regarding the bilateral trading balance this is continuously negative and during 2010 has reached €976,9 millions rising up to 68% in relation to 2004 (Figure 5).

Figure 5: Bilateral trading relationship between Cyprus and Greece. (Source: Processing of statistical data of national statistical services).

Focusing specifically on the wood and furniture sectors, bilateral trade between Cyprus and Greece shows a great interdependence in volume and value. Nevertheless, the pressure of the global financial

crisis and this of the deep recession of the Greek economy start to become clear, regarding wood sector's bilateral trade. During the period 2006 – 2008 the total value of Greek wood and wooden products imports from Cyprus has reduced from €7,970 millions to €6,924 millions, while exports towards Cyprus have also been reduced from €12,282 millions to €11.488 millions (Figure 6). Same is the picture regarding the volume of wood and wooden products trade for the same period, with imports to show a reduction up to -13% and exports -6.5% respectively.

Figure 6: Bilateral trade of wood and wooden products of Greece and Cyprus for the period 2006 – 2008. (Source: Processing of statistical data of national statistical services).

Slightly different seems to be the situation in the furniture sector's bilateral trade between the two countries. Hence, Greece's furniture imports have increased during 2006 – 2008 in value and volume up to 182% and 63% respectively, while exports have also a positive image reaching €21,077 millions in value and Kg 4,25 millions in volume during 2008 (Figure 7).

Figure 7: Bilateral trade of furniture products of Greece and Cyprus for 2006 – 2008. (Source: Processing of statistical data of national statistical services).

The above data, as we have mentioned, show a great interdependence between the bilateral trades of the two countries in general and in the wood and furniture sectors specifically. Cyprus stands as

one of the major trading partners of Greece in the E.U. and vice versa. Furthermore, due to macroeconomic similarities and specific sector's similarities we can argue that foretell that it is very possible that the Cypriot wood and furniture sectors can be "contaminated" by the Greek recession, facing similar negative effects. Therefore, we could argue that the spill over's of the Greek economic problem are being expected to show up in the Cypriot economy as well, and more specifically in wood and furniture sectors. The present research tries to highlight these effects at firm level performance making the necessary benchmarking of the main findings in both countries.

The purpose of the present study is to benchmark the consequences of the economic crisis in the wood and furniture enterprises of two economic linked countries (Greece and Cyprus), in order to study the contagion mechanisms and it's time lag and finally which are the effects, concerning alterations in enterprises' sales, profits, market share and their number of customers. Furthermore, the present study aims to highlight the initiatives and mainly the directly applied strategies of the enterprises in order to confront economic crisis, and their forecasting regarding their future.

Methodology

For the primary data collection of the study, the methodology of editing, gathering and processing of specially constructed for the purpose of the study questionnaires was used, according to the basic principles of marketing research, responsibility, transparency, liability, perspicacity and the connection to strategy (Gordon and Langmaid, 1988; Tull and Hawkins, 1990; Doyle, 1998; Aaker et al. 2004). The participating researchers were specialized scientists and they were addressed to the entrepreneurs or to staff members using personal interviews.

The related questions were formulated in such a way, so as to be concise for the maximum facilitation of the interviewed. The questionnaire contained two different groups of 25 questions in total. The first group contained 15 questions related to the effects of economic crisis and the applied marketing strategies and the second group 10 questions, in order to detect the profile of each enterprise.

The study lasted 18 months (beginning of 2009 till autumn of 2011). At a first stage a random sample of 60 questionnaires was gathered from Greek wood and furniture enterprises and in 2011 (after the expiration of the 18 months period) from 91 related Cypriot enterprises (namely 10% of the total population approximately).

A pilot questionnaire was applied in five enterprises in Greece and Cyprus. From this pre sampling we were able to detect parts of the questionnaire that clarifications were needed and thus the quality of the questionnaire was improved and took its final form (Dillman, 2000).

Data were edited, processed and analyzed using the statistic package SPSSWIN ver 17.0 and all the related tests of Frequencies, Descriptives, Crosstabs, Analysis of Variables Independency using chi-square criterion, Correlation analysis and Analysis of variance - T-test were made (Norusis, 2007; Howitt and Cramer, 2003).

The construct validity was based on the test of unidimensionality of the elements constituting each factor, as well as the content validity of each factor separately. We used Factor analysis according to the method of Principal Component Analysis. Regarding the content validity of the research's variables, the statistical factor of Cronbach Alpha was used (Siomkos and Vasilikopoulou 2005, Chantzoudis *et al* 2009, Sarigiannidis *et al* 2009).

Results

In total, Greek and Cypriot wood and furniture enterprises believe that their sectors have been negatively till very negatively affected from the recent economic crisis in a percentage of 88.3% and 84.4% respectively. A small percentage (8.4% and 4.4% respectively) seems to show growth (Figure 8). The positive affection of the sector constitutes the belief of the majority of the enterprises that have less than 10 employees and shows an annual turnover of less than 1,000,000 €. The One-Way Anova analysis has revealed that the difference between the answers of the entrepreneurs in both countries is not statistically significant. Farther analysis of homogeneity using Levene test, shows that the null hypothesis is confirmed (H_0 = the average of the answers regarding the affection of wood and furniture sectors from the crisis - positively, negatively, neutrally, very positively, very negatively – between the two countries, do not shows differences). From the above finding we can assume that the negative consequences of economic crisis in Cyprus, regarding wood and furniture enterprises, get transmitted from Greece, showing a time lag of 1.5 years.

Figure 8. Affection of wood and furniture sectors from the economic crisis in Cyprus and Greece

Concerning the enterprises that have participated in the study, the affection of the economic crisis has till now negative impacts in a percentage of more 70% of them in both countries (Figure 9). Only 10% and 7.7% correspondingly, of the enterprises that are in their majority (80%) small enterprises, showing an annual turnover less than 1,000,000 €, have been affected positively. This reveals that the economic crisis has negatively affected mainly medium and big sized enterprises more intensively, confirming also the null hypothesis (H_0 = the average of the related answers concerning the affection of

the wood and furniture enterprises by the economic crisis in both countries) using the One-Way Anova analysis.

Figure 9. Economic crisis affection value in wood and furniture enterprises, of Cyprus and Greece.

At this point it is interesting to quantitatively register the impacts of the economic crisis concerning the sales, profits, market share and the number of customers of the study's enterprises. The variations of the basic economic characteristics of the enterprises per country are analytically presented in Table 1, according to their statements. Results show that there are no significant variations between the enterprises in both countries, at least concerning the average of the sales, profits and customers number reduction and market share reduction.

COUNTRIES	Type of affection	Alterations %			
		Sales	Profits	Market share	Number of customers
CYPRUS	Average	-21.1%	-21.2%	-17.1%	-16.4%
	Negatively	-21.8% (64)*	-21.9% (60)	-18.4% (43)	-27.8% (36)
	Positively	+17,5% (6)	+7,2% (3)	+7,5% (2)	+28,8% (4)
GREECE	Average	-19,7%	-25,9%	-19,2%	-11,6%
	Negatively	-26,5% (43)	-29,8% (44)	-25,0% (38)	-19,8% (22)
	Positively	+16,9% (4)	+8,3% (5)	+25,0% (5)	+14,3% (7)

* The number of answers

Table 1. Sales, profits, market share, number of customers alterations per activity for Cypriot and Greek wood and furniture enterprises

The forecasts that enterprises make regarding their economic situation during the next year, show that are being relatively optimistic (Figure 10). Only 38.3% of the Greek and the 23.1% of the Cypriot enterprises foresee that the situation is going to get worse (more or less). Of course more pessimist seem to be the Greek enterprises, since the country's economic crisis is much more intensive! This fact

does constitute a pessimistic attitude from the Greek enterprises but a reality, since 1.5 years after the period of the data collection, the situation in Greece has become substantially worse. Recent official statistical data (EL.STAT. 2012) shows that industry's production has been reduced per 59.9% regarding furniture and 18.9% regarding wood and wooden products, in a two years period (March 2012 – March 2010)!

The X^2 test has shown that there are no statistically significant differences between the answers regarding the above mentioned forecasts and the size of the enterprises.

Using the One Way ANOVA in order to statistically analyze the data concerning the reduction or increment percentages of the 4 indexes that are being presented in Table 2, the null hypothesis was rejected only for the following variables «sales reduction percentage forecasting» at a significant level $\alpha < 0.01$, «market share increment percentage forecasting» at a significant level $\alpha < 0.1$ and «profits reduction percentage forecasting» at a significant level $\alpha < 0.005$.

Figure 10. Forecasting regarding the situation of wood and furniture sectors in Cyprus and Greece during the next 12 months period

Economic crisis confrontation efforts

The direct efforts that the study's enterprises have undertaken for the confrontation of the economic crisis seem to vary between Greece and Cyprus (Figure 11). Although the main measures were the reduction of the products' prices and the reduction of the advertisement expenditures in both countries, a variation seems to exist regarding the percentage of their implementation. Hence, the main measures that Greek enterprises have undertaken during the end of 2009 were the reduction of products' prices in a percentage of 73.3% and of the advertisement expenditures in a percentage of 46.7%, while the relative percentages regarding Cypriot enterprises were 57.1% and 25.3% respectively. As a second choice Cypriot enterprises have preferred loans contracting, in order to enhance their financial liquidity. It is very possible that the Greek enterprises did not have this choice, since funding with the help of the banking had been minimized because of the major consequences of the economic crisis that continues in Greece during 2012, to the banking system. Although the

reduction of products' prices is an indicated measure, which always has to be under serious consideration in relation to the production cost, the reduction of advertisement expenditures have negative consequences for the enterprises themselves. In this way enterprises are getting introverted and lose the capability to occupy a position in consumers' preferences. Hence, during a market research, they are not going to visit an enterprise that does not advertise itself in any way.

COUNTRIES	Alterations % per average			
	Sales	Profits	Market share	Number of customers
CYPRUS	-19.7% (23.6)	-24.3% (24.2)	-11.6% (20.5)	-19.2% (26,2)
GREECE	-17.5% (27.1)	-27.1% (24.1)	-16.4% (17.5)	-19.0% (32,3)

* Std. Deviation

Table 2. Forecasting of sales, profits, market share and number of customers per activity of the Cypriot and the Greek wood and furniture enterprises

Crosstabulation has shown that the enterprises that occupy more than 10 employees, have implemented in bigger percentage, as measures for their confrontation to the economic crisis, the rescission of some sectors of their activities, the cutting off of bonuses, the reduction of personnel and their personnel training expenditures. On the contrary, the direct measures of the smaller enterprises were mainly the reduction of their products' prices and less the increment of marketing and advertisement expenditures.

Figure 11. Measures regarding the confrontation of any problems of the enterprises, related to the consequences of the economic crisis

The basic marketing strategies that Greek and Cypriot enterprises are following seem to vary regarding their ranking (Figure 12). The ANOVA analysis using homogeneity test (Levene statistic) and the use of the F-test, has shown that the implemented strategies in which the means of the above

ranking are statistically significantly correlated to the country in which each enterprise is operating (rejecting the null hypothesis H_0), are:

- Better customer service (F=13.124 for df=1, $p<0.001$)
- Lower prices (F=11.352 for df=1, $p<0.001$)
- The continuous products' improvement (F=9.943 for df=1, $p<0.005$)
- The bigger market share (F=3.754 for df=1, $p<0.1$)

The rest of the strategies that are presented in Figure 12, do not seem to vary statistically significantly between the wood and furniture enterprises in both countries. The disposal of products of higher quality seems to be the first major strategy of the Greek and Cypriot enterprises (1.40 and 1.26 in ranking with 1 as excellent), while in the last position of the ranking stands the implementation of the better customer service, regarding Greek enterprises (2.40) and this of the products' continuous improvement regarding the Cypriot ones (2.58).

The Pearson correlation concerning the implemented marketing strategies of the Greek and Cypriot wood and furniture enterprises for the confrontation of the economic crisis has shown that:

- The more the Cypriot wood and furniture enterprises invest in their products' innovation, the higher is their quality (Pearson correlation coefficient = 0.636, at a significance level $\alpha=0.01$)
- The more the Greek and Cypriot wood and furniture enterprises emphasize on the quality the higher are the products' prices (Pearson correlation coefficient = -0.536 and -0.596 respectively, at a significance $\alpha=0.05$ and 0.01 respectively)

Figure 12. Basic marketing strategies of the study's enterprises

A basic parameter of the study was the formation of proposals for the Cypriot wood and furniture enterprises regarding their confrontation to the economic crisis, based also on the former existing experience of the Greek economic crisis management in the sector and the related enterprises.

Content validity (Cronbach's Alpha = 0.891) regarding the significance of the proposals for the confrontation of the economic crisis from the Cypriot enterprises has shown that the determinants (answers) that have been detected constitute concrete and reliable structures, capable to contribute to the measurement of the factor in which they belong to. From the evaluation (Table 3 column 2) of the above proposals concerning the Cypriot wood and furniture entrepreneurs, the 5 ones that have been highlighted as most significant in descending order are (ranking from 1-7 with 7 as the most significant): Better and more effective monitoring of the departments of the firm (5.67) > Emphasis on innovation and technology (5.63) > Furniture certification according to European norms (5.55) > Greater emphasis on effective marketing (5.55) > Maintenance of prices in realistic levels (5.51).

The Factor analysis has shown after the rotation of the factor's matrix that 5 factors that describe the proposals regarding the confrontation to the economic crisis are: operation strategies (1,2,3,4,5,6,7 variables), certification processes (8,9,10,11 variables), sales process and monitoring (12,13,14,15 variables), internet and marketing (16,17,18 variables) and the reduction of expenditures (19, 20 variables). The interpretation of the above 5 factors reaches the percentage of 67.9% of the total variance (Eigenvalues).

Cronbach a (Alpha) coefficient is: for the 1st factor (0.849) for the 2nd (0.833) for the 3rd (0.765), for the 4th (0.843) and for the 5th (0,514). From the above mentioned results it is ascended that for the 1 – 4 factors, Alphas are very high (not for the 5th one), hence the content validity of the scale is very high, since they overcome 0.70 (Siomkos and Vasilokopoulou 2005).

Conclusions – Proposals

Greece and Cyprus which are two countries with bilateral economic, trading and national linkages have been affected significantly by the recent economic crisis. In their majority (more than 70%) Cypriot wood and furniture enterprises have suffered from the economic recession showing a time lag of 18 months approximately in relation to the Greek ones. There are many common elements and common choices that have been highlighted in the present study, so that the enterprises prevent the consequences of the economic crisis.

The average sales, profit and number of customer's reduction of the enterprises do not show statistically significant variation between Greece and Cyprus for a period of 1.5 years. This fact shows that the present situation of the Greek wood and furniture enterprises is very possible to become a reality for the Cypriot enterprises 18 months later. The above mentioned scenario may not be verified because of the smaller size of the Cypriot enterprises in relation to the Greek ones, since the present study has shown that the smaller wood and furniture enterprises seem to have more possibilities to have a positive influence in their operation by the economic crisis.

The short term (1 year) forecasting of the enterprises seem to be relatively optimistic and they do not seem to statistically vary between both countries, at least regarding the profits and sales increment, the reduction of their market share and the increment or the reduction of their customers' number.

Table 3. Factor matrix after rotation regarding the proposals in confronting the economic crisis of Cypriot and Greek wood and furniture enterprises

The main initiative that the study's enterprises are undertaking regarding the confrontation of the economic crisis is the reduction of the prices of their products. As a second choice Greek enterprises in early 2009, have moved towards the reduction of the advertisement expenditures, a fact that has

worsened their position (Papadopoulos et al 2010). Cypriot enterprises in late 2011 have chosen this initiative in a smaller percentage, having though as a second choice bank lending. The above mentioned initiatives according to relative previous experience do not seem to be recommendable regarding the enterprises that show a declining trend in their statistics. A successful “recipe” and exhortation for the enterprises that face economic recession and show a declining turnover being in an emergency is: a) granting of smart advertisement b) reconsideration of their operational basis c) saving d) preparation for the delivery of the best possible product and e) enforcement of greater discipline and morality in their interior. The “secret” is that the above initiatives’ sequence is being followed precisely (Papadopoulos *et al* 2012).

Statistically significant variations do not seem to exist regarding the ranking of the basic marketing strategies that Greek and Cypriot wood and furniture enterprises are applying and specifically regarding the disposal of products of better quality, the over-satisfaction of their customers’ expectations, tailor made products and services, their entrance to markets with great potential and the application of products’ innovations.

Of great importance are also the findings of the present study, that the more emphasis the above enterprises show on quality the higher are the prices of their products, as well as that the more they invest in products innovation the better is the quality.

The evaluation of the proposed initiatives regarding the confrontation of the economic crisis from the Cypriot enterprises has highlighted that the most significant are: better and more effective monitoring in all of the departments in the firm, innovation and technology and furniture certification according to European norms. Finally, the factor analysis has shown that a total of 20 proposals regarding the confrontation of the economic crisis that have been proposed in the questionnaire of the study only for the Cypriot wood and furniture enterprises, could be grouped in 5 major categories of proposals which are: operational strategies, certification processes, sales processes and monitoring, internet and marketing and finally, the reduction of expenditures.

As it is a common belief that when a problem occurs and it is left to chance or when we spent time without dealing with the problem, it leads to great confusion, disorder, stress and bad mood in a personal level and even more in a firm level. The solution is it’s immediate confrontation. According to the philosopher L.R. Hubbard: *«Whatever can be confronted by somebody, can also be handled. Problems spring from the inability of confronting something. You can’t solve a problem by running away from it»*. Thus, wood and furniture enterprises have to realize the above and act aggressively. Furthermore, they should give major emphasis on initiatives that will strengthen the trust of their customers and become even more reliable. (Papadopoulos 2012).

Further research could be done by analyzing the basic financial indexes of Greek and Cypriot wood and furniture enterprises and correlating them to the applied strategies of the previous 1-2 years, in order to investigate their effectiveness. The research could also be expanded to the wood and furniture enterprises of rest European countries that are economically and trade linked with Greece

and Cyprus such as: Italy, Spain, Bulgaria etc. in order to benchmark the consequences of the economic crisis as well of the applied marketing strategies.

STRATEGIC HRM IN THE 21ST CENTURY: IS 'CORE PLUS CONTEXT SPECIFIC' THE ANSWER?

Pavlou, Fotis¹

¹ Director of Academic Programmes / Lecturer, Cyprus Institute of Marketing, Cyprus. Email: fotis@cima.ac.cy

Abstract

This manuscript argues that the traditional routes for achieving a strategic fit (horizontal integrations and vertical alignments) need to be re-assessed. After introducing the notion of Strategic HRM, the paper enters into a critical evaluation of the three prevailing HRM models. The first -'Universal Model'- is conceptualised as a particular way of managing and emphasise on the universal applicability of 'best HR practices'. The second -'Contingency Approach'- describes a particular field of study whereby HRM depends on various contingent forces ('outside-in' approach), emphasising the fit between organisational goals and HRM. The third and final -'HR Architecture'- draws attention to internal resources (which are characterised by value, rarity, imperfect imitability and lack of substitutes) and highlights the differentiation of different workers (focusing on human capital - 'inside-out' orientation).

To reconcile the identified 'tensions' between these models; to respond to their falsities and overcome their shortcomings, the current paper proposes a new research paradigm: a 'Core Plus Context' specific approach to HRM. In essence, 'CPC' represents a more integrated approach for analysing SHRM. Alongside with this concept, a special reference is made to the importance of 'enactment' element. Enactment is considered as an integrated component of this orientation and is fundamental for the successful realisation of any HR policy / strategy. The key message is that in the 21st century, where the multidimensional function of HRM is exposed to and surrounded by various contextual particularities; an updated and comprehensive research paradigm is needed, now more than ever.

Keywords: Strategic HRM; 'Best Practice'; 'Contingency' Approach; 'HR Architecture'; 'Core Plus Content Specific' HRM.

Introduction

As a means to conceptualise a new strand and an alternative way of analysing Strategic HRM (SHRM), the subsequent analysis critically reviews the three principal models that dominate -up to now- the related literature. These are the 'Universal Model'; the 'Contingency' Approach and the 'HR Architecture' Idea. Beyond highlighting the key attributes of the three models, the main objective of this article is to bring forward their shortcomings and respond to their falsities by conceptualising a more pragmatic and integrated research paradigm. Building on the existing literature, an updated concept; namely 'Core Plus Context specific HRM' is introduced as a natural extension / supplement of SHRM.

Strategic HRM

A major development in HRM over the last thirty years has been the emergence of Strategic HRM. This concept provides intellectual reinforcement to the belief that organisations' workforce and HRM systems (i.e. policies, practices and processes) have the potential to provide a source of competitive advantage. Given that SHRM derives from the concepts of strategy and HRM, a more detailed definition of strategy is needed. Strategy is about planning and implementation and is the process of defining intentions and matching resources to opportunities for achieving and sustaining a competitive advantage. Looking into the professional standards of CIPD, Armstrong (2006: p114) suggests that a successful strategy provides an 'achievable vision for the future, to foresee longer-term developments, to envisage options and their probable consequences and to select sound course of action'. Broadly, this concept is explained as the organisation's long-term direction and scope, with the ultimate goal to match its resources to the continually changing environment. One of the most important aspects of strategy is its aim is to achieve strategic fit, an orientation that is mainly expressed through the 'matching concepts'; matching HR practices into bundles (horizontal integrations), matching HRM strategies with business plans and designing HR practices according to the unique characteristics of organisations' workforce (vertical alignments).

Many view SHRM as an integrated process which tests organisations' ability to effectively plan, develop and implement HRM systems in order to be in line with their business objectives. This has to be achieved having in mind organisations' internal and external contingencies. In essence, SHRM provides a unifying interactive framework for not only combining different HR policies and practices together, but also aligning the overall HRM system with organisations' business strategy.

'Universal Model': The Idea of 'Best Practice'

Widely referred as 'high commitment', 'universal', 'high performance work systems' or 'high involvement'; 'best practice' model mainly assumes the idea that HRM across any organisation will gradually shift towards convergence (Marchington & Wilkinson, 2012). This normative approach advocates a number of universal practices that are argued to be suitable for all organisations. The basic assumption is that 'the more organisations adopt and implement these practices the clearer the payoff will be in terms of performance improvements' (Bach, 2005: p8) and that 'all firms will see performance improvements only if they identify and implement best-practice' (Boxall & Purcell, 2000: p189).

According to one of the traditional supporters of this orientation Huselid (1995), the central point is that all organisations will enjoy significant benefits by investing in 'best practices'. Ultimately, the suggestion is that 'all else being equal, the use of high performance work practices and good internal fit should lead to positive outcomes for all types of firms' (p644). Such claims are reinforced by Delery and Doty (1996: p828) who conclude that 'some human resource practices always have a positive effect on performance'. Similar to this direction, one of the most influential authors of this philosophy, Pfeffer (1998), defends his position by exemplifying that 'best practice' HRM is capable of producing

positive outcomes for all organisations, regardless the country within which they operate, the type of market which they are located in, their size, structure etc.

An important assumption within this strand is that, while the importance of individual HR practices is undisputed, their isolated implementation may not have incredible effect. For this reason, there is also strong theoretical support for a 'bundled' approach. Authors such Guest et al. (2004) and Kepes & Delery (2008) demonstrate the idea of combinations of high commitment practices into bundles and argue that by integrating them into strategic formations they will work more effectively, thus producing better results rather than if these were implemented individually. Briefly, taking the idea of bundles one step further, there are strong debates regarding the internal relationship between the different HRM activities which may appear as 'powerful connections' or 'deadly combinations'. The former describes a case of a positive synergistic effect: when the combination of two or more HRM practices produce greater effects than individual HR practices, whereas the latter refers to a negative synergistic outcome which occurs when HRM practices work against each other, suppressing each other's effect.

In essence, the underpinning assumption of this philosophy is that there is a universal way of managing and one 'best' way for practicing HRM. However, to what extent is this 'best practice' HRM feasible; especially within the current setting characterised by longstanding financial crisis and extended severe 'cost-cutting' schemes? Actually, the decision for adopting 'best practice' HRM is not so straightforward. In certain occasions different HR practices (such as training schemes, work-life balance provisions, profit-sharing arrangements, team-based bonuses etc.) may be desired by employees at the shopfloor, but may be undesirable by the management due to their costly nature and vice versa. Also, beyond the fact that the idea of 'best practice' deviates between employers and employees (and between various managerial layers); there is also the obvious case that the feasibility; return of investment or attractiveness of 'best practices' differs from organisation to organisation. Indeed, 'to claim that a bundle of best practice HRM is universally applicable leads us into a utopian cul-de-sac' by ignoring momentous forces both internal and external the organisation (Purcell, 1999: p36).

The 'Contingency' Approach

The de-contextualised concept of 'best/ideal' practices has led researchers to develop the thinking that HRM should vary depending on the impact that different forces have on organisations. The rationale behind this philosophy is that HRM should be designed to manage people 'across different jobs, workplaces, companies, industries, societies and cultures' (Boxall et al., 2008: p4). Trying to come up with an alternative way of thinking, researchers reach the conclusion that 'HR practices should and does vary between organisations depending on strategy and market conditions' (Marchington & Wilkinson, 2005: p124) and that the success of any HR system is subject to different contextual features. This 'fit/contingency' approach results as an answer to the concerns related to the universal position. The message expressed by this alternative 'matching model' is that the function of HRM will

become more productive if practices are ‘designed to fit certain critical contingencies in the firms specific context’ (Boxall & Purcell, 2000: p189). This conceptualisation focuses on assessing the degree to which organisations achieve a successful ‘vertical alignment’ between HRM and their business strategy.

Actually, the contingency model adopts the opposite direction from the universalistic one, suggesting that the context within which organisations operate will determine the way that HR practices will appear. This implies that HRM varies among different workplaces, and there is no ‘ideal’ set of universal practices. Rather, contextual forces (as these are summarised in Table 1) highly influence management’s decisions regarding HRM.

<i>Forces External to the Organisation</i>	<i>Forces Internal & Related to the Organisation</i>
<i>Economic / Type of economies</i> <i>Type of financial systems</i> <i>Legal / Monitoring systems</i> <i>Political – local / national / international developments</i> <i>Social characteristics</i> <i>Technological</i> <i>Cultural</i> <i>Type of IR systems</i>	<i>Sectoral</i> <i>Product market situation</i> <i>Financial position</i> <i>Degree of professionalisation</i> <i>The size of organisation</i>
<i>Source: Compiled by the author</i>	

Table 1: Forces Influencing the Operation of HRM

Although the above forces deserve greater elaboration, it should be obvious that there are more deep-seated concerns whether an ideal set of practices can always have a positive impact on all organisations. This becomes even more apparent when looking into the ‘fundamentals’ of the contingency model. Attempts to explore the nature of this model reach the conclusion that HRM systems will be successful only when HR strategy is aligned with organisations’ stage of development, strategic orientation or management style (Gratton et al., 1999). For example, business’ life cycle models (i.e. start-up, growth, maturity and decline stages) are frequently applied to illustrate why employers adopt different HRM strategies at different stages. Moreover, looking into competitive advantage strategies (i.e. cost reduction; quality enhancement; innovation), the proposition is that HR policies and practices should be designed to fit with organisations’ competitive strategy and be supportive to their business plans.

Although contingency frameworks have many positive attributes, there are also concerns and limitations to be highlighted. Marchington & Wilkinson (2012) identify some basic shortcomings of this orientation. Firstly, ‘best fit’ is criticised due to its deterministic assumptions. The problem rests in

the idea that it is possible to derive with a particular set of 'tailored' HR practices by simply evaluating the business strategy or competitive pressures of the firm. Yet, this raise several problems, as in reality, organisations may not have an obvious or distinct strategy (that could be categorised), thus making almost impossible to assert any correlation between HRM with business strategy.

Also, the proposition that different product market situations call for particular patterns of HRM raises some concerns. In reality, a single organisation may maintain businesses expanding to more than one market. Therefore, categorising distinct management strategies depending on unique market situations may be too risky to be assumed. This is because many times external factors may require adopting different types of HR tactics simultaneously. Also, an obvious shortcoming is that contingency models neglect the importance of the process of change. For example, while the idea of relating organisations' life cycle stages with their HRM strategy is intriguing, this is done assuming a static background. Yet, it is much more difficult to draw a line and estimate the precise point were organisations move from one stage to another, thus making almost impossible to identify the exact time at which a new strategy is required.

A further concern arises given that organisations are not 'the complete authors of their own HRM' and do not have an absolute control. Issues such as barriers in the efforts to convert strategic intentions into actual implementations and the interests or pressures from social actors and institutional forces (i.e. employees, customers, trade unions, governmental bodies, regulatory systems etc.) are largely downplayed (Boxall & Purcell, 2008). Overall, these models are presented in an oversimplified manner, neglect the importance of dynamics and change processes; aspects that are necessary for gaining a real understanding of the relationship between HRM and its environment (Paauwe & Boselie, 2008).

The conclusion is that simply focusing on a single factor and ignoring others influencing the practice of HRM lead to several criticisms. It is important to also recognise that different influences are equally worth evaluating and bear in mind that within organisations, the nature, preference and status of different HR practices may vary across several layers, departments, managers, employees etc.

The 'HR Architecture' Idea

To combat some of the above criticisms, researchers adopt an alternative way for analysing HRM, by focusing on the internal resources of organisations -the human capital. This 'resource-based' view is a counteractive approach to paradigms assuming that organisational productivity is influenced solely by external forces. This means that organisations seeking sources of competitive advantage should have an inward orientation, focusing on their employees' competencies and intellectual capabilities (Allen & Wright, 2008).

Initiating their arguments by recognising the fact that 'differences in institutional settings affect the nature of HRM', Paauwe & Boselie (2008) explain that the 'outside-in' orientation of contingency / best fit models has gradually shifted to an 'inside-out' focus. Therefore, less attention is given to the

outside organisational environment since the core implicit assumption is that the external context matters less than internal resources for creating sustained competitive advantage.

Two of the most influential authors in this area, David Lepak and Scott Snell argue that there is no 'optimal' HR bundle or a specific HRM strategy that would be adopted to manage all employees at all organisations. Rather, investments on HRM should be done according to the different types of employees employed within organisations. This idea of 'HR architecture' assumes that HRM vary depending on the type of workers, as well as according to their occupational groups within which they belong. In essence, the key message of this orientation is that just like there is no universal / ideal bundle of HR practices for every organisation, there may be no one best set of HR practices for every employee.

Although there may be some HR practices that resonate with every worker in the organisation, others might be appropriate to some, but not to other occupational groups. For example, while continuous training may be appropriate for employees working in IT services, for other occupational groups such intensity may not be necessary. Similarly, appraisals are expected to be essential for professional workers who wait for internal promotions, whereas for administrative employees, who have minimum opportunities for advancement into a managerial position, such focus on appraisals may not be so crucial. This emphasises the importance of having an 'HR architecture' (Lepak & Snell, 1999), whereby different approaches and HR practices / bundles are targeted to different occupational groups always according to their distinct needs, responsibilities and roles.

Two of the founders of this model of HRM: Wernefelt (1984) and Barney (1991) articulate that collectively, human resources influence organisational performance and have the potentials to offer a unique source of competitive advantage. Theorists within this framework highlight how organisations' capabilities flow from inside-out and exemplify the way that organisations can best tailor their HR practices in order to manage their different types of workers. Fundamentally, this model is based on the belief that four firm-specific attributes are those which allow organisations to gain and sustain a competitive advantage. These are a) the value - i.e. having a distinct impact and making a valuable contribution, b) rarity - i.e. being scarce / in shortage in the market and not available to competitors, c) imperfect imitability - i.e. extremely difficult to be imitated since they are formed under unique historical conditions and d) a lack of substitutes - i.e. not easily substitutable by other equally or more effective resource.

Despite accepting the above attributes as necessary for gaining competitive advantage, a basic argument is that real success can only be achieved if certain conditions exist. For example, in order for human capital to be able to truly contribute to organisational success, organisations must recruit and retain higher quality employees than those in competitive organisations. Moreover, it is necessary that organisations ensure the continuous development of their workforce. This however raises some concerns given that many organisations may not be able to do that; or they may even not have this orientation as a primary aim.

Also, beyond the concerns whether or not human resources in reality meet the 'core' conditions offered by Barney (1991), there is a strong argument that such models do not actually represent a theory (Priem & Butler, 2001). The criticism is that this 'resource-based' view is tautological in its definition of key constructs. This is because if and only if a company possesses unique, rare, imitable, non-substitutable resources among the competition, these resources will lead to competitive advantage. The problem with this statement is that it requires definitional dependency. Thus, without this dependency (i.e. without the four firm-specific attributes), the statement that firms will gain a competitive advantage does not logically follow.

Another argument is that just like the contingency models appear to have limited focus on the internal and operational aspect, this philosophy neglects external forces. Hence, despite its usefulness in understanding the internal potentials of an organisation, it fails to recognise the social context from which the organisations draw their human capital. Therefore, one of the greatest criticisms against this orientation is its weakness in defining the boundaries and contexts in which it takes place. Nevertheless, even in the face of these concerns, there is a general consensus that this framework has an immense influence upon SHRM as it allows to understand how internal resources have the potential to contribute to organisational success (Wright et al., 2001, Allen & Wright, 2008).

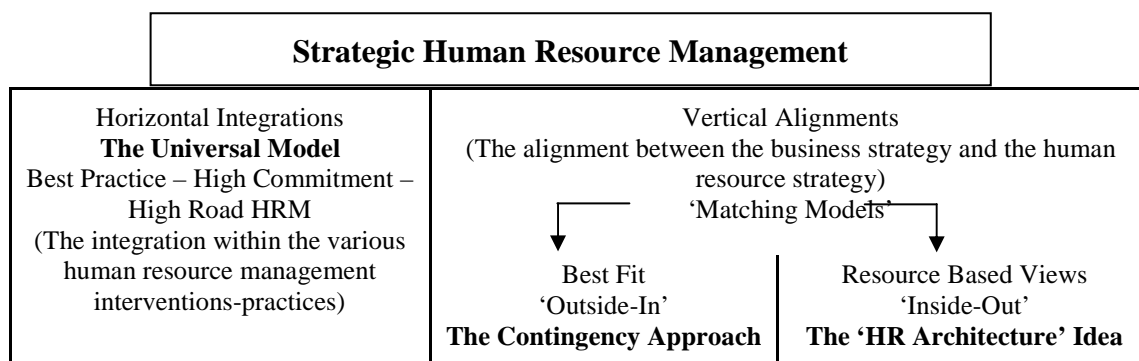

Figure 1: Components of Strategic Human Resource Management

Source: Compiled by the author

Summarising the aforementioned, the cornerstone of SHRM (see Figure 1) is the establishment of effective associations between the strategic aims of the organisations and the different HRM policies and practices. The way to achieve this is through horizontal integration of their practices (i.e. a 'bundled' approach) or vertical alignment between the business and the HR strategy (i.e. 'outside-in' & 'inside-out' focus). However, as seen throughout the preceding discussion, given that falsities and shortcomings are acknowledged; could an alternative paradigm be the way for analysing HRM in the 21st century?

Is 'Core Plus Context Specific' HRM the Answer?

Research findings indicate that due to various factors; different or the same HR policies and practices may apply, or not, to diverse settings. Essentially, the argument is that what is 'best' for one

particular setting, it is not necessarily 'best' for another. Therefore, it is suggested that researchers activated in the HRM area need to reconsider their conceptualisations and be cautious against prescribed models and become more skeptical about any claims for universal applicability.

Rather, the suggestion is to search for those practices that are most efficient and effective. These HR practices unavoidably vary among organisations depending on a wide range of factors. Nonetheless, while there is a departure from the idea of a set of 'ideal' practices for all organisations, the belief is that certain HR practices were, are and will always be of fundamental importance for any organisation. Yet, the importance of these practices again depends upon a range of forces that have a direct and/or indirect influence on organisations. The ultimate proposition is that whatever the focus of any HRM-related study, its starting point should always be a careful examination of the contextual particularities.

The aim is not to challenge the importance or applicability of the various 'best' HR practices offered by different researchers. Rather, the argument is that these practices may appear in various forms, in diverse combinations and may be adopted and implemented differently under different circumstances. This observation calls for a more integrated way of analysing HRM; developing a conceptual framework which would facilitate the idea of some 'Core Plus Context' (CPC) specific practices.

This proposition is not totally new as voices from some traditional HRM researchers calling for a more comprehensive -up to date- strand glitter in the literature. As Purcell (1999) explains, it is important to be aware of when and where a bundle of 'best' practices is adopted and understand why organisations decide to embrace these practices. Also, for Purcell, it is equally important to comprehend how organisations' unique surroundings and particular needs shape their HRM system. Similarly, Youndt et al. (1996), while highlighting the importance of the universal approach in understanding the benefits of HR practices across all contexts, they also urge a concurrent focus on the contingency factor which is vital for deriving with 'situationally-specific' theories.

The developers of HRM policies and HR specialists ought to focus on recognising policies and practices in particular organisational contexts. They also have to be able to evaluate information and make decisions from the spectacles of their own particular framework. This means that HRM researchers must appreciate how institutions and markets influence the management of their people and organisations instead of reproducing different versions of 'best practice'. This is essential since 'any given policy, or bundle of policies will be interpreted and enacted differently in different organisational contexts, in the light of their culture, structure and administrative heritage' (Truss, 2001: 1145).

While there is a contest between the best practice / best fit models in the literature, the current paper suggests that these perspectives should be seen as complementary. Now, more than ever, HRM is a multidimensional field and as such no factor should be downplayed. For this paper, it is not just about a copy paste of best practices, is not just about external focus and is not just about internal focus. It is a

combination of these, proposed as Core Plus Context specific approach. This is because one of the most important challenges that organisations face is the reciprocal association between external and internal fit. An ignorance of either the internal or the external aspect may impair the effectiveness of the overall HRM system.

In more detail, CPC could be examined both from a broader angle and from a more sector-specific level. At the broad level, CPC finds support in Boxall & Purcell (2003: pp69-70), who put forward an alternative conceptualisation for reconciling tensions between best fit / best practice. The authors place 'best fit' evaluations to be at the 'surface level' of HRM policy and practices. At this level, contextual factors at the societal, sectoral and organisational level exercise great influence (stressing the importance of context-specific practices). Beyond that, the authors also recommend that 'best practice' views should be considered as more appropriate at the 'underpinning layer' of generic HRM. Here, the belief is that in most of the cases, some 'best practice' principles will be more cogent and effective (i.e. acknowledging some 'core' practices). Consequently, at this level, the CPC should be adopted to facilitate research that take place among organisations operating within different countries or sectors.

Beyond that, CPC is also helpful for conceptualising the way that HR practices appear in organisations operating under similar contextual particularities. At this level, the proposition of CPC is closest to the idea of 'table stakes' offered by Boxall and Purcell (2008: p83) and Purcell et al. (2009: p13). For the authors, while highlighting the importance of differentiation in the 'HR Architecture' model, they mainly focus on how organisations operating in the same industry share a similar 'baseline'; 'resources and skills needed simply to play the game'. Comparable with CPC suggestion, Purcell and colleagues propose that these 'table stakes' may not be a source of competitive advantage. However, these set the point of departure for developing 'tailored-to-the-organisational reality' HRM system and for establishing a strategic focus that will differentiate the organisation from competition.

At this point it should be clarified that this proposition has the potential to contribute to those organisations that have a genuine interest in adopting a strategic approach to HRM. To avoid some of the criticisms surrounding dogmatic models of HRM, CPC can be useful for those that seek to develop their workforce. However, for organisations that compete solely on price cost reduction, this proposition will not be so appealing. This is because the dominant orientation of such organisations contradicts with the overall philosophy of CPC.

Beyond the above, one additional element in CPC can be seen the original extension of the above propositions, making it more 'realistic' in its nature. In order for this model to be successfully conceptualised, an 'implementation' component should also be accommodated. This is because the value of a horizontal or vertical philosophy is cancelled out in the absence of a successful enactment dimension. HRM authorities not only need to have a theoretical and technical knowledge of HR practice, but they also must be knowledgeable of HRM processes to ensure that HR strategy is put into effect and that policies are operationalised into real-life practices at the workplace. The value of CPC model becomes more apparent by evaluating the 'processes' of HRM. The proposition is that

while the existence of different policies and practices and their integration / alignment is important, the way that these are delivered and enacted is what really counts.

Translating HRM strategies and policies into action seems to be one of the most fundamental riddles to be solved and as such, this separate dimension is dedicated to the 'enactment' element. The degree to which organisations are successful in this aspect will eventually determine the impact and value of HRM. Evaluating employees' experiences and perceptions about the different HRM policies and practices, or exploring line managers' behaviour and dedication for delivering these policies can shed some light on this component. Combining these two research endeavors would allow researchers to gain a genuine understanding of the HRM puzzle.

Conclusion

The aim of the paper was to reveal the limitations of the dominant SHRM models, and based on that, to develop a more unified concept. On the whole, this paper disagrees with the mimetic isomorphism within HRM and suggests caution against claims about the universality of 'best' practices. Instead, a more 'situationally-specific' framework is proposed; a conceptual argument stressing the necessity for an implemented CPC specific approach. By drawing attention to both 'core' plus 'context specific' aspects, this proposition represents a step forward since it helps to facilitate the tensions that exist between the different models of HRM. Building on that, this conceptualisation highlights the 'enactment' aspect, thus avoiding the criticism surrounding many of the prescriptive propositions existing in the HRM literature. CPC can be considered as the natural advancement of the existing models adopted to analyse HRM; an updated and more integrated strand that best captures the complexities and accommodates the particularities of HRM in the 21st century.

Connoisseurs of this field can immediately spot potential grounds for expanding the above arguments. The 'enactment' element of CPC actually stresses the importance of focusing on the way that the HRM policies and practices are implemented. The argument is that it is not enough to only explore the way that organisations set up horizontal integrations or vertical alignments. There are still much to be gained from future research endeavors that, not only pursue a CPC specific approach; but at the same time seek to identify the 'processes' (Guest, 2011) by which HRM policies and strategies are realised. Simple as it may sound, this opens the doors to an enormous field of study - Analytical HRM (Boxall et al., 2008, Delbridge, 2011). Future efforts pursuing this orientation have the potentials to add to our existing knowledge by moving away from the surface 'best practice' / 'best fit' debates. By entering into a deeper level of analysis, scholars will be able to develop a multi-level research endeavor in order to understand the way that HR policies and strategies (i.e. seniors' intentions) become implementations (i.e. by line managers), and how these implementations are experienced and perceived by employees at non-managerial positions. On the top of that, one can envisage further expansion of this field by researching the way that non-managerial employees' experiences and perceptions may impact on their attitudes; behaviours and eventually their performance.

Abstract

The bankruptcy forecasting literature may be labelled as somewhat diverse, with several authors contributing with the employment of different techniques and methods. Nevertheless, it is not the case for survival analysis, a methodological approach that, in our opinion, may be of great usefulness and can enrich this strand of research, so relevant nowadays, in times when many economies and companies are struggling worldwide.

The aim of this paper is to propose and develop a model for the prediction of Portuguese textile business failure using Survival Analysis, together with the comparison of the results obtained with other techniques, namely Discriminant Analysis and Logit.

The selection of this sector was based on its relevance in terms of employment and also its importance in the Portuguese industrial structure, in addition to being one of the sectors most affected by globalization, which is resulting in numerous insolvent and bankrupt firms.

When comparing the results obtained, we can observe that for the group of non-failed companies the models based on discriminant analysis and logit exhibit, in general, higher levels of accuracy. Conversely, this was not the case for the group of failed companies.

However, if we do not consider the temporal sequence of the proposed model based on survival analysis, its percentage of success was greater than 87% and 76% for second and third years prior to failure, respectively, significantly higher than those obtained by the discriminant analysis and logit models.

Keywords: Corporate Failure, Survival Analysis, Temporal Predictive Model.

Introduction

The problem of corporate bankruptcy has been, and will surely remain a topic of particular interest to a broad set of economic agents. The corporate bankruptcy - economic, financial or legal - can result from a diverse set of complex causes, both of internal and external nature, that can be attributed, for

example to a weak organizational structure, the company's own strategy, technological changes, or to changing economic conditions.

The development of predictive models for corporate bankruptcy is a strand of research that was driven by the seminal work of Beaver (1966) and Altman (1968), and there are an increasing number of researchers who are interested in this subject.

In the past four decades many studies have been published, with methodological refinements that were not always accompanied by an improvement in the results obtained. Perhaps that is the reason why in recent years the researchers have searched for alternative techniques and tools in order to develop models with greater usefulness and accuracy.

Overall, it seems arguable that the models developed for corporate bankruptcy prediction can be as much as useful as helpful for decision making. Therefore, in this paper we propose a model for corporate bankruptcy prediction based on survival analysis. Despite being an unusually employed technique in this type of study, it is believed that its possibilities seem to be have been still little explored, and therefore we believe this paper can offer a significant contribute to the existing research in the bankruptcy prediction field.

Literature Review

Some of the most important research on corporate failure forecasting started to be developed in the 1970s. This strand of research was focused mostly on the use of statistic techniques, or on automatic learning techniques adapted to accounting indicators, with the purpose to obtain forecasting models that could provide indications about a future possible insolvency condition (Beaver, 1966; Altman, 1968; Blum, 1974; Martin, 1977; Tan and Kiang, 1992).

Nevertheless, not every study pursued this purpose. While some of the seminal research was aiming to prove whether accounting figures could have some information about the future solvency of a company, some other were comparing models with the purpose to distinguish among the best possible options (Frydman *et al.*, 1985; Gentry *et al.*, 1985; Aly *et al.*, 1992; Koh & Tan, 1999, or Charitou *et al.*, 2004). Furthermore, some other research attempted to verify the effectiveness of some models during a certain time space dimension (Lizarraga, 1998 or Grice and Dugan, 2001).

In order to develop an empirical research about the corporate failure forecasting, it is needed a sample of companies that can be used in a modelling process. Ideally, the sample should not only be representative of the research companies, as it collection also should ensure a random selection of both failed and non-failed companies. In practical terms, the literature on failure forecasting offers a different reality: researchers use mostly samples with the same number of observations for failed and non-failed companies.

Several techniques have been used in the development of corporate failure models in the last four decades. Following the publication in 1968 of Altman's Z-score, most of the papers published in the 1970s have used the discriminant analysis as well (Blum, 1974; Elam, 1975; Altman *et al.*, 1977; Moyer,

1977; Norton and Smith, 1979; among others). Nevertheless, the uprising criticism raised by the use of this analysis led researchers to develop other techniques, using different testing possibilities, such as logit and probit models.

The technological evolution and the computing advances provided the conditions for the development and use of other techniques which, despite not free from limitations, do not require the observation of some of the statistical assumptions.

The Cox Proportional Hazards Model

A brief rationale of the Cox proportional hazards model follows, preceded by the description of the survival and hazard functions. According to Collet (1994), the current survival time of an individual t can be regarded as the realization of a random variable T , which may assume any given non-negative value. Therefore, T indicates the time to failure of a firm. T is thus associated with survival time and follows a given probability distribution. Being T a continuous probability distribution, and assuming f as the underlying probability density function, the function of distribution is then given by

$$F(t) = P(T < t) = \int_0^t f(u) du. \quad [1]$$

which represents the probability of the survival time being inferior to a given value of t .

The survivor function $S(t)$, is defined as the probability that a firm will survive longer than t times units, being equal or higher than t , and assumes the following notation:

$$S(t) = P(T \geq t) = 1 - F(t). \quad [2]$$

The survival function may therefore represent the probability of the survival time of an individual to exceed a given value of t .

The hazard function describes the evolution over time of the immediate rate of "death" of a firm. To obtain the hazard function, we assume the probability that the random variable associated with a survival time T is in between t and $t + \delta t$, subject to a T value greater than or equal to t , which can be shown as

$$P(t \leq T < t + \delta t | T \geq t). \quad [3]$$

The hazard function $h(t)$ is then the limit of that probability divided by the interval of time δt , with δt tending to zero as we can verify below:

$$h(t) = \lim_{\delta t \rightarrow 0} \left\{ \frac{P(t \leq T < t + \delta t | T \geq t)}{\delta t} \right\}. \quad [4]$$

The hazard $h(t)$ is the probability of failure in the next instant, given that the firm was alive at time t (Lane *et al.*, 1986).

According to Collet (1994), from this point some useful relationships can be obtained between the survival and the hazard functions.

Considering the Bayes' theorem, the probability of a given event A, subject to the probability of a given event B, is $P(A | B) = P(A \cap B) / P(B)$. Based on this result, the conditional probability of the hazard function in equation [4] is:

$$\frac{P(t \leq T < t + \delta t)}{P(T \geq t)}, \quad [5]$$

which is equal to

$$\frac{F(t + \delta t) - F(t)}{S(t)}, \quad [6]$$

where $F(t)$ is the distribution function of T.

Then,

$$h(t) = \lim_{\delta t \rightarrow 0} \left\{ \frac{F(t + \delta t) - F(t)}{\delta t} \right\} \frac{1}{S(t)} \quad [7]$$

being,

$$\lim_{\delta t \rightarrow 0} \left\{ \frac{F(t + \delta t) - F(t)}{\delta t} \right\} \quad [8]$$

the definition of the derivative of F , at the moment t , given by f , and therefore

$$h(t) = \frac{f(t)}{S(t)}. \quad [9]$$

The survival function, $S(t)$, can be obtained from the following equation:

$$S(t) = \exp\{-H(t)\}, \quad [10]$$

where

$$H(t) = \int_0^t h(u) du . \quad [11]$$

The function $H(t)$ is called the cumulative hazard function and may be easily obtained from the equation [10].

$$H(t) = -\log S(t) \quad [12]$$

One model that we could apply is the proportional hazard model proposed by Cox (1972), which is also known as Cox regression model.

The definition of the model can be made as follows. Assuming that the hazard of "failure" for a given time period depends on the values x_1, x_2, \dots, x_p of p explanatory variables X_1, X_2, \dots, X_p , the set of values of explanatory variables in proportional hazard model will be represented by the vector \mathbf{x} , so $\mathbf{x} = (x_1, x_2, \dots, x_p)'$.

We designate $h_0(t)$ as the hazard function of a company for which the values of all variables that make the vector \mathbf{x} is zero. The function $h_0(t)$ is called baseline hazard function. The hazard function for i companies can then be written as:

$$h_i(t) = \psi(x_i) h_0(t), \quad [13]$$

where $\psi(x_i)$ is the function of the values of the vector of explanatory variables for i companies.

The function $\psi(x_i)$ can be interpreted as the risk over time t for a company whose vector of explanatory variables is \mathbf{x}_i on the risk for a company whose $\mathbf{x}=0$.

Since the relative risk $\psi(x_i)$ can not be negative it should be written as $\exp(\eta_i)$, where η_i is a linear combination of p explanatory variables in \mathbf{x}_i . Therefore,

$$\eta_i = \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_p x_{pi}, \quad [14]$$

which is equivalent to

$$\eta_i = \sum_{j=1}^p \beta_j x_{ji}. \quad [15]$$

where β is the vector of coefficients of the x_1, x_2, \dots, x_p explanatory variables in the model.

The quantity η_i is called the linear component of the model, also known as risk score or prognostic index for i firms. The proportional hazard model can generally be expressed as follows:

$$h_i(t) = \exp(\beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_p x_{pi}) h_0(t). \quad [16]$$

The Proposal of a Predictive Model

Taking into consideration the models offered in the literature, but also by employing a specific set of variables that we find appropriate to test using a survival function, follows here our proposal of a predictive model of corporate failure.

The variables used

In this paper, several economic and financial indicators were used to construct a set of independent variables. Similarly to the procedure used in diverse studies devoted to predicting business failure, the selection of the independent variables was based on its popularity, measured by its use in previous studies.

Table 1, shown in next page, lists the 60 selected indicators that were collected from the balance sheet and from the income statement of the companies included in the sample.

X1	<i>Total assets / Total Liabilities</i>
X2	<i>(Current assets - Inventory) / Current Liabilities</i>
X3	<i>(Current assets - Current Liabilities) / Total Liabilities</i>
X4	<i>(Current assets - Current Liabilities) / Sales</i>
X5	<i>Current assets / Total assets</i>
X6	<i>Current assets / Current liabilities</i>
X7	<i>Current assets / Total Liabilities</i>
X8	<i>Fixed Assets / Current assets</i>
X9	<i>Depreciation expense / Operating gains</i>
X10	<i>Equity / Total assets</i>
X11	<i>Equity / Net Fixed Assets</i>
X12	<i>Equity / Liabilities</i>
X13	<i>Cash-flow / Current liabilities</i>
X14	<i>Cash-flow / Liabilities</i>
X15	<i>Financing charge / Operating gains</i>
X16	<i>Financing charge / Operating profit (or loss)</i>
X17	<i>Financing charge / Total bank loans</i>
X18	<i>Cash / Total assets</i>
X19	<i>Cash / Current liabilities</i>
X20	<i>(Cash + Bills receivable) / Current liabilities</i>
X21	<i>Bills payable / total assets</i>
X22	<i>Inventory / Total Assets</i>
X23	<i>Inventory / Sales</i>
X24	<i>Working capital / Total assets</i>
X25	<i>Staff costs / Fixed Assets</i>
X26	<i>Staff costs / Operating gains</i>
X27	<i>Property, plant and equipment / Current assets</i>

X28	<i>Property, plant and equipment / Total Assets</i>
X29	<i>Intangible assets / Total Assets</i>
X30	<i>Net Fixed Assets/ Total Assets</i>
X31	<i>Fixed Assets / Long-term liabilities</i>
X32	<i>(Fixed asset investments + Current asset investments) / Total assets</i>
X33	<i>(Cash + Current asset investments) / Total assets</i>
X34	<i>Current liabilities / Total Liabilities</i>
X35	<i>Long-term liabilities / Current Liabilities</i>
X36	<i>Long-term liabilities / Total Liabilities</i>
X37	<i>Total Liabilities / Equity</i>
X38	<i>Operating gains / Current assets</i>
X39	<i>Operating gains / Total Assets</i>
X40	<i>Operating gains / Operating Costs</i>
X41	<i>Operating gains / Fixed assets</i>
X42	<i>(Net profit before tax + Depreciation expense + Provisions)/ Financing charge</i>
X43	<i>Retained earnings/Total assets</i>
X44	<i>(Reserves + Retained Earnings) / Total Liabilities</i>
X45	<i>Extraordinary result / Net profit</i>
X46	<i>Net profit/Total assets</i>
X47	<i>Net profit/ Equity</i>
X48	<i>Net profit/Liabilities</i>
X49	<i>Net profit / Operating gains</i>
X50	<i>Net profit/ Sales</i>
X51	<i>Operating profit (or loss)/ Total assets</i>
X52	<i>Operating profit (or loss)/ Financing charge</i>
X53	<i>Operating profit (or loss)/ Operating gains</i>
X54	<i>Operating profit (or loss)/ Sales</i>
X55	<i>Sales / Total assets</i>
X56	<i>Sales / Current assets</i>
X57	<i>Sales / Cash</i>
X58	<i>Sales / Inventory</i>
X59	<i>(Net profit before tax + Financing charge) / Sales</i>
X60	<i>Net profit before tax / (Net profit before tax + Financing charge)</i>

Table 1: Independent variables

The companies' sample

In order to adjust the model, it was necessary to obtain a sample of companies where the event of interest occurred, this is, where there was a closure of activity.

Based on the information provided by insolvency administrators it was possible to obtain a sample of 17 companies, whose survival times were known and that are classified as belonging to the group of failed companies.²⁹

Concurrently, we obtained a sample of 23 companies that did not fail, i.e., with survival times censored. All companies belong to the textile industry and the information needed was collected from the balance sheets and income statements of three consecutive financial years, comprising the time periods from 2003 to 2007.

Taking into consideration the survival times, it was possible to split each company into 3 sets of observations, which resulted in a group of failed companies with 51 observations, and a group of companies that did not fail with 69 observations.³⁰ To illustrate this situation, one can consider the data from a company that was active until six months after the latest year for which we have data records. Since we collected data for 3 consecutive years, it is possible to have data for 6, 18 and 30 months prior to the time of business closure. This procedure was repeated for all 40 companies in the sample.

The selection method of the explanatory variables followed Collett (1994) procedure, and the testing was performed using SPSS software, version 18.0.

The explanatory variables that contributed significantly to the reduction of statistics $-2 \log \hat{L}$, are shown below, in table 2.

	B	SE	Wald	df	Sig.	Exp(B)
X3	,897	,304	8,740	1	,003	2,453
X6	-1,734	,562	9,526	1	,002	,177
X13	-5,424	1,033	27,579	1	,000	,004
X60	,236	,085	7,765	1	,005	1,266

Table 2: Variables in the Equation

While the variable X3 represents (Current assets - Current Liabilities) / Total Liabilities, the variable X6 refers to Current assets / Current Liabilities, the variable X13 represents Cash-flow / Current Liabilities and the variable X60 represents Net profit before tax / (Net profit before tax + Financing charge). The value of the last column [Exp(B)] exhibits the risk, relatively to a basic function, for each variation of one unit of the respective explanatory variable.

In Table 3 are shown the values of the survival function relatively to the average of the variables' values.

²⁹ The survival times for the 17 companies are as follows: 4 companies with 4 months, 2 companies with 5 months, 4 companies with 6 months, 4 companies with 8 months and 3 companies with 10 months.

³⁰ Each observation is regarded as a company.

Survival Table

Table 3: Survival Function Table

Temporal model based on survival analysis

The survival analysis provides a quantitative information about the probability of a company to fail at the end of a time period t and not only whether it will, or not, going to fail.

With the intention of making this model generic and applicable to any company, in the sense that one can observe the output expressed as failed or not failed, we performed a transformation of the model output, making the result dichotomy probability, 0 (zero) or 1 (a), this is, the likelihood of fail, or not fail, respectively. For this we used three cut-off points that correspond to the frequency values determined at the end of a given time, to compare with the values of the survival function. The time periods to be considered for the study are: 12 months, 24 months and 36 months.

The frequency of the event, as well as the values of the survival function for each one of those moments of time, was based on the respective figures for the nearest time instants obtained in the survival model developed earlier.

Combining all this information was then possible to develop an algorithm using Matlab, version 7.1 (Algorithm 1) which allows us to produce a company's performance forecast over the period considered.

The result can be displayed in a table with four columns (an example is given in Figure 1), where in the first column the company appears identified, while in each of the remaining a forecast is provided indicating whether the company will fail (0) or not (1) the next 12, 24 and 36 months, respectively.

In order to run the algorithm, the steps shown below should be followed, once the Matlab program is initialised:

- 1 – First, write the name of the algorithm (in the present case “survival”) followed by clicking on “enter”;
- 2 – Second, write “load results” and then a click on “enter”;
- 3 – Finally, one should click twice on the icon of the table A1.

Whenever we need to apply this algorithm to data from other companies (can be a database with information from one to up thousands of companies) it will be enough to enter the algorithm and to change the name of the database that comes after the word “load” (writing the name of the new database), after the data has been imported into a Matlab file.

Thereafter, and for its operation is only necessary to repeat the three steps mentioned before.

We then apply this model to the sample of textile companies, consisting of 445 non-failed and 143 failed companies, including the respective indicators for each of the three years.

For the data corresponding to one year prior to failure we have considered as correct or true classifications, for each of the groups of companies, the following codes:

<i>Failed Companies</i>	0	0	0
<i>Non-Failed Companies</i>	1	—	—

For non-failed companies, whenever the first column assumes de value one, the classification is considered to be correct, since there is no information about what occurred in the following years, for a substantial part of these companies.

The results obtained revealed a significant high level of accuracy, correctly classifying 439 non-failed firms, corresponding to a percentage of 98.65%, and also 135 failed companies, which translates to an accuracy percentage of 94.41%.

Using data for two years prior to failure, the correct classifications had to match the following symbols:

<i>Failed Companies</i>	1	0	0
<i>Non-Failed Companies</i>	1	1	—

The information that we had in our database for this period allows us to suggest that companies belonging to the group of failed ones continued active, over at least one year, failing however into some of the situations considered within the definition of failure from the second year. With regard to the non-failed companies, we know that at least within the two following years, they have continued

their activity without having occurred any of the situations that have been defined in this research as failure.

In this case, the hits percentage in the group of non-failed companies remains high, with 398 companies correctly classified (89.44%). Nevertheless, in the group of failed companies, only 45 companies were correctly classified, corresponding to an accuracy rate of 31.47%. However, if we do not take into account the temporal sequence, the model assumes that 87.41% of the companies in this group will fail during the period considered.

For the three years prior to failure condition, we have considered classifications adjusted for each of the two groups of companies according to the following symbols:

<i>Failed Companies</i>	1	1	0
<i>Non-Failed Companies</i>	1	1	1

The model managed to correctly classify 295 non-failed firms (66.29%) and 65 failed companies (45.45%). Again, if we do not take into account the temporal sequence, the model assumes that 109 of the 143 companies (76.22%) fail during the period considered.

Even employing data for each year, we can conclude that the model maintains high percentages of success for the group of non-failed firms, especially for the next two years, regardless the year. For the group of failed companies, the hitting level decreases as we move away from the moment of failure, but achieves very reasonable results if we do not consider the temporal sequence.

Other statistical models proposed

Sample selection procedure

To be part of the sample companies had to submit data for three consecutive financial years, the period comprised between 2003 and 2008. Was selected a sample of 445 failed companies and 143 non-failed companies belonging to the textile industry. Subsequently the same sample was divided into two samples, the test sample (with 80 randomly selected failed companies and 160 non-failed companies whose data corresponding to the same exercises economic and approximately the same size) and a validation or holdout sample, with the other firms (285 non-failed companies and 63 failed companies).

Discriminant Analysis

In Table 4 we can observe the significance of the discriminant function obtained. The centroid (average overall index for each group) is -2.799 for the group of failed companies and 1.382 for the group of non-failed companies. An analysis of the scores of each company showed that the point that

gave the smallest error is fixed in -0.64. To classify each company of the test sample, as well as in samples of the said verification value used as a cutoff point. The results are shown in Table 6.

Test of Function(s)	Wilks' Lambda	Chi-square	df	Sig.
1	,203	375,930	5	,000

Table 4: Wilks' Lambda

$$\text{Function 1: } Z = -12,360 + 0,883 * X_{10} + 13,032 * X_{40} + 2,573 * X_{48} - 2,546 * X_{59} - 0,222 * X_{60}$$

Logit

The estimation of the logit model was also based on data from the test sample for the year prior to failure, consisting of 80 companies failed and 160 non-failed, following the stepwise forward Wald. The ratios included in the model selected is the X14 (Cash-flow / Liabilities) and X46 (Net profit/Total assets) as one can observe in Table 5. A cutoff point of 0.5 was used.

	B	S.E.	Wald	df	Sig.	Exp(B)
Step 1a X14	13,021	7,788	2,795	1	,019	45162,824
X46	46,913	11,446	16,800	1	,000	2,366E20
Constant	2,829	,805	12,367	1	,000	16,932

a. Variable(s) entered on step 1: X14, X46.

Table 5: Variables in the Equation

After gathering and assessing the overall performance of all models, its collection is summarized in Table 6, in which the rate of hits for each of the groups of companies can be easily comparable.

Model	Test sample		Holdout sample		2 years before failure		3 years before failure	
	F	NF	F	NF	F	NF	F	NF
Discriminant Analysis	92,5	99,38	87,3	98,6	62,2	97,3	47,6	98,4
Logit	95	98,1	92,06	98,95	79,7	96,9	42	98,2
Survival Model	—	—	94,41	98,65	31,47	89,44	45,45	66,29
Survival Model without Temporal Sequence					87,41	89,44	76,22	66,29

F: Failed; NF: Non Failed

Table 6: Summary of the percentage of hits for every model used

Observing the results we can conclude that with the data of the test sample, all models provided a level of correct classification of companies exceeding 90%, and the error type II is always below 2%. It appears that this type of error is always very low for every period considered, with percentages never exceeding 3.5%. Conversely, the type I error, which increases as the period considered is extended, presents higher percentages, recording percentages superior to 50% using the data for three years prior to failure.

Conclusions

One of the purposes of this paper was to design a model for the prediction of business failure within the textile industry using survival analysis and to compare its predictive ability with other statistical models.

One of the models developed in this paper employs survival time, or the hazard rate, as the dependent variable and assumes that failed and not failed companies come from the same population, considering the second ones as censored observations.

With the intention of making this model generic and applicable to any company, in the sense that one can observe the output expressed as failed or not failed, we performed a transformation of the model output, making the result dichotomy probability, 0 (zero) or 1 (one), this is, the likelihood of fail, or not fail, respectively.

The results show that with the data of each year high percentages of success for the group of non-failed firms continue to be observed, especially for the two following years, regardless the year taken as reference (correctly classifying 439 non-failed firms with a percentage of accuracy of 98.65% in the year prior to failure; and correctly classifying 398 companies in the second year, which corresponds to an accuracy rate of 89.44%).

Concerning failed companies, the hit level is lower, with 135 failed companies correctly classified in the year prior to failure, which translates to a percentage of 94.41%, but there was a significant reduction of hits in the second year, with only 45 companies correctly classified. However, for this group of companies the model' results can be regarded as very much reasonable when the time sequence is not considered. Indeed, according to this assumption, the model correctly estimated that 87.41% and 76.22% of companies would fail during the period considered, with data from the second and third years, respectively.

To conclude one can say that for the group of non-failed companies the models based on discriminant analysis and logit obtained, overall, better results. Nevertheless, the same was not observed for the group of failed companies, if not considering the time sequence.

Abstract

The purpose of this paper is to explore the ethical issues in retailing and its implications on comparative consumers' purchase decisions of cosmetics in the United Kingdom and Bangladesh. Consumer response to ethical and green issues in recent years appears to vary considerably between developed and developing economies. In particular, this paper also intends to identify how and to what extent, in a developing country like Bangladesh, consumers' purchase decisions are influenced by the concept of ethical, green and animal welfare issues and what impact these have on brand or product preferences. Finally, the role of retailers in cosmetics marketing is also considered.

A structured questionnaire survey was conducted among female Bengali consumers in the capital city of Dhaka in Bangladesh and female British consumers in Southwest London in the United Kingdom. The Mann-Whitney U test was conducted to explore the attitudes of the consumers in the two different countries towards the green and ethical marketing environment and their impact on the purchase decision process of buying cosmetics.

Ethical purchasing attitudes have some similarities between the UK and Bangladesh. However there could be differing reasons for the adoption of ethical stances. Young consumers, however, have similar attitudes in both countries.

Keywords: Cross-culture, Consumer Behaviour, Consumer Attitudes, Ethics, Retailing.

Introduction

Ethical purchasing, otherwise known as 'ethical consumerism', refers to those individuals that are conscious consumers (Szmigin et al., 2009), who are "highly aware of ethical issues and many are ready to put their money where their morals are", (Freestone & McGoldrick, 2007, p445). Ethical consumerism can be defined as "the practice of purchasing products and services that actively seek to minimise social and/or environmental damage, and the avoidance of products deemed to have a negative impact on society or the environment," (IGD, 2007). This includes concern for a broad, complex range of issues including the environment, animal welfare rights and human rights (Wheale & Hinton, 2005). It can include the pro-active behaviour of purchasing goods or services due to their

perceived ethicality or behaviour that involves avoidance (i.e. boycott) of goods or companies due to their perceived unethical practices (Cherrier, 2007; Szmigin et al., 2009).

As such, traditional marketing profiling, positioning and communication techniques may need to be reappraised if products are to appeal to this growing market sector (Diamantopoulos et al., 2003) and retailers will need to understand better the ethical markets relevant to their particular products to create successful marketing strategies. For example, in the case of the toiletries market sector of which cosmetics is a significant constituent, research has shown that upholding animal rights / welfare is considered the most important ethical consideration to which takes priority over environmental concerns and those relating to human rights (Wheale & Hinton, 2005).

To further complicate this situation for marketers, although ethical consumers may possess the knowledge, ability and aspiration to make ethical purchasing decisions this is not always reflected in the consistency of their actual purchasing behaviour (Carrigan & Attalla, 2001; De Pelsmacker et al., 2005). This situation has been variously described as: 'the attitude: behaviour gap', the 'words/deeds inconsistency', the 'halo effect' and the '30:3 syndrome' (Shaw & Clarke, 1999; Cowe & Williams, 2000; Carrigan & Attalla, 2001; Newholm, 2005; Nicholls & Opal, 2005; Wheale & Hinton, 2005).

Literature Review

Both in developed and developing economies the importance of green marketing is inevitable for marketers in adopting their corporate strategy, production process and supply chain activities.

Consumers benefit in several ways through green marketing. The benefits often influence consumer decision making and consumer will vary in their extent to which they value their benefit (Dahlstrom, 2011). The consumers who feel concerned about their contribution to reduce climate change are often sensitive about corporate efforts to reduce pollution. At the same time consumers value the opportunity to be associated with environmentally friendly products and organisations (Cornelissen, 2008). For example the retail atmosphere of body shop prompts customer to associate their consumption with an environmentally friendly organisation (Kent and Stone, 2007).

In Bangladesh every year there has been an increasing impact from natural disasters caused by climate change. Bangladesh makes the smallest contribution to global emissions of GHGs (Greenhouse Gases). According to the Little Green Data Book (2007), in the South Asia group, the total per capita emission of CO₂ is 1.0 ton, where the contribution from Bangladesh to CO₂ is less than 0.02 ton. The per capita emission of CO₂ in the United Kingdom is 9.4 tons and an American citizen emits about 19.9 tons of CO₂ every year. In order to reduce GHG emissions the UN Global Compact stands for 'Caring for the Climate' to demonstrate the importance of business leadership on the issue of climate change; which consequently influence two multinational cosmetics companies L'OREAL and Unilever to become signatories of GC (Global Compact) among 147 multi-stakeholder companies.

The cosmetics industry attempts to contribute to maintaining a green and sustainable environment by recycling the materials in packaging. The European cosmetics industry appears, in general, to be

thoughtful about the use of large quantities of chemicals in their products. The finished cosmetics products and safety ingredient usage are already deregulated and controlled via the seventh amendment of the cosmetics directives; and the Registration, Evaluation, Authorisation and Restriction of Chemical substances (REACH) initiative addresses both the safety and long-term environmental impact of the ingredients used in cosmetics, as well as their packaging (REACH, 2007).

The latest innovations in packaging of natural cosmetics; for example, *“Aveda uses environmentally-friendly packaging materials by determining the entire life cycle of a package and the environmental impact that package will have from the starting point of sourcing of raw materials, to making that package, and to the final disposal of the container”* (Dianne, 1996). Aveda also focuses on the post using consumer waste as it believes that *“a package is not truly a recycled package unless it contains post-consumer waste”* (Dianne, 1996). The idea of refillable fragrance is not only environmentally friendly but also economically profitable and leads to customer satisfaction. In 1990 when Rocha introduced Globe fragrance, customers complained that they felt guilty about throwing away such a beautiful bottle. As a consequence, this led the company to introduce a refillable ‘Globe’ fragrance range, and later Rocha also introduced the refillable Eau de Toilette ‘Tocado’ range, and the refillable luxury metal edition of Globe (Alev, 1994). There were economic reasons for introducing refillable bottles according to Rocha’s brand manager; nearly one fifth of the company’s \$64 million women’s fragrance wholesale turnover was generated in the previous year (Alev, 1994).

Consumers’ Concern about Animal Welfare

The very controversial issue of animal testing was first introduced in 1993. The animal rights activist groups are continuously protesting against animal testing which consequently places pressure on marketers to stop the practice. It has been found from a survey undertaken by the Age/Gallup organisation that 60 percent of consumers declined to use such cosmetics and toiletries such as shampoo, lipstick and perfume which are tested on animals (Laurie and Adrienne, 1990). On the other hand the Cosmetic, Toiletry and Fragrance Association and health-and-beauty aids companies argue that animal testing is vital to ensure the products’ safety although some major companies such as Revlon Inc., Avon Products and Faberge Inc. have stopped animal testing (Laurie and Adrienne, 1990). Companies such as The Body Shop built their business models on products which were environmentally-sourced and free of animal testing.

Animal Ingredients and Animal Testing in Cosmetics Products

The ban on animal testing in cosmetics and toiletries does not ensure that the products do not contain animal derived ingredients. As The Body Shop (1995) states: *‘Until now there has been no non-animal alternative which is compatible with the type of ingredients used in the beads and this is a problem throughout the cosmetic industry’* (p. 25). The cosmetics industry has historically used many animal-derived ingredients which are by-products of the meat industry (p. 25).

The recent concerns for environment and animal welfare among the consumers pressurises the manufacturers to reposition the old products and bring in new products. This is helping to expand the organic beauty industry. For example, in 2006, Clarins and Kibio, the two French beauty companies, created a partnership in order to produce natural and organic skin care ranges (Pitman, 2006). In 2007, YSL Beaute developed its first organic skin care line with Stella McCartney and L'Oreal purchased the leading French organic cosmetics maker and supplier, Sanoflore, in 2006 (Hill, 2007).

While undertaking this research there does not appear to be a significant body of literature about cosmetics producers based in Bangladesh or about the attitudes and concerns of consumers in that country.

Research Methodology

As mentioned earlier, this paper seeks to identify the attitudes of consumers towards the environment and animal welfare in a cross-country environment. A questionnaire survey method was selected for data collection. The purpose of this survey was to measure consumers concerns about green environment and animal welfare issues into their purchase decision of buying cosmetics products between developed and developing nation. A two country comparison was performed in order to acquire a comprehensive understanding of the attitudes and concerns of how consumers in a developing country such as Bangladesh value green environment and animal testing and animal ingredients into their cosmetics purchase comparing to the consumers in a developed nation the UK.

Questionnaires were developed for use in the UK and Bangladesh (in Bengali). Over 300 questionnaires were posted in Bangladesh using personal contacts and viral messaging. Approximately 1,500 were posted in the UK. From Bangladesh, 150 fully completed questionnaires were returned and 142 from the UK, providing a total viable sample of 292 questionnaires.

In order to meet objectives which aim to explore the attitudes towards environment and animal welfare issues and its influences on the decision making process of buying cosmetics, the following variables and scales were constructed using with 5-scale Likert measurement (1= strongly agree, 2=agree, 3= neither agree nor disagree, 4= disagree and 5 =strongly disagree).

- Environmentally friendly packaging (Single-item Likert scale)
- Use of organic cosmetics and save environment (single-item Likert scale)
- Animal welfare (Multi-item Likert scale)

The target population specifically defined for this study is *female consumers* in the United Kingdom and in Bangladesh. the target population were selected as young female consumers age between (18-21, 22-25, 26-29), middle-age female consumers age between (30-33, 34-37, 38-41, 42-45) older consumers or the senior citizen age 50 and above in terms of the differences in geographic, socio-graphic, psychographic and economic environments in the UK and in Bangladesh.

A non-probability and convenience sampling technique applied to distribute questionnaires. The data obtained for this study was collected from the capital city of Dhaka in Bangladesh and the Hampshire County in the United Kingdom. The questionnaire was administered among female consumers aged over 18 in both countries. The data were analysed and interpreted by using the SPSS 17.0 (Statistical Package for Social Science). A non-parametric Mann-Whitney U test and a contingency table analysis technique have been performed in order to compare the differences in the ranked position of scores in two different countries.

Results

Normality Test

The data distributions (see appendix- 1 and 2) for the United Kingdom $df(137) = 0.00$, $p < .05$, and the data distributions for Bangladesh $df(147) = 0.000$ both appear to be non-normal for each variables. The significance of K-S and Shapiro-Wilk tests are less than .05 therefore, significant. The tests of normality therefore support the application of non paramedic test for this data.

The seven statements in the table-1 represent the concerns for environment and animal welfare among Bengali and the British consumers.

a. Grouping Variable: Nationality

Table-1: Test Statistics

Bengali respondents differ significantly from the British respondents on the first statement 'when purchasing cosmetics, I think it is very important to select products which have environmentally friendly packaging', $U=8639.000$, $Z= -2.827$ is significant at the level $p < .05$. On the second statement 'When purchasing cosmetics I think it is important to select a product that do not contain animal ingredients', Bengali respondents differ significantly from the British respondents, $U=8059.500$, $Z= -3.502$, $p < .001$. The third statement 'when purchasing cosmetics I think it is important to select products whose ingredients have not been tested on animals' Bengalis did not differ significantly from

the British consumers $U = 9537.500$, $Z = -1.247$, $p = >.05$. The statement on the importance of the use of scientifically controlled cosmetics, showed Bengalis differ significantly from the British, $U = 7012$, $Z = -5.017$, at the level of $p = <.001$. The attitudes towards the use of organic cosmetics can reduce the use of chemicals differs significantly between the Bengali and the British consumers $U = 9560.500$, $Z = -2.951$, $p = <.05$. The other two statements doesn't differ significantly among Bengalis and the British in terms of organic cosmetics can save environment ($U = 9560.500$, $Z = -1.268$, $p > .05$) and organic cosmetics is very important ($U = 9597.500$, $Z = -1.147$, $p > .05$).

Differences in the Level of Environmental Concerns among Bengali and the British Female Consumers by Age

The data (Appendix 3) reveals that young Bengali female (age group 18-29) were strongly agreed with the statement in their purchase decision of buying cosmetics that it is important to select a product which have environmentally friendly packaging then the British young consumer. However British middle age and senior citizen (age 46-50 and 50 over) showed greater importance in choosing a cosmetic which has environmentally friendly packaging.

Bengalis (age group 22-37) strongly agreed that it is important to select cosmetics which are scientifically controlled that it doesn't damage their skin and prevent social embracement. On the other hand, from the UK mean score it can be seen that the most age groups of British consumers were neither agreed nor disagreed about the importance of scientifically controlled cosmetics brand apart from the one in age profile 46-50 and over 50. (Refer to appendix-3)

The use of organic cosmetics can reduce the use of chemicals was strongly supported by young British (aged group 22-33) whereas young Bengalis 18-21 years old showed strong support towards the statement. The age group 22-25 and over 40 British consumers strongly agreed that the use of organic cosmetics can save the environment whereas the young Bengalis aged between 18-21 years old showed their concerns to save environment by using organic cosmetics. (Refer to Appendix-3)

British female age 46-50 showed greater interest in the use of organic cosmetics and its importance than the rest of the age groups. On the other hand the younger female Bengalis age group 18-29 and 30-37 agreed that the use of organic cosmetics is important to them. (Refer to Appendix-3)

Differences in the Level of Animal Welfare Concerns among Bengali and the British Consumers by Age

The mean score and the standard deviation represent attitudes of Bengali and the British consumers towards animal welfare into their cosmetics purchase. Young female Bengali (age 18-29 and 30-37) showed stronger feelings against the purchase of cosmetics that contain animal ingredients then the British female consumers at the similar age. On the statement of the animal testing in cosmetics products young British female consumers (age 22-29 and 30-33) showed stronger appeal that they will select cosmetics whose ingredients have not been tested on animals. On the other hand the young Bengali (age 22-25) showed stronger appeal for the animal welfare and would purchase

cosmetics that are animal-test-free. The other age groups of female Bengalis didn't show any particular concerns about animal testing in cosmetics. (Refer to Appendix-4)

From the result of the mean score of the age and concerns for environment and animal welfare on the bar chart (Appendix-5), it can be seen that both younger, middle age and senior British citizens showed concern about green environment, animal welfare and the importance of using organic cosmetics. On the other hand mostly the young and the middle age Bengalis showed greater concern about environment, animal welfare and the importance of using organic cosmetics. This shows that there is a change occurring in the new generation of the female Bengalis, their way of thinking and judgment and lifestyle.

Conclusions, Limitations and Recommendations for Future Research

The results indicate that consumer behaviour concerning cosmetics and ethics have some similarities between the UK and Bangladesh. However there could be differing reasons for the adoption of ethical stances. For instance in the UK there could be concerns about ethical testing and organic bases, however in Bangladesh there could be the additional concern about cosmetics harming the skin. The interesting feature is that the younger consumers in Bangladesh are similar in their attitudes to the general UK consumer. This could be a reflection of the way global communications are reaching out to all countries and how the younger element are absorbing global trends more quickly. The limitation of the research is the fact that more qualitative analysis could not be carried out. It is clear that this aspect would have enriched the results and provided interesting insights. The recommendation for future research is that more countries should be sampled and that the cosmetic companies should be interviewed to obtain greater consumer insights.

CORPORATE GOVERNANCE: ASPECTS AND PROBLEMS IN UNIVERSITY SPIN-OFFS

Piccarozzi, Michela¹

¹ Researcher – Department of Economia e Impresa (D.E.Im), University of Tuscia – Viterbo. Email: piccarozzi@unitus.it

Abstract

The aim of this work is to analyze the phenomenon of university spin-off (USOs) and to underline the importance of corporate governance in order to create value and to obtain good performances in USOs.

The importance of USOs as a vehicle for the realization of university research results is underlined by the development that this kind of company have had in Italy in recent years.

The study is led both through literature and the analysis of some cases. The reported experience is about the USOs of Tuscia and allows to highlight how the beginning of a USOs is a complex process that often has to overcome many obstacles as in management, in corporate governance and above all in financial, because of the difficulty in finding economical resources.

So, we want to focus especially the corporate governance problems in USOs and analyze how good governance affects companies performances.

Keywords: Spin-off, university, technology transfer, corporate governance, performance, value.

Introduction and methodology

The modern economy is focused on an information and knowledge system, so the success is increasingly linked to innovation and technology transfer.

These are strategic elements for the development of the economy.

With this awareness growing attention has been gathered by spin-offs (especially USOs) .

USOs is a way to create a new businesses using the results of researches or university projects to develop a new product or a innovative service.

The term spin-off means the creation of a new economy unit by some people that leave a previous activity carried out within the company or another institution that already exists (for example from universities, research laboratories, etc.).

There are two aspects that characterize a spin-off:

- the first is the support for the creators of the new corporation;
- the second one is the process through which a spin-off is made.

So, the essence of spin-off is to help an aspiring entrepreneur to transform an idea, a potentiality, an opportunity of production, technological or market, that someone else does not want or cannot use in commercial terms, in a new company.

There are two different typology of spin-off: industrial spin-off and university spin-off (USOs).

The first one is a corporation born from a pre-existing one.

Instead USOs is an enterprise established by a group of researchers, professors or PhD students. It is a start-up company whose formation is dependent on the formal transfer of intellectual property rights from the university and in which the university holds an equity stake³¹.

So USOs can increase the relationships between universities and companies to improve the knowledge's transfer and to achieve competitive advantages.

The paper is structured as follows.

First, we introduce the main aspect and problems of university USOs through national and international literature.

Second, we present the USOs of Tuscia to analyzed the importance of a definition of a clear Corporate Governance.

Through the analysis of the cases³² we can see how CG is important for the performances³³ of USOs.

USOs: main aspects and international experiences

One of the first aspects to consider when we talk about USOs is the definition of the issue.

In fact, there is not a clear framework for USOs and often researchers use the same concept for studying and describing different realities³⁴.

So we have to separate USOs from research-based spin-offs.

Research-based spin-offs can be defined as new companies set up by a host institute (university, technical school, public/private R&D department) to transfer and commercialize inventions resulting from the R&D efforts of the departments. (CLARYSSE, HEIRMAN, DEGROOF, 2000).

These cannot be confused with USOs that come only from university research.

³¹ WRIGHT M., LOCKETT A., CLARYSSE B., BINKS M., (2006), *University spin-out companies and venture capital*, Research Policy, n. 35, 481-501.

³² The analysis of case studies has used a qualitative methodology (YIN, 2005). Were collected company documents, conducted workshops and informal interviews with both proponents and with support staff to the creation of spin-off.

³³ NEELY, MILLS J., PLATTS K., GREGORY M., RICHARDS H. (1996) *Performance measurement system design: should process based approaches be adopted?*, *International Journal of Production Economics*, n. 46-47 , p. 24.

³⁴ "an academic spin-off can be described as a business venture which is initiated, or become commercially active, with the academic entrepreneur playing a key role in any or all of the planning, initial establishment, or subsequent management phases" (WEATHERSTONE, 1995)

". . . the formation of a new firm or organization to exploit the results of the university research" (GORMAN, JONES-EVANS, 1999).

"a USOs is a new company that is formed by individuals who were former employees of a parent organization, and a core technology that is transferred from the parent organization" (Steffensen, Rogers, Speakman, 2000).

In this paper we will define USOs as new companies created from universities to exploit knowledge produced by academic activities in a profit making perspective (KLOFSTEN, MAGNUS, JONES-EVANS, 2000).

USOs are not a new phenomenon.

The first example of these companies can be found in the development of Silicon Valley; it can be attributed to the action of scientists who left their industrial or academic lab, for example Helwett and Packard or the Basf company³⁵.

We can find a lot of USOs companies.

In France MUSTAR (1995) analyzed 200 cases of USOs and he highlighted how the success of these companies depends on their capacity to establishing linkage with different actors (research lab, clients, other companies and financial institution).

In Sweden (STANKIEWICZ, 1994) or in Scotland (DOWNES and EADIE, 1997) USOs are small companies and only a few started with relevant growth perspective.

The most relevant USOs cases come from USA (ROBERTS, 1991).

Universities in USA are more structured and organized to create new companies, so researchers, PhD students and Professors, who want to improve a commercial activity based on their research results, can count on incubators, science parks etc³⁶.

In Italy USOs are often small companies with not many employees and short-growing³⁷.

Their biggest troubles are the financial requirements.

We can identify three different types of USOs in relationship with financial requirements: the first, companies that do not need a lot of capital and work in consulting and R&D; the second, companies that need a lot of capital; usually in this case who finance the USOs became its partner; the last one, companies born with public money.

³⁵ BASF is today one of the largest chemical companies in the world, it has led the market famous products, like the indigo dye, which was one of the first dyes synthesized on an industrial scale, the invention of the technology necessary for functionality of magnetic tapes. Between the end of the nineteenth and early twentieth century, many scientists who have formed companies then become large multinationals like Siemens and Philips. These are all examples of USOs.

³⁶ The Bank of Boston (1997), has calculated that USOs companies have contributed with 10 billion dollars per year and about 300.000 new jobs to the Massachusetts economy. These companies employed 1.1 million people and have annual world sales of 232 billion dollars.

³⁷ A survey conducted in 1996 (CHIESA, PICCALUGA) has established the presence of 50 academic USOs having the following characteristics:

- low turnover;
- operating in the software industry, microelectronics and biomedical.
- 52.2% of companies manufacture and sell products, nearly one third offering advice and services to other businesses, and few engaged in contract research;
- the organization of origin assume different roles: in some cases provides services, cooperate in research, or gives orders to the USOs, while others simply take note of the phenomenon without taking specific actions.

The first category is more frequent in Italy and these companies have low costs and usually work in the services sector.

One of the greatest aspects of the USOs, investigated in the literature, are the problems that exist in these realities, which starts from the time to develop your business idea up to the stages of growth and development of the company³⁸.

The origin of such barriers that prevent the emergence and exploitation of new business ideas within universities is typically tied to cultural, organizational, financial, and legal aspects and often stem from the fact that they still do not consider the promotion of entrepreneurship as their institutional purpose.

First of all the cultural barriers inherent in the researchers themselves who often sees the process of USOs a good way to leverage its cultural formation. Most researchers do not considers the creation of enterprises as a continuation of its main task, namely to disseminate knowledge and to verify their findings.

We can group the problems related to the USOs in three categories, this classification will be subject of study in this work.

The categories are³⁹:

- corporate governance issues;
- financial issues;
- issues of management control.

The first category relates to the structure of the USOs.

Often, USOs are small because the proponents do not really analyze and define the relationship between players who will operate in the company. This implies a unclear definition of roles and no responsibility that it may create problems, particularly when it relates to the client or trying to obtain financing.

The second category refers to the financial aspects of the initiative. The resources that a researcher can draw are very limited, both for the few funds that are earmarked for research, both for the short preparation of lenders to invest in really small and highly risky.

The lack of financial resources, as we shall see, is surely the greatest problems encountered and the one causing problems for many USOs mainly limiting their capacity for growth and development.

³⁸ ROGERS (1986), DAHLSTRAND (1997) , DOUTRIAUX (1987), DI GREGORIO E SHANE (2003), STEFFENSEN, (1999).

³⁹ The classification of the problems is the result of the comparison between the analysis of literature and the study of business cases, and it wants to highlight what has emerged from studies on USOs and at the same time analysis of real cases.

Finally the issues of management control, even those such as organizational, fall into those aspects of an internal nature, and are closely associated with the management, analysis of the results of the USOs and to how they are set lines of action.

We can describe USOs' issues along their life cycle.

So we can understand the importance of these issues and especially their impact on the lives of the USOs.

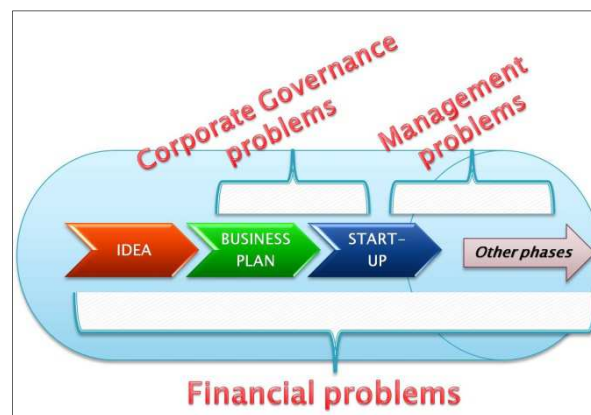

Table 1 USOs problems throughout the company life cycle

We can see that financial problems are present in all stages of the life of the USOs, and they are considered the most important and relevant.

Corporate governance problems arise in the initials stages of the spin-off, in particular these are related to the design of business plans and with the planning and organization of activities.

Last, management problems begin with the start-up of activities and continue to be present during all the life of USOs.

Here we want to focus our attention on the first category of problems, the corporate governance one, that are related with the organizational and bureaucratic aspects of USOs.

The role of governance in USOs ⁴⁰

According to MONKS and MINOW (1995) corporate governance is "the relationship between different participants in defining an organization's direction and performance". Corporate governance

⁴⁰ The analysis of USOs's performances will be evaluated with a qualitative method, since the companies are in the early years of life, so we'll analyze the ability of the USOs to define operational procedures, to find customers and in particular to achieve new projects and organize decision-making process between proponents and partners. These aspects are essential for further quantitative analysis of performance (it will be possible when USOs will be in the top of their activities and we will have more data and results available)

stands for a tendency towards a decent, fair and reliable direction: "to do the right (good) things and to do things right (well)".

Thus in essence corporate governance is quality care.

"Corporate governance is the whole of institutional and organizational mechanisms, together with the decisions and rights to intervention and control going with them, which can help to solve conflicts of interest between the different stakeholders in an organization, and who define, individually or as a whole, in what manner important decisions in the organization are made, and finally define which decisions are to be made", says H. Schmidt.

The corporate governance structure specifies the distribution of rights and responsibilities among different participants in the corporation such as, the board, managers, shareholders and other stakeholders, and spells out the rules and procedures for making decisions on corporate affairs.

By doing this, it also provides the structure through which the company's objectives are set and the means of attaining those objectives and monitoring performance⁴¹.

The studies about corporate governance and performances can be divided into three fields⁴²:

- studies analyzing the relationship between board and performances;
- studies analyzing the relationship between the composition of the board and performances;
- studies that analyze corporate structure, its functioning and the relationship with performances.

When we talk about corporate governance aspects in USOs the fields of studies to which we refer is the third one. In particular the most important element is linked to relations between members, especially between the university and proponents; by the analysis of the cases we'll see how clear organization and distribution of responsibilities and roles of these individuals leads to achieve good performance, while conflicts and lack of transparency in the organization often involves the failure of the USOs, or the need to lengthen the time of start-up.

One of the main problems in USOs, as we have seen, it is given by the difficulty of understanding to the proposers of the importance of a clear internal organization; indeed proponents often lack managerial skills and therefore do not understand the relevance of governance rules (in the cases analyzed the proponents are mainly from universities of agricultural sciences, natural sciences and literature).

So, we have to specify two different aspects: first of all, the choice of a governance model; secondly the importance of organization and separation of duties between the members.

The first aspect allows us to understand the USOs's profile.

⁴¹ WOLFENSOHN (1999) UCHE (2004) and AKINSULIRE (2006).

⁴² FAMA and JENSEN (1983), JENSEN and MECKLING (1976), FORBES and MILLIKEN (1999), GOODSTEIN, GAUTAM and BOEKER (1994), KLEIN (1998), BHAGAT- BALCK (2002).

In fact the choice of a governance model over another underline that universities seeking control of risks and responsibilities in USOs's implementation.

While organization and separation of duties is the aspect on which to focus more attention in particular because it is related to performance.

Evidence from the cases: Tuscia's USOs

University of Tuscia in Viterbo began to create spin-offs in 2007 with the support of a project draw up between University and Ce.F.A.s⁴³ to improve the creation of new companies.

The aim of the project (named "Skills match for the USOs's start-up") is to achieve a specific guidance and support to start-up of USOs from the beginning to the commercialization of the results.

The project aims to increase and qualify the birth rate and success of innovative companies, to create new highly qualified jobs, to promote the culture of entrepreneurship and innovative approaches in the field of enterprise creation, to spread innovation and new technologies through the relationship between academic research and local production, to bring those working in traditional academics and bring down those barriers that prevent, or at least slow down, the relationship between business and university.

In two years Tuscia created a lot of different USOs; we want to focus our attention on:

- BioforItaly Ltd, a company involved in development of process in forestry and agro-environmental inventory;
- Sea Tuscia Ltd, a company that use renewable energy and biomass;
- Tusciazyme Ltd, that use a patented enzyme for the production of paper;
- Tecnelab Ltd, a consultancy for management and organization of archives⁴⁴.

⁴³ Ce.F.A.s is a company in partnership with the Chamber of Commerce that provide the creation of new firms with different services: management services, advertising, human resources development.

⁴⁴The USOs's idea has to pass different steps first to be approved; These are the three phases established in the project "Skill's match for the USO's start-up" and these are inspired to Clarysse and Moray's process.

- Pre-incubation phase;
- Incubation phase;
- Post-incubation phase.

The *Pre-incubation* phase is focused on the organization of support activities and on all the fundamental informations for development of an action plan.

This phase is introductory to the following two, and in this moment the Ce.F.As's collaboration is very important in order to gain all the needs. (structures, staff, market informations etc.).

The *Incubation phase* is the central step of process and it is the important one.

In this phase staff develops the activities with business plan and It appears strategic the link between USOs and University, in particular with Faculty of Economic.

In Tuscia's project in fact the collaboration with Faculty of Economic allows to collect informations and skills to improve all the business plan element (about competitors, market, financial needs, management aspects). Professors teach USOs's staff about economy, management, control systems and budget in order to give us some instruments and skills to manage the company. Lastly, in the *Post-Incubation phase*, USO is ready to start its activities and to sell goods and services. In the preliminary phase we can find three different promoters: the USOs's Academic Commission; the Academic Board of Governors; the Academic Senate.

First of all, a Commission analyses and selects all the USO's proposals in order to establishes which one could became a company and if university will have a equity in this.

By analyzing the four cases of USOs of Tuscia's University, we can focus on the importance of a clear definition of corporate governance aspects.

All the Tuscia's USOs adopt as a legal form the limited liability company for two reason: first of all to have limited risks, both for the university and the proposers, and also to have a greater decision-making and financial autonomy⁴⁵.

	<i>Legal Form</i>	<i>Board members</i>	<i>Members</i>
<i>Biofor Italy</i>	<i>Ltd</i>	3	11
<i>Sea Tuscia</i>	<i>Ltd</i>	5	6
<i>TusciaZyme</i>	-	-	-
<i>Tecnelab</i>	<i>Ltd</i>	3	11

Table 2 Corporate Governance aspects in Tuscia's USOs

USOs show a structure very similar, the main differences are related to the skills of individual proponents: BioforItaly and Sea Tuscia's proposers come from different sectors and therefore they have greater powers.

Each member brought a different expertise and this has allowed to establish basic rules for defining the modalities for carrying out the activities; decisions were made on a project, for each project was identified a coordinator and a responsible.

The coordinator organize and manage every specific activities, and the responsible assigns tasks and report to the board on its achievements.

With that organization proponents haven't had difficulty in division of labor and responsibility, and so they have helped to create a clear vision of the USOs.

This is very important for relations with customers and with the university (this monitor the activities of USOs) and to achieve good performance (parameter considered is the number of customers and projects launched).

TusciaZyme not yet established.

In this case there was a problem regarding the agreement between the three members: university and the other two companies involved in the project.

The two companies wanted to keep their procedures for coordination of projects, this resulted in a lack of uniformity in the organization and especially a lack of transparency for the customer.

Same applies to Tecnelab.

Second, the Commission submits all ideas that passed the first step to both Academic Board and Academic Senate; they will approve conclusively only the more interesting ideas and they will note these in a USOs's register.

Lastly, University stipulates an academic convention with the approved USOs in which it regulates all the partnership's details and also the possibility for the USO's members to use the university's brand.

⁴⁵ A study on a sample of Italian universities shows that most of these adopt a traditional model of governance and a limited legal form. GROSSI and RUGGIERO (2008)

Problems, misunderstandings and lack of defined roles led to the failure of the start-up process of the USOs, so Tecnelab is still being approved precisely because of these internal issues.

So this USO has been accompanied by a group of students of the faculty of Economics to assist proposers in understanding the importance of governance and internal organization. Students have produced a handbook of principles and suggestions for the Tecnelab proposers.

Conclusion

Through these cases we can focus on weaknesses and opportunities of the USOs (despite we can generalize these results because we analyzed only cases from one University) and we can also understand how corporate governance is fundamental tool to achieve good performances.

In fact, corporate governance is important for two main reason:

- first of all Corporate Governance is necessary to coordinate and organize the different people involved in USOs, for example Professor, PhD students, Researchers or administrative workers;
- secondly, to define a clear structure of the company and to have a greater chance of funding.

In the cases we can see how the first two USOs (Biofor Italy and Sea Tuscia) that have a clear organization and an efficient division of tasks and responsibilities between the proponents obtained in these first years of life the best results, considering the number of contracts and cooperation agreements signed.

On the contrary, the other two cases presented considerable difficulties in the internal relations and this has influenced the approach of good governance and therefore this lack of transparency has affected the performance.

So, the problem of governance in USOs can be qualified as a problem of "corporate culture" because often the proponents have not a management skills and they don't understand the importance of USOs's organization for the performance and business results.

Abstract

This paper investigates the role of two different strategic orientations (market orientation and technology orientation) in contributing to the innovative capabilities and business performance of firms. It is concluded that in sectors sharing characteristics of both science-based and traditional production business models, innovation is not the only driver of success, and that alternative strategies or combinations of strategies might lead to equally acceptable economic performance targets. To test our hypotheses, we conducted a survey in the Italian cosmetics industry on a sample of 80 firms.

The study indicates that there is no one optimal way in terms of improving economic performance: typically, market-oriented approaches can achieve profitability comparable to those of companies with strong technological orientation and superior innovative capability.

Keywords: Strategic orientations, Innovation, Economic Performance, Cosmetic industry.

Introduction

Related literature

Previous studies offer empirical evidence supporting the process designated as *marketing orientation – innovation and product development efforts – economic performance* chain (Hurley and Hult, 1998).

Several studies investigated the relationship between market-oriented approaches and marketing policies (Taghian, 2010), while others concentrate on the influence of different strategic orientations⁴⁶ on innovative capability (Athahene-Gima and Ko, 2001); lastly, some studies assess the direct effect of various strategic orientations on economic performance (Jaworski and Kohli 1996; Hult and Ketchen, 2001).

The marketing oriented stream of research argues that a market-oriented culture is the determining factor in a firm's competitive success (Narver and Slater, 1990). Specifically, it is suggested, that strategic approaches that are market driven make a substantially greater contribution to the

⁴⁶ 'Strategic orientations are capabilities that reflect the strategic directions a firm takes to create the appropriate behaviours for continuous superior performance' (Hortinha, Lages and Lages, 2011, p. 38).

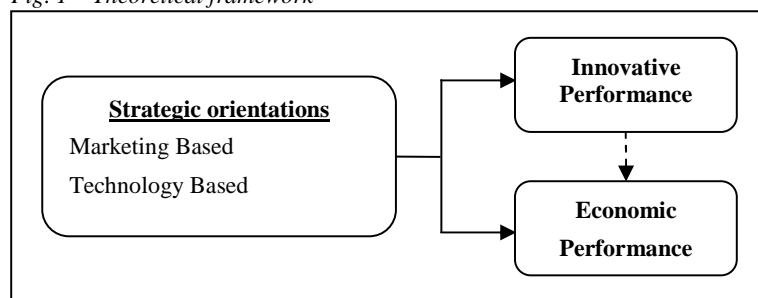

performance of firms than alternative strategic orientations such as entrepreneurial, technology or learning orientations (Grinstein, 2008). Other studies promote the notion that innovation is a potential mediator in the relationship between the basic orientation governing the relationship between a firm and its market (customers and competitors) and corporate performance (Han, Kim and Srivastava, 1998). These studies consider exploitation and optimization of the outcomes of innovative activities as the main drivers in the process of value creation, and as playing a leading role in the competitive dynamics between firms (Ahuja, Lampert and Tandon, 2008).

At the next level of evaluating strategic outcomes, it is noted that the concept of corporate sustainability is increasingly being addressed by corporate managers and policy makers. It implies not only managing relationships with customers, but also other stakeholders including shareholders, investment in the technologies of the future, the scientific community and so forth (Hult 2011). Ultimately, the concept of sustainability suggests that in order to survive, corporations need to develop marketing oriented sustainability framework (Crittenden, et al, 2011).

Study Objective

Only few empirical studies examine the simultaneous impact of a strategic choice on both innovative and economic outcomes. This paper empirically, attempts to fill this gap. In particular, we will focus on market-based and technology-based approaches with the objectives of: a) understanding the association between the adoption of each choice and the performance of the innovative process in the same field; b) studying the relationship between R&D capabilities and business performance; and c) showing how each strategic approach contributes to economic performance. The proposed theoretical framework is shown in figure 1.

Fig. 1 – Theoretical framework

The Italian Cosmetic Sector

We focused on the Italian cosmetic industry as our unit of analysis. Competitively, the sector is a hybrid of science-based industries (e.g. pharmaceutical) and traditional Italian industries (e.g. fashion). Innovative processes have been thoroughly analysed especially with regard to the pharmaceutical sector, including biotech companies as well as the science- and technology-based sectors (Sher and Yang, 2005). The cosmetics industry is knowledge-intensive with basic and applied research platforms offering a substantial contribution to the competitive strategies of firms. Typically, the process which leads from idea generation to commercialization of an innovation appears to be

lengthy, costly and complex. The end result is an increased pressure on firms to recover their investments in R&D – a pressure which is heightened, in the cosmetics business, by the short life-cycle of products. For this reason, some firms were forced to modify the traditional organizational model of R&D from *in-house* to external (outsourced R&D) by forming strategic alliances with other partners – businesses, universities, research laboratories etc. The object is to parcel out the costs of research to some extent, and of reducing the risks of failure at the research stages, particularly discovery. The cosmetics field also characterized by a considerable use of marketing resources: investments in advertising and promotion, enlargement of the brand portfolio, development of the sales network and distribution channels (Kumar, Cindy and Dumonceaux, 2005). The industry is thus a suitable one for the efficient testing of different strategic orientations and their influence on the innovative capabilities of firms as well as economic performance.

Theoretical Background and Research Hypotheses

The concept of market orientation first emerged in the literature in the nineties, to indicate a series of actions undertaken by firms to implement customer orientation; actions supported by an organizational culture and behaviour focused on governing relations with their own reference market (Kohli and Jaworski, 1990). As already mentioned, several of these studies examine the effect of this orientation on corporate performance, demonstrating its superiority over other strategic orientations (Hult and Ketchen, 2001). Others show how such an approach is not the only one possible and that other strategic orientations can have a positive influence on the competitive advantage and performance of firms (Noble, Sinha and Kumar, 2002). Furthermore, there is an ongoing debate on the relationship between strategic orientation and innovation (Lukas and Ferrel, 2000; Grinstein, 2008). Some authors argue that market-oriented firms are less capable of innovating (MacDonald, 1995) because they are either too focused on satisfying the needs expressed by customers or too busy imitating competitors (Narver, Slater and MacLachlan, 2004), while firms with a strong *technology orientation*, i.e. 'the ability and the will to acquire a substantial technological background and use it in the development of new products', (Gatignon and Xuereb 1997, p. 78), are able to more effectively exploit (at an innovative performance level) pro-active behaviours aimed at integrating new technologies into the product development processes (Hortinha, Lages and Lages, 2011). Conversely, other studies show how typically market-driven behaviours are positively linked to innovative capacity - because firms which are closer to their customers are in a privileged position to anticipate their needs (Houston, 1986); because their continuous monitoring of competition allows them to better enhance their own offer (Han, Kim and Srivastava, 1998) and, lastly, because market-oriented firms are more able to take advantage of the learning processes deriving from the use of information (Atuahene-Gima, 1995). Bearing in mind the various perspectives offered in the literature, our first research hypothesis to be tested is as follows:

H1: *technology orientation enables a greater innovative performance than a market-driven orientation.*

While firms have historically managed the innovative process internally, through their own research and development (Mowery, 1983), nowadays innovative activity is characterized by greater fragmentation both on a spatial and functional scale (Plechero and Rullani, 2007, p. 93). According to Von Hippel, the study of the sources of innovation presupposes 'categorizing firms and individuals in terms of the functional relationship through which they derive benefit from a given product, process or service innovation' (Von Hippel, 1990, p. 22). As mentioned, earlier collaborative relationships between firms have intensified in recent years. The cases of the pharmaceutical and biotechnology industries are emblematic. In this context the innovator is no longer the single firm but rather a network of firms (Malerba, 2000, p. 263). In this competitive environment, firms do not join forces exclusively to access new resources, but also to learn, and then to exploit, their newly acquired knowledge to develop innovation (Dyer and Singh, 1998). In sum, many studies highlight the positive effect of the relationship capabilities developed by the firms, as well as different performance levels (Echols and Tsai, 2005). This suggests the second research hypothesis:

H2: technology oriented firms can achieve economic results comparable to those of market-oriented firms through the employment of networking capabilities.

Research methods

Questionnaire, sample and data collection

This study is based on empirical material contained in a dataset created by the authors between 2010 and 2011. The database contains primary data regarding structural, strategic and evaluation aspects of the innovative process of 80 Italian cosmetics firms, during the three years 2007-2009.

The data were gathered by means of an *e-mail survey*. The reference population was selected from firms associated with Confindustria-UNIPRO, which together cover 90% of the Italian cosmetics markets in terms of turnover. In order to compare the performance of the innovative activities with the economic-financial results, the primary data were integrated with the balance sheet information contained in the AIDA data bank. To this end, of the 454 firms associated with UNIPRO in June 2010, only joint-stock companies with a turnover equal to or exceeding €100,000, and a balance sheet updated on AIDA to 31/12/2009, were selected. The selected firms numbered 355 (table 1).

Table 1

<i>Population and sample of firms</i>		
<i>Item</i>	<i>No.</i>	<i>% turnover</i>
<i>Cosmetics Industry Population (2009)</i>	1238	100.00% *
<i>UNIPRO associated firms (June 2010)</i>	454	90.00%
<i>Joint-stock Companies **</i>	355	89.38%

<i>Sample ***</i>	80	29.20%
-------------------	----	--------

* *Industry Turnover 2009: 9.11 billion of Euros.*

** *Firms receiving the questionnaire.*

*** *Redemption: 22.53%.*

The questionnaire comprised 35 questions divided into three main sections: a) structural data, b) innovative process, c) marketing strategies. Following some telephone prompting between November 2010 and March 2011, we obtained 80 questionnaires with a redemption rate of over 22%, covering 29% of the market in terms of specific turnover.

Descriptive statistics and measures

To avoid distortions due to self-selection mechanisms, we defined the constructs relating to different strategic orientations on the basis of measurable variables, which the literature generally considers more likely to be associated with technology orientation and market orientation, respectively. According, to the technology-based orientations are characterized by a high proportion of investments in R&D, R&D personnel, and graduates involved in the innovative process (Grinstein, 2008). On the other hand, market orientation is generally characterized by a high proportion of marketing personnel as well as by number of external agents, size of brand portfolio and investments in advertising (Pucci, Simoni and Zanni, 2011).

The construct relating to networking capability was defined on the basis of the overseas production rate and a multi-item scale relating to the use of external innovative sources, in particular suppliers of raw materials and technology, universities and research centres and firms in other industries⁴⁷.

As relevant variables measuring R&D performance we considered, radical innovation rate, the incremental innovation rate⁴⁸ and the time to market⁴⁹ (Griffin and Page, 1993). We decided to exclude the *patents* variable from the construct because of the lack of observations related to this indicator.

Lastly, in regards business performance, the principal economic indicators were used: turnover variance, ROI (return on investment), ROS (return on sales), ROE (return on equity) and ROA (return on assets).

⁴⁷ For each external source the questionnaire provided a Likert scale of importance measuring from 1 'minimum importance' to 5, 'maximum importance'. The construct allows a satisfactory reliability index, with Cronbach's α equal to 0.77.

⁴⁸ In our case we determined the relationship between the number of radically (incrementally) new products launched on the market over three years, and the product portfolio at the outset.

⁴⁹ This variable, in our case expressed in months, measures the average time gap between the creation of a product and when it is put on sale.

Tab. 2 – Descriptive statistics

Variable	Average	Median	SD	Min	Max

Average ROA (three years)	7.08%	6.09%	9.62%	-33.30%	32.14%

Note: * share of graduates in scientific disciplines.

Table 2 shows the descriptive statistics of the variables selected. All the variables (with the exception of the economic indicators relating to single firms) are measured as averages in the three years 2007-2009.

It can be seen that this is a medium-high technology intensive field (average investments in R&D equal 7.7%⁵⁰) with good profit outcome in a period of economic recession.

⁵⁰ At a European level, a technology intensive industry is one where the ratio between investments in research and development and turnover is around 10% (OECD, 2009).

The correlation matrix in Table 3 shows the links between the selected variables. For the sake of clarity we have excluded from the table all economic indicators apart from ROI.

Aver. ROI	0,107	-0,084	0,020	-0,145	0,028	0,041	-0,125	-0,240*	-0,145	0,154	0,028	0,121	0,829**	0,869**	0,906**	1,000

Note: * Significant Correlation at level $p < 0,05$, ** Significant correlation at level $p < 0,01$

It can be seen that the variables relating to the different constructs (R&D resources, innovative performance and networking capacity) are all internally linked to each other. As regards the economic variables, with the sole exception of radical and incremental innovation rates, there are no significant links between the operating profit indicators and the other parameters selected.

Having considered the number of variables, their correlation and the size of the sample, we then conducted a principal component analysis to find the four main constructs: R&D resources, marketing

resources, innovative performance and networking capacity. To this end, Table 4 shows the results of the analysis conducted on the 12 variables found with regard to the 80 firms assessed.

Tab. 4 – Results of principal component analysis *

Variables	Comp 1	Comp 2	Comp 3	Comp 4
<i>R&D resources</i>				
<i>R&D personnel</i>	0.6353			
<i>R&D investments</i>	0.5384			
<i>Prop. graduates</i>	0.5028			
<i>Marketing resources</i>				
<i>Marketing personnel</i>		0.5489		
<i>Agents</i>		0.5761		
<i>Brands</i>		0.5545		
<i>Invest. in advertising</i>		0.5648		
<i>Innovative performance</i>				
<i>Radical innov. rate</i>			0.5944	
<i>Incremental innov. rate</i>			0.5066	
<i>Time to Market</i>			-0.5294	
<i>Networking capacity</i>				
<i>External innov. sources</i>				0.5699
<i>Overseas production</i>				0.7319
<i>Variance</i>	0.2385	0.1813	0.1678	0.1046
<i>Cumulative variance</i>	0.2385	0.4198	0.5875	0.6922

* Rotation method: Promax with Kaiser Normalization

The analysis shows that the four components found account for almost 70% of the variance in the database. Specifically, R&D resources 24%, marketing resources 18%, innovative performance 17% and networking capacity 10%.

Results

Thanks to the components identified above, we were able to proceed with a cluster analysis on a sample of firms. Given the aims of the study, the *cluster analysis* was carried out using complete linkage, through which an observation is added to a cluster if it shows some similarity to other members of the cluster. Solutions with a number of clusters from 2 to 4 were tested; with the exclusion of four outliers, the 2-cluster solution proved the most effective in accounting for the internal homogeneity and external heterogeneity between groups (Ketchen and Shook, 1996). Table 5 shows the analysis conducted on the principal components.

It can be seen that the two clusters initially differ in the proportion of R&D resources and marketing resources employed. This confirms that there are two distinct strategic groups within the sample of firms selected, differentiated by structural features and adopted strategies (Porter, 1982).

Table 6 shows the characterization of clusters according to the variables at the outset⁵¹.

Tab. 5 – Results of cluster analysis on principal components

Cluster	Observations*	Components	Average	Dev. St.
1	35	R&D resources	-0.1333	1.1885
		Marketing resources	0.0806	1.3649
		Innovative performance	-0.8630	0.8864
		Networking capability	-0.6530	0.7115
2	41	R&D resources	0.0830	1.5853
		Marketing resources	-0.2869	1.0039
		Innovative performance	0.7267	1.2502
		Networking capability	0.6031	1.0583

Note: 4 outliers excluded

Tab. 6 – Characterization of clusters

Variables	Cluster 1	Cluster 2
<i>Averages</i>

Large firms	5	6
Medium-sized firms	7	11
Small firms	23	24
(Multinationals)	(2)	(7)

Note: N = 76, 4 outliers excluded

⁵¹ Again proving the distinction between the two strategic orientations, table 6 shows how the size of the firm does not influence the adoption of each orientation.

The first group shows a lower propensity to invest in R&D, typical of technology-oriented approaches (Gatignon and Xuereb, 1997), but its average values are considerably higher as regards marketing resources used, particularly number of agents, size of brand portfolio and share of turnover used for advertising and promotion, i.e. variables which are more likely to be associated with market-driven strategies (Srivastava *et al.*, 2001).

Tab. 7 - Correlation between economic indicators and innovation rate

<i>ROA 2008</i>	-0.233*	-0.181
<i>ROA 2007</i>	-0.251*	-0.248*
<i>Average ROA (three years)</i>	-0.275*	-0.214

Note: * Significant correlation at level $p < 0.05$

The findings confirm our first research hypothesis, i.e. that technology orientation enables the achievement of superior innovative performance to market-oriented approaches. The second cluster, in fact, not only shows higher averages for the radical and incremental innovation rates, respectively 25.37% and 40.39% against 10.64% and 17.95%, but also the time required from product conception to marketing (time to market), is shorter: 10 months for the first and 7 for the second. In regards the contrasting positions highlighted in the literature, the findings of our analysis would seem to support studies which recognize a greater capacity for exploiting resources and organizational competencies focused on developing new ideas and new products in technology-oriented firms (Hortinha, Lages and Lages, 2011).

Finally, in regard to our second research hypothesis, Table 8 shows the averages for each economic indicator with reference to the two clusters identified and to the sample of firms interviewed, considered together. This table also shows the index analysis on the group of only joint-stock

companies associated with Confindustria-UNIPRO (which together cover approximately 89% of the Italian cosmetics turnover), to highlight any variance with the sample averages.

It can be seen that, with the sole exception of the indicators referring to the turnover variances and ROE, the profit outcomes of the two groups are both in line with the sample averages and the scope of references. The variance in the return on equity can probably be placed on the different budget policies which may distinguish the smaller firms from large firms and multinational groups; for the latter, in fact, global profit may depend on inter-group budget policies on an international scale. In regards to the turnover variance, on the other hand, it seems that the more technology-oriented firms exploit their own innovative capabilities to force the growth effect, but with no difference in profit. The difference in resource levels dedicated to R&D leads to investments in production-type fixed assets (e.g. new premises, production lines, takeover of other firms, etc.) which favour growth in terms of size, but not always growth in short term profits. The profitability of more technology-oriented firms, which, as shown in Table 7, is similar to that of market-oriented firms, seems to depend on other factors. In our study we hypothesized that the gap could be filled by networking capability, of which the technology-oriented firms would be able to take advantage. Table 6, in fact, highlights a substantial difference between the two clusters. In particular, the cluster of technology-oriented firms exploits overseas production to a greater extent and, therefore, related cost recovery (especially in labour terms). Again, there emerges a different degree of willingness to seek external innovation sources which, we remember, include suppliers of raw materials and technology, firms in other industries, universities and research centres. In regards to the effects on profit capability, the cluster analysis confirms the findings over the whole sample, i.e. there is no marked difference in profit linked to a single variable; on the other hand, since profitability is similar between the two groups, it is possible to deduce that the relational capability used by technology-oriented firms helps to make up for marketing skills, which are more highly developed in market-oriented firms. The analysis would seem, therefore, to confirm the findings in the literature, i.e. that relational capabilities developed by firms have a positive effect on economic performance (Echols and Tsai, 2005).

Discussion, Theoretical and Managerial Implications

The aim of this study was to improve the understanding as to how the relationship between strategic orientations, innovative capability and economic performance in the cosmetics industry, with special reference to the Italian context.

On a broad strategic level the study confirms that the factors that determine the competitive advantage of other Italian made products are also significant drivers within this sector. The ability to compete and create value does not depend on *one optimal strategy*, but rather depends on the strategic management of a broader set of market place considerations. For instance, strategic alignment can be achieved through the strengthening of competencies and resources in the marketing area (investments in the creation of brand equity, improving the reach and depth of developing an effective promotional mix, distribution networks). Furthermore, it can be achieved through the reinforcement of

technological competencies (investments in R&D), which affect innovative performance, as in other technology-based industries. This pattern is consistent for small and medium-sized firms as for large firms;

The study provides some ideas as to how to improve corporate competitiveness and sustainability:

- The opportunity of developing an organizational structure (internal and external) which reduces the inefficiencies of various organizational-based processes, specifically those related to new product development; such a structure may aid the organization to adopt and implement sustainable marketing operations including the success launch of new products.
- In the context of strategic planning, innovativeness auditing and measuring the performance of innovative processes as well as the correlation of their value explicitly with marketing objectives, can be also useful.
- The option of articulating and prescribing corrective actions which can be adopted by management to improve the economic performance of developmental innovative processes, and in general to align new product development efforts and marketing capabilities.

Limitations and Future Development of the Research

This research has some limitations and some possible future research directions are suggested.

- In regards methodology, the size of sample analyzed does not allow us, on the one hand, to apply an investigative methodology which could better capture linkages between the constructs identified or to increase the number of variables within the model. In addition, the use of the cluster analysis, while permitting the identification of homogeneous groups in the sample, does not allow the study of the relationship between variables;
- The scope of the study should be extended on an international scale so as to throw light on the originality of the strategic orientations of Italian firms compared to other international competitors (e.g. French cosmetics firms).

TAYLOR TO YAMASHINA – EMPLOYEE INVOLVEMENT IN INDUSTRIAL ENGINEERING PROJECTS

Rao, Kambhampati Venkata Satya Surya Narayana¹

¹ National Institute of Industrial Engineering (NITIE), Mumbai, Maharashtra, 400 087, India. Email: nkvs@yahoo.com

Abstract

Employee involvement in improvement activities was planned and executed in an excellent manner in Japanese organizations. Total quality management and total productive maintenance are two broad system level improvement approaches that used employee involvement and provided significant economic benefits. Japanese practices in these improvement techniques were recognized by practitioners as well as scholars of other countries and research studies as well as plant visits by professional executives were undertaken to understand the Japanese practices. Total industrial engineering as a concept was proposed by Yamashina in the Japanese tradition. Employee involvement in industrial engineering was indicated as an activity to be promoted by F.W. Taylor. Mogensen developed the idea further in his 'work simplification'. Yamashina, in developing 'world class manufacturing' approach, introduced the concept 'total industrial engineering'. Total industrial engineering can be explained as enterprise-wide industrial engineering as well as total employee involvement in industrial engineering. The concept has the power to attract the attention of senior management as well as the frontline operators to appreciate the potential of industrial engineering to improve efficiency and productivity. The paper attempts to describe the way employee involvement was advocated and progressed over the period in IE theory and practice.

Keywords: Industrial engineering, Employee involvement, Frederick Taylor, Yamashina, IE projects, Methods improvement.

Introduction

F.W. Taylor considered as the father of industrial engineering (IE) has emphasized the involvement of operators in industrial engineering studies or time and motion studies. But an impression was successfully created by behavioral management theoreticians that industrial engineering theory and practice had no role for the ingenuity and initiative of operators. According to them, this lack of opportunity for participation had resulted in lack of motivation in operators to work for the improvement of systems or production systems. A compilation of thoughts of industrial engineering pioneers and practitioners may help in evaluating the issue of employee involvement in industrial engineering.

This paper is an attempt to highlight the need for employee involvement, suggested and practiced by various industrial engineering specialists and compare them with the remarks of persons who observed absence of employee involvement in IE projects and to point out the implications for employee involvement in IE projects.

Observations of Behavioral Researchers

Rensis Likert (Likert,1961) in his book “New Patterns of Management” had made some observations on job design and his observations were quoted by Alan Mogensen (Mogensen, 1963), the industrial engineer who pioneered work simplification in his article in the Handbook of Industrial Engineering edited by H.B. Maynard.

Likert has compared repetitive jobs and varied work as two systems of job design or patterns of management of production work. In repetitive work or jobs, the jobs are broken down into simple repetitive tasks of short duration and standardized procedures have been established. Standards, which specify the amount of work, each worker is to produce are set for these jobs. Workers may be on incentive or not, but they are usually under a fair amount of direct, hierarchical pressure to produce as per specified standard. Likert’s observation was that in job organization systems, intervening variables such as perceptions, attitudes, expectations, motivations and the effectiveness of communication are not measured and analyzed. In varied work systems there is more role for operators in developing production processes and there is cooperative-motivation system. Likert advocated for progressive combination of best of the job-organization and the cooperative-motivation systems of management and improving the combined system further.

While Likert had developed his argument in a more guarded way, Drafke and Kossen (Drafke and Kossen, 2002) were more forthright. ‘One of the prime goals of classical management is to improve productivity. To do this, early managers often focused on motion studies and time-motion studies.... The result of all the study on performing a task was often referred to as “the one best way.” ... This attitude that all workers are to use the management’s way is indicative of the autocratic nature of classical management. ...Many years after Taylor, Fayol and Weber, management theorist Chris Argyris claimed that classical management makes people unmotivated, and by not involving workers, it creates an attitude of “I don’t want to be involved” even if managers ask, which they weren’t doing.’’

Douglas McGregor (McGregor, 1960) also took the line that repetitive workers were not involved in work processes development and improvement. He made the statement that a worker’s know-how and ingenuity, properly utilized, might make a far greater difference to the success of the enterprise than any improvement in his physical effort, although of course his effort is not unimportant. He highlights the point that a worker achieves recognition and other important social and ego satisfactions from the utilization of his knowledge about the work.

In contrast to the observations of behavioral management researchers, Taylor did advocate involving employees in improvement and standard setting activities and also emphasized that scientific management is for the mutual benefit of employees and employers. Industrial engineers like Gilbreths were more direct in doing fatigue studies etc. to make sure that demands on employees are within their physiological, anatomical and cognitive capabilities. We describe and discuss the ideas advocated by industrial engineers in this regard in more detail in subsequent sections.

Taylor's Advocacy of Employee Involvement

According to Taylor, scientific management has four great underlying principles. They are:

- The development of a true science.
- The scientific selection of workman.
- His scientific education and development.
- Intimate friendly cooperation between the management and the men (Taylor, 1911a).

He also explained that scientific management was based on:

- Science, not rule of thumb.
- Harmony, not discord.
- Cooperation, not individualism.
- Maximum output, in place of restricted output.
- The development of each man to his greatest efficiency and prosperity (Taylor, 1911b).

Taylor identified the then existing system of management as "initiative and incentive" system. Hence some of the later scholars started criticizing that scientific management is not utilizing the initiative and ingenuity of the workman and is only focused on the physical effort of the workman. But Taylor clearly recognized the importance of cooperation between the management and the men, cooperation between industrial engineers and workmen, and the importance of initiative and ingenuity of the workmen for improvement of work methods.

He clearly stated, "It may seem that with scientific management there is not the same incentive for the workman to use his ingenuity in devising new and better methods of doing the work, as well as in improving his implements, that there is with the old type of management. It is true that with scientific management the work man is not allowed to use whatever implements and methods he sees fit in the daily practice of his work. Every encouragement, however, should be given to him to suggest improvements, both in method and implements. And whenever a workman proposes an improvement, it should be the policy of the management to make a careful analysis of the new method, and if necessary conduct series of experiments to determine accurately the relative merit of the new suggestion and of the old standard. And whenever the new method is found to be markedly superior to the old, it should be adopted as the standard for the whole establishment. The workman should be give full credit for the improvement, and should be paid a cash premium as a reward for his ingenuity. In this way the true initiative of the workman is better attained under scientific management than under the old individual plan" (Taylor, 1911c).

Taylor also commented that in modern work systems, the culture has to be such that a person loses none of his originality and personal initiative even though he is controlled by many other men and has to work harmoniously with them.

Gilbreth on Initiative of Operators

Gilbreth answered to a question that scientific management does not take the place of the ingenious man. It does not supplant him. Instead, it furnishes a specially equipped planning department that is staffed by ingenious persons of the organization and the ideas from the persons outside this department are recognized and incentives are offered for it. Scientific management specially provides for the mechanism to foster suggestions from operators to improve standard methods. He made the comment that operators must first use standard methods and once they have mastered them can come out with suggestions for improvement. According to Gilbreth, scientific management offers the first standard method of obtaining high efficiency and those best qualified to invent and make new methods are specially assisted and encouraged to improve the present standard methods. Thus the ingenious employee's initiative is assisted and employed in improvement activity of the organization (Gilbreth, 1973).

Acceptance and Implementation of Taylor's Employee Involvement Plan by Industrial Engineering Practitioners and Academics

Industrial engineers and industrial engineering authors had tried to follow the suggestions of Taylor and other pioneers in involving workmen in IE studies. In Maynard's Handbook of Industrial Engineering, Kendall White (White, 1964), Director-Staff Industrial Engineering of Thompson Ramo Wooldridge Inc., exhorts all industrial engineers to obtain participation from the persons concerned with the method. Participation leads to familiarity and to pride of authorship. The operators who suggest simple fixtures are supporters of the new methods and do not need further special efforts to sell the new methods. Those closest to the machines, materials and procedures have true expertise and the industrial engineer has to be a catalyst to draw out, organize and put the detailed knowledge available with various persons of the organization to work.

Nadler (Nadler, 1955) in his text, Motion and Time Study, discussed the issue of human issues in IE studies. He advocated that the IE analyst should tell the worker why he is doing something, what he is doing, how he is doing etc. The analyst should get suggestions also from each of the workers, since they know their job details. Involving employee in developing new methods should give him the feeling that he did some of the work in improving his job. The fact that he knows his job better than many others should help him give suggestions and ideas.

In the first edition of the classic ILO textbook on Work Study published in 1957, Introduction To Work Study, it was stressed that workers would be more likely to accept new methods if they were allowed to share in their development. Therefore, the work-study man should take the operator into confidence from the start, explaining various steps involved in the study, the reason or logic for doing the step and the output expected from it. Various tools of investigation have to be explained to him. The study persons were asked to always involve and discuss with the workers for suggestions or ideas on improvements that can be made. They have to be recorded in the analysis or checklist sheets. Whenever they are embodied in the new methods, full credit must be given to the worker. Major

suggestions merit monetary rewards. They strongly wrote, "Let him play as full a part as possible in the development of the new method, until he comes to feel it is mainly or partly his own (ILO, 1957).

Alan Mogensen in his Work Simplification approach tried to involve supervisors and operators directly in improving methods and this approach had number of successes and Rensis Likert highlighted the benefits of this approach in his book.

Books, Management Guide for Work Simplification by Bernard Lewis (Lewis and Pearson, 1961), Manager, Industrial Engineering Branch, Department of Navy, and William Pearson and Work Improvement by Guy C. Close (Close, 1960), Industrial Engineer, Aluminum Company of America advocate employee involvement and systems for suggestion schemes.

In IE solutions magazine, the official publication of IIE, also industrial engineers have published articles advocating employee involvement and case studies (Paulsen, 1994), (Jindia and Lerman, 1995).

Total Industrial Engineering – Yamashina

Yamashina (Yamashina, 2000) examined the challenges to world class manufacturing and in one of the papers coauthored by him industrial engineering was recognized as one of the important improvement approaches along with total productive maintenance (TPM), total quality management (TQM) and just in time (JIT) (Yamashina and Kubo, 2002). Total industrial engineering is a term being used by Yamashina in his presentations on World Class Manufacturing approach. The framework for total industrial engineering can be set out following the frameworks of TQM and TPM

Figenbaum (Feigenbaum, 1986) spelt out the principles of total quality control. Total quality control is an effective system for integrating quality development, maintenance and improvement by various groups in the organization. In total quality control, the organization-wide impact of quality initiatives on quality as well as cost is recognized. Quality is considered as a strategic area that contributes to business profitability and positive cash flow. The factors affecting product quality can be divided into technological and human and both are managed in TQM. A total quality system may be defined as the agreed company-wide and plant-wide operating work structure, documented in effective, integrated technical and managerial procedures, for guiding the coordinated actions of the people, the machines, and the information of the company and plant in the best and most practical ways to assure customer quality satisfaction and economical costs of quality.

Yamashina as a coauthor explained that the expression "total" in TPM could mean the full participation of all production workers in the maintenance activity. In contrast to specialist maintenance, it is a form of in which the operators of the operation department participate. In TPM with the motto, 'Protect your own equipment by your own hands,' a revolutionary change was made so that the operating department would conduct as much maintenance as possible (Nakajima et al., 1992).

Total industrial engineering as a concept is similarly an enterprise-wide system to assure efficiency and eliminate waste. The explanation of industrial engineering as human effort engineering and

system efficiency engineering by Narayana Rao (Rao, 2006), (IIE, 2010) clearly brings out the special focus area of the industrial engineering function. Effectiveness and efficiency are the two pillars on which commercial organizations or even public organizations function and prosper. Effectiveness is providing right products of the desired specification at the required time and place and quantity. Every activity and process in the organization has to be effective. It has to produce the desired service or product at the required time in desired quantity and it has to deliver it at the place specified by the customer. Along with the effectiveness dimension, there is efficiency dimension. The organizations have to use the most efficient systems and processes. If they fail to do so, the competitors will implement more efficient processes and drive them out of work. Hence every organization has to continuously improve its efficiency. Efficiency is demanded in every section of the organization and every employee contributes to it. Hence, total industrial engineering, efficiency oriented effort by every employee makes sense. Industrial engineering function or activity has to be so designed that it takes place on a continuous basis at all divisions of an organization and all employees participate in it. The responsibility of developing and using the most efficient methods rests with the line management and they have the support of the staff services of specialist industrial engineering department to bring in the newly developed techniques as well as application of the techniques in more focused and rigorous manner. But it is to be recognized by everybody in the organization, that efficiency is everybody's job and persons doing the job continuously have the potential to come out with many useful ideas on improving the processes. They need to be involved in a structured way to feed those ideas into methods development process that occur continuously as well as periodically. Yamashina has done significant service to the IE discipline by pointing out its role as total industrial engineering as a management and organization activity which needs to be used along with TQM and TPM to reduce costs, losses and waste.

Benefits of Employee Involvement

There is a need to examine the literature relating to the benefits of employee involvement for recommending to the industrial engineering profession to take special steps to promote employee involvement (EI) in IE projects. Litwin [Litwin, 2010) reviewed the literature on employee involvement and pointed out that Hawthorne studies were criticized for methodological shortcomings. Locke and Schweiger's (Locke and Schweiger, 1979) review concluded that EI led to employee satisfaction but not to reliable results in productivity. Kanter's (Kanter, 1983) empirical work resulted in the suggestion that EI is appropriate if the frontline staff have knowledge that is not available with higher ranked persons. Studies of Kelley (Kelley, 1996) and Batt (Batt, 1999) have led to the conclusion that larger productivity gains were obtained with new technology when employee involvement was practiced. Industrial engineering studies examine minute details of operations and the output results in modifications to products or methods. There is change in technology as a consequence of IE studies, even though the magnitude is small. It is appropriate to work on the premise that employee involvement of design and production departments leads to more appropriate

and beneficial modifications in products and processes and the implementation of technology changes will lead to better outcomes when accompanied by EI.

Findings and Conclusion

Employee involvement in decision making and management increases their commitment to the working of the organization and improves the performance of organizations. The importance of employee involvement in IE studies was recognized by the founder of the discipline Taylor himself and Taylor did advocate employee involvement in his writings. Thinkers in industrial engineering who followed Taylor also endorsed Taylor in advocating employee involvement. Scholars from the behavioral science area, expressed the view that scientific management has not given due importance to involving the operators' brains. But, industrial engineering discipline did not take such a view. It made provision for ascertaining the suggestions of the operators at various stages of methods development process and advocated that operators are given credit for their suggestions and also are given monetary rewards for contributing to methods development. There is a need to reconcile conflicting opinions of industrial engineering authors and behavioral science authors in this regard. The term "total industrial engineering" being used by Yamashina is an appropriate term in the context of employee involvement advocated by Taylor himself. Industrial engineers have to develop models of total industrial engineering using models of TQM and TPM as guides. Industrial engineering has great potential to contribute to the survival and growth of business organizations as total industrial engineering in which all employees participate.

Abstract

Companies operate in a highly competitive market at a globalized time. One of the strategies used by firms, which characterize this global integration of the markets, is called the Mergers & Acquisitions (M&A). These transactions are one of the biggest events that can occur in a companies' life which consequently produce impacts not only for the companies involved but also for the market structure. In fact, this phenomenon involves a set of controversies among academics who continue to debate, for example, whether these operations result in an increase of productivity or if they create rather than destroy value for the shareholders of the companies.

Furthermore, despite a consensus on the popularity of Mergers and Acquisitions operations (e.g. Lubatkin, 1983 and Gaughan, 2007), there are many reasons for performing these operations, the most targeted to achieve a good investment, that is, a profitable businesses (Pautler, 2001). In fact, M&A is a strategy used by organizations in order to achieve their objectives of growth and diversification

This paper aims to examine takeovers that have occurred in the last decade in Portugal using the event studies methodology. The results obtained suggest that the shareholders of the buying companies' usufruct narrow returns only, tending to close to zero. In global terms, the results suggest a positive impact for the involved shareholders in this type of transactions. Finally, it is important to note the potential presence of insider trading in these transactions.

Keywords: Mergers & Acquisitions (M&A), Takeovers, Event Study, Supranormal Returns, Portugal

Introduction

Companies operate in a highly competitive market at a globalized time. One of the strategies used by firms, which characterize this global integration of the markets, is called the Mergers & Acquisitions (M&A). These transactions are one of the biggest events that can occur in a companies'

life which consequently produce impacts not only for the companies involved but also for the market structure. In fact, this phenomenon involves a set of controversies among academics who continue to debate, for example, whether these operations result in an increase of productivity or if they create rather than destroy value for the shareholders of the companies.

Furthermore, despite a consensus on the popularity of Mergers and Acquisitions operations (e.g. Lubatkin, 1983 and Gaughan, 2007), there are many reasons for performing these operations, the most targeted to achieve a good investment, that is, a profitable businesses (Pautler, 2001). In fact, M&A is a strategy used by organizations in order to achieve their objectives of growth and diversification

On the other hand, Pasha (2010) states that, although M&A's have intended to increase the performance of enterprises, studies in finance can not reach this conclusion, i.e., the return obtained by the acquiring company has not been higher than this would get an operation of investment, production, with the same level of risk.

Pautler (2001), believes that organizations opt for this investment strategy (M&A) when this type of activity provides the acquisition of new knowledge and skills, i.e. the ability to enter new markets (and products).

The study of the present paper encloses some existing aspects in literature with respect to this phenomenon, such as the underlying reasons to the occurrence of M&A; and the characterization takeovers and brief comments on the relation between the M&A and the agency theory and corporate governance as well.

This paper aims to examine takeovers that have occurred in the last decade in Portugal using the event studies methodology. The results obtained suggest that the shareholders of the buying companies' usufruct narrow returns only, tending to close to zero. In global terms, the results suggest a positive impact for the involved shareholders in this type of transactions. Finally, it is important to note the potential presence of insider trading in these transactions.

Motivations for M&A

The concept of globalization and the consequent growth of the economy and level of competition not only between companies but also among employees in organizations originated entered a "battle" with the intention of being the best acting in the market.

One strategy often used by organizations for this purpose consists of the M&A (quick method to achieve the company's growth and diversification), this technique is used in order to maximize knowledge and skills and thereby manage to achieve the ability to defeat their rivals reaching their goals faster than their opponents.

Frantslikh (2005), argues for the existence of "three forces" that drive the occurrence of M&A: i) rapid technological change, ii) new and more efficient means of funding and iii) more favorable regulations.

Damiani & Pompei (2009), contribute to the clarification of this phenomenon by presenting the main reasons for performing acquisitions, the fact that they promote increased market power of firms, efficiency and mitigate the impact of transaction costs. Andrade et al. (2001), adding that several aspects have been exposed to explain the emergence of mergers, and these are related to efficiency (economies of scale and / or synergies), obtaining market share (ensuring monopolies or oligopolies); market discipline (expulsion managers of companies with a poor performance), managers' personal interests; obtain advantage through diversification (exploration of domestic capital markets).

From another perspective Jensen (1988), argues that the transactions related to the control of an organization impact the lives of its actors (whether managers, customers, community and employees), since these operations are normally associated with major restructuring , layoffs (from managers to workers) in order to acquire new competitive conditions.

In contrast Martynova & Renneboog (2006), argue that takeovers are a means of survival used by companies to cope with the impact of market globalization and competitiveness. Thus, Stigler (1950) cited by Pautler (2001), considers that the main reason for the occurrence of this activity is the ability to obtain market power. According to Tichy (2001), one of the reasons for the occurrence of this phenomenon is associated with increased efficiency through synergies and opportunities for growth and improvement of management / organization (control firms).

Following the same line of reasoning Martynova & Renneboog (2006), reinforce this argument by showing how primary explanations for the occurrence of this phenomenon to create synergy and correction of management failure. In fact, Berkovitch & Narayanan (1993) cited by Anderson & Marshall (2007), consider that we are dealing with motivations related to synergy when managers seek returns that benefit shareholders. Conversely, when they (managers) seek gain for themselves, then we are dealing with motivations related to the agency.

Cost reduction, entry into new markets or exploit mispricing premium are second Martynova & Renneboog (2006) the primary reasons for takeovers. Jensen & Ruback (1983), present as sources of value for takeovers (motivation to carry out these operations), reducing agency costs, avoid the collapse of companies, reducing costs of production and distribution (synergies) to achieve economies of scale, greater efficiency and use of technological resources and production company; eliminate the poor performance of managers of target companies, among others. The second possible M&A (Pautler, 2001), by diversifying the business (thus obtaining financial efficiencies) to obtain financial benefits, as companies diversify to reduce their risks (be they cost or the actual collapse of the company).

However, Cole et al. (2006), consider that managers are driven to act in accordance with the maximum interests of shareholders, since, when they can not ensure maximization of value and gains / profits for shareholders, they are subject to external threats. Therefore, in this case we are dealing with managers motivated by synergies, where they make an accurate judgment about the value of the company to acquire and are intended to increase shareholder value, because a combination of other

companies allows you to create synergies and reduce costs (Arnold & Parker, 2009). Lubatkin (1983), argues that the synergies associated with the M&A can be of three types, the technical economies (the ability of the company lower prices through better utilization / efficiency of its resources), economies of diversification (being related to mergers conglomerate, based on the extent of the increased performance associated with the risk or through a reduction in their risk with respect to its performance) and pecuniary economies (associated with the ability of firms unable to exercise the price they deem appropriate through its market share and size) and is associated with vertical and horizontal mergers. Pautler (2001), adds some factors that are related to the occurrence of mergers, including those linked to efficiency, taxes and financial benefits, market power effects, hubris and greed of managers; get a "good buy" and expropriation of stakeholders.

Mueller & Sirower (2003: 33) have also questioned as to the basis / source of the causes of takeovers, "Why do the managers of These Firms undertake such gambles?". The issue pointed out two reasons, the hubris (managers believe they can observe the true value of other companies, at the same time no one else can see) and managerial discretion (because they feel they are "playing" with the money of others .)

Anderson & Marshall (2007) emphasized the presence of motivations related to the synergy and hubris in takeovers (takeovers that destroy value), but did not detect the presence of motivation related to the agency. The same guideline Arnold & Parker (2009) also verified the existence of these phenomena (hubris and synergies). Thus, consider the hypothesis that synergy is associated with an expectation of successful acquisition and value creation, while the hubris and managerialism are associated with a poor post-merger performance and deterioration in value.

Another motivation exhibited by Cole et al. (2006), is related to the fact that managers wish to increase their "empire" because company size is a factor taken into account for determining the compensation received by managers. Therefore, have an interest in increasing the size of the company and one way / strategy to achieve this is through acquisitions (incentives for managers to make purchases).

The hypothesis of diversifying acquisitions is also called as a factor, because managers are less able to diversify their risk as opposed to shareholders, who can build the best portfolio possible by controlling the level of risk considered acceptable for this (Tichy, 2001). Pautler (2001), presents the possibility of using this strategy (M&A) in order to deviate from financial problems. However stakeholders (individuals interested in the success of the company encompassing customers, suppliers, state, creditors and employees) are damaged. However Tichy (2001), goes further potential explanations for the appearance of this activity, among them increased market share through acquisitions and power (market power hypothesis), changes in the current environment, that is, changing technologies, deregulation and competition policies and making a profit after the close of the agreement, through the acquisition of companies that operate in different markets.

One reason for acquiring companies to follow this strategy is related to the fact that making a "good buy". Thus, it is considered a good buy when the target company is undervalued, that due to poor performance of the managers or by the existence of anti-takeovers laws that prevent the proper functioning of the market for control of companies (Pautler, 2001).

Finally, we note that several reasons have been suggested as a reason for companies to use M&A as strategic.

From the available literature we can see that the authors often point to the following: a) Companies that carry out these strategies, execute them under two assumptions: i) the acquiring company can achieve a gain greater than it is to be achieved by the current managers, ii) the extracted value of those assets will be higher than the amount paid by the market (Ghuri & Buckley, 2003); b) Achieving synergies, the importance of the amount invested in the operation and role of the manager involved in the operation (Campa & Hernando, 2004); c) "profit maximization is a vital objective of mergers" (Singh & Mogla, 2008: 63); d) The possibility of achieving economies of scale, behavior of managers (building empires) (Ghuri & Buckley, 2003); e) A means of removing inefficient managers (target company), maximization of sales, risk reduction, among others (Singh & Mogla, 2008); f) Taking profit (key objective of mergers) increase the size; liquidity; leverage; gain by merging with another company in the same sector of activity, age of business (the older ones have more experience and better performance than the most new, which in turn are more flexible) and mergers between groups and subsidiaries (Singh & Mogla, 2008).

The Event Study Methodology

The Event Studies have been used to analyze aspects related businesses (e.g. changes in the distribution dividends, equity issuance), business (e.g. merger and spinoff announcements, hiring and firing of senior managers) and regulation (e.g. changes in regulation banks and changes of regulation concerning pollution) (Campbell et al., 1997). Peterson (1989), states that the purpose of an Event Study is to determine if a supernormal return a given organization that is related to a particular event. He adds this methodology to analyze the market response to a particular event (can be seen in the share price over a period close to the event).

Campbell et al. (1997), reinforce this idea by stating that the Event Studies of ascertaining the effect on value of shares caused by one or a set of events. An event is therefore considered to be any change, development, ad that can cause a considerable change in the price of a particular action in a given period, i.e., is related to the dissemination of market information (Campbell et al., 1997; Peterson, 1989). Khotari & Warner (2006), also add that this technique has an important purpose in capital market, i.e., is a means of testing their efficiency despite extensive studies based on this methodology have not changed over time, i.e. continue to focus its attention on supernormal returns cumulative over a period in which the event occurs and the sample mean of shares. Despite the event studies is a technique used in analyzing the impact of M&A in the capital market, i.e., applied research in finance and accounting, can also be employed in other areas (Pautler, 2001; Mackinlay, 1997).

The Event Studies have been used to analyze aspects related businesses (e.g. changes in the distribution dividends, equity issuance), business (e.g. merger and spinoff announcements, hiring and firing of senior managers) and regulation (e.g. changes in regulation Banks and changes of regulation concerning pollution) (Campbell et al., 1997). Peterson (1989), states that the purpose of an Event Study is to determine if a supernormal return a given organization as it relates to knowing that an event / event is immediately reflected in the share price is considered that after the announcement of mergers the share price quickly adjusts to this new information, thus incorporating any changes in share price (efficient capital market) (Andrade et al., 2001; Mackinlay, 1997).

Considering the existence of statistical evidence, that mergers create value for shareholders (analyzes performed using event studies), one can find a link between the conditions prevailing in the economy that occur in these operations and the value for shareholders, i.e. the business cycle has an impact on the level of value obtained by shareholders (Andrade et al., 2001; Tse & Soufani, 2001).

Thus, the Event Study is a method used to determine the reaction of investors, i.e., "The goal of an event study is to measure the abnormal stock market returns Associated with the announcement of an exogenous shock," and waiting to get a return supranormal positive in case of successful fusions (there is the creation of value "... in the eyes of investor") on the other hand, the failed fusions are expected to get a return supranormal negative due to the destruction of the expected value (Diepold et al ., 2006: 6). In short, Event Studies, studies, or event, is a methodology based on the difference of the return obtained by certain securities at an event (announcement of OPA 's), called by R_{it} (return of title i at time t) and the return that would be obtained if this announcement had not occurred (referred to as $E(R_{it})$). Thus, with this difference we obtain supernormal returns (AR_{it} - Abnormal Return) according to equation [1]:

$$AR_{it} = R_{it} - E(R_{it}) \quad [1]$$

To determine the payoff for a particular title, if there was no announcement ($E(R_{it})$), i.e. in the absence of information of this operation, one uses the existing information in the returns of the securities in question, a period called for Estimation Window. The Estimation Window, is the time / period immediately preceding the Event Window, which is the day when the announcement occurs.

This methodology assumes that the capital market is efficient (the stock prices reflect all information available), and considering that the return of each title (R_{it}) has a stable and linear with the average return market (R_{mt}). Therefore, a technique used to determine the potential return of a particular title in the absence of notice is the Market Model (Pautler, 2001).

Thus, the model is estimated using the returns of the securities of the company and the market index during the Estimation Window. Mackinlay (1997), states that for any reason the market model is given by the following equation [2]:

$$R_{it} = \alpha_i + \beta_i * R_{mt} + \varepsilon_{it} \quad [2]$$

As the expected value and the variance of the error obtained as follows:

$$E(\varepsilon_{it}) = 0; \text{VAR}(\varepsilon_{it}) = \sigma^2 \varepsilon_{it} \quad [3]$$

After determining the parameters of this model, we define the return provided by supranormal notice for each day of the Event Window through the estimation of equation [4]:

$$AR_{it} = R_{it} - (\alpha_i + \beta_i * R_{mt}) \quad [4]$$

Then proceed to the calculation of average supernormal returns (AAR) for each day of the Event Window and finally accumulate supernormal average returns. Thus the average supernormal returns are obtained from equation [5]:

$$AAR_t = \frac{1}{N} * \sum_{i=1}^N AR_{it} ; \text{VAR}(AAR_t) = \frac{1}{N^2} * \sum_{i=1}^N \sigma \varepsilon_i^2 \quad [5]$$

Where the average cumulative supernormal returns (CAAR) and its variance are obtained by the equation [6]

$$CAAR_{(T1;T2)} = \sum_{i=1}^N AAR_i ; \text{VAR}(CAAR_{(T1;T2)}) = \sum_{t=T1}^{T2} \text{VAR}(AAR_t) \quad [6]$$

Where:

T1: first day of the Event Window

T2: last day of the Event Window

The Estimation Window

In the execution of an Event Study is a necessary step in determining the estimation window. Campbell et al. (1997) define the estimation window as the period in which the parameters will be estimated.

Mackinlay (1997: 15) considers that it is more common to use a period before the event where "... the market model parameters Could Be Estimated over the 120 days ..." pointing out that the event period is not included in the estimation window to ensure that the event does not influence the performance of the model parameters estimated.

Schwert (1996) in their study conducted between 1975 and 1991 based on mergers and acquisitions successful and unsuccessful (1814 cases), used an estimation window of 253 days (-379, -127), that is, ending 127 days before the first public announcement of intention to carry out this operation. Still in his study, Schwert (1996) to calculate the cumulative returns supernormal used a window of (-126, +253) on the day of the announcement, noting that the CAR began to increase 42 days before the announcement, the greatest increases occurring between -21 and -1 days before the announcement.

Cole et al. (2006) analyzed 220 mergers between 1991 and 2000 and estimated by OLS regression with an estimation window from 300 to 50 days before the announcement went public. Peterson (1989) considers the estimation period based on daily round typically between 100 and 300 days of analysis and studies based on a monthly basis are around 24 to 60 months.

In this paper we use an estimation window with a period of 120 days (-140, -21). Although it is considered that a long estimation window allows for a greater reliability of the model parameters of the market, it is known that these same parameters are unstable, so then a short-term estimation window is used here.

Event Window

Mackinlay (1997), notes some steps required to perform an Event Study is the first step, the definition of event we want to analyze and determine their event window. Campbell et al. (1997) describe the Event Window as the period in which the event occurs. In fact, Mackinlay (1997) considers that the event window covers the period in which stock prices involved will be studied by arguing that it should be higher than the day on specific days of the event or event. Therefore one must consider at least the day before and after the day of the event to be able to capture the time that occurs in these into account. Cole et al. (2006) in their study relied on a 3-day event window (-1, 0, +1), also used in this paper. In short, Peterson (1989) adds that the periods of the event are around 21 and 121 days (when studies are conducted on a daily basis) and 25 to 121 months (monthly basis). In this paper, several very short term windows are to be used.

Time horizon and sample

To perform the empirical analysis was necessary to collect information and data from various sources, namely: CMVM (Portuguese financial markets supervisor); Dathis; NYSE Euronext Lisbon (Portuguese stock exchange market); BolsaPT and Yahoo Finance. The present study is the timeframe between 2000 and 2010, time seems to be sufficient to check the context in terms of the OPA's (takeover bid) in Portugal. Selected timeline allows us to analyze the characteristics of these transactions in the last decade and thus gives us a more recent study. Moreover, a decade allows for the incorporation and inclusion of the various events that characterized the environment of the Portuguese market (e.g. financial crisis in 2007, entered into force in 2000 of the Code of Securities, the single currency in the euro area stock market integration Values of Lisbon and Porto (Oporto Stock Exchange) on Euronext).

In the period under review (2000-2010) Portuguese companies were involved in OPA 90 's. So we start at an early stage with a sample of OPA 90 's (of which two cases are the company that were targeted for takeover by the same company, but through another of the same group). After this selection process the final sample used for the consolidation of the literature review and considered for the empirical analysis was by 60 OPA's, being the final sample composed by 27 acquirers.

Post-Merger & Acquisitions (M&A) Returns for Bidder Firms

This section begins with the presentation of supernormal returns earned by shareholders of the acquiring and target companies that are part of our sample. These results were achieved by analyzing the series of quotations from the constituent entities of our final sample. So, are exposed to each of

these entities were 14 time windows, where the longer window is (-20, +20) and corresponds to the very shortest day of the preliminary release of the OPA.

Figure 1 below presents the evolution of the CAAR acquirers raised with the OPA 's during the twenty days before and after the announcement of preliminary release with the CMVM. The 27 acquiring companies that constitute the final sample seem to get very low returns, slightly higher than zero, i.e., these operations seem to suggest they are not very favorable for investors buyers, in terms of supernormal returns. However, by looking at Figure 1 we can see a movement (increase) in returns days before the preliminary announcement and a sharp decline on the day of the event.

Figure 1. Supranormal average cumulative return (CAAR) of acquirers.

The analysis of the evolution of CAAR through Figure 1 demonstrates a very curious when -6 (six days before the preliminary announcement), i.e., is projecting a sharp increase in supernormal returns collected by the shareholders. As can be seen in Figure 1 appears reflected the potential existence of insider trading in the Portuguese market.

With regard to the days following the preliminary release no official movement demonstrates a clear and continuing trend throughout the day, seemed to stabilize at around 4%. Table 1, shown below, summarizes the CAAR of acquiring companies and their statistical analysis for the various time windows selected. In making its analysis we verified that shareholders of acquiring companies get returns close to zero in the time windows with respect to shorter periods and even achieving negative returns in two windows, namely the (0, +1) and (0, 0).

JANELAS	CAAR	T _A	Nº CAR > 0	T _B
(-20;+20)	0,03944	8,80515***	15	0,3849
(-20;+5)	0,03654	5,61726***	15	0,3849
(-20;-1)	0,04841	8,88401***	14	0
(-10;10)	0,0362	7,2903***	15	0,3849
(-5;+5)	0,03665	28,6056***	14	0
(-5;+3)	0,04639	4,50674***	13	0
(-5;+1)	0,04803	3,49601***	14	0
(-5;-1)	0,04853	3,99438***	12	0,3849
(-3;+3)	0,00598	28,2217***	13	0
(-1;+3)	0,00233	8,60605***	14	0
(-1;+1)	0,00398	14,487***	11	0,7698
(0;+2)	0,00233	11,1412***	13	0
(0;+1)	-0,00049	7,1563	12	0,3849
(0;0)	-0,00957	-2,36275**	10	1,1547

Table 1: Average cumulative return of supranormal acquirers by OLS

Note: * significant at 1%, ** significant at 5% and 10% *** significant in two-tailed tests

It is also observable in Table 1 that shareholders of acquiring companies reaped positive returns of around 4% in the longer time window (-20, +20). Additionally, we see a deterioration of these supernormal returns on shareholder returns three days before and after the day of the announcement, with insignificant returns, i.e. very close to a null return.

Discussion of Results and Conclusions

In this research paper we intended to make a small contribution to the understanding of the fascinating world of M&A. Accordingly, we performed a review of the literature that is presented in the earlier sections of the paper, including the reasons justifying the M&A different strategies and motives.

During this analysis the existence of a heated discussion between scholars regarding this matter was also mentioned. In fact, there is no consensus as to the reason of occurrence of M&A, if these operations add value or not and whether they do generate value for shareholders of the companies involved, particularly for the shareholders of bidding companies. However, in general terms it is accepted that these transactions are one of the most important events that can occur in a business life.

For the purpose of this study the returns enabled by OPA's that occurred in the last decade in Portugal was examined, from the point of view of acquiring firms. The findings obtained concerning the returns for acquirers were shown to be similar to other studies, that is, the results indicate that these shareholders obtained almost null returns, than can be even negative in some cases (windows on the day of the event and that includes the day after the day of the event).

Finally, as we consider future lines of research that would be interesting to analyze, one could suggest to examine further whether the presence of insider trading is really influential, trying to capture the reasons and the extent of such phenomenon in the capital markets.

Last but not least, we hope that this paper may help managers to examine better their M&A initiatives and decisions, as evidence suggest that globally this operations may result negatively, probably due to overpaying.

CONSUMER BEHAVIOUR ERASMUS NETWORK (COBEREN)

Rodríguez Santos, Carmen¹

¹ University of León (Spain). Email: carmen.santos@unileon.es

Abstract

The main aim of COBEREN is provided to the academic and entrepreneurial worlds with a wide base of knowledge about culture and consumer behaviour as well as an updated data base on culture. Applying the same methodology in 31 European countries, we obtain comparable data in order to analyze similarities and differences among these countries.

Culture is the “prism” through which people view products and try to make sense of their own and other people’s consumer behaviour” (Solomon et al., 2006: 498). But culture is a crucial variable not only for economic studies but also for social studies. Thus, "without cultural patterns - organized systems of significant symbols - people would have difficulty living together" (De Mooij, 2004). Culture defines a human community, being individuals the "result" of their culture.

Due to the importance of culture, this project will provide: updated and rigorous teaching material (useful not only in the marketing field but also in the areas of anthropology, sociology, social psychology and psychology), a key pool of knowledge and methodology in the research field, an updated data base about culture and consumer behaviour accessible and useful not only for the academic and business world but also for the social strategic and tactical decisions to be taken by the competent organisms.

Keywords: Culture, Consumer Behaviour, Europe, Network

Consumer Behaviour Erasmus Network (COBEREN)

This proposal is established within the economic field, more specifically in the culture and consumer behaviour area.

Culture is the “prism” through which people view products and try to make sense of their own and other people’s consumer behaviour” (Solomon *et al.*, 2006: 498). But culture is a crucial variable not only for economic studies but also for social studies. Thus, "without cultural patterns -organized systems of significant symbols - people would have difficulty living together" (De Mooij, 2004). Culture defines a human community, being individuals the "result" of their culture.

Despite the importance of culture and also considering that culture is not static, there is not:

- A tool to accurate measure culture,
- A pool of updated knowledge of culture descriptors, and
- A knowledge of the culture profile of the European countries.

Given this situation, the specific aims of the network are the development of:

- An accurate measure and updated data related to culture, comparing 31 countries.
- A base of knowledge about culture and consumer behaviour, through applying the same methodology in the diverse countries, making thus the data comparable in order to analyse similarities and differences among the countries. Thus, consumer behaviour is a very new and interdisciplinary field (Solomon *et al.*, 2006). With COBEREN we try to make possible this interdisciplinarity.

With this project Coberen will provide: updated and rigorous teaching material (useful not only in the marketing field but also in the areas of anthropology, sociology, social psychology and psychology), a key pool of knowledge and methodology in the research field, an updated data base about culture and consumer behaviour accessible and useful not only for the academic and business world but also for the social strategic and tactical decisions to be taken by the competent organisms.

The intended study has not yet been carried out in Europe, in spite of its importance, having to refer always in teaching and researching to the studies made in USA, not transferable to the context of Europe and not applicable to provide the students with the appropriate knowledge and professional competences in the future, neither to support several lines of research interesting in diverse fields. This knowledge on culture in Europe is crucial for the teaching and research in different fields: marketing, consumer behaviour, sociology, psychology, anthropology and socio psychology.

Moreover in this project we will materialize the analyses of culture analysing complementarily the different consumer behaviours in European countries and the linkage among those concepts. This knowledge it is not only useful in teaching and researching, but it is priceless also for the Commercial National Institutions in each country, crucial in their strategic decisions and actions in the different countries.

The fact that the envisaged results do not exist shows that this type of activity can only be undertaken by an academic network like COBEREN given the expert framework underlying the project, and counting on the numerous research groups and their collaborating staff and business partners. If we compare the benefits and the durability of them with the costs, the later are to be considered significantly small.

The benefits are divided in:

A. Teaching and research

- Material in teaching and research will be updated.
- A new tool to measure culture will be developed, to be applied periodically, providing updated data on culture
- A data base will be provided on culture descriptors in European countries (maintaining this data base updated).

B. Economy

- Consumer behaviour will be analysed in the different European countries, linking this behaviour with culture. Apart from the areas of marketing and socio psychology, this knowledge is crucial in professional formation, making possible the linkage of the higher education institutions with the business world. Moreover this knowledge is essential for the organisms in each country responsible for taking strategic and tactical decisions in the commercial section.

C. Society

There are a lot of programs inside Lifelong Learning area trying to encourage interculturality but in all these programs it would be crucial, as a knowledge base, to have an objective and solid knowledge about culture (culture descriptors) in the different countries. It is not possible to be sensitive, to be tolerant, to be respectful, to behave appropriate if we do not know culture in the different countries. So this knowledge it is not only crucial for the customer analysis and for the managerial intercultural relations, but from the social point of view, and this perspective is crucial and applicable in every discipline.

Impact

Through the consecution of the aims proposed by COBEREN:

- It will be provided to the academic and entrepreneurial field with an updated data base about culture. This is crucial not only from a social perspective but also from an economic perspective allowing the take of commercial decisions (both strategically and tactically) with a enough base of information. More over this data will be based on the application of the same accurate methodology, doing possible the comparability among countries in Europe.
- The teaching will be improved thanks to the information about the European countries, improving the teaching and implementation of subjects, mainly: consumer behaviour, market research, commercial management and advertising.
- The research will be improved through the development and empirical prove of a tool to measure culture. Not only this, but this project will improve, through the experience, the knowledge about cross-cultural research methodology.
- The pool of knowledge will contribute through consultancy activities to public organism and firms to take the appropriate actions
- This project will provide the opportunity for new collaborations (in teaching, researching, innovation in enterprises...) in Europe.
- The meeting among partners will provide with a data of contacts also for other cooperations, all looking for an educational and research system of quality in Europe.

Quality Of The Valorisation Plan (Dissemination And Exploitation Of Results)

The network will make the results and outcomes available to a vast educational and industry community that shall be interested, through various means:

The Project results will be published at the CORDIS: Project Information & Dissemination Service of the EU (<http://cordis.europa.eu>). Also, the associated partners which are mostly international networks of universities will serve as platform at surveys as well as for final distribution of results. Final results, the database, book, CD and general outcomes will be made available to all interested persons in the academic world through the communication channels of these groups (websites, newsletters, message boards, international offices, etc.). Specific presence sessions plus poster sessions will be organized and displayed at EAIE annual meeting to the widespread of the opportunities arising from the work of COBEREN.

More specifically directed to dissemination at the business world, representatives of COBEREN will attend the following Marketing international events: AMS, EMAC, ESOMAR and EMARK.

For Networks Only: Please Demonstrate The Extent To Which The Activities Proposed Are Networking Activities

No individual institution could assume this big project without the support of such as the network developed, although it has been demonstrated and expressed the need of the outcomes that this project will provide.

It is needed to update the teaching material, where, when dealing with culture and consumer behaviour topics, references are made to studies not updated or not from Europe. Moreover, this knowledge will open new lines of research, impossible now to be undertaken given this gap of knowledge.

In spite of the relevance of the outputs Coberen will provide and the need of them being recognized in the academic system, nobody has been able to establish a solid network and a work project as COBEREN to undertake such a project.

Quality Of The Work Programme

The programme has been rigorously developed, having organized the work in the following task sections, configurated through groups of work, having the assignments of responsibilities and the cronogram of action.

I MANAGERIAL ACTIVITIE

II. FRAMEWORK OF DISSEMINATION

II.1. Website

III SECONDARY DATA

III.1. Preliminary literature update

III.2. Secondary data on country indicators and consumer behaviour

IV. QUALITY EVALUATION

IV.1. Quality evaluation of desk task

V. ACADEMIC/PRACTITIONER CONTRIBUTION

V.1. Report on descriptors

IV.2. Quality evaluation of report

VI. DEVELOPMENT OF TOOL

VI.1. Development of the tool to measure culture

VI.2. Quality evaluation of measure

VI.3. Manual describing the tool

VII. PRIMARY DATA

VII.1. Preparation field work

VII.2. Evaluation field work definition

VII.3. Field work

VII.4. Control field work

VII.5. Edition and depuration data

VII.6. Quality evaluation edition process

VII.7. Analysis of data

VII.8. Evaluation analysis of data

VII. 9. Interpretation of data

VII.10. Evaluation interpretation of data

VII.11. Manual on Culture & Consumer Behaviour

VII.12. Quality evaluation of dissemination manual

VIII. DEVELOPMENT DATA BASE

VIII.1. Development of data base

VIII.2. Evaluation data base

VIII.3. Dissemination of data base: CD and access through internet

VIII.4. Evaluation dissemination data base

IX. PRACTICAL DISSEMINATION

IX.1. Academic conference

IX.2. Evaluation conference

IX.3. Students seminar

IX.4. Evaluation seminar

IX.5. Workshop with enterprises

IX.6. Evaluation workshop

X. WEBSITE UPDATE AND EFFICIENCY

XI. GLOBAL EVALUATION

With the configuration of this plan of action we can assure the outputs expected with COBEREN and the efficiency, utility and dissemination of these results. The results will make a relevant contribution in the teaching, research and social fields, expecting a usability of the results for 15 years.

Innovative Character

We have made a deep review of the material used in the areas of consumer behaviour, marketing, anthropology, psychology and socio psychology. In all this material (having checked material used for teaching but also material used for research), when analysing the "culture" concept, reference is made to studies and data bases from USA, given the lack of such a knowledge from Europe. Experts know that these data can not be transferred to Europe but there is not other way to solve this gap of knowledge than making reference to the only data available, that is the analysis of culture from the United States of America. Experts are aware of the innovation that will represent to have such a knowledge about culture in European countries, but it is difficult to have this knowledge from the different countries, applying the same methodology, and moreover, using a rigorous methodology. Some studies and attempts have been made, and reference is made in those manuals also. The main attempt was made by Hofstede, being mentioned this work in all the books reviewed. But this study was carried out between 1967 and 1973, using a tool developed for the analysis of employee values and was applied to IBM workers (not a representative sample). It was a very good attempt and apart for the critics it has received, it is the only study made, and so, it is the only reference we can use for the study of culture in Europe.

Given this context:

- COBEREN will provide with a tool to analyse culture, which will be periodically applied to have updated data on Europe,
- through this network of experts:
 - data and knowledge on culture will be developed, making this available for the different fields implied and materializing this knowledge in updated teaching and research material, as well as a data base on culture;

- an analysis of the consumer behaviour in the different countries will be carried out, providing knowledge on the linkage between consumer behaviour and culture.

Quality Of The Consortium

To set up the present network, one year has been needed to select the partners (2007), having looked for the professors expert in the topic, most of them Directors of the Marketing Departments of their institutions or leading important groups of researchers. It took us one year to make the selection to assure a solid network on which to base this project and one year more to develop a solid project, with the task planning, responsibilities division and cronogramme to assure the relevance of the results, and the success to get these outputs as well as to fulfill the quality evaluation we will made on them.

Why COBEREN?

The knowledge of consumer behavior is of great relevance from the economic and civic point of view. There must be a pool of knowledge in consumer behavior that allows the firms and other associations and public organisms to take appropriate decisions regarding the market. Currently this knowledge is neither organized nor clearly disseminated.

When dealing with cross-cultural consumer behavior the issue is even more complicated, as there is not a general framework for consumer behavior analysis, which prevents the comparison of local studies because of different methodologies.

Thus, when some data about consumer behavior is needed, there are contradictions and a lack of a general pool of knowledge that allows us to have a general view of the market –something which is vital for economic decisions.

Moreover a key point in this discipline is the analyses of the CULTURAL BASE of such similarities and differences of consumer behavior in the different countries.

Thus, there are not currently studies related to culture which:

- involve a representative sample,
- come up to as many countries as 31,
- and are regularly updated.

The reasons for this network are:

- The development of a measure (as a reference in the discipline) to analyze culture, given the critics the measures applied have received.
- Moreover this measure will be applied in 31 countries, generating a pool of updated data on culture which is priceless for the academic and business worlds.
- Furthermore this cultural description will be analyzed with reference to the different consumer behaviors showed in each country, a complete framework essential to update teaching material, improve research and to take and implement economic and social decisions in the business and civic world.

In this project the efforts of two smaller networks are summarized: International Network on Consumer Behavior Studies and CIRCLE.

Regarding the impact, in the field of consumer behaviour, culture, and the linkage among both, it is necessary: a deep REVISION of the state of the situation, the development of an UPDATED, HOMOGENEOUS AND RIGOROUS MEASURE (considering the new context of Europe and cross-cultural analysis) to be implemented periodically to provide updated data, and AN UPDATED KNOWLEDGE on consumer behaviour and culture for teaching, research and taking strategic and tactical decisions.

This analysis is a key point for:

- The academic field: there are very limited studies on cross-cultural consumer behavior. Moreover, when dealing with culture, there are few studies, none of them updated, and limited.
- The educational field: teaching in subjects related to this field will be enriched with this knowledge.
- The firms: this information is crucial for taking decisions and trying to expand or surviving in local markets.
- The country economy: at this level it is essential to have a perspective of the situation of each country.
- It is the purpose of this network to finish developing an INSTITUTE OF CONSUMER BEHAVIOUR STUDY where all this knowledge can be gathered and disseminated.

What Are Going To Be The Outputs Of COBEREN?

The products will be:

- A data base where the data collected will be made accessible to all higher education and public organisms through a password sent once an online form has been completed.
- A CD providing a profile of culture in the different countries.
- A book summarizing the results of the European Consumer Behavior Analysis.
- A particular conference organized by COBEREN.
- Seminars with students where to disseminate such knowledge also organized by COBEREN.
- A workshop with business owners where to disseminate and try to develop specific future actions.
- A website to disseminate this knowledge and as a way to contact the network for possible help or requests.

Step By Step Of The Work Of COBEREN

WORK PACKAGE 1

Management and Coordination

This work package includes the following functions:

- Management
- Administration
- Financial control
- Coordination
- Monitoring

A standardised framework will be developed for carrying out research, dissemination of results and monitoring development, quality and implementation of the outputs.

The task included in this work package include:

- Establishing the network rules.
- Agreeing on the COBEREN chart.
- Signing the partners' agreements.
- Attending meetings and writing and communicating the minutes of the meetings.

- Controlling the quality of the work packages, assignments and final evaluations.

This work package is the responsibility of the Managerial Committee, which is formed by the following partners:

P1: University of León, Spain

P3: University of Savoy, France

P4: Ca'Foscari University of Venice, Italy

P9: University of Vaasa, Finland

P10: University of Nicosia, Cyprus

<i>Deliverable number</i>	<i>Description</i>	<i>Delivery date</i>	<i>Responsible partner</i>	<i>Partners contribution</i>
1.1	<p><i>First meeting</i></p> <p>The first meeting will be held in León (Spain) and the most relevant points of the agenda will include:</p> <p>COBEREN Rules COBEREN Chart Partners' agreements</p> <p>Discussion and resolution of doubts to ensure correct implementation of the project and strict adherence to the timescale</p>	19 th –20 th Nov. 2009	P1, P3, P4, P9, P10	<p>Discussion of the rules and chart of COBEREN. Agreement on work packages, assignments and budget. Participation and contribution in the meetings.</p>
1.2	<p><i>COBEREN Organisational Chart</i></p> <p>In order to establish responsibilities, the COBEREN Chart will be designed, discussed and agreed on among partners. This chart will be published on the COBEREN website.</p>	19 th –20 th Nov. 2009	P1, P3, P4, P9, P10	
1.3	<p><i>COBEREN Rules</i></p> <p>It is absolutely essential to agree on the Network rules in order to ensure correct functioning and to achieve the aims and future direction of COBEREN. These rules will be established on the basis of our experience of other networks and associations. They will be discussed during a meeting with all the partners, which will include the participation and input of a University of León academic specialising in Law</p>	19 th –20 th Nov. 2009	P1, P3, P4, P9, P10	
1.4	<p><i>Administrative issues: partners' agreements</i></p> <p>The partners' agreements will define the rights and obligations of the partners, and they will be established on the basis of the contract signed with the Commission of the European Communities</p>	19 th –20 th Nov. 2009	P1, P3, P4, P9, P10	
1.5	<p><i>Minutes, agenda and conclusions</i></p> <p>From the very first meeting onwards, minutes will be taken and communicated among partners.</p>	21 st Dec. 2009	P1, P3, P4, P9, P10	
1.6	<p><i>Second meeting</i></p>	3 rd –4 th Jun.	P1, P3, P4,	

	<i>The second meeting will be held in Annecy (France), and will focus on two major issues:</i> - Discussion of the final stage of the secondary information search. - Receiving feedback on work towards tool development	2010	P9, P10	
1.7	<i>Minutes, agenda and conclusions</i> After the second meeting, minutes will be distributed among partners.	21 st Jun. 2010	P1, P3, P4, P9, P10	
1.8	<i>Third meeting</i> The third meeting will be held in Venice (Italy), and will discuss data analysis, to be implemented over the coming 11 months	3 rd Mar. 2011	P1, P3, P4, P9, P10	
1.9	<i>Minutes, agenda and conclusions</i> After the third meeting, minutes will be distributed among partners	11 th Mar. 2011	P1, P3, P4, P9, P10	
1.10	<i>Fourth meeting</i> The fourth meeting will be held at the University of Nicosia and will discuss previous results of the research and materialisation in outputs. The main point on the agenda will be the Conference.	7 th Jun. 2012	P1, P3, P4, P9, P10	
1.11	<i>Minutes with the agenda and conclusions</i> After the fourth meeting, minutes will be distributed among partners.	15 th Jun. 2012	P1, P3, P4, P9, P10	
1.12	<i>Final meeting</i> The fifth meeting will be held in León (Spain), to evaluate the project and the future of the network (Institute of European Consumer Behaviour).	19 th Sep. 2012	P1, P3, P4, P9, P10	
1.13	<i>Minutes with the agenda and conclusions</i> After the fifth meeting, minutes will be distributed among partners.	21 st Sep. 2012	P1, P3, P4, P9, P10	
1.14	<i>Annual summary: year one</i> Each year, a summary of the main results and news from the network will be drawn up and published on the COBEREN website.	30 th Sep. 2010	P1, P3, P4, P9, P10	
1.15	<i>Annual summary: year two</i> Each year, a summary of the main results and news from the network will be drawn up and published on the COBEREN website.	30 th Sep. 2011	P1, P3, P4, P9, P10	
1.16	<i>Annual summary: year three</i> Each year, a summary of the main results and news from the network will be drawn up and published on the COBEREN website	28 th Sep. 2012	P1, P3, P4, P9, P10	

WORK PACKAGE 2

Secondary data

As companies expand globally, international marketing research becomes ever more crucial. Nevertheless, consumer behaviour in international markets is still not well understood, despite the importance of consumers and the knowledge acquired about them. As Meglena Kuneva, EU Consumer Commissioner pointed out “There are now more than 490 million consumers in Europe and their expenditure represents over half of the EU’s gross domestic product (GDP). Consumers are essential to economic growth and job creation. Yet there is an EU-wide lack of consumer confidence when it comes to cross-border shopping. I believe that consumers should be as confident about making purchases in other countries as they are at home”.

The aim of this network is to provide the knowledge necessary to better understand this scenario. Moreover, the information this network aims to collect would significantly contribute to the ten major priorities for the future development of consumer policy which have been defined by the European Commission (European Commission, www.cec.org.uk).

To fulfil this objective, the goal of this work package and of work package 3 is:

- To review, interpret, and summarise the knowledge, tools and measures developed for analysis of "culture" with a view to generating understanding and organised knowledge in this field.
- To obtain secondary data to develop indicators for European countries on consumption patterns, family structure, income, social class and age subcultures.

<i>Deliverable number</i>	<i>Description</i>	<i>Delivery date</i>	<i>Responsible partner</i>	<i>Partners contribution</i>
2.1	<i>Virtual interaction-homogenisation</i> Virtual interaction is essential for coherent, coordinated work and fulfilment of the proposed aims and outputs.	12 th Feb. 2010	P1, P3, P4, P9, P10	<i>Search the secondary information (indicators and consumer behaviour) for the own country.</i> <i>Review literature in national publications.</i> <i>Summarize the information and conclusions.</i> <i>Edit the country descriptors</i>
2.2	<i>Send the country descriptors</i>	29 th Jul. 2010	P1, P3, P4, P9, P10	
2.3	<i>Secondary data on indicators & consumer behaviour</i> Specifically, the indicators to identify include: - Consumption pattern - Family structure - Income - Social class - Age subcultures - Culture - Concept of self - Personality, values and motivations - Lifestyles - Determinants in purchase decisions - External influence: family, social groups and opinion leadership The second meeting will include a general presentation of the indicators identified for each country. Subsequently, a report describing the descriptors for the 30 countries will be prepared.	15 th Oct. 2010	P1, P3, P4, P9, P10	
2.4	<i>Website to publish first cross-cultural report</i> A website will be developed for publication of the first network report, which will focus on the descriptors for the 30 countries	8 th Apr. 2010	P1, P3, P4, P9, P10	

WORK PACKAGE 3

Literature review

The principle aims of the network are the development of:

- An accurate measure and an updated data related to culture, comparing 30 countries.
- Development of a knowledge base on consumer behaviour, applying the same methodology in the various countries in order to produce comparable data and facilitate analysis of similarities and differences between the countries.

A. Currently, there does not exist:

- An accurate tool to measure culture.
- A pool of updated knowledge on culture descriptors.
- Information on the cultural profile of European countries.
- At present, only two models exist which provide country scores that can be used for the analysis of consumption data (De Mooij, 2004): the models by Hofstede and Schwartz.

Geert Hofstede's model presents some limitations:

- The data base was compiled using information collected at IBM; consequently, the sample is not very representative.
- Information was collected using the company's employee attitude survey.
- The survey was undertaken between 1967 and 1973, and the data has not been updated.
- More dimensions could be considered nowadays, and in depth country analyses conducted.

Through the current project we aim:

A.1. To develop an accurate tool to measure culture.

A.2. To provide an updated data base on culture descriptors for 30 European countries.

A.3. To develop a model for profiling different European cultures. Shalom Schwartz's values are based on all cultures. For this reason, the goal of the present project is to:

A.4. Update Shwartz's scale in order to provide current information on values in European countries.

B. Consumer Behaviour is an interdisciplinary field. The COBEREN analysis will relate this discipline to culture.

In this work package, a homogeneous and accurate tool will be developed to measure culture, which can be implemented every 5 years in order to compile a homogeneous, longitudinal and updated data base on this topic. Such information has become crucial, both in academic and practical terms.

<i>Deliverable number</i>	<i>Description</i>	<i>Delivery date</i>	<i>Responsible partner</i>	<i>Partners contribution</i>
3.1	<p><i>Literature review</i></p> <p><i>A methodology will be developed to measure culture. This will become a benchmark in academic literature and a tool to be applied systematically every 5 years in order to maintain an updated homogeneous data base on culture in Europe.</i></p> <p><i>The literature review will be sent to the partners by the 29th of July, to be discussed and improved at the meeting in Hannover</i></p>	29 th Jul. 2010	P1, P2, P3, P9, P18, P7	Contribute in the tool development Pretest of the tool in the country.
3.2	<p><i>Discussion and Communication</i></p> <p><i>The literature review will be discussed and improved at the meeting in Hannover.</i></p>	17 th -18 th Aug. 2010	P1, P2, P3, P9, P18, P7	

WORK PACKAGE 4

Market research preparation

Market research preparation implies:

- Design of the questionnaire (translation into different languages)
- Design of the sample
- Selection of a sampling method
- Development of a data base

<i>Deliverable number</i>	<i>Description</i>	<i>Delivery date</i>	<i>Responsible partner</i>	<i>Partners contribution</i>
4.1	<i>Send the questionnaire</i>	5 th Oct. 2010	P3, P7, P10, P11, P24, P29, P32	Feedback of the questionnaire Sample information of the country Coordination of sampling method implementation
4.2	<i>Discussion & Communication</i> Discussion and communication is fundamental at all stages, but in this case it is even more crucial in order to produce comparable data for the following stage.	8 th Oct. 2010	P3, P7, P10, P11, P24, P29, P32	
4.3	<i>Research design: sample, sampling method</i> Technical specifications will be developed, considering the population characteristics of each country, as well as facilitating sample comparison between countries.	15 th Oct. 2010	P3, P7, P10, P11, P24, P29, P32	
4.4	<i>Final questionnaire design</i> The first version of the questionnaire will be sent to all partners by the 7 th of June, making the necessary adjustments on the basis of feedback, in order to produce the final version by the 30 th of June. This final version will also be submitted to all partners for further discussion and final input.	15 th Oct. 2010	P3, P7, P10, P11, P24, P29, P32	
4.5	<i>Translation of questionnaire</i> The questionnaire will be translated in order to be implemented in each country	29 th Oct. 2010	P3, P7, P10, P11, P24, P29, P32	
4.6	<i>Design data base</i>	29 th Oct. 2010	P3, P7, P10, P11, P24, P29, P32	

WORK PACKAGE 5**Market research implementation**

Market research will be coordinated and monitored to avoid bias.

<i>Deliverable number</i>	<i>Description</i>	<i>Delivery date</i>	<i>Responsible partner</i>	<i>Partners contribution</i>
5.1	<i>Field work</i> <i>Field work will be conducted (Nov. 2010).</i>	30 th Nov. 2010	P4, P2	<i>research in the country</i> <i>Selection and training of interviewers</i> <i>Update and control of data collection</i> <i>Communicate the data collection</i> <i>implementation, edition of the final data base</i>
5.2	<i>Data collection: monitoring / control of bias</i> <i>Concurrent with data collection, monitoring will be conducted in order to control and correct possible deviation (15th of November).</i>	Nov. 2010	P4, P2	
5.3	<i>Data base editing</i> <i>After collecting the data, each country will be required to edit this information in order to ensure validity and accuracy of the information which will constitute the data base</i>	15 th Dec. 2010	P4, P2	

WORK PACKAGE 6

Reorganizing knowledge and academic theory in the discipline

This work package will include:

- Analysis and interpretation of the data collected
- Homogenisation and explanation of the interpretations
- Production of results

Deliverable number	Description	Delivery date	Responsible partner	Partners contribution
6.1	<i>Edition and depuration of global data base</i> Once each country has edited the corresponding data, all data will be combined and edited, to form the global data base.	3 rd Feb. 2011	P6	Contribute to the edition Contribute in analysis and interpret the data
6.2	<i>Analysis of data</i> The analysis will be systematically published on the COBEREN website, with access limited to the partners. The goal is to keep partners informed and receive their feedback, providing a complete and in-depth analysis of the data.	9 th Jun. 2011	P1, P3, P6, P9, P10, P14, P15, P18, P21, P28, P34	
6.3	<i>Interpretation of data</i> Information obtained from the data analysis will be interpreted and explained by the experts comprising the network. This interpretation and explanation will be conducted, communicated and updated through the website.	7 th Jul. 2011	P1, P3, P6, P9, P10, P14, P15, P18, P21, P28, P34	
6.4	<i>Discussion and Communication</i> There will be regular communication between partners.	6 th Oct. 2011	P1, P3, P6, P9, P10, P14, P15, P18, P21, P28, P34	
6.5	<i>Homogenization of final interpretation</i> Agreement on the final content and structure of the book will be reached, based on the information and data previously collected and interpreted.	29 th Nov. 2011	P1, P3, P6, P9, P10, P14, P15, P18, P21, P28, P34	
6.6	<i>Updating the data base on culture</i>	1 st Mar. 2012	P1, P3, P4, P9, P10	
6.7	<i>Updating knowledge on cross-culture issues</i> A book will be published on culture and consumer behaviour in European countries, and will include sections on similarities and differences and how to implement the appropriate commercial. This will constitute the second part, the first being the report on descriptors for European countries (delivered in work package 2). A second report will be prepared on "Cross-cultural market research", describing practice and presenting advice	4 th Jul. 2012	P1, P3, P4, P9, P10	

WORK PACKAGE 7

Promoting improvements in teaching and research

The primary motives for building this network include:

- The need for a data base on culture, compiled using the same rigorous methodology in order to provide knowledge on culture for more than 30 countries.
- The need to provide an academic tool to measure culture, in order to maintain an updated data base of country descriptors.
- The relevance of reorienting consumer behaviour research.
- The need of reorganise teaching and research on culture and consumer behaviour.
- The managerial implications of the information/consultancy contributions of this network.
- The relevance of the networks associated through this proposed network in terms of research, dissemination and linking the research-education and academic-professional areas.
- The development of a cooperative network.
- The possibilities and importance of a future institution focused on updating and disseminating of knowledge about consumer behaviour and culture in Europe.

The tasks included in this work package are:

- To provide Higher Education Institutions with the future book, all reports and access to the data base on culture.
- To organise an academic conference, and to publish the conference proceedings.
- To organise a student seminar and to provide grants for some students to attend the event.

<i>Deliverable number</i>	<i>Description</i>	<i>Delivery date</i>	<i>Responsible partner</i>	<i>Partners contribution</i>
7.1	<i>Updating the material used for research & teaching</i> <i>Updating the material used for research and teaching in the diverse disciplines for which this knowledge is relevant.</i>	4 th Jul. 2012	P1, P9, P14, P23, P24, P32	<i>Participate in the conference</i>
7.2	<i>Academic conference</i> <i>An academic conference will be held, organised by partner 10 (Cyprus), the proceedings of which will subsequently be published on the network website</i>	6 th Jun. 2012	P10	
7.3	<i>Student seminar</i> <i>During the academic conference, parallel seminars will be held on different tracks and issues, with the aim of contributing to the development of student research, by using both the results of the project and the knowledge of the experts.</i>	7 th Jun. 2012	P10	

WORK PACKAGE 8**Promoting improvements in the business world**

Promoting improvements in commercial strategies through cooperation with companies and public organisations. More specifically, we aim to analyse consumer behaviour issues which are both economically and socially important. These include:

Perception, learning & memory, motivation, involvement, values and self-concept, attitude, individual decision-making, shopping/purchase, post-purchase, group influence and opinion leadership, family, income, social class, gender roles, age subcultures, lifestyles.

<i>Deliverable number</i>	<i>Description</i>	<i>Delivery date</i>	<i>Responsible partner</i>	<i>Partners contribution</i>
8.1	<i>Create access to knowledge</i> Access to the data base will be facilitated subject to certain requirements.	1 st Mar. 2012	P1, P3, P4, P9, P10	<i>Participate and look for companies which can be interested in the data base</i>
8.2	<i>Enterprise Workshops</i> The first "Entrepreneurial congress on cross-culture in Europe" will be organised. The deliverable 8.3 will be developed on the basis of these workshops.	8 th Jun. 2012	P1, P3, P4, P9, P10	
8.3	<i>Cooperation and consultancy projects</i> From the first congress, a network goal will be to provide this service in the future (ensuring 8th Jun. 2012 continuity through the development of a European Institute of experts on Consumer Behaviour).	8 th Jun. 2012	P1, P3, P4, P9, P10	

WORK PACKAGE 9

Control and quality evaluation

The purpose of this work package is to ensure quality fulfilment of the aims, after having achieved the individual aims proposed for the target groups:

Academic: The study of marketing in European Higher Education will benefit from a data base on culture throughout European countries, a pool of knowledge about consumer behaviour, and how this is influenced by culture. The study of economics will also benefit from this knowledge, together with other disciplines such as anthropology, psychology and statistics (this latter by providing indicators for the different European countries, thus contributing to the development of statistical and econometric models).

Furthermore, scientific theory will benefit from the tool developed and the methodology implemented, facilitating accurate measures of culture. This will improve not only research but also teaching, providing the Higher Education system with the material necessary to complement and update current knowledge.

Finally, the increased knowledge obtained from cross-cultural market research will benefit theory and practice in the fields of market research and methodology.

Students: Doctoral students can participate in this project, by attending or actively participating in the seminars to be held. This will provide them not only with better knowledge but also with the tools to improve their practice and the experience needed to complement their academic training. Undergraduate and Master's degree students will benefit from the better knowledge provided by this research on consumer behavior, culture and methodology, as well as from the different materials to be produced (report, book and data base).

Companies and public organizations: Given the issues of globalization and segmentation, appropriate knowledge about the market it is essential in order to make strategic and tactical decisions. Through the material generated by this project, as well as the workshops that will be organized, this network aims to provide the knowledge and consultancy advice required for reaching appropriate economic decisions, even more crucial nowadays given the economic crisis situation we are facing.

<i>Deliverable number</i>	<i>Description</i>	<i>Delivery date</i>	<i>Responsible partner</i>	<i>Partners contribution</i>
9.1	<p><i>Web evaluation and control</i></p> <p>The web will be evaluated addressing the following aspects: organisation, usability, access, information, update, members' site, aesthetic quality, overall impression. WORK PACKAGE 10**Dissemination of project results. Within the work packages 2-9**

The dissemination of results is extremely important. Through such dissemination, the COBEREN network aims to:

Provide the academic and entrepreneurial worlds with an updated data base on culture. This is crucial, not only from a social perspective but also from an economic perspective as it will facilitate more informed commercial decision-making (both strategically and tactically). Furthermore, this data will be collected using the same rigorous methodology, making comparison between different European countries possible.

Enhance teaching, through the provision of information on European countries, contributing to improving teaching and implementation of academic subjects, primarily in the fields of consumer behaviour, market research, commercial management and advertising.

Facilitate current research on these topics through the development and empirical testing of a tool to measure culture. In addition, the experience of this project should contribute to improving knowledge about cross-cultural research methodology.

Increase the pool of knowledge through the provision of consultancy services for public organisations and companies, helping them to take the appropriate actions and make the right decisions.

Establish networks and open the door for further collaboration (in teaching, research and enterprise innovation, etc.) throughout Europe.

Establish links between partners, through the creation of a database of contacts which will undoubtedly foster further co-operation, research projects, and academic initiatives in the future, all striving towards quality in European education and research

COMPETITION AND PERFORMANCE OF AGRO FOOD FIRMS: STRATEGIC AND FINANCIAL CHOICES OF CAMPANIA FIRMS'

Abstract

Over the last few years, the agro food industry has been undergoing a process of accelerated change, consequent to the incessantly modifying food geography, both from the demand and the supply side. This essentially exploratory research analyses the strategic choices of Campania agro food firms, as well as their wider strategic management process, performance and capital structure. The study focuses on competitive strategies that are largely affected by the mono-product nature of the SMEs, which characterize the economy of the Campania region (Italy). In this context the research investigates the critical factors of success and/or failure of the Campania agro food industry, the strategies adopted by regional firms, their resulting performance, their capital structure and the actions necessary to increase competitiveness. The methodology is based on extended secondary data research and literature review, as well as on a survey of sixty-five firms. Combining these, the research demonstrates some fundamental strategic problems of Campania firms, relating to competition, decision making and financial performance. Some firms were found to implement winning strategies, with their most important characteristic being their marketing orientation; and specifically their ability to understand and predict market trends and consumer behavioral patterns and to adopt appropriate and timely strategies.

Keywords: Agro, food, business, industry, strategy, marketing, finance, Italy, Campania

Introduction

Over the last few years, the agro food industry has been undergoing a process of accelerated change, consequent to the incessantly modifying food geography, both from the demand and the supply side. This essentially exploratory research (Selltitz et al., 1976; Tsetsekos, 1993) analyses the strategic choices of Campania agro food firms as well as their wider strategic management process and financial performance.

Historically and according to Modigliani and Miller (1958), researchers try to explain how firms choose their capital structure, since identifying an optimal structure can maximize the value maintaining their financial mix. The analysis and review of different approaches in the literature

confirm an optimal composition of financial sources. This must be compatible with the strategic profile of the firm in order to take part in the value creation process.

In this context the research investigates the critical factors of success and/or failure of the Campania agro food industry. The methodology is based on extended secondary data research and literature review, as well as on a survey of sixty-five firms. Secondary data was collected mostly from major agro food companies' data found in the AIDA (Bureau Van Dijk), ISTAT⁵², INEA⁵³, ISMEA⁵⁴ and Campania Region databases. The acquired data has substantially helped to define the context of the research in both industrial and organizational terms (e.g. number of firms, size, capital structure, performance); as well as to offer a point of comparison and interrelation to the primary research results.

Combining the above methods, the research demonstrates some fundamental strategic problems of Campania firms, relating to decision making and financial performance. In parallel and on the contrary, some firms were found to implement winning strategies (Vrontis et al., 2011), with their most important characteristic being their marketing orientation.

The Italian Agro Food System

The international food industry is generally characterized by a growing integration with the rest of the agro food system and food chain.

The links between agriculture, the food industry and food distribution presently create a general and integrated vision of the agri-food system (Brasili and Fanfani, 2006; Fanfani et al., 2009).

The Italian food industry is a fundamental part of the country's economic system and represents an important sector of its manufacturing industry. In recent years the food industry has been affected by the wider decline and loss of competitiveness of the Italian industry. In fact, over the last decade, the food industry has closely followed the changes of the manufacturing industry, both regarding the levels of productivity investment (Gallino, 2003; Nardozi, 2004; Toniolo and Visco, 2004).

The food industry has further evidenced some contrasting (anti-cyclical) characteristics from the past. Specifically, this has been true not only for the regular growth of food consumption, but also for the constant and consistent development of its exports within the previous decade (Brasili and Fanfani, 2006). An evaluation of the economic value of the agro food system in Italy has been carried out by INEA. In 2009, value added (VA) at basic prices in the primary sector, including forestry and fishing, dropped by 11.5% compared to 2008. Agriculture's share of value added in Italy's economy shrank by 1.8%.

The share of Italian agriculture to the total economy is marked by strong geographical differences: indeed, in the Centre-North, agriculture's share is 1.6% in terms of VA at basic prices and 3.9% in

⁵² ISTAT is the Italian National Statistic Institute

⁵³ INEA is the Italian National Agriculture Institute.

⁵⁴ ISMEA is the Italian National Agriculture and Food Services Institute.

terms of work units, whereas these values are 3.4% and 8.6%, respectively, in the South. The structure of the economy has evolved continuously over the past decade: agriculture's share of VA to the national total dropped from 2.8% to 2.6%. Over the same period, industry's share, in the narrow sense, fell from 23.4% to 19.4%, while that of trade, transport and communications remained stable, moving from 23.9% to 23.7% (INEA, 2011). Construction increased from 5% to 5.3%; financial services, information technology and research rose from 24.7% to 27.2%; and the public sector and other public services grew from 20.1% to 21.5%. In 2009, the total number of persons employed, expressed in work units (AWU), decreased by 2.6%. In 2009 agriculture's share of AWU in Italy's economy was 5.2%.

Product of Designated Origin

Italy's products of designated origin continued to increase in number, to 210 registered PDO and PGI products (22.6% of the EU total). Most of Italy's PDO and PGI products are fruits, vegetables and cereals (nearly 40%), extra-virgin olive oil (19%), cheese (17.6%) and prepared meats (almost 16%). Neapolitan pizza has become Italy's second TSG (Traditional Speciality Guaranteed), joining mozzarella. According to ISTAT, there were 80,600 businesses with PDO-PGI certification in 2008, 92.8% of which were farms and 5.8% processors.

ISMEA production figures for 2008 reveal a decline in production (-6.5%), mainly within the fruit and vegetable category (-20%). There were increases for cheese (+4.5%) and meat-based products (+2.1%). Olive oil made a strong recovery (+48.6%), after being severely affected by bad weather in 2007. PDO-PGI production value, up by 3.6% over the previous year, was around 5.2 billion euro; value of consumption on the national market was roughly 7.8 billion euro (+6%). Cheese alone accounts for over half of production value, followed by prepared meats. The trend in foreign demand, though positive, indicates a slowdown compared to the rather brilliant results of preceding years: PDO-PGI exports rose by 5.2% in volume and 3.2% in monetary terms, for a value of over a billion euro. PDO-PGI exports did well for fruit and vegetables (+7% in volume and +29% in value) and cheese (+4% in volume and value), while exports were down for meat-based products (-3% in both volume and value).

ISMEA figures on demand for PDO-PGI products indicate a drop in domestic consumption in 2008, of 4.3% in volume, and an increase of 2% in value, caused by higher average retail prices. Not all products felt the crunch from the economic crisis: Grana Padano cheese remained stable, partly thanks to trade promotion strategies in large-scale distribution. Exports of Alto Adige Speck, Asiago and Pecorino Romano did well. Exports declined sharply for Buffalo Mozzarella, because of the dioxin scare; and Valtellina Bresaola (a prepared meat), consequent to a drop in production and increased costs of raw materials, following the closure of imports of Brazilian beef (ISMEA, 2011: 83-84). The number of Italian quality wines increased for both PDO and PGI. There are 380 DOC and 49 DOCG wines. Production of 15 million hectoliters of DOC-DOCG from the 2009 harvest (+4% compared to 2008) accounts for 35% of all wines produced in Italy.

Production Trends and Investments in the Sector

The ups and downs in agriculture, and in the Italian economic system in general, also affected the agricultural land market. In 2008, the price of land showed a modest increase (+1.2%), to an average of 17,500 euro per hectare. Purchase and sale of land gradually slowed following restrictions of access to credit and the reduction in supply, though interest in land increased.

Comparison with the general consumer price index also reveals a drop in land value expressed in real terms: the land patrimony nationwide showed a decrease of 2.1%, confirming a lowering trend that began in 2005 and brought real values down to 2000 levels.

The share of investments in agriculture to the national total fell further, dropping to 3.5%, and the ratio to value added in agriculture also shrank considerably (-5.1% from 2008 to 2009). Investments per worker amounted to 6,400 euro, 33% less than the national average, with a decrease of nearly 16% in 2008. The percentage breakdown by type of goods shows a stronger share of investments in machinery and equipment (from 55.7% in 2003 to 57.3% in 2007, the most recent figure available). Capital stock in agriculture, after depreciation in real terms, dropped by -1.2%, reinforcing the downward trend already seen in 2008. On the contrary, capital stock per worker increased slightly (+0.6%).

In 2009, agricultural output at basic prices, including connected services, forestry and fishing, declined in value by 8.4%, compared to 2008, owing to a drop in output volume (-2.4%) and basic prices (-6.1%). By category, drops in production were recorded for field crops (-6.3%), tree crops (-2.6%) and fodder crops (-2.7%), while livestock remained stable (+0.6%). Declines were also observed for connected services, contract services and maintenance (-1.8%), agri-tourism (farm stays), and other secondary activities (-0.4%).

At a community level as well, the 2009 farm year was marked by a decline in both output volume (-0.6%) and prices (-10.2%). Drops in production mainly affected cereals (-5.7%), flowers and lants (-2.8%), olive oil (-9.3%), beef (-3%) and sheep meat and goat meat (-5.1%). Production was up though, for oil-seeds (+10.8%), sugar beets (+7.7%), vegetables (+2.9%), potatoes (+2.1%) and fruit (+4%). Wine also increased moderately (+0.9%). Production was down somewhat for milk (-0.5%) and eggs (-0.4%). Among associated activities, modest increases were shown by services linked to production (+0.2%), while secondary activities, including agro tourism, declined (-1.2%).

The Italian Agro Industrial System

The agro industrial system is made up of a number of activities through which agriculture interacts with all the sectors connected to it, up and down the supply chain: the inputs industry (fertilisers, pesticides, animal feed, energy, etc.) and the food, distribution and catering industries. The agri-food sector is estimated to have been worth some 246 billion euro, or 16.2% of GDP, in 2009. The main contributions were: approximately 25.1 billion from agricultural value added (VA), 22.4 billion from intermediate consumption in agriculture, 16.6 billion from agri-industrial investments, 25.7 billion

from VA in the food industry, 38.9 billion from VA in the catering industry and 98.8 billion from marketing and distribution.

The Italian Food Industry

The food industry, including drinks and tobacco, numbered around 60,300 businesses in 2008, down 4.5% from 2007 (ISTAT – Structure and size of businesses – 2008). In 2009, employment reached 456,200 work units, with a 9.9% share of employment in industry as a whole. 70% of labourers and approximately 77% of value added at basic prices in the sector were concentrated in the Centre-North. In 2009, production in the entire sector, though down slightly (-1.5%), showed partial solidity, considering the marked drop in industry overall (-17.4%). Value added in the sector dropped in volume (-1.4%) compared to 2008, but rose in value (+2.8%) as an effect of rising prices (+4.3%). The share of VA in industry in the narrow sense (mining and manufacturing) and in agriculture was 10% and 102.7%, respectively.

In the EU 27, production in the food industry, including drinks and tobacco, declined in 2009 by around 1% compared to 2008. Total value of production (based on 2007 figures) was roughly 913 billion euro, or 13.5% of industrial production value as a whole; there were 4.7 million employed, or 13.6% of those employed in the industrial sector.

Food Consumption in Italy

In 2008, Italian families' total expenditure for food and drink, including alcohol, was approximately 142 billion euro, a decrease in value of 1.7%. Total consumption also dropped in volume (-3.6%). Expenditure for eating out (canteens, restaurants, fast food, etc.) amounted to around 71 billion euro, slightly lower than the level for 2008, because of a drop in consumed volume (-2.5%). Between 1999 and 2009, the impact of this figure, in relation to the value of food consumption, rose from 41% to 50%. The most important categories in terms of expenditure are meat (31.4 billion euro), bread and cereal products (26.7 billion), fruit and vegetables (25.1 billion) and milk and dairy products and eggs (18.2 billion). Compared to 2008, decreases in volume were recorded for all types of food, especially sugar and confectionery (-4.9%), bread and cereals (-4.6%), meat (-4.3%), fish (-3.4%), oils and fats (-3.3%), coffee, tea and cocoa (-3.2%), fruit (-2.4%) and alcoholic beverages (-5.2%).

Foreign Trade

2009 was marked by a decline in value in all major macroeconomic aggregates. Indeed, compared to 2008, there was a drop of nearly 5% in total agro industrial output, and a more marked slump in trade flows. Imports slackened by 10%, exports by 8%, creating an improvement of 13% in trade balance, though it remains negative. In terms of normalized balance, the improvement was nearly one percentage point, for a value of -11.4%. Trade indicators also demonstrated the negative trend that affected Italy in 2009. Propensity to export worsened by 3.5%, in the face of a positive change posted for 2008. Propensity to import continued the negative trend of the previous year, with a more marked drop of 4.4%. In both cases, the change is mainly attributable to the drop off in trade flows. But there

were improvements in both the degree of self-sufficiency (+1.1%) and the degree of trade cover (+2.1%).

Agri-food's share to total trade showed an increase compared to the previous year, to 10.6% for imports and 8.5% for exports. Italy's most important trading partner, the EU 27, accounts for roughly 70% of both total imports and exports, a stable percentage in both cases compared to 2008. Other important areas for imports were South America (9% of the total) and Asia (7%); for exports, North America (10%) and the aggregate of Other Non-Mediterranean Countries (7%).

Italy's competitive advantage in processed products is shown by the industry's 80% share of total agro food exports and 66% of imports, the former slightly improved over 2008 and the latter stable.

The unfavourable trend affected both aggregates, with greater stability in the industry (-5.1% for exports and -9.3% for imports) than for the primary sector (-18.8% for exports and -12.2% for imports). Compared to 2008, the normalized balance worsened by roughly three percentage points for the primary sector and eight points for the agri-food industry. Retail of 'Made in Italy' products, the most representative of our agri-food, changed for the worse in 2009. In particular, as regards the primary sector, the most significant sales value was for fresh fruit, which showed a drop of 21.2% in exports compared to 2008.

Italian Agro Firm Structure

According to ISTAT figures in the most recent sample survey made on structures and production on farms (SPA), in 2007 there were just under 1.7 million farms in Italy, with an Utilised Agricultural Area (UAA)⁵⁵ of 12,744 million hectares. Average farm UAA of 7.6 hectares continues to grow, showing an increase of 3.2% owing to the gradual decline in number of farms, in the face of substantially stable UAA.

Italian agriculture continues to be made up mostly of small and medium-sized farms: 49.5% of farms have less than 2 hectares. Nonetheless, these farms cultivate only 6.1% of total UAA, while the 2.4% of farms with over 50 hectares account for nearly 40% of total UAA.

According to the 2007 ISTAT survey of structures and production on farms (SPA), the total workforce in terms of workdays on Italian farms was distributed as follows: 39.4% in the North, 15.9% in the Centre and 44.7% in the South. Compared to 2005, the total number of workdays dropped nationwide by 6.4%. The greatest reductions were in Sicily, Liguria and Valle d'Aosta; workdays increased significantly in Sardinia, Puglia, Veneto and Molise.

⁵⁵ The Utilised Agricultural area means the total area used for crop production, which is exhaustively described as : Arable land including temporary grassing and fallow and green manure, permanent grassland, land under permanent crops (e.g. fruit and grapes), crops under glass and other utilised agricultural areas.

Primary Research Results - The Campania Region Agro Food System

Introduction and Methodology

In 2009, value added (VA) at basic prices in the primary sector, including forestry and fishing, dropped by 0.6% compared to 2008. Agriculture's share of value added in Campania's economy grew up by 0.2%.

Campania's products of designated origin continued to increase in number, to 20 registered PDO and PGI products (9.5% of the Italian total). Most of Italy's PDO and PGI products are fruits, vegetables and cereals (nearly 55%), extra-virgin olive oil (20%), cheese (20%) and prepared meats (almost 5%).

In Campania there are also 18 DOC (4.73% of the Italian total) and 3 DOCG (6.12% of the Italian total) wines. Production of 0,288 million hectoliters of DOC-DOCG from the 2009 harvest accounts for 16% of all wines produced in region.

The primary research rests on a survey concerning 65 firms that commercialize agricultural product under their own brand, which represents about 3,35% of the corresponding firm population of the Campania region. The quantitative statistical analysis of data was mono and bi-variable. The sample is a little part of the total population of agro food firms. 80% are production firms and only 20% are transformation firms⁵⁶. The territorial distribution of firms shows a predominance of Avellino (28%), Benevento and Caserta (23% each) followed by Salerno (15%) and Napoli (11%).

Industry and Structural Analyses

One of the primary structural characteristics of the regional agri food firm is its strong integration with the primary sector (Rossi, 2008). In fact all enterprises produce at least one product of designated origin: 76% of these are PDO and 24% are PGI products.

One of the most notable results is the small size of wine firms. 60.2% of enterprises have a turnover of less than one million euro. Their small size is confirmed also by their number of employees who, in 63.5% of the cases, is less than 10 people. The Benevento and Caserta, provinces have the highest number of micro-enterprises, while the provinces Avellino, Salerno and Naples have a stronger presence of larger firms.

The data show that the principal problem is the low amount of equity that, in many cases, is at the minimum (legal) level (about €11.000). The undercapitalization of Campania SMEs is similar to the wider Italian agri food system. It is nonetheless especially alarming if these data are viewed in conjunction with the investments made by companies, that are already excessively indebted. This is a weakness for Campania firms that could undermine their competitiveness (Rossi et al., 2012).

⁵⁶ Production firms are the enterprises that realize all phases of production process starting with selection of the grapes and ending with bottling the finished wine. Transformation firms are all the enterprises that have not a production of grapes but they transform the grapes of other producers

The results demonstrate that the Campania agri food firms are under-capitalized. This is a problem in itself, since a large part of investments is covered through excessive debts. The low capitalization could influence the growth processes of firms and the under-capitalized enterprises could be merged with or acquired by international firms.

The regional agri food system is based, with few exceptions, on micro-enterprises, which are, by nature, often incapable of holding a pro-active attitude towards the changing and intensifying competitive environment. This appears in fact, to be the principal weakness of the regional wine sector. Regarding competitive strategy approaches, the results show that a large part of the regional firms pursue differentiation strategies (59%), an important part (about 36%) pursues niche strategies and even fewer (5%) choose cost leadership strategies.

Though the above strategies are claimed to be followed, it is not easy to determine if they are indeed implemented, to what degree, in what manner and how successfully. Frequently, it appears that they are simply general statements of a principle or mere general directions; instead of articulated and systematic processes that need to be formulated, implemented and monitored in order to be successful.

Further concerns are raised by the bi-variable analysis. The combination of size, net equity and strategic planning give important results: the complex organizational structure is linked with an evolved legal status and also with a high net equity. These enterprises present also a strategic planning that is more formalized. This means that firms with a high turnover and a higher number of employees have higher net equity and pay more attention to the strategic processes (Rossi et al., 2012).

Corporate Performance and Financial Analyses

To verify the effectiveness of strategic choices and their success, it is important to further undertake a corporate performance analysis. Strategic choices have some reflections on the corporate performance indicators (Hitt et al., 1998; Lumpkin and Dess, 1996). The first indicator to consider is the average turnover, which in 2009 was above 1.8 million. A comparison with data for 2008 shows a reduction of 1.8 %.

However this data is influenced by the excessive heterogeneity of the sample. Vegetables and cereals firms have the highest turnover (about 2.7 million euros), but this group presents greater uniformity. The wine and the extra-virgin olive oil firms have an average turnover of over 1.3 million. These groups are also characterized by high heterogeneity.

The average ROI in 2009 was 3.1 %, with an increase of 0.2% compared with 2008, but ROI value is far from the value of the major Italian wine enterprises (-1 percentage points). ROE is stable: from 1.9% in 2008 to 2.1% in 2009. Actually, the difference with the major national agri food enterprises is about 1.5. The low value of these indicators is due to the low value of Capital Turnover (for ROI) and the high impact of debt costs on net income (for ROE). The exiguous EBIT, in fact, is further eroded by the cost of financing. The value of these indicators has a double significance: on the one hand it

indicates a corporate growth, and on the other it represents a structural weakness of Campania wine firms (Rossi et al. 2012). Extra-virgin olive oil firms present a low value (2% ROI and 1.1% ROE), but the cheese enterprises are the firms that present the lowest profitability (1.21% ROI and 0.55% ROE). There is an important explanation of the low profitability of these groups: olive oil societies and cheese firms are not integrated upstream in the chain.

These data illustrate the weakness of strategic choices of a large part of the enterprises of the sample. The problem is more relevant to those enterprises that do not have formalized planning. For these firms, there is a problem of effective strategic implementation. Particularly vegetables and cereals enterprises appear incapable of implementing a proper strategic process, adequate for a changing industry and market. This problem is relevant also to wine firms largely for the same reasons (Vrontis and Thrassou, 2011).

The analysis of financial structures shows that all firms in the sample have excessive debt: in fact the capitalization index is less than 45%.

Finally, empirical analysis of investment policies show an increase of materials immobilization (+13.4%) and a low growth of intangible immobilization (+0.3%) for Campania firms. However, the increase of fixed assets has not interested in the same way all the companies in the sample: extra-virgin oil enterprises show little growth of immobilization (+3%), because they do not control the upstream phases of the production process.

Combining Primary and Secondary Data

The research has combined primary data with secondary ones to reach some specific findings regarding the Campania region agro food firms. These findings relate to industry, strategic, marketing and structural issues. Their interrelation and interpretation substantially and practically assist researchers and practitioners in their work at both the industry and the organizational level.

The research has demonstrated various fundamental strategic problems of Campania firms. However, it was also found that some firms are able to implement winning strategies, objectively measured by performance data (Vrontis et al., 2011). The single most important characteristic of these successful firms lies in their marketing approach and specifically in their ability to understand/predict market trends and consumer behavioral patterns; and to adopt appropriate and timely strategies. Specifically:

- size does not appear to be a factor of success. On the contrary, proper strategic formulation and implementation processes are.
- In terms of prescriptive conclusions, the obvious advice is to adopt proper strategic marketing processes. Beyond this, the research recommends mergers and acquisitions as the means to growth and the achievement of proportional cost economies (scale and scope).

- Regarding the financial aspect, this research's structural analysis found that there is low enterprises' capital and high financial exposure, which produces a double negative effect: firstly, high interest expenses erode the low operating revenue; and secondly, the resulting vulnerability of many local high-quality wine firms to acquisitions from larger international wine-makers
- The research has further surfaced a deficiency regarding the degree and nature of investments. Specifically, the need was pinpointed for investment in tangible assets to be supported by investments in research and development. Investments that aim for product and process innovations; brand repositioning along a higher (consumer-perceived) quality; and market and consumer knowledge towards development of ideas, creativity, originality and consumer-focused tactics.

<i>Company</i>	<i>Industry</i>	<i>Sales growth rate</i>	<i>ROI</i>	<i>Net worth / borrowings ratio</i>
<i>Feudi di San Gregorio</i>	<i>Wine</i>	<i>5,53%</i>	<i>4,60%</i>	<i>78,0%</i>
<i>Mastroberardino</i>	<i>Wine</i>	<i>2,89%</i>	<i>7,57%</i>	<i>110,0%</i>
<i>Industria Olearia Biagio Mataluni</i>	<i>Oil</i>	<i>12.13%</i>	<i>3.33%</i>	<i>61.1%</i>
<i>Cilento SpA</i>	<i>Cheese</i>	<i>6.46%</i>	<i>4.78%</i>	<i>67.04%</i>
<i>Pastificio Luico Garofalo SpA</i>	<i>Veg. & Cereals</i>	<i>1.59%</i>	<i>10.87%</i>	<i>52.57%</i>

Table 1. Top Five Campania Agro Food By Performance Indicators
Source: Research Results

- As far as product and brand design are concerned, it was found that the two need to be interlinked and developed in parallel. Specifically, Campania wine makers should continue to valorize their autochthones vines because they are appreciated and preferred by consumers, both locally and internationally. These wines have a strong cultural link with the region and this is both a practical, but also a brand advantage (Thrassou and Vrontis, 2009). For this reason it is important to 'rediscover' the values and cultural cues that identify the region.
- Beyond external collective action though, the agro food firms between themselves should learn to collaborate, both formally and informally. Especially in areas such as the building of international brand image, human resource development and attraction of external support, cohesion and collaboration is vital (Vrontis et al. 2011).

Conclusions

The essence of the above can be encapsulated in three fundamental guiding principles that must be applied towards achieving the desired competitiveness of the Campania wine enterprises:

- Understand and adopt proper strategic marketing processes throughout the organization and with a long term view
- Utilize the sustainable competitive advantage of the link with the region to strengthen and refine both the product and its brand image.
- Pursue cost efficiencies and economies of scale, be it through social support, collective actions, intra-industry networking or mergers/acquisitions.

The position the Campania enterprises are in, is neither new nor surprising to the business world. The elements of incessant change, intense competition, difficulty in adaptation, financial pressure and uncertainty are the rule rather than the exception in the 21st century (Vrontis and Thrassou, 2007). Like in most industries of most of this increasingly globalised business world, the agro food firms of Campania, Italy, will probably go through a long period of change, self-reflection and experimentation. Unavoidably some will fail and some will come out of it stronger than before.

Campania firms though, do have something positive to build on. They have a tradition, they have an already existing brand image to utilise, and perhaps more importantly: the harsh competition is largely with other regions/countries of the world and not necessarily between themselves. Individual firms therefore do not stand alone.

Abstract

In the last years, the integrated use of internet in the company marketing strategies has brought about deep changes in the economic sector of the countries. The World Wide Web has become the most important way companies share business information with other enterprises (B2B) and with consumers (B2C). Consequently, the companies have modified the processes making significant changes, mainly in the fields of communication and sales.

The study presented here is to be situated in the category of the B2C relations and is specifically addressed to the nurseries and gardening companies in the Southern regions of Italy that use the Internet as a communication and promotion tool.

The goal of this paper is, on the one hand, to evaluate the website quality and, on the other hand, to verify the entrepreneurs' perception of the role that the web-marketing strategies have on the companies economic performance.

The results show that the websites are well-framed and with a well-groomed design, but lacking in the some essential functions able to improve the usability of the website. Moreover, the surveyed companies give a little importance to the customer and community services, in fact few of them have a chat or a forum. The adoption of the website as sales channel is hardly diffused. The website stimulated sales that were ultimately transacted both via phone, fax and email, and in the place of business. Finally, the increase of the business profits depends mainly on the additional customers.

Keyword: Web-marketing, Web-site quality, Nurseries and gardening companies, Competitiveness, Southern Italy

Introduction

Due to the increasing competitive environment in recent years, ICTs has been playing a crucial role to sustain the development of companies and especially their performance growth. In fact, the advent of Internet led companies to enter the Net and to develop their personal website. This tool helps companies to improve the "Business to Consumer" relationships, to develop virtual sales channels and to attract new customers. Therefore, the quality of the website is crucial to draw the consumers' attention and to influence their decisions.

The exponential growth of web users in Italy, which in December 2011 reached the 35.8 million mark (representing 7.1% of European users) with a penetration rate touching 58.7% of the entire population (Internet World Stat, 2012), has encouraged companies to adapt rapidly to this trend by implementing increasingly innovative technologies. In 2010 in Italy, 98% of total number of Small and Medium Enterprises (SMEs), with a number of employees between 10 and 249, accessed the web mainly for banking and financial services (88%), receiving digital goods and services (47.0%) and obtaining after sales services (27.0%) (Eurostat, 2012). According to Eurostat data, on 1 January 2011 (Eurostat, 2011), 63.0% of SMEs have their own website or homepage, but, only 14.0% have some ordering, booking and reservation facilities.

The presence in the virtual web space, in Italy, has mainly developed in service companies working in areas such as tourism, computer and insurance (Casaleggio Associati, 2010). Therefore, the implementation of these modern technologies within companies from agro-food sector is very slow for mainly one reason amongst others that consumers usually appreciate direct contact before purchasing.

This study will focus mainly on the Southern Italy operating in the flower and ornamental plant sector, as one of the more interesting in socio-economic terms (Schimmenti, 2009). Moreover, according to the previous research (Asciuto et al., 2011), this sector is more and more interested by introducing and the use of web-marketing.

After the exploratory research made on the analysis of web marketing strategies adopted by several Italian companies (Asciuto et al., 2011), this research aims to assess the improvement of companies' competitive performance through the adoption of effective web-marketing models. More precisely, what is the effectiveness of the website as a tool of additional sales? The knowledge of these aspects is useful to prove the effectiveness of online marketing policies for companies to improve their performance.

In this paper, we will initially analyse the literature in order to show the crucial role played by the quality of websites in attracting web users and converting them into customers. We will then proceed to describe a methodological approach in order to examine the quality factors and how entrepreneurs perceive the importance of web presence. Subsequently, we will illustrate the results emerging from various website consulting activities and a telephone survey. Finally, we will present our discussion and concluding remarks.

Supporting literature

The World Wide Web has become the most important way organizations share business information with other enterprises (B2B) and with consumers (B2C) (Beatty et al., 2001; Zwass, 1996; Hoffmann et al., 1995); due to the great potential of its mass-interactive nature, the World Wide Web has led to a huge number of customers and organizations participating in a global online marketplace,

introducing new commercial standards related to marketing in business world (Bucca et al., 2006; Manthou et al., 2005; Kotler, 2002; Hoffmann and Novak, 1996, 1997).

To stay at the tremendous growth of the Internet as a medium of communication, and particularly at the rapid adoption of the World Wide Web as a new market, many companies have reengineered their communication tools and marketing strategies by establishing their presence on the Web (Brychan et al., 2004). Moreover, in order to strength the potential of the Internet, many companies are providing increasingly sophisticated websites (Auger et al., 2003) in order both to differentiate their websites from other companies' and to achieve a competitive advantage (Lynch and Ariely, 2000). Several studies have identified the website design as a key factor for the development of a successful virtual space (Hernández et al., 2009; Cyr et al., 2008; Cao et al., 2005; Frost and Strauss, 2002; Ranganathan and Ganapathy, 2002; Huizingh, 2000); a good website design includes high quality information, easy and attractive navigation, good content, product comparison, personalization, experiential nature and ease of ordering (Lepkowska-White and Eifler, 2008; Lepkowska-White et al., 2004; Brown et al., 2002; Page and Lepkowska-White, 2002; Chatterjee, 2001; Geyskens et al., 1999; Alba et al., 1997).

Empirical studies consistently found that having a website offers many benefits to companies, mainly as location and time independence as well as the opportunity, especially for small companies, to overcome the limitations of size and compete more effectively with other companies both locally and nationally, improving companies economic performance (Dholakia and Kshetri, 2004; Geysken et al., 2002; Vescovi and Iseppon, 2002; Quelch and Kleyn, 1996). Benefits for companies also include reduced advertising costs, the ability to monitor customer choices and gather market information (Beatty et al., 2001), as well as the ability to communicate over long distances (Barton, 2003), new customers, increased sales and enhanced competitiveness (Burke and Sewake, 2008); productivity, marketing savings, and incremental or new revenue streams represent other crucial factors (Hoffmann and Novak, 1996). Lasly, Muske et al. (2004) found that agro-based entrepreneurs agreed that possessing website increase their agro-business profits.

However, in spite of the many benefits of having a corporate web site, various researches indicate that its adoption remains limited (Auger et al., 2003; Beatty et al., 2001). In 2011, the overall percentage of enterprises in Italy with a website is 63% (Eurostat, 2011) leaving a substantial percentage of companies who does not own a corporate website. According to Casaleggio Associati (2010), the presence of companies in the virtual space is quite common in the sectors of touristic, information and insurance products and in the leisure time. The same doesn't apply to agri-food SMEs as several researches show; for example, according to Warren (2004), less than one third of farmers surveyed had used the Internet for business purposes; Muske et al. (2004) report the same for agricultural micro-businesses. More recently, a survey conducted by Begalli et al. (2011) verified the low level of internet marketing adoption by Italian speciality wineries, highlighting a low website adoption rate (60.7%). Similarly, in a survey on the adoption of Internet technologies in Hawaiian flower growers during 2005, Burke and Sewake (2008) found that about 78% of surveyed growers reported using the Internet for business-related activities, and of those using the Internet, only 54% reported having a website.

The presence of agri-food SMEs in the web has been hampered by different issues related to firm typology, to the encountered difficulties in integrating modern ITs in the firm organisation, to the lack of marketing ability and finally to the characteristics of the agricultural products themselves (Schimmenti and Galati, 2010; Simmons et al., 2007; Bucca et al., 2006; Manthou et al., 2005; Amponsah, 1995; Huffman and Mercier, 1991; Jarvis, 1990; Putler and Zilberman, 1988).

Few studies have focused on the perceptions of SMEs agri-food companies' entrepreneurs regarding the strategic value of web marketing. Begalli et al., (2009) is one of the few that dealt with this; they found that only the 61.0% of entrepreneurs with websites perceived the internet as an important tool to promote their company. Simmons et al. (2007) highlight the need for SME agri-food companies to develop an awareness of the importance of the adoption of the internet for their business.

Objective and methodological approach

The present research is situated within Business-to-Consumer relationships and is particularly aimed at nurseries and gardening companies that integrate internet into their business for communication and promotional purposes and/or as an additional sales channel.

On one hand, this study based on website consulting, aims to analyse the main structural features of a potential website enabling it to be labelled as "good" and whose awareness is pivotal to define effective online marketing solutions. On the other, the study intends to examine in what way the interviewed operators perceive websites as a tool enabling the improvement of the corporate economic performance.

The quality of the website may depend on task-related factors affecting end users such as presentation, quality and appeal, content and functional adequacy, navigability (Rababah and Masoud, 2010), website safety and reliability, quality of the offered services (Parasuraman et al., 1988; Pitt et al., 1995), usefulness as perceived by the user and perceived user-friendliness (Davis, 1989), to cite but a few. In this paper, the quality features chiefly considered are those relating to a model already suggested in a previous scholarly contribution (Schimmenti et al., 2012). The proposed model based on those suggested by Cox and Dale (2002), as well as Begalli et al. (2009), differs greatly due to a diverse combination of content parameters, also including convenience, design and comfort facets (Figure 1). In particular, accessibility and speed are not taken into account, although such characteristics encourage users to return to the website.

In order to assess the presence of the main quality features in all websites visited, and considering the lack of an existing official database containing the searched data, we proceeded to conduct our search in a few specific portals such as proflora.it and florovivaismo.com, integrating the emerging data with other information sources available via the most important search engines. We viewed an overall number of 52 websites relating to nurseries and gardening companies located in the Southern regions of Italy, and especially in Abruzzo (2 websites), Basilicata (4 websites), Calabria (3 websites),

Campania (8 websites), Molise (1 website), Apulia (10 websites), Sardinia (5 websites) and Sicily (19 websites).

Figure 1 – Adopted model (Schimmenti et al., 2012)

The survey relating to website data conducted from January to March 2012 was carried out on the basis of a provided questionnaire divided into 5 sections. The first section aimed to define the context (site typology: informative, communicative or transactional). The second section proposed to analyse the website content and convenience (website size, languages used, information regarding the company and the type of products and services offered, product availability, purchasing terms and conditions, right of withdrawal, purchasing modality, payment methods, user registration, treatment of personal data, final target of the offered products and services, type of company certification, participation in trade shows). The third section analysed the website design and confort (graphic organization, map view, features of the links appearing on the web pages, possibility of website browsing, presence of animations). The next section of the questionnaire proposed to investigate customer services (presence of Frequently Asked Questions-FAQs, telephone and/or fax number and of a toll free number for information requests, a service for filing customer complaints, a service for information queries and/or new product requests, technical support). Lastly, the fifth and final section aimed at analysing community services and user loyalty building strategies (access permitted to registered members by entering a User-id and password, the presence of a 'My Account' page, presence of forums, chat rooms and specific links, any special offers for habitual net surfers, opportunity of sharing the website on Facebook).

By contrast, in order to glean the companies' perspective on the strategic importance of websites, a telephone survey aimed at the actual companies was conducted at the same time, by presenting the

interviewees with a questionnaire broken down into 10 questions that attempted to investigate the level of importance of websites perceived in communication, promotional and commercial terms. In particular, we verified the value of sales conducted thanks to web presence compared to the overall company sales, as well as the impact of web presence in terms of turnover variation compared to the previous situation (without website).

Results and discussion

The quality of web site

The survey conducted by visiting websites shows the points of strength and the main critical issues concerning the web-marketing strategies adopted by companies operating in the floral and ornamental plants sector.

Regarding the Context, the quasi-entirety of visited websites is endowed with informative and communicative functions⁵⁷ (50 websites), whereas the transactional function was detected only in 2 of the examined websites.

In relation to the Content, we found that companies mostly direct their websites at Italian web users; accordingly, 63.4% of websites is only available in Italian, although the number of websites that may also be consulted in English is significant (26.9% of cases). Corporate information, as defined by Robbins and Stylianou (2003), relating to the data provided by the company regarding its background, activity, product or service description, etc., which is vital in increasing the quality of the information stated on the websites, is broadly available in the viewed websites. Approximately 80% of websites contains a detailed description of the company history and relevant company activities, whereas in fewer cases (67.3%) information regarding products and offered services was provided. As regards the products offered by the companies (mostly flowering plants and shrubs), it is possible to obtain information on species and/or varieties (35 cases), flowerpot size (22 cases), plant height (11 cases), flower-growing techniques and packaging types (7 cases, respectively), price and product availability (6 cases, respectively) on the website homepage and/or in other site pages. Information relative to delivery deadlines is stated less frequently (2 cases). Finally, in no case are the website update frequency and number of received visitors mentioned.

Regarding Customer service features, and specifically as regards transactional websites (2 cases), the purchasing procedures appear to favour online order placement by completing a provided form, which nevertheless fails to enable the user to complete his/her transaction. In such cases, payment may be carried out via bank transfer or by cash on delivery. Customer service seems to be virtually neglected by the investigated companies and is more often than not confined to the more traditional means of communication, such as telephone and fax. In 78.8% of cases, the user may request

⁵⁷ The function informative concerns the data of the company supplies regarding its background, activity, products or service description. The communicative function is related to the facilities and communication channels that companies offer for users to establish direct contact. Finally, the transactional function concern the ease with which the internet transaction may be completed (Hernández et al., 2009).

information online even prior to registration (11 cases). However, in this latter case no information is supplied regarding the treatment of personal data. Furthermore, FAQs, namely the transmission of messages intended for habitual users, were encountered only in 2 cases.

As far as web design is concerned, most websites are well structured and besides presenting images of available products and services both on the homepage and in other pages, some also contain a brief text sometimes divided into paragraphs. This aspect is essential. In fact, as already established by other research projects, the perceived quality of information and therefore the information mode are also significantly affected by the way in which the information is presented to the user, and represent a key opportunity for fostering positive response from online users (Flavián et al., 2009). In 75.0% of cases the “homepage” link is available on each page, thus making the navigability of the website much easier. However, other equally important solutions advancing web usability appear rarely. For instance, such solutions include the change of link colour following consultation (1 case), the presence of a search bar found only in 7 consulted websites, which also lack a search function made more user-friendly by a drop-down menu, the “map view” function enabling a rapid visualization of the structure and website file organization (4 websites). Lastly, 15 consulted websites present some sort of permanent animation. These features, that are frequently neglected in the viewed websites, become extremely relevant for improving web usability and navigability (Flavián et al., 2009; Robbins and Stylianou, 2003; Clyde, 2000; Hudson et al., 2000).

Any community services stated in the examined websites are generally of the traditional kind, since there are virtually no forums and chat rooms available, through which users may communicate prior to registration with the company in question, which, in turn, would become better acquainted with its customers and better able to meet their expectations. Moreover, very few websites (14 cases) offer the possibility to access the website as members by entering a user-id and a password.

Web site and economic performance of the companies

Our analysis focussing on website quality features was followed by a survey aimed at the actual nurseries and gardening companies whose websites were visited and based on investigating how the interviewed operators perceived web-marketing tools, as well as their impact on economic performance.

Almost all interviewees (51 operators) believe that websites are an effective tool for boosting their company image while promoting any offers. However, only 42 operators acknowledge web presence as conducive to increasing the competitiveness of their company on the market. There are several reasons for this, many ascribable to endogenous factors stemming from the investment efforts needed for the structuring of a quality website, as well as the human resources required for the maintenance of its functionalities. The nurseries and gardening industry is also restricted by further limitations relating to the type of perishable products in question, which inevitably affect the logistic organization of the companies, and to the need for customers to establish a direct contact with the product prior to purchase. Likewise, these two cited reasons determine the poor diffusion of e-commerce in the

investigated sector, as stressed repeatedly by the interviewed operators. Although websites are considered by 41 of the interviewed entrepreneurs as an effective alternative sales channel compared to the traditionally adopted ones, they are hardly used to settle any business transactions (2 cases) and their use is largely restricted to providing purchasing instructions, enabling the actual purchases to be speeded up but not completed.

Furthermore, by conducting a direct survey we also proposed to assess the impact of web presence from an economic viewpoint. As for the incidence on the overall turnover ascribable to the web presence of the companies, the data was not readily quantifiable according to the interviewed operators, in some instances due to the poor contribution of the website to their sales, and in other cases because no particular attention was paid to this aspect. On average, for those companies yielding this data, the turnover correlated directly or indirectly to the web represents approximately 15% of total sales.

Half of the interviewees also acknowledges a certain influence of the website in the variation of the overall turnover of the company compared to the previous situation when the company itself did not benefit from it. On average, companies have registered an increased turnover which is estimated as reaching the 10% mark. In alignment with the results shown by Burke and Sewake (2008), for a number of companies websites have generated various benefits, which although not directly stemming from online transactions, have contributed to improve their economic performance, especially thanks to loyalty building strategies directed at old customers and to the attainment of new customers, also enabling the containment of the crisis and its repercussions.

Finally, it appears that nurseries and gardening companies were introduced to the world wide web around 2005. There is also a scattering of companies which can be considered true pioneers, as they became equipped with a website as early as towards the end of the 90s. We cross-referenced the year in which the website was launched online and the turnover variations, failing, however, to find a direct correlation between the two variables, as per Beatty et al. (2001).

Conclusion

The present study carried out by analysing 52 websites referring to nurseries and gardening companies operating in Southern Italian regions enabled us to identify the points of strength as well as any structural limitations of the visited websites, while assessing how the interviewed operators perceive the importance of the role played by websites within company management strategies.

Our research showed that in most cases websites fulfil quality criteria which are broadly acknowledged by the existing empirical literature, in particular those relating to website design. However, a number of functionalities ensuring the optimization of web usability are largely absent. Moreover, it is felt that companies are reluctant to integrate certain tools (forums, chat rooms, social networks, etc.) promoting a direct interaction with web users and advancing the possibility of converting the latter into loyal consumers. This trend is in conflict with the general dissemination in

recent years of tools that are able to interact directly with users in order to develop a stable and lasting relationship.

Our research showed that most consulted websites do not endorse e-commerce methods for their sales, but tend to use the web as a mere informative and promotional tool, in any case bringing about an improvement of the company's economic performance. According to the classification suggested by Worhach (2000) identifying three stages of e-commerce involvement (Connectivity, Customer connections and Commerce) we may therefore argue that all viewed websites fall within the Customer connections stage.

Accordingly, it is essential for nurseries and gardening companies situated in the Southern regions of Italy, most of which are small in size and mainly employ traditional distribution channels (Schimmenti, 2009), to acquire a greater awareness of the opportunities which the internet is able to offer in order to increase or enhance company competition. This, in turn, entails the possibility for the companies to make technical investments for implementing updated IT tools or developing appropriate cognitive and technical qualifications which are currently deficient among surveyed companies.

Abstract

Under the invitation of the European Directive 52/2008/EC, the Legislative Decree n. 28 of 4 March 2010 has introduced mediation to the Italian legal system, as an alternative mean of resolving civil and commercial disputes. The purpose of this paper is to reconstruct the motives behind and the path through which mediation has been introduced in Italy as the institute to solve the long-standing problem of the inefficiency of justice. Indeed, in an international comparison, the Italian judicial system ranks in the last positions, and this hampers firms growth, foreign investment, and the development of financial and credit markets. Mediation is seen as a way to solve this problem and thus foster the economic and social development of Italy. Early results on the application of the new institute seem encouraging, although the spatial distribution of mediation offices could not be able to meet the demand of new procedures coming from different areas of the country.

Keywords: Efficiency of the judicial system; Mediation; Italy

Introduction

Under the invitation of the European Directive 52/2008/EC, the Legislative Decree n. 28 of 4 March 2010 has introduced mediation to the Italian legal system, as an alternative means of resolving civil and commercial disputes.

The stated aim of the new institute was to relieve the civil courts of the burden of pending cases that accumulated over decades of poor functioning of the judicial system. In fact, the efficiency of the judicial system is one of the fundamental determinants of growth and economic development of modern economies: its inability to protect creditors rights discourages investments both domestic and from abroad.

According to the latest Doing Business report, prepared by the World Bank, Italy ranks in the last positions in terms of ability to ensure the enforcement of contractual agreements. Also, taking into account the high taxation and the excessive government bureaucracy, it is easy to explain the low growth rates of the Italian economy.

Mediation, as introduced by the Decree mentioned above, should be a fundamental step towards greater efficiency of the judicial system and thus should foster economic growth and social development of Italy.

The purpose of this paper is to reconstruct the motives behind and the path through which mediation has been introduced in Italy as the institute to solve the long-standing problem of justice, and to analyze the early available data on its application.

The paper is organized as follows. The next two sections describe the process leading to the enactment of European Directive 52/2008/EC and the salient characteristics of the latter.

In Section 4, an analysis of the Italian civil justice system, compared to those of other western countries, is provided to shed light on the reasons leading to the Legislative Decree 28/2010, whose features are discussed in Section 5. Finally, Section 6 reports some data on the first nine months of mediation in Italy, whereas the last section draws some conclusions.

The path towards the EU Directive 2008/52/EC

The EU Directive n. 52 of 21 May 2008 stems from a long regulatory process and the progressive focus and clarification of issues related to the development of Alternative Dispute Resolution (ADR) techniques.

Since 1993, the European Commission had devoted attention to ADR schemes in a Green Paper with reference to access of consumers to justice and the settlement of consumer disputes in the European market (Barberio et al., 2011).

Afterwards, through the Recommendation 98/257/EC, the Commission established the basic principles (transparency, independence, debating, effectiveness, legality, liberty and representation) (Impagnatiello, 2011) to be followed by adjudicative ADR schemes, in which a third person settles the dispute by taking a decision with respect to the different positions of the parties.

In the wake of such measures, the Council also called on the Commission (Resolution on a Community wide network of National bodies for the extra-judicial settlement of consumer Disputes) to extend the criteria of the Recommendation 98/257/EC to other alternative means of dispute resolution (including conciliation).

Granting the request of the Council, the European Commission issued the Recommendation 2001/310/EC, which identified the basic principles which should inspire consensual ADR schemes and, then, a Green Paper on ADR in civil and commercial matters.

The aim of the Green Paper was not only to take stock of the situation, but also and above all, to open a wide debate among Member States on how to ensure an optimal environment for the development of ADR in the single market. In the document, the Commission regards mediation as a form of social reconciliation, more appropriate - in many cases - than recourse to the ordinary courts or arbitration.

Once the extensive consultation process was ended in October 2004, the Commission presented a proposal for a Directive that, building on the Green Paper, pursued the aim of promoting the use of mediation by rules based on principles such as confidentiality, enforceability of agreements, suspension of prescription periods and the adoption of a quality system and a uniform standard of conduct for mediators.

The EU Directive 2008/52/EC of 21 May 2008

At the end of the process outlined above, the European Union issued the EU Directive n. 52 of 21 May 2008 (the Directive) on civil and commercial mediation. A Directive, instead of a Regulation, in order to tying Member States to achieve goals, while leaving the choice of which tools to use (Sensini and Sgambati, 2011).

Although the text formulated by the European Parliament and the Council of the European Union states that the provisions contained in the Directive shall apply only in cross-border disputes, nothing prevents Member States to also apply them to internal mediation procedures (Dalfino, 2010).

The guidelines and the circumstances that led the Community legislator to make the 14 articles of the Directive are enunciated in the recitals of the preamble. In the first recital, it is stated that "The Community has set itself the objective of maintaining and developing an area of freedom, security and justice, in which the free movement of persons is ensured. To that end, the Community has to adopt, inter alia, measures in the field of judicial cooperation in civil matters that are necessary for the proper functioning of the internal market".

In this regard, the legislator states that:

- "to facilitating better access to justice, the European Council at its meeting in Tampere on 15 and 16 October 1999 called for alternative, extra-judicial procedures to be created by the Member States" (Recital 2);
- as early as May 2000, "the Council adopted Conclusions on alternative methods of settling disputes under civil and commercial law, stating that the establishment of basic principles in this area is an essential step towards enabling the appropriate development and operation of extrajudicial procedures for the settlement of disputes in civil and commercial matters so as to simplify and improve access to justice" (Recital 3);
- since the 2002 Green Paper, the European Commission had undertaken "widespread consultations with Member States and interested parties on possible measures to promote the use of mediation" (Recital 4).

So, the legislator, having recalled that the objective of the Directive is to ensure better access to justice (Recital 5), identifies in mediation an alternative means of resolving civil and commercial disputes (Recital 6).

The main features of the new institute can be deduced from Recital 6. In fact, it is recognized that mediation, thanks to *“processes tailored to the needs of the parties”* can lead to agreements that are *“more likely to be complied with voluntarily and are more likely to preserve an amicable and sustainable relationship between the parties”*.

The preservation of the relationship between the parties represents the most innovative element of the new institute: this has induced the European legislator to promote and encourage mediation as an effective means of resolving disputes (Sensini, Mariano and Sgambati, 2011).

More specifically, Recital 3 states that *“The principle of access to justice is fundamental”*. This principle, together with that affirmed in the next recital, enhances the tools and methods of alternative dispute resolution as remedies for many problems of national judicial systems and, at the same time, such tools can simplify and improve access to justice. In Section 6, are highlighted the most important aspects of the institution. The greater likelihood of compliance with the agreement reached and, at the same time, the preservation of the relationship between the parties are at the heart of the institute (Supino, 2011).

In mediation, the third does not pronounce any decision, and there are not a prevailing party and a losing party; when, with the help of the mediator, the parties find an agreement, there is a realistic chance that the same is complied with voluntarily.

The Directive, while limits the use of mediation to claims/rights which can be freely disposed by parties, recommending that *“it should apply in civil and commercial matters. However, it should not apply to rights and obligations on which the parties are not free to decide themselves under the relevant applicable law”* (Recital 10), on the other hand, it gives great autonomy to the parties stating that mediation *“should be a voluntary process in the sense that the parties are themselves in charge of the process and may organise it as they wish and terminate it at any time”* (Recital 13).

In Recital 19, the Directive, in order to enhance the institution and to make equal its effects to those of other legal proceedings, provides that *“Member States should [...] ensure that the parties to a written agreement resulting from mediation can have the content of their agreement made enforceable”*.

In Recital 24, then it encourages Member States to formalize the provision of a suspension or revocation of limitation periods in order not to prevent *“the parties from going to court or to arbitration if their mediation attempt fails”*.

In the rest of this Section we highlight the salient features of the main articles of the Directive under discussion.

Article 1 sets out the objectives and scope of the law, stating that the purpose of the Directive is to *“facilitate access to alternative dispute resolution and to promote the amicable settlement of disputes by encouraging the use of mediation and by ensuring a balanced relationship between mediation and judicial proceedings”*. Moreover the same article stipulates that the Directive applies *“in cross-border disputes, to civil and commercial matters except as regards rights and obligations which are not at the parties' disposal”*.

under the relevant applicable law” and does not extend “to revenue, customs or administrative matters or to the liability of the State for acts and omissions in the exercise of State authority”.

Article 2 provides for the scope of the Directive, stating that *“a cross-border dispute shall be one in which at least one of the parties is domiciled or habitually resident in a Member State other than that of any other party”.*

Article 3 clarifies that:

- *“Mediation means a structured process, however named or referred to, whereby two or more parties to a dispute attempt by themselves, on a voluntary basis, to reach an agreement on the settlement of their dispute with the assistance of a mediator” (letter a);*
- *“Mediator means any third person who is asked to conduct a mediation in an effective, impartial and competent way, regardless of the denomination or profession of that third person in the Member State concerned and of the way in which the third person has been appointed or requested to conduct the mediation” (letter b).*

Each State may provide *“voluntary codes of conduct by mediators and organisations providing mediation services”* and *“encourage the initial and further training of mediators in order to ensure that the mediation is conducted in an effective, impartial and competent way” (Art. 4).*

Likewise, Member States are free to make the use of mediation compulsory or introduce incentives or penalties provided that such measures *“does not prevent the parties from exercising their right of access to the judicial system” (Art. 5).* The last point is very important because it is clear that if the mediation process has to preserve its freedom and voluntariness, the right of the parties to take direct action through the courts must be retained. If this was prevented, the principles that stand at the base of the mediation would be harmed.

Article 6 establishes the enforceability of agreements resulting from mediation unless their content *“is contrary to the law of the Member State where the request is made or the law of that Member State does not provide for its enforceability”.* In the second paragraph of the same article, it is stated the enforceability of the agreement *“by a court or other competent authority in a judgment or decision or in an authentic instrument in accordance with the law of the Member State where the request is made”.*

Article 7 provides for the right to confidentiality in mediation proceedings, providing that, unless otherwise disposed by the parties, they shall be dispensed from testify unless *“this is necessary for overriding considerations of public policy of the Member State concerned, in particular when required to ensure the protection of the best interests of children or to prevent harm to the physical or psychological integrity of a person where disclosure of the content of the agreement resulting from mediation is necessary in order to implement or enforce that agreement”.*

Article 8 provides for the protection of the rights of the parties to resort, after the mediation procedure, to the ordinary justice system, and requires Member States to provide adequate suspension of the terms of prescription or limitation.

Finally, Article 12 stipulates that Member States must comply with the Directive by the deadline of 21 May 2011.

Efficiency of the Italian judicial system: an international comparison

The efficiency of the judicial system, whose measurement depends upon the analysis of its three main dimensions (accuracy, duration of trials and costs), is a fundamental condition for the smooth functioning of the economy of a country.

Recent studies showed that the inefficiencies of civil justice have a negative impact on the entire economic system, hampering firms growth, foreign investment, and the development of financial and credit markets. Legal rules and their enforcement are recognized by many authors as one of the main indicator of the economic performance of a country (Bianco et al., 2007; CENSIS, 2009; Jappelli et al., 2005; Johnson et al., 2002; La Porta et al., 1998; Leaven and Woodruff, 2007; Rajan and Zingales, 1998; Sensini, 2011; Zan, 2006; Padrini et al., 2009).

Country	Rank 2011	Procedures (number)	Time (days)	Cost (% of claim)
<i>Luxembourg</i>	1	26	321	9.7
<i>France</i>	6	29	331	17.4
<i>United States</i>	7	32	300	14.4
<i>Germany</i>	8	30	394	14.4
<i>United Kingdom</i>	21	28	399	24.8
<i>Portugal</i>	22	31	547	13.0
<i>Japan</i>	34	30	360	32.2
<i>Spain</i>	54	39	515	17.2
<i>Montenegro</i>	133	49	545	25.7
<i>Kosovo</i>	157	53	420	61.2
<i>Italy</i>	158	41	1210	29.9

TABLE 1 – Enforcing Contracts Rank (183 countries) – 2011

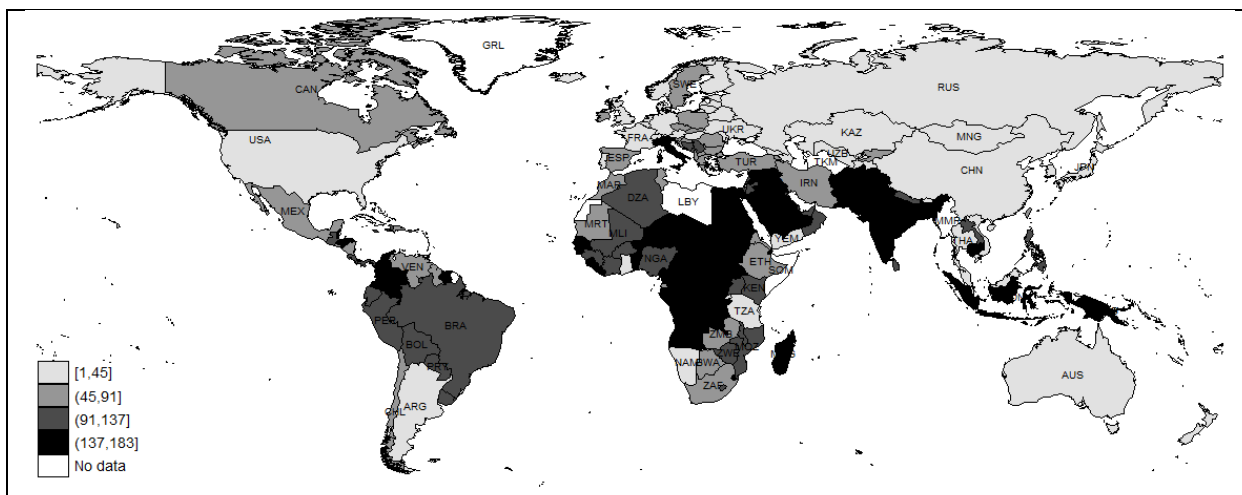

In Italy, the growing culture of litigation, the congestion of the courts, the excessive workload of the magistrates, the long duration of trials and the costs of judgments, have determined a deep crisis in the judicial system (Costantino, 2005; Pepino and Rossi, 2007).

In particular, the excessive time for the resolution of the disputes have increasingly weakened the strength and certainty of rules, feeding a vicious circle in which the slowness of legal remedies foments further incentive to disregard contractual obligations, with serious repercussions not only on the competitiveness of country but also on the social perception of the concept of justice (Sensini, 2012).

The current duration of the civil trials are likely to give rise to opportunistic and speculative behavior, disregarding the request of justice of who is aware of the full legitimacy of his claim and turns to State to be protected and obtain a just satisfaction of his rights and interests.

In this regard, statistical data show a worrying situation. To reach a judgment, a dispute takes 845 days in first grade, 1,163 days in second grade and 1,195 days in the Supreme Court: 3,203 days to go through all levels of courts. Indeed, the reports of the Commission Européenne Pour Efficacité de la Justice (CEPEJ – European Commission for the Efficiency of Justice) and the World Bank show, for Italy, a picture far from comforting.

Table 1 shows ranks in terms of ability to enforce contracts for some developed economies as calculated by the World Bank in its Doing Business 2012 report. Italy ranks in the last positions after Montenegro and Kosovo. The same can be appreciated from the map reported in Figure 1.

FIGURE 1 – Enforcing Contracts Rank - 2011

In the current economic scene, globalized economies are increasingly affected by speed and efficiency. The serious dysfunctions of the civil justice are likely to further compromise the future paths of growth, development and modernization, as well as to produce negative effects in terms of confidence in the credibility and legitimacy of institutions.

The choices of economic agents, which is already subject to business risk, need for certainty, at least legal, that encourage investments rather than discourage them.

The attractiveness of a country and the competitiveness of its firms necessarily calls for an efficient judicial system and thus a drastic reduction of duration of trials and their costs.

The Legislative Decree n. 28 of 4 March 2010

The Italian legislator, in line with the suggestions from the European Union, implemented mediation by the Legislative Decree No. 28 of 4 March 2010 (the Decree), with the goal of reducing the

workload of civil judges and gaining efficiency in the functioning of the judicial system (Fabiani and Leo, 2010).

The new institute, has expanded the tools made available by law for the resolution of disputes, promoting (albeit, in some cases, forcing) and extending (through fiscal incentives and legal deterrents) the freedom of the parties, with the goal of create a new cultural approach to the dispute.

Mediation, in fact, albeit subject to certain regulatory constraints, is characterized by a logic entirely new with respect to the trial: the parties are not bound by principles of procedure, but they are directly involved in negotiating the agreement, with the aim of composing the dispute in an independent solution and govern in new ways the conflicting relationship (Dittrich, 2010).

Indeed, Art. 1 of the Decree defines «mediation» as “the activity, however named or referred to, performed by a third impartial party and aimed at assisting two or more parties both in reaching an amicable agreement for the settlement of a controversy, as well as in formulating a proposal for its resolution”. The term «conciliation», instead, identifies “the settlement of a controversy following the performance of the mediation”.

The new legislation does not resize the central role of judicial protection, because, if the mediation does not lead to a shared solution, nothing prevents the parties to resort to ordinary courts (Sciancalepore, 2011). Nevertheless, the Decree, at Art. 5, has introduced two kinds of mediation procedure:

- a mandatory procedure, which is a prerequisite to access ordinary justice and applies to litigations regarding the following matters: *condominium, property rights, division of assets, inheritance, family agreements, leasing, gratuitous loans, firms renting, damages due to car/nautical accidents, medical liability, damages from libel by press and finally insurance, banking and financial contracts;*
- a voluntary procedure, which applies to any civil and commercial litigation regarding matters other than those listed above.

Mediation procedures are managed by public or private mediation organisms enrolled in a special register kept by the Ministry of Justice (Art. 16). The procedure start following an application for mediation by one or more parties of a controversy to a mediation organism. The person in charge of the institution designates a mediator and makes an initial meeting among the parties within 15 days from the application (Art. 8). The entire procedure must come to a conclusion within a maximum of 4 months (Art. 6).

Parties can be assisted by legal advisers, which have a duty to inform their clients about the possibility to settle the controversy through mediation (Art. 4).

Some data on the early application of mediation

According to the latest figures released by the Ministry of Justice, in the period March-December 2011, 60,808 mediation procedures have been initiated, and 40,162 of them have come to their conclusion. Table 2 shows the distribution of the procedures by matter.

<i>Subject</i>	<i>Number of procedures</i>	<i>Percentage</i>
<i>Condominium</i>	655	1.08
<i>Property rights</i>	11,999	19.73
<i>Division of assets</i>	3,507	5.77
<i>Inheritance</i>	3,058	5.03
<i>Family agreements</i>	59	0.10
<i>Rental property</i>	7,239	11.90
<i>Gratuitous loans</i>	1,240	2.04
<i>Firms renting</i>	932	1.53
<i>Damages due to car/nautical accidents</i>	529	0.87
<i>Medical liability</i>	4,465	7.34
<i>Damages from libel by press</i>	764	1.26
<i>Insurance contracts</i>	4,925	8.10
<i>Banking contracts</i>	5,590	9.19
<i>Financial contracts</i>	2,086	3.43
<i>Others</i>	13,760	22.63
<i>Total</i>	60,808	100.00

Source: Our elaboration on Ministry of Justice (2012) data

TABLE 2 - Mediation procedures by matter – March-December 2011

The most frequent type of litigation concerns insurance, banking and financial contracts (20.72%), property rights (19.73%) and rental property (11.90%).

As regards the geographical distribution, the highest number of procedures has been managed in the region of Campania (15.3%), followed by Lombardia (12.3%) and Emilia-Romagna (9.7%).

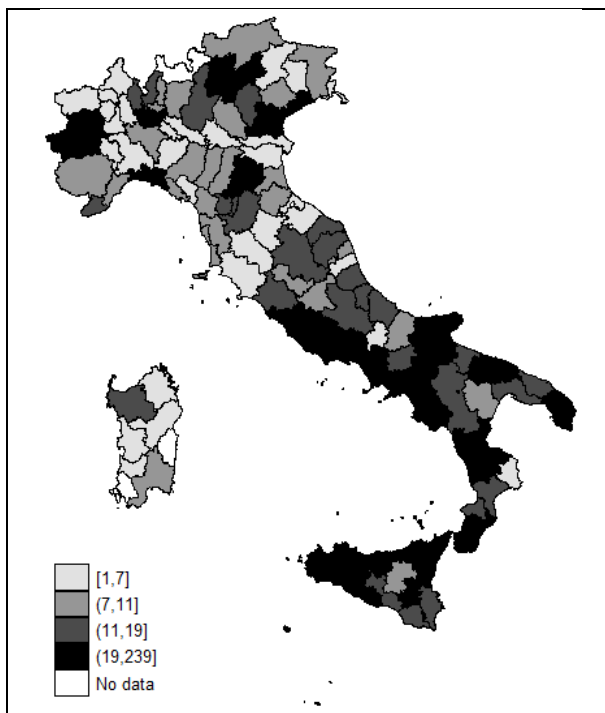

Taking into account the procedures come to the conclusion (40.162), the called party has joined the mediation in the 36% of total. In this case, the proceedings were concluded with the attainment of an amicable agreement in more than half of cases (52%). In other words, in nine months, the civil judicial system has been relieved of 7,158 new trials.

These data are quite encouraging, though refer only to the mandatory mediation, which, however, accounts for 77% of the total number of procedures. Moreover, one should consider the extremely short duration in which disputes have been resolved; on average, a mediation procedure has taken three months (69 days if the called party has not joined and 57 otherwise), whereas the average duration of a civil trial, in the same period, was 1,066 days.

The average value of the dispute amounted to 93.700 Euro. Finally, the applicant, in most cases (84%) has been assisted by a lawyer; conversely, the called party has been advised only in 21% of cases, unless he decided to join, in which case this percentage rises to 85%.

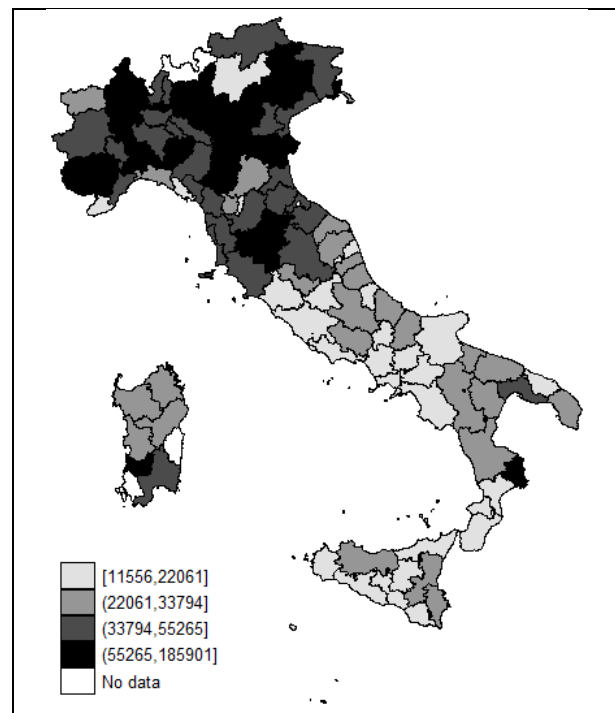

As noted above, under the Decree, procedures are managed by mediation organisms. As of 30 April 2012 there were 838 organizations in Italy with 2044 offices located throughout the country.

Fig. 1 reports the map of the provincial distribution of mediation offices. They are located primarily in the South, where, because of the high rate of unemployment, mediation is seen as an important job opportunity.

Source: *Our elaboration on Ministry of Justice (2012) data*

FIGURE 2 – Number of mediation offices by province - 2012

Source: *Our elaboration on Ministry of Justice (2012) data*

FIGURE 3 – Number of inhabitants per mediation office by province - 2012

This, however, has led to an inhomogeneous distribution of mediation offices, which in some cases could not be able to satisfy the demand of proceedings from residents. Figure 2 shows the distribution of the number of inhabitants per office; as one can see, there are marked differences among provinces: the inhabitants to number of offices ratio ranges from 11,556 in the province of Avellino (located in the South of the peninsula) to 185,901 in the province of Novara (located in the North-West of the country). More generally, the northern area of the country is characterized by a number of offices that, at first glance, seems insufficient.

Summary and conclusions

In this paper we have analyzed the path leading to the introduction of mediation to the Italian legal system as a means of alternative dispute resolution in civil and commercial matters. Many people consider mediation as a way to solve the problem of inefficiency of the Italian judicial system, which in international comparison, ranks near the bottom of the list.

Early results on the application of the new institute seem encouraging, although the spatial distribution of mediation offices could not be able to meet the demand of new procedures coming from different areas of the country.

In order for mediation to work, however, the quality and professionalism of its two main actors, organisms and mediators, should be high. And to this end, probably, would be useful to provide even more stringent qualifying requirements than those currently in force.

Indeed, the challenge of mediation before being legal, is social and cultural. However, in a country characterized by high conflict, where negotiation is not still recognized as a way to resolve disputes, mediation cannot, by virtue of only legal obligation, to enter fully and immediately into culture.

It is then necessary to promote the philosophy of mediation (and, more generally, of ADR), understood not as downsizing of the central role of the judicial protection, but as a useful tool to complement the ordinary justice and promote conflict resolution and continuity of social relations and trade.

And in this challenge, the quality and professionalism plays a major role in creating a climate of confidence and foster the development of a new culture of conflict.

The proper functioning of mediation organisms and constructive criticism aimed at better remodel the current regulatory framework are welcome, at least until the philosophy of mediation will not become the cultural heritage of our country.

In contrast, criticisms aiming to destroy the new institute without the prospect of alternative hypotheses for resolution to the problem of the inefficiency of justice seem less useful.

INTERNATIONAL JOINT VENTURES' EFFECTIVENESS: A PROJECT-MANAGEMENT AND TEAM-THEORY CONTRIBUTION

Shetach, Ana¹

¹Dept. of Health Systems Management, Yezreel Valley College, Israel. Email: shetachf@netvision.net.il

Abstract

This paper attempts to draw on Team Theory and practice and, more specifically, on know-how from the study of Project Management, to seek insights into enhancing the effectiveness of International Joint Ventures, with the aim of contributing to their effective and efficient decision-making and operation processes. Based on an analysis of the obstacles that may stand in the way of the efficient implementation of international joint ventures, five specific conditions for such mega-projects' success are brought forth. A couple of practical tools for their attainment are proposed. The article suggests that the construction of the teams involved, as well as the working-procedures that may render their work effective, should be flexible and made adaptable to the specific assignment or case, which is specifically dealt by each team, at the time; and that the optimal set of procedures to adopt, throughout the working sessions of the teams, which are involved in the venture, are those which will gear the team with the means, to contribute to the eventual materializing and finalization of a quality and practical set of decisions; for the benefit of the overall venture process.

Introduction

Drouin *et al* (2009) wrote: "Performance problems in international joint venture (IJV) operations have been linked to inadequate attention to human resource issues, during the formation stage of IJV projects. However, little research has considered how HR approaches are brought to the strategic agenda, during the IJV formation stage, and no research has investigated the factors that facilitate or impede the shaping of these HR approaches, to improve IJV success". (p. 344)

Why do IJVs often encounter performance problems and have notoriously low success rates? What are the obstacles standing in the way of IJVs' success? How can IJV's functioning be improved, to increase their long-term effectiveness? Those queries stand in the basis of this paper.

Various critical elements to be considered for the enhancement of successful IJVs are brought forth in the recent literature. Kandemir & Hult (2005) discussed the notion of organizational learning culture. They argued that "IJV achieves superior performance by higher levels of innovativeness (openness to new ideas) and innovation capacity (capacity to implement innovations)" (p. 430).

Farrell *et al* (2011) suggested that a learning orientation, IJV partner mutual dependency and management control, have a positive effect upon the learning success. They also showed that organizations with higher levels of learning orientation and learning success have higher levels of business performance. Their findings imply that foreign partners in IJVs, which are successful in

achieving their learning goals and improving their knowledge, will be winners in terms of improving their business performance.

Mohr A.T. (2006) analyzed the differences in the way partner firms assess the performance of IJVs. He wrote: "...an understanding of these differences is important for the practice of, and for research into IJV management. From a managerial point of view, firms, as well as IJV management, need to know how the partners evaluate the venture's performance" (p. 247).

Drouin *et al* showed that "the shaping of HR approaches in the IJV formation stage is influenced by key individual, organizational, and cultural factors such as composition of the IJV team, firm's distribution of power and decision-making style, organizational frame of reference, and socio-cultural distance between IJV partners" (p. 344).

Katsioloudes & Isichenko (2007) revealed that diverse importance values, by the various partners in the venture, were responsible for IJVs' failures.

Magnini (2008) discusses hotel IJVs. He emphasizes the importance of effective knowledge sharing at the individual joint venture manager level, at the relationship level between individuals, and across the entire organization.

Das & Teng (1998) and Gray & Larson (2006) discuss the issues of trust and control. They argue that a balanced approach of combining control and trust may be a crucial factor that contributes to effective IJV performance.

IJVs have been investigated in a variety of cultures; for example: Acquah (2009) studied ventures in Ghana, Farrell *et al* (2011) studied some in Malaysia, and Katsioloudes & Isichenko focused their research in Russia. All in all, factors concerning shared goals and values, knowledge sharing, efficient management control and various human relations factors, all seem to highly influence the outcomes of IJV over time, in any given cultural and intercultural circumstances. Yet, As Drouin *et al* (2009) wrote: "...the research literature on IJVs has not paid much attention to HR patterns or managerial behaviors associated with the parent companies of JV enterprises" (p. 345).

This paper attempts to assemble the above inputs into a united, practical and applicable conceptual framework. The following discussion constitutes the potential contribution of team and project Management Theory and practice, to the inquiry into the crucial factors that determine IJVs effectiveness. It proceeds to shed some light on the appropriate steps and general approach needed to be taken, to enhance IJVs effectiveness in a variety of cultural and political frameworks.

A CONTRIBUTION FROM TEAM AND PROJECT THEORY AND PRACTICE

A major field of study within Management Theory is that of Teamwork, and the management of projects and decision-making processes within teams. Team Theory limits itself to issues that have a direct implication to team-work, team-processes and the difficulties encountered within them. Effectiveness is a primary and central issue within those scopes of knowhow. IJVs – their goals and

objectives, the structure of the involved forums and their working procedures, their association with the concerned managements, owners, and organizational units, as well as other factors and sectors, for the benefit of whom they exist, would, therefore, be a direct concern for team and project experts.

The diagnostic tools for studying the functioning of teams will be applied to IJVs, to help shed some light on the factors that render them, as the literature reveals, often enough, insufficiently effective, to this day.

Daft (2000) proposed the following characteristics of a team: (a) two or more people are required in order to constitute a team; (b) people in a team have regular interaction and (c) people in a team share a common performance goal. In teams, people have complementary skills and work together to achieve a shared purpose. They hold themselves mutually accountable for its accomplishment (Schermerhorn, 2001; Dessler, 2004)

Teamwork is, therefore, all about a group of people having a common "raison d'être", and attempting to get goals materialized and achieved. Pineda & Lerner (2006) defined a project team as a collection of individuals who are interdependent in the tasks they perform and who share responsibility for outcomes. The various forums that handle the different aspects of a complex process such as an IJV, at its various stages, will hereby be referred to as teams.

Many have questioned, researched and discussed the issue of effective and efficient decision-making and decision-implementation in teams (e.g. Adizes, 1992, 2004; Beirhoff & Muller, 2005; Tjosvold, 2006; Gibson & Saxton, 2005).

It has been shown, within a variety of organizations, that when different stakeholders, from different functional areas or organizations, are involved in a working team, such as any IJV team, contradictory interests, assumptions, expectations, knowledge and perceptions may seriously jeopardize team processes (Elias & Zwikael, 2007).

Adizes (2004) views the management of any team, project or decision, as an overall process of maximizing two objectives: the quality of decisions taken *and* the efficiency of their implementation. A set of two tools is recommended to promote those two managerial objectives (Adizes, 1992; Shetach, 2009; Shetach, 2010): The "capi" Model and the Revised Decision-Square Model (RDSM). When managing team decisions and projects, one should make sure, in advance, that the decision (or set of decisions) one is taking is a qualitative, suitable and workable one. In order to ensure both the quality of the decisions to be taken *and* the smooth process of their application, the "**capi**" Model (illustrated in Fig, 1) recommends that team and project managers investigate three potentially hazardous factors, *prior* to implementation:

1. The factor of "*authority*" - The "capi" Model "advises" its users to verify, in advance, *whether the project manager has, in fact, the full authority to act independently upon decisions, taken within the project.*
2. The factor of "*power of cooperation*"- In order to ensure maximum success in any decision, the "capi" Model recommends, that one must take initiative steps, *in advance*, to ensure full cooperation,

of all “power-holders”, in the future - *ensuring that co-operators have the necessary know-how and/or capabilities and/or resources as well as willingness and interest to cooperate.*

3. The factor of “influence” (or “information”) - One should also make sure, in advance, that the decision one is taking, *is a qualitative, suitable and workable one.*

It is the coalition (“c” in the model) of the three factors - “authority” (“a”), “power of cooperation” (“p”) and “influence” (“i”), and the *preliminary analysis of the decision-situation* with the aid of this combination, that enables one to be sure, to the maximum of one’s potential abilities, of the ultimate results of one’s doings. For an IJV team’s set of decisions to have a chance of eventually being implemented successfully, representatives of all the three above factors, from all parties concerned, are required to man it.

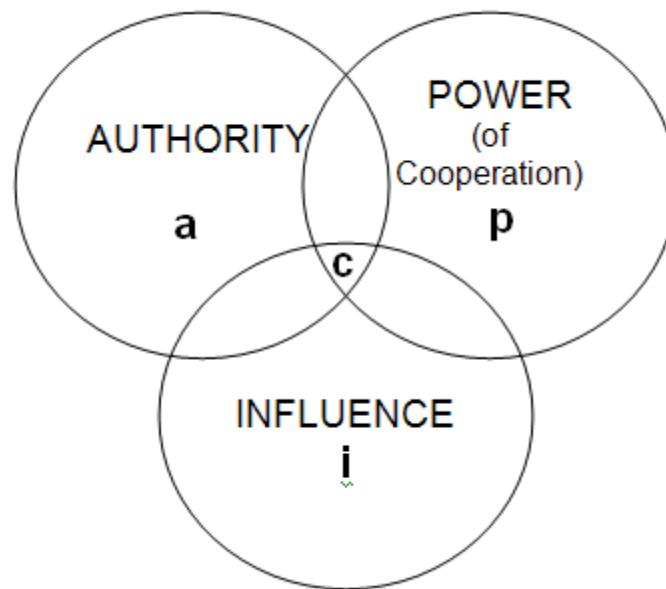

Fig. 1: The “capi” Model

The RDSM (Revised Decision-Square Model) is a tool that ensures efficient follow-up and a high level of control over project and decision implementation processes. It collapses all the possible variety of decision aspects, into four categories that constitute the four sides of a square (Shetach, 2009). Those decision aspects include not only the common goals, a detailed operative description of the final project/decision results, a detailed implementation timetable, resources and processes for their attainment, and the distribution of assignments among committee members, but *also* dates for future follow-up meetings of the team, *and* the nominated project/decision coordinator for that team. Figure 2 presents a detailed RDSM.

The RDSM states that the more thoroughly, clearly and unequivocally one “seals” (i.e. specifies in detail) all decision-aspects, one has a better chance of efficient implementation. It recommends “sealing” a Decision-Square (usually more than one, i.e. a square per each topic or aspect of the overall

issue or project-aspect), before the end of every team meeting, which takes place as part of the project or venture. This tool touches on extremely *basic* issues, such as *tying all loose ends, ensuring clear and unequivocal communications within teams, setting follow-up meetings and dates, etc.* Its contribution for managers is in emphasizing the obvious (such as scheduling enough follow-up meetings, to ensure that quality and timetables will be maintained), which is sometimes neglected or taken for granted, thus hindering, or even totally jeopardizing efficient implementation.

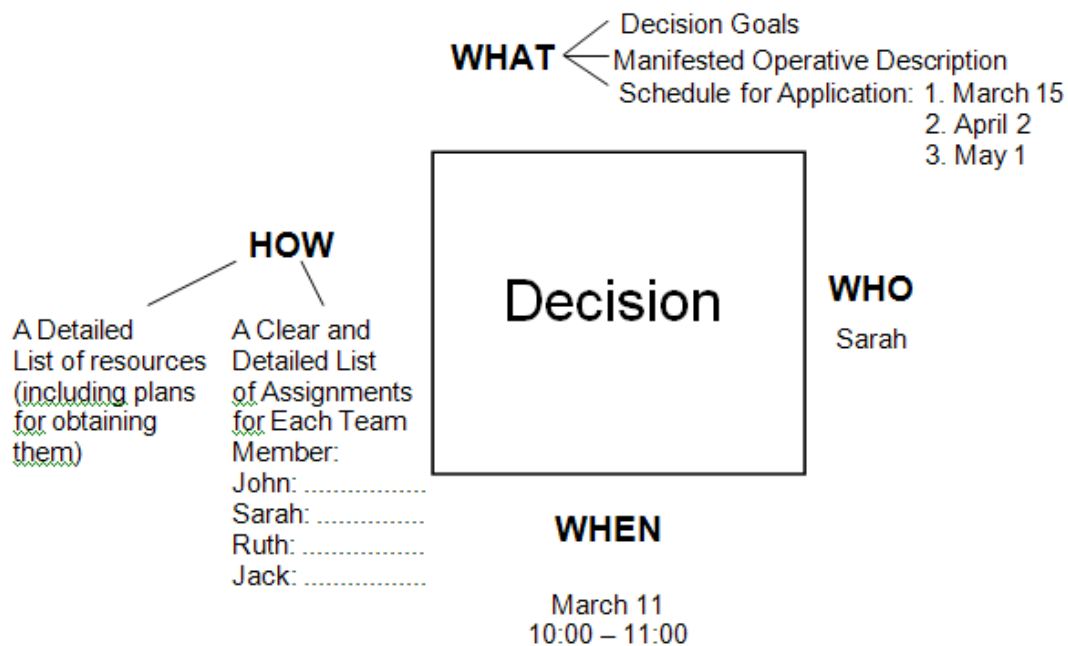

Fig. 2: The Decision-Square Model – An Elaborated Example

The significance of these two models for future IJVs work is elaborated in the following.

CRITERIA FOR EFFECTIVE IJVS

A variety of obstacles, apparently, stand in the way of the effective proceeding and outcomes of IJVs; many of which have been researched and discussed in the literature. Examples are provided in the literature in Drouin *et al's* (2009) work, in that of Farrell *et al* (2011) and in others'. A comprehensive understanding of the nature of such obstacles is thus essential, to be able to search for specific strategies and techniques to overcome them.

Shetach (2010) reported of an extensive long-term observation into obstacles, interfering with team decisions and team performance. She came up with five categories of obstacles that cover the full spectrum of such interferences, in the attainment of effective and efficient team-work results. She proceeded to present the critical factors by which to construct a working-team, in order to ensure its eventual effective functioning.

It is to be argued, in the following, on the basis of the above work (Adizes, 1992; Shetach, 2009; Shetach, 2010), that in order to maximize IJVs' effectiveness, teams involved in those ventures should be constructed and managed to stand up to *six major criteria*:

1. Their specific mission, within the overall venture, should be clarified and agreed upon among team members, considering the interests of all parties concerned.
2. They must be provided with the appropriate authority, to carry out their missions.
3. They need to be manned by a suitable composition of members, representing the relevant expert professions, as well as the factors that are expected to carry out the team's decisions.
4. They must function along a suitable set of regulations and working procedures. The decision making process within the committee should enable all members to share their dilemmas and interests, and to, eventually, arrive at mutually satisfactory decisions.
5. They should employ an efficient method for follow-up and control over their decisions.
6. A "supreme" team, systematically overlooking and monitoring the overall IJV process, in charge of the coordination and cooperation of all other team, which stands up to criteria 1-5, is required.

As will be argued in the following, effective IJV teams' work, as well as the overall venture, can be maximized on condition that *all six criteria* are applied *simultaneously*, for all teams involved.

These six are elaborated, one by one, in the *following six sections*:

1. Mission Clarification

Are all IJV teams' missions clarified and agreed upon, regarding each particular issue, by all its members; with all partners' interests taken into consideration (from the top executive team down to each and every specific/professional one)?

IJVs, by nature, are processes that attempt to bring together organizations, which can each benefit from the union, due to the potentially differing strengths of each one. These differences enable the potential contribution of each partner for the benefit of the other. In addition to that, the composition of the teams that are constructed to deal with the various aspects of the venture is often of an interdisciplinary nature. All those differences, within the various teams, produce a state of contradictory preliminary interests of their participants. Each factor within the team would naturally view "effectiveness" and "success", of any discussed issue, in different terms. Differing goals and objectives tend to hinder the development of constructive discussion processes, failing to lead to mutually agreed-upon recommendations and decisions (Katsioloudes & Isichenko, 2007).

A preliminary pre-discussion stage, within each meeting, spent in dealing openly with viable goals and objectives for each case or topic, is rarely attempted, on the common assumption that the declared goals are common knowledge and that underlying interests are irrelevant or non-discussable. Teams tend to rush into the actual topics under hand, rather than "waste time" on controversial issues that may hinder their "progress".

Thus, it is absolutely essential for effective teams to work their way through decision making processes, only after a clear, mutually agreed-upon mission, and specific goals, have been reached among its members (Shetach, 2009).

2. Authority

Is each IJV team provided with the appropriate authority, to carry out its missions (which are often to provide quality recommendations as well as to ensure that they will be considered and that the final decisions will eventually be applicable)?

In order for the recommendations and decisions, taken within the team, to have validity - to actually influence the venture's progress - they should be taken, and thus backed up, by the same people, who are formally authorized to see those decisions through (Adizes, 1992; Shetach, 2010) (see above description of "capi" Model).

Each team should thus include, as active members, the executives of the partner-organizations, who are the "figures of authority" (Shetach, 2010), regarding the implementation of the team's decisions, or the consideration of its recommendations. In some cases teams are deliberately "freed" from the presence of top executives, to enable easygoing or rather specific and detailed discussions. It is hereby argued that "freedom of discussion" is a high price to pay for the recommendations eventually being doubted, invalidated, rejected or plainly ignored. Therefore, the figure of authority regarding whatever issue is on the agenda should be present in the meetings in which these issues are dealt with. In other words, the specific executives of each party should preside when issues within their authority are being discussed, recommended upon and/or decided upon.

If this condition does not prevail, the team's decisions risk having a mere recommendation status, thus missing their designated objective. Evidence for these practices can be observed daily, as part of decision-making processes handled within organizations. As for their recommendations – those may risk having limited affect on the particular system, which is expected to consider carrying them out. Participants holding on to positions of authority within their organizations will render the teams' decisions (conclusions) more likely to materialize and succeed over time. This argument may be directly related to some of the deficiencies in IJVs' effectiveness, reported in the literature (Das & Teng, 1998; Drouin *et al*, 2009; Gray & Larson, 2006).

The crucial question, which is brought up here, and which has apparently not yet been directly considered by researchers and writers, in this field is whether any particular IJV team has, in addition to having a decision-making authority, a decision-implementation authority, i.e. an authority to follow its decisions through. This issue also has a direct impact on the following criterion.

3. Composition of Members within IJV Teams

Is each team manned by a suitable composition of members, representing the relevant expert professions, as well as the factors that are expected to carry out the team's decisions/recommendations?

Drouin *et al* (2009) discuss the issue of the "Composition of core IJV team" (p. 351). It is argued here that this issue is relevant for *all* teams associated with the IJV process. In order for a team to have both a qualitative decision-making potential and an efficient decision-implementation mandate, the composition of its members is a crucial factor. IJV teams are composed of members representing the various parties, as well as a variety of units/departments/professionals from each party, whose contribution, in terms of the content of the decisions taken and their implications on a variety of organizational aspects over time, is required. Decision making processes within large teams can be extremely cumbersome, and ungainly. Efficient team processes require a limited number of participants, as well as structured working procedures (see criterion 4 in the following). Due to the fact that IJVs require the involvement of many organizational factors from each party, the following dilemmas are highlighted: Whose participation is, in fact, crucial for obtaining effective and efficient decisions and outcomes within IJV teams? Is there a specific technique to determine the appropriate composition of the various teams?

It is hereby argued that the appropriate composition of each team should be adapted to the specific issues to be discussed within it, as well as the overall conditions that prevail in the organizational settings and cultures of the parties in the venture, at that particular time. If, for example, a team is constructed to solve issues regarding a particular aspect of the venture, it is absolutely essential that the managers that should eventually be responsible for implementing those solutions or decisions, not to speak of the executive who is expected to authorize these actions, should all be part of the process of arriving at these recommendations. Otherwise the recommendations may not suit one or more of the above, and/or one or more of the above will refuse to cooperate with its implementation.

If effectiveness is measured by the quality of the recommendations and decisions taken, and by the level of efficiency of their implementation, then the rationale for member composition could well be that of maximizing those two objectives. The "capi" Model (Shetach, 2010) (see model description in the above) can serve as a potential formula for determining the precise composition of members for any given team, regarding any particular sitting or discussion or issue to be dealt with, at any particular point in time. It is hereby advised that IJV teams have a wide reservoir of potential members, from a variety of relevant professions, all in positions of authority and expertise within their organizational units, who could be called-on any team's session or set of sessions, according to varying "capi" requirements.

4. Regulations and Working Procedures

Do the teams function along a suitable set of regulations and working procedures? Do the decision making processes within them enable all members to share their goals, dilemmas and interests, and to, eventually, arrive at mutually satisfactory recommendations and decisions?

Decision making processes, practiced throughout IJV team meetings, need to be monitored along effective and efficient techniques of directing meetings. Decisions and recommendations arrived at, should be based on professional reasoning, knowhow and expertise, of each and every team member.

The discussion processes should lead to mutually agreed upon conclusions, to ensure the cooperation of all members in the consequent follow-up and implementation of the team's "products" - each member within his own domain.

5. Follow-up and Control

Do the teams employ an efficient method for follow-up and control, over the consequences of their recommendations, and over the implementation processes of their decisions?

In order to ensure that recommendations are dealt with and decisions are followed through, efficient follow-up procedures are required. The vast majority of decisions, which are eventually inefficiently applied or altogether immaterialized, are subject, in many cases, to inefficient processes of follow-up and control. The RDSM (Shetach, 2009) can be easily adopted for use in any IJV team, to guarantee that their decisions and recommendations are followed through, and eventually applied successfully (see model description in the above).

The "Supreme" Alliance Team

Has an alliance functional team been nominated to ensure the overall monitoring of the IJV process, by promoting coordination and cooperation among all teams involved in the IJV?

Kale et al. (2002) found that having an effective alliance function, which is responsible for overseeing and coordinating the firm's alliance activity, was positively linked to greater IJV success. An alliance function is essentially a structural mechanism, in the form of a separate organizational unit or managerial team that is responsible for the management and coordination of the overall activity associated with the IJV. (Dyer *et al*, 2001).

It is hereby argued that this managerial team is not only essential for the efficient follow-up and control of all decisions and derived activities, within such a complex multi-team venture; but that unless this team stands up to all above five criteria, it is bound to fail, jeopardizing the overall success chances of the IJV.

It is highly recommended that each one of the six above criteria will present itself as a dilemma for IJV managements, to be considered before and along each and every step of the way of IJV planning, deciding and implementing along time, to maximize its desirable outcomes.

SUMMARY AND IMPLICATIONS

Researchers (Hoang & Rothaermel, 2005; Kale *et al*, 2002; Kale & Singh, 2007) argue for the need to extend existing research on alliances, in order to inquire into other factors that may play an important role in alliance success. Anand & Khanna (2000) emphasized the need for future research to explore the organizational determinants of this capability.

The contribution of his paper towards this inquiry is through the introduction of theories and practice from an adjacent field to the investigation of IJVs. Organizational and Team Theories attempt to cross professional boundaries, as well as boundaries of organizational and political settings,

cultures, etc. They try to deal with the differences and variations at all organizational, team and situational levels, considering the commonalities of human settings, which are designated to promote goals. Drouin *et al* (2009) recommended to focus not only on the operational phase of IJVs, but also on the pre-operational or project level of the IJV formation stage. Thus, the "capi" tool (see in the above) attempts to provide executives, managers and team members with the specific means, to determine the situational characteristics of each organizational setting, enabling to accord manning, structures and working procedures to the specific requirement and goals of each team process. The RDSM tool can significantly contribute to efficient follow-up and control of the operational phase of IJVs (Drouin *et al*, 2009).

The crucial issue, when discussing ultimate IJV effectiveness, should not be limited to investigating how the various teams involved, in particular settings, constitution and working-procedures, might improve their decision-making capabilities. The issue should rather focus on their effective results in *both taking* quality ethical decisions *and*, eventually, rendering them efficiently *implemented*.

The five conditions, presented in the above, when *combined together* and applied in all team, throughout the overall venture, guarantee an increasingly effective and efficient IJV. It is hereby argued that teams, which are not led by figures of authority within the organizational parties, which do not include representatives of all prevailing interests, and whose meetings are not managed efficiently, are unlikely to arrive at relevant and suitable decisions, which are likewise likely to be implemented. And last of all, efficient follow-up techniques are required, to guarantee that the recommendations and decisions arrived at by those committees, will, eventually, be put to practice.

Each particular team, within each specific setting, which is part of an IJV in whatever field, country, culture, etc., is hereby encouraged to be diagnosed along those five criteria, and to be modified accordingly, to enhance its effectiveness and maximize its efficiency. The *construction* of those teams, as well as the *working-procedures* that may render them effective, should be *flexible* and made adaptable to the specific issue or process or case, which is dealt by each team, *at the time*.

CONCLUSIONS

Researchers and writers within the field of IJVs have discusses the effectiveness of those processes in general terms, pointing towards the need to promote human relations among parties , as well as to ensure managerial control over the actual processes involved. Drouin *et al* (2009) wrote: "In practice, only a small amount of time is devoted to HR approaches in the IJV formation process. One of the challenges, therefore, in both academic research and management practice, is to shift the focus away from IJV operations and toward the IJV formation stage of parent firms in order to identify and address the roots of human resources management problems before they grow" (p. 345).

This paper attempts to specify the practical means to obtain those objectives. It views effectiveness of IJVs in light of both the quality of decisions taken throughout the process *and* their decision-implementation potential. It is argued here that the ultimate criteria for effectiveness are the specific

results obtained, within the actual operating ground, and the extent of positive change acquired, in light of the previously set missions and objectives, rather than the recommendations and decisions arrived at, within meeting rooms. It is about bringing about the anticipated results for the benefit of all sides, and efficiently monitoring and maintaining them along time.

Thus, an attempt to adopt a few notions from Team Theory has been, hereby, made. Five specific conditions for IJV teams' success are brought forth. It is argued that when all of these five are applied and practiced *together*, and within all the teams involved, an increased effectiveness *and* efficiency of the overall IJV process could be guaranteed.

Thus, the following conclusions are reached here:

- The specific constitution of members, of all teams involved, should vary according to the particular mission addressed at each and every meeting or series of meetings.
- The appropriate constitution of team members is that which will ensure quality *and* applicable decisions and recommendations.
- Members in each specific sitting of an IJV team must have the necessary decision-implementation authority, i.e. an authority to follow their decisions through.
- IJV teams require a wide reservoir of potential members, from all parties, representing a variety of relevant positions and professions, all in positions of authority within their organizational units, who could be called-on a team's session or set of sessions, as required.
- The optimal set of procedures to adopt, throughout the working sessions of IJV teams, is that which will gear the team with the means to finalize a quality *and* practical set of decisions.
- An efficient "supreme" alliance management team is required, to monitor the overall IJV process, coordinating the functioning of all other teams involved in the venture.

Finally, the arguments and recommendations of this article need to be tested in a variety of IJV constellations, to specifically validate them for the effective and efficient management of those processes along time.

THE RELATIONSHIP BETWEEN SERVICE QUALITY AND CUSTOMER SATISFACTION: AN EMPIRICAL CASE

Silvestri Cecilia¹

¹ University of Tuscia, Department of Economics and Management (DEIM), Via del Paradiso 47-01100-Viterbo-Italy, e-mail c.silvestri@unitus.it

Abstract

The relationship between quality and satisfaction is characterized by a strong conceptual and managerial evolution. On the one hand, quality is the antecedent of the customer satisfaction, but on the other hand, it more and more frequently coincides with the customer satisfaction itself, although they differ conceptually. However, without the satisfied customer, quality does not exist. Actually, the first assumption that must be taken into account concerns the presence of an absolute relationship of integration between the two concepts, as empirically pointed out in this paper. If customer satisfaction is pursued in a quality-oriented approach, the chances of making the customer satisfied raise. The research aims at studying the level of gap between expected and perceived quality, as well as verifying the existence of a relationship of dependence between quality and satisfaction. As the research develops in the field of services, the objective is to study the impact that the five dimensions of ServQual have on customers' satisfaction, paying special attention to the factors which measure "functional quality", that is the quality of the human relationship between customer and provider. For this purpose a statistical approach based on an empirical analysis was used. A questionnaire was administered to collect data and both descriptive and multivariate statistical tools were applied in order to analyze data.

Keywords: quality, customer satisfaction, ServQual, services, functional quality

Introduction

The dynamic increase in competition, the progressive globalization of markets and the technological, sometimes radical, innovations, which occur with increasing frequency, make it very difficult for the firm to know what buyer really wants. (Busacca, 2000; Costabile 2001, Kotler, 2007; Kerin *et al.*, 2010; Pride and Ferrell, 2010). The globalization has created an increase in competition on a worldwide scale, causing the fall of traditional ways of competitive advantage and making factors as tacit knowledge and the other intangible assets crucial for the success of companies (Ancarani, 1999; Meyer and Ruggles, 1999; Ferrata, 2000; Golfetto, 2000; Gosselin 2005; Kerin *et al.*, 2010; Pride and Ferrell, 2010; Meyer, 2011; Paschal, 2011). In this new economic setting the combination of quality and innovation was defined as the "high road to development" (Pyke *et al.*, 1990) for the protection and the growth of industry. In this field, the concept of "Quality" represents the contents of a product or service as well as the capacity of an organization or a system to create a product or to provide a service, matching customer's needs optimally (effectively and efficiently) (Ishikawa 1976, 1985; Deming, 1986; Juran, 1986; Feigenbaum, 1991; Abbot, 1995; Bonechi *et al.* 2004; Reid *et al.* 2011).

Product/service quality, customer satisfaction and profitability of a company are dimensions closely connected together. A high level of quality determines major customer satisfaction (Mittal and Kamakura, 2001), that allows the company to apply higher prices and often to reduce costs. Studies have demonstrated a strong correlation between product quality, *customer satisfaction* and company's profitability (Adam *et al.*, 1997, 2000; Patterson and Spreng, 1997; Lam and Schaubroeck, 1999; Cronin *et al.*, 2000; Bonechi *et al.* 2004; Tian-Cole *et al.*, 2002; Tari *et al.* 2007).

Quality and customer satisfaction in services

Quality is, then, one of the company's key to success. The competitive advantage of a firm depends on the quality and on the value of products and services that the firm can provide (Grönroos 2002; Parasuraman *et al.*, 1996; Hutchinsona *et al.*, 2009). Quality in services represents the basis of competitive edge. The service, or to be more precise, the activity characterizing a service can be defined as a process consisting in a series of more or less intangible activities that usually, but not necessarily take place in the interaction between client and employee and/or human resources or products and/or systems of the service provider, and that are provided as solution to customers' problems (Grönroos 2002; Parasuraman *et al.* 1985, 1988, 1994, 1996). Therefore, the service is essentially a personal relationship established between at least two people: the provider/providers and the customer/customers. If one of the members of the relationship is absent, the service does not exist (Grönroos 2002; Visconti 2007; Ravichandran *et al.*, 2010). Due to those characteristics, services are perceived as a particularly complex phenomenon and service quality is thus considered a complex and difficult concept. Three components determine the quality of a provided service: technical quality (what is received), functional quality (how service is received) and relational quality (who provides the service). It is now clear that technical quality is a prerequisite for good quality, because it ensures an acceptable quality. However, the functional and relational dimensions can add a substantial value for customers and create a favorable competitive edge. In short, it is possible to beat competition providing more and better services to the customers and paying more attention to the functional/relational quality of those services. (Parasuraman and Berry 1991; Grönroos 2002; Hutchinsona *et al.*, 2009; Ravichandran *et al.*, 2010)

If satisfaction is generally considered a broad concept (Oliver 1997; Kotler, 2007; Zeithaml *et al.* 2006; Pascal, 2011; Al-alak and El-refae, 2012), the evaluation of service quality specifically focuses on some service dimensions such as: reliability, responsiveness, assurance, empathy, tangibles (Parasuraman *et al.* 1985, 1988, 1994, 1996; Parasuraman and Berry 1991). On the contrary, satisfaction is all-comprehensive: it is influenced by the perceptions about the quality of the service, the quality of the product, and the price, as well as by situational and personal factors. According to this theory, the perceived quality of the service is a component of the *customer satisfaction* (Anderson, *et. al.*, 1994; Cronin and Taylor, 1992; Zeithaml *et al.*, 2006). It is possible to affirm that the customer satisfaction is the customer evaluation of a product or a service relative to its capacity to fulfill customer's needs and expectations. An inadequate performance causes dissatisfaction with the product/service. (Cronin and

and Taylor, 1992; Zeithaml and Bitner, 2003; Oliver, 1997; Patterson and Spreng, 1997; Theodorakis *et al.*, 2001; Tian-Cole *et al.*, 2002; Kotler, 2007)

It is then evident the importance of measuring and monitoring *customer satisfaction*. The latter represents the ending part of a customer-focused business process started by analyzing the needs and continued by managing the relationships (Ruyter, 1997; Stewart, 1999; Gomez *et al.*, 2004).

One of the many quantitative tools to measure customer satisfaction is the ServQual questionnaire. It is composed of two opposed sections of statements, the first section relates to the customer expectation, the second one concerns the perception. Both expectation and perception are measured on an interval scale. (Parasuraman *et al.*, 1982, 1986, 1988, 1991; Visconti, 2007). This methodology is especially used in the area of services because, thanks to the use of information deriving from a field investigation, the five main dimensions of services are represented: reliability, responsiveness, assurance, empathy, tangibles. The gap between expectations and perceptions measures satisfaction level. (Parasuraman and Berry 1991; Theodorakis *et al.*, 2001; Ravichandran *et al.*, 2010; Khalid *et al.*, 2011)

Methodology

The analyzing model is based on the hypothesis that a quality-oriented approach helps to make the customer satisfied. For this purpose, a questionnaire, ServQual, was created to investigate the relation between quality and *customer satisfaction*. The objective is to demonstrate how the five dimensions measuring service quality produce *customer satisfaction*. The research took place on May 22 and 26-28, 2011, and it was conducted in the services sector, more exactly in a shoe shop of large retailers. The difficulty to identify univocally the exact population of clients of the store led to the application of an accidental non-probability sampling scheme, as it occurs widely in market researches. The sample of subjects interviewed was composed of about 300 people. In order to collect data, questionnaires were administered only inside the same store. The respondents answered the questions of the questionnaires through direct interview or self-compilation. As mentioned before, the used survey tool was the ServQual with the following main areas of analysis:

- *Customer profile*, containing information on socio-demographic aspects of customer (necessary to identify the personal characteristics of customer);
- *Quality expected and perceived* by customers, with reference to the five dimensions of ServQual;
- *Customer Satisfaction*, dealing with the global level of satisfaction with the received service and shop's ability to understand consumers' needs.

For the questions regarding the perception of quality by customers, a Likert scale of measurement was used with evaluation given by the respondents from 1 to 6, where 6 expresses the greatest positive assessment (fully satisfied) and 1 negative (dissatisfied). In addition to the 5 questions relative to the customer profile, the questionnaire has 20 closed questions (with a Likert scale of measurement from 1 to 6) which cover the five dimensions of quality. Having been used the ServQual method, for

each dimension both the expectation and the perception were studied in order to analyze the gap. In the part regarding the Customer Satisfaction, the questionnaire has 1 closed question with a Likert scale of measurement from 1 to 6 to measure the global level of satisfaction. Data elaboration was initially carried out with a descriptive aim using statistical indicators of central tendency and variability and afterwards with tools for multivariate analysis and with multiple linear regression models. The different calculations were performed using the "STATA Statistics/Data Analysis" statistical program.

Analysis of results

69% of the interviewed sample is female, whereas the remaining 31% is male (fig.1). As figure 2 shows, 21% of the interviewees are aged between 18 and 25 years, 34 and 41 years, 26% between 26 and 33 years, 17% between 42 and 49 years, while the remaining 15% are over 50 years old. Most respondents, 82%, live in the city of Viterbo and in the provinces (fig. 3); 53% have upper middle school diploma and 33% have university degree (fig. 4). Finally, when observing fig. 5, it is possible to notice that 20% of the participants are employees and students, 14% housewives, 7% freelancers followed by 6% of teachers and workers. 5% are pensioners and entrepreneurs.

The research studied, then, the level of quality expected and perceived by customers from the store analyzing the gap (Table 1). The data analysis shows that the shop succeeded enough in satisfying the expectations of customers. The average of factors of the dimensions appears high, it has an expected value of 5.36. The average of perceptions is 4.82. Consequently, the total gap between perceptions and expectations is minimum, more exactly it is equal to (-) 0.54. Although a positive gap was not recorded (typical of fully satisfied customers), data shows that the store has good capacity to provide a good service. In fact, the interviewed sample is composed of both satisfied, loyal customers and unsatisfied customers. Notwithstanding the presence of negative assessments expressed by unsatisfied customers, the value of the gap is however minimum. This implies that the number of

satisfied people is greater than the number of unsatisfied ones, as fig.6 illustrates, demonstrating the shop’s capacity to efficiently and effectively meet customer’s needs.

Fig. 6 – Customer Satisfaction

Source: our results

The second objective of the research was to study and analyze the existence of a relationship of interdependence and dependence between the dimensions of perceived quality and *customer satisfaction*.

The analysis of the main components allows reducing the amount of information relating to the independent variables from 20 explicative variables of quality to 5 (table 2 and 3).

Source: our results

Based on the obtained results and the new variables, it was possible to study the correlation with the aim of verifying the possible existence of a reciprocal dependence between the two variables by studying the intensity of their bond.

Table 4 - Correlation between the dimensions of quality and the dimensions of customer satisfaction.

Obs = 301	Customer satisfaction	T1	C1	R1	A1	E1
Customer satisfaction	1					
T1	0.63	1				
C1	0.69	0.79	1			
R1	0.61	0.63	0.84	1		
A1	0.62	0.73	0.78	0.67	1	
E1	0.60	0.52	0.68	0.68	0.62	1

Source: our results

Data in table 4 shows the existence of a linear relationship that connects the variables studied. Especially the correlation coefficients that measure the strength of the bond between the satisfaction variable and the five dimensions, have values which allow supporting the existence of a good relationship of reciprocal dependence. By observing the data, it is possible to note that the coefficient connecting satisfaction and "responsiveness" is the highest. Dealing, in fact, with a shoe shop of large retailers, the greatest expectation of customers is to find easily and quickly the product that best fits their needs, as well as to rely on personnel who are easily approachable and able to answer customer's questions efficiently and effectively. Another variable, i.e. tangibles, has a significant impact on satisfaction. The logistics of the store, the display and the tidy arrangement of products influence the variable of "responsiveness", since they facilitate finding the wished product (correlation coefficient equal to 0.79), and consequently, these factors influence satisfaction (0.63).

When building the multiple linear regression model, the 5 variables obtained from the factor analysis represent the explicative variables whereas satisfaction is the dependent variable.

*** significance at the 99% level, ** significance at the 95% level, * significance at the 90% level

Adjusted R-squared is an index providing information about the goodness of fit of the model and its value allows claiming that 52% of the total variability of *customer satisfaction* is explained by the linear relationship with the quality variables entered. F-test is used to check the “global” significance of the model. Table 6 illustrates how the value of the explained sum of squares is higher than the residual sum of squares, that implies a high F value so that it is possible to affirm that, on the whole, the model fits good the data, therefore the null hypothesis can be rejected and the alternative hypothesis can be accepted. Finally, the t test, or alternatively the p-value, is used to assess the significance of each estimated coefficient.

By analyzing in detail the results of the estimate in the regression model (table 7), it appears that T1, C1 and E1 variables have a significant positive relationship with satisfaction. Concerning R1 and A1 variables, a significant relationship of dependence does not exist (p-value 0.735, and 0.171, respectively). Considering the five dimensions measuring quality in services, 3 have a significant impact on satisfaction: “Tangibles”, conveyed by factors like logistics, display of products, cleanliness and appearance of personnel; “Responsiveness”, that is ease and quickness in obtaining the desired product, and willingness of personnel to be available; “Empathy” that means particular attention of personnel to the demands and needs stated by customers.

“Assurance” and “Reliability” do not seem, indeed, to have a determining effect on satisfaction, as well as the capacity of personnel to communicate and advise and the possibility to choose from a good assortment of products and several prices. However, the study of the model allows affirming the existence of a relationship of dependence between quality and satisfaction. The analysis of residuals also confirms this hypothesis (fig. 7 and 8). It deals with a graphical model with whom it is possible to assess the assumptions of the model and to determine whether the model is adequate for the data under study.

Fig. 7 – Analysis of Residuals

Source: our results

Fig. 8 – QQ-plot for checking the normality of residuals

Source: our results

Fig. 9 – Analysis of residuals - Median

Source: our results

Figure 7 confirms the assumption of normality of residuals. Residuals in fact are normally distributed at each level of x and this allows affirming that the parameter estimation of the model is not seriously compromised. The assumption is then confirmed by fig. 8, where the distribution of residuals around the straight line is analyzed again. Although the extreme values depart more from the straight line, the assumption of normality is respected. In conclusion, fig. 9 illustrates how residuals are distributed around their median, and their trend proves what stated before.

Conclusion and Implications

The relationship between quality and satisfaction is characterized by a strong conceptual and managerial evolution. On the one hand, quality is the antecedent of the *customer satisfaction*, but on the other hand, it more and more frequently coincides with the *customer satisfaction* itself, although they differ conceptually. However, without the satisfied customer, quality does not exist.

Actually, the first assumption that must be taken into account concerns the presence of an absolute relationship of integration between the two concepts, as empirically pointed out in this paper. If *customer satisfaction* is pursued in a quality-oriented approach, the chances of making the customer satisfied raise.

The initial phase of the research had the objective to analyze the gap between customers' expectations of the service and the effective perception of the quality provided. For this purpose, the ServQual method was applied, as it allows studying such a gap thanks to the 5 dimensions which measure service quality. The results demonstrate store's capacity to provide a good service to clients. Although the shop is not yet able to fully exceed their expectations, the gap takes a minimum value, demonstrating that the received service corresponds (even if not totally) to the wished service.

The study and the analysis of the existence of a functional relationship between the independent variable (customer satisfaction) and a series of other explicative variables (ServQual dimensions) characterize the second phase of the research.

The research shows empirically the existence of a relationship of dependence between quality and customer satisfaction which can validate the thesis that customer satisfaction also depends on the perceived quality. The quality system creates customer satisfaction, and for this reason it should be pursued and present in every area of business management. Only in this way can the excellence, the customers' complete and full satisfaction/loyalty be achieved.

In the case analyzed it was demonstrated how the 5 dimensions affect satisfaction significantly, in particular 3 dimensions seem to have a significant impact on satisfaction: (i) tangibles, (ii) responsiveness, (iii) empathy.

A welcoming and clean location, that allows customers to find easily the desired products, represents a determining factor to enhance customers' satisfaction, as well as the willingness and capacity of the personnel to solve and understand potential problems or doubts arose during the purchase. All these aspects have an important role, because they confirm the hypothesis that the interaction between clients and personnel is decisive for the assessment of the quality perceived by the consumers, especially in the field of services. Two dimensions concerning various aspects of the personnel have incisive effect on satisfaction. In this case the frontline personnel play a key role. The dimension of "responsiveness" demonstrates also how the efficiency of cashiers and thus the waiting time at the checkout counter are important factors for the increase in satisfaction.

The dimensions that seem not to influence satisfaction are (i) "assurance" and (ii) "reliability". The values of their *p-value* demonstrate that there is not a relationship of dependence. There could be different explanations for the phenomenon. Firstly, the service investigated is a simple one and in these services the relational component not always has a crucial importance. In this kind of services the most important dimensions are very often only the technical and functional quality, relational quality has less importance. In the case of this research, the store belongs to large retailers and the customers do not expect staff to be particularly able to communicate or inspire trust. Customers' objective is to find personnel that are available, easily approachable (considering that the store is very large), and able to find fast the best product the customers desire. This concept can also be applied to the dimension of "reliability". The store belongs to large retailers, therefore the assortment of products and prices, as well as the updating of discounts and promotions are prerequisites. The choice of

buying shoes in a big shop involves already the awareness to find a wide assortment of products at competitive prices. In our case it is, then, an aspect that clients do not take into account. Therefore that dimension does not contribute to the creation of satisfaction. However, it is interesting to observe how “empathy” is the most significant dimension even in a simple service. That demonstrates customer’s need to feel himself unique and special in every store he is, always and anyway.

However, the model has limitations. Primarily, to validate the results it would be appropriate to repeat the analysis over several years to verify if the existence of the relationship of dependence between satisfaction and quality demonstrated in this paper is actually confirmed. In particular, it would be appropriate to study whether and how the significance of the five ServQual dimensions decreases or increases over the years, and then to analyze the trend, as well as potential variation of the gap.

Another limitation is related to the number of the sample interviewed. In fact, a larger sample would lead to more reliable results, refuting or confirming the initial assumptions. Finally, to test the model a comparison should be developed, not only temporally but also geographically, proposing the same study in other centers of the same shoe shop chain, situated not only in the same local area but also in other provinces or regions. Using this approach it would be possible to work with a more heterogeneous sample and the results would acquire more validity.

Based on these observations and in order to complete and validate the model obtained in this paper, it is proposed testing the veracity of the achieved results through further appropriate studies in order to bridge the limitations encountered. For these reasons, the research will focus its attention on specific aspects, such as sample size and homogeneity of it. The aim is therefore to increase the number of respondents and especially to repeat the study over several years and in several locations where there is the same store, developing a comparison both temporally and geographically.

Abstract

All over the world there are consumers which, due to many reasons, are not able to use services offered by banks and other financial institutions. These are consumers who are being excluded from the financial services market, and consequently from the contemporary society. Financial exclusion comprises a set of difficulties which some people face whilst accessing basic financial services. Therefore, financial exclusion is often referred to as a plague of the 21st century. The problem of financial exclusion has been given little attention both in practice as well as in specialist literature, although it afflicts not only poorer countries or world regions, such as Latin America or Africa. In fact, it is becoming more common in highly-developed countries as a result of immigration of poorer people and consolidating processes in the financial sector, with frequent closures of less profitable branches of smaller banks and other financial institutions situated in smaller towns and on city outskirts. The aim of the paper is to determine the scale and the level of the phenomenon of financial exclusion of European countries during economical volatility. This paper is also an attempt at defining reasons behind the phenomenon and at identifying groups which are most prone to financial exclusion.

Keywords: financial exclusion, customers, financial market, economic volatility, European market

Introduction

All over the world there are households which, due to many reasons, are not able to use services offered by banks and other financial institutions. These are households whose members are being excluded from the financial services market, and consequently from the contemporary society. Therefore, financial exclusion is often referred to as a plague of the 21st century.

The problem of financial exclusion has been given little attention both in practice as well as in specialist literature, although it afflicts not only poorer countries or world regions, such as Latin America, Africa or Asia. In fact, it is becoming more common in highly-developed countries of Europe and North America as a result of immigration of poorer people and consolidating processes in the financial sector, with frequent closures of less profitable branches of smaller banks and other financial institutions situated in smaller towns and on city outskirts.

Financial exclusion comprises a set of difficulties which some people face whilst accessing basic financial services. This means that financial institutions do not allow some of their present or would-

be clients to access their basic banking offer such as bank accounts and other related products or basic insurance. People who have been excluded from the financial services market are not only denied access to credits, loans or payment cards, but are also turned down by bank tellers on account of insufficient amount of funds they want to withdraw or deposit. A milder variant of exclusion consists in charging bigger fees and commissions from people who are not commercially attractive for a financial institution. Such a policy is meant to discourage people who do not fit a desired customer segment from using financial services.

People who have been excluded from the financial services market cannot settle their financial commitments (rent, electricity, etc.) through their bank account, thus being forced to use less convenient and more expensive cash payments. Without being able to take a bank credit, they resort to loans granted at a usurious interest rate by non-banking institutions or various financial agents whose operation is frequently illegal. People who do not have their own bank accounts also encounter problems connected with finding work or receiving welfare benefits. Moreover, they are in a worse position when it comes to planning their expenses. Thus, financial exclusion is closely related to social ostracism.

The aim of the paper is to determine the scale and the level of the phenomenon of financial exclusion on European market during economical volatility. This paper is also an attempt at defining reasons behind the phenomenon and at identifying groups which are most prone to financial exclusion.

Financial exclusion – theoretical background

The term financial exclusion was first coined in 1993 by geographers who were concerned about limited physical access to banking services as a result of bank branch closures (Leyshon and Thrift, 1993). Throughout the 1990s there was also a growing body of research relating to difficulties faced by some sections of societies in gaining access to modern payment instruments and other banking services, to consumer credit and to insurance. There was also concern about some people lacking savings of any kind. It was in 1999 that the term financial exclusion seems first to have been used in a broader sense to refer to people who have constrained access to mainstream financial services (Kempson and Whyley, 1999). Since then, a number of commentators have added their views of how financial exclusion should be defined.

Research to date in the field of financial exclusion has been wide and diffuse. Much of it has been concerned with defining and documenting the nature, causes and consequences of financial exclusion, together with actual and proposed solutions: Donovan and Palmer (1999), Financial Services Authority (2000) and Sinclair (2001). Several specialist streams of research have emanated from this broad field. These include geographic and other 'space locations' (like social and economic) of financial exclusion: Leyshon and Thrift (1995), Dymski and Li (2002) and Fuller and Jonas (2002); the role of bank strategies: Alexander and Pollard (2000), Argent and Rolley (2000) and Boyce (2001); the future of mutuality: Rossiter (1997) and Waite (2001); the genesis, evolution and efficiency of specialist

financial institutions, like credit unions: Fuller (1998), Hayton (2001) and McKillop *et al* (2002); and finance for small businesses in deprived communities: Bank of England (2000 a & b).

The term “financial exclusion” has a broad range of both implicit and explicit definitions. Research carried out and discussions held among experts within the present research project leads us to propose the following definition: financial exclusion refers to a process whereby people encounter difficulties accessing and/or using financial services and products in the mainstream market that are appropriate to their needs and enable them to lead a normal social life in the society in which they belong.

There is also a widespread recognition that financial exclusion forms part of a much wider social exclusion, faced by some groups who lack access to quality essential services such as jobs, housing, education or health care. Difficulties accessing appropriate financial services. Beside the fact that use of financial services makes more and more part of a standard life, the way to access and use those services may be more and more over demanding on various aspects as geographical, technical, cultural, educational or about guarantee and risk analysis criteria. This leads to a large range of access and use difficulties that are deeply related to each country's market structure (Anderloni, 2003).

Financial products will be considered “appropriate” when their provision, structure and costs do not lead the customer to encounter access and/or use difficulties. These difficulties are caused simultaneously by the characteristics of the products and the way they are sold (supply side) and the situation and the financial capability of the customer (demand side). The analysis of each structure (both demand and supply sides) may, for each country, highlight the way supply meet demand, and how appropriate it is (Carbo *et al*, 2004).

Much of the exclusion appears to arise from a failure of the mainstream commercial providers to supply a range of products that are appropriate to the needs of all sections of society. “Mainstream providers” may be considered as non stigmatizing providers regarding to the national reference. Related to the market structure of each country, a particular type of providers may appear as mainstream in one and as “alternative” in another one (e.g. saving banks are mainstream in France or Spain, but not in the United Kingdom). “Alternative” may refer to organizations paying special attention to marginal segments, often operating as not-for-profit organizations and acting in compliance with rules and regulations or other providers which exploit the marginal market segments and often act on the borderline of legality.

Financial exclusion is deeply interrelated with social exclusion: if the latter almost automatically leads to the first, financial exclusion belongs to a process that reinforces the risk to face social exclusion. Being objectively excluded or having a subjective feeling of being excluded can begin or be reinforced by access or use difficulties in financial practices. The perfect financial inclusion may therefore be described by the capacity to access and use appropriate financial services proposed by mainstream providers. Meanwhile, there may be an adequate “second best choice” to get appropriate services proposed by alternative providers that comply with rules and regulations and do not exploit

low income people. At least, an authenticated “social / open minded” provider may give a sufficiently safe / positive image to enable excluded people to try once again financial services, which could then be the first step towards financial inclusion with mainstream financial providers.

Methods of Research

The main source that has been used to assess levels of financial exclusion in Euroepan market is the Eurobarometer Survey 60.2. To date, however, use of the Eurobarometer data has been restricted to looking at access to specific products only (*banking*: Anderloni and Carluccio, 2006; Corr, 2006; *credit*: Nieri, 2006; *life insurance*: Corr, 2006).

Although Eurobarometer surveys individuals aged 15 or over, our analysis is restricted to people aged over 18 as this is the legal age of access to some types of product (including a transaction bank account with an overdraft and unsecured credit). It asks about the holding of a range of financial products, including transaction accounts (with a cheque book and/or a payment card facility), deposit accounts (which pay interest but have no payment card or chequebook) and other savings products including life assurance policies, stocks/shares, collective investments (unit trusts) and bonds. The forms of credit covered include overdrafts, credit and charge cards and loans for car purchase and other purposes.

It is important to note that the Eurobarometer data is useful to draft a broad picture and to be able to draw very rough international comparisons, but that is it not 100% accurate information. Indeed, experts have underlined that the questions are sometimes interpreted differently from one country to another, and as the study shows, comparisons with national data sometimes show quite important gaps, which could not only be due to samples issues. To summarize, it is one of the best data available for the moment, but it can still be improved in the future.

Results and Discussion

The analysis of data from Eurobarometer shows that 22 per cent of adults aged 18 of adults in the European Union had no bank account at all. We describe these people as ‘*unbanked*’. A further 7 per cent in those countries had only a deposit account with no payment card or cheque book – these we have called ‘*marginally banked*’. Generally, adults were less likely to hold revolving credit than savings. In all 56 per cent of European Union adults had no access to revolving credit (credit card or overdraft) whilst 42 per cent respectively did not have a savings product. Putting this together, we find that around 20 per cent of all adults in the EU countries had none of these three types of financial product and might, consequently, be considered ‘*financially excluded*’.

Levels of financial exclusion varied widely, ranging from one per cent or less in Denmark, Belgium, Luxembourg and Holland to 41 per cent in Lithurania and 48 per cent in Latvia. Indeed, the countries with large proportions of adults who are financially excluded feature among those with the highest proportions of people excluded from each of the three types of financial services we have studied in detail: banking, unsecured credit and savings.

Moreover, there was a broad a correlation between levels of financial exclusion and the levels of affluence (measured by the GDP per capita) and inequality (Gini coefficient), which is consistent with other research (Kempson, 2006). Where affluence was high and income inequality was low, levels of financial exclusion tended also to be low.

The Eurobarometer analysis shows wide variation in exclusion from transaction banking services across the European countries – ranging from 2 per cent of individuals in Holland and 4 in France to 65 per cent in Latvia or Lithuania and 78 per cent in Greece. It should be noted, however, that in Estonia, a high proportion of individuals had a deposit account even though they lacked a transaction account, so the proportion lacking an account of any kind was a good deal lower.

Using the Eurobarometer data it is possible to compute two variables to measure the level of exclusion from unsecured credit. The first is the proportion of people with no credit in the form of an overdraft, credit card or loan; the second is a narrower definition – of access to mainstream revolving credit facilities (overdrafts and credit cards). Both measures, however, tend to provide an over-estimate of credit exclusion as they will include people who are opposed to borrowing and so decline such facilities or they simply did not need them. Importantly, the extent of this will vary from country to country, depending on the prevailing attitude towards borrowing. It should also be noted that there are three quite distinct types of credit card in Europe, and also that the Eurobarometer survey puts charge cards together with credit cards even though they do not offer extended credit. Secondly, the Eurobarometer survey excludes some forms of credit that are quite prevalent in some countries – including goods bought on credit through mail order catalogues and, in Poland, a form of credit known as hire purchase. Despite these concerns about the Eurobarometer data, it does offer at least some insight into levels of access to credit across the European countries. These should, however, be kept in mind when interpreting the findings of the analysis.

Across the European countries 56 per cent of adults aged 18 or over did not have any revolving credit facilities. Again there was wide variation across countries. The proportion of people with no revolving credit was lowest in Denmark (18 per cent) and Luxembourg (19 per cent). The highest proportions were found in Lithuania (86 per cent), Estonia and Latvia (80 per cent).

As we saw earlier, around 42 per cent of European customers had no savings account at the time of Eurobarometer survey. Once again there were wide variations across individual countries. Sweden was the country with the highest incidence of saving account-holding – only 7 per cent of adults lacked a savings account. At the other extreme, countries in the Europe where a large proportion of the population did not have a savings account included Latvia (76) and Estonia (67).

Financial exclusion affects some groups of people more than others and, on the whole, similar types of people are disproportionately affected regardless of the prevailing level of exclusion in their country.

<i>Characteristics</i>	<i>Group 1</i>	<i>Group 2</i>	<i>Average</i>

Table 1. Type of people likely to be financially excluded in European market

The earliest analysis of financial exclusion concluded that it involves those processes that serve to prevent certain social groups and individuals from gaining access to the financial system (Leyshon and Thrift, 1995). The authors contend that people with limited incomes and certain disadvantaged

social groups represent too high a risk as customers for mainstream financial institutions, which then avoid geographical areas where these groups of the population live. In other words, financial exclusion was seen in terms of physical and geographical access. Since then, there has been a large body of research that has identified a wide range of other factors that restrict access to and use of financial services or that renders them less appropriate.

Generally, the causes of financial exclusion are many and varied, a general tendency can still be detected. Indeed, and not so surprisingly, the most frequently evoked causes (at least by seven countries or more) seem to be, respectively, in each group of barrier, the following:

Societal factors

- *Demographic changes technological gap*: the ageing population has difficulty in staying up-to-date with all the new ways of dealing with money;
- *Labor market changes*: more flexible meaning less stable incomes;
- *Income inequalities*: bring difficulties of access to financial services.

Supply factors

- *Risk assessment* procedures: generally they are becoming more and more tight and thus create financial exclusion;
- *Marketing* methods: they can be unclear and lead potential clients to abandon the request or to mistrust financial institutions and look for other alternatives;
- *Geographical access*: location of financial services providers are too far away from potential clients;
- *Product design*: the terms and conditions are not clear and target public is not defined;
- *Service delivery*: the financial service is delivered by inadequate means for the target public, e.g. Internet for older people;
- *Complexity of choice*: can be an education issue, too many products proposed, target public has trouble to choose.

Demand factors

- Belief that bank accounts are not for poor people or low self esteem;
- Concern about costs: potential clients fear costs might be too high or lack information;
- Fear of loss of financial control: bank account feels intangible compared to cold cash, also some means are seen as “unsure” i.e. Internet hacking;
- Mistrust of providers: fear of bankruptcy or lack of confidence with financial institutions.

Undeniably, societal, supply and demand factors can play a role in the exclusion or limited inclusion of individuals. Let's take for example the risk assessment factor. The lack of permanent address and identification documents, the lack of an "official" or stable job, not speaking the national language, and living in deprived economic circumstances may render it more difficult to have easy and fair access also to basic financial services.

This is clearly shown in credit scoring models, variables such as area of residence (i.e. postal code or also specific address), kind of job position, period of time in the same working place and of living at the same address are used in order to define the credit score. These models are mainly used for deciding whether to accept or to refuse a demand for unsecured loans and mortgages, but often represent a tool for customer segmentation and for identifying "undesirable" customers.

To conclude, although societal factors were most commonly mentioned as the cause of financial exclusion, there are a number of failures of supply and demand that are clearly important. These almost certainly exist more widely than was reported but only come to light when the situation is explored in detail. Such evidence only exists in a minority of countries.

Conclusions and Direction for Future Research

The paper, from the authors' perspective, both, contributes to the current literature related to financial exclusion and provides valuable insights for practitioners who consider financial services market development.

Financial exclusion is a process whereby people encounter difficulties accessing and/or using financial services and products in the mainstream market, that are appropriate to their needs and enable them to lead a normal social life in the society in which they belong. Given the growth in high-cost fringe banking services that target people who do not have access to mainstream financial services and the limited respect of consumers' rights and fair dealing rules by some alternative financial providers that exploit low-income people, it is important to consider the interplay between services and providers when assessing the access someone has.

While access is the first step towards financial inclusion it is important to have information about people's levels of usage of financial services too. As we shall see later, many people are deterred from using financial services by many of the same factors that may deny others access.

It is important to acknowledge that financial exclusion is not an absolute concept (excluded or not) but a relative one, rather like poverty, with degrees of exclusion. People vary in their extent of engagement with specific services (e.g. transaction banking where we have both the unbanked and the marginally banked). And they also vary in the number of types of financial products to which they can gain access. It may be helpful in this context to use the term financially excluded for those who lack all products and marginally included for those who have limited access – just as poverty is often described either in terms of being in the lowest income deciles or quintile or, alternatively, of being

below a threshold. Finally, sampling for surveys should be constructed in order to allow data to be analyzed at both individual and family level and should be explicit about the lowest age covered.

Analyses show that levels of financial exclusion are lowest in the countries such as Denmark and Sweden where the standard of living is universally high. They are highest in countries like Latvia, Lithuania and Poland that have transition economies and low levels of gross domestic product.

Financial exclusion affects some groups of people more than others and, on the whole, similar types of people are disproportionately affected regardless of the prevailing level of exclusion in their country. These are people living on low incomes; and consequently those who are unemployed, lone parents caring for children full-time and people who are unable to work through sickness or disability. In new member states, retired people also have high levels of financial exclusion. Regression analysis shows that these are the most significant factors statistically and have the largest effects.

There are three groups of causes of financial exclusion: societal, supply and demand. It is on supply and demand reasons that we can better identify what could be done to avoid financial exclusion. Risk assessment, geographical access as well as product design and delivery are causes of financial exclusion that merit more attention in the public debate.

It should be borne in mind that this research has some limitations, The key limitation of this study is connected with the choice of the Eurobarometer as source of data. The Eurobarometer surveys provide a broad international comparison based on "standard" functioning of markets and economies more than a perfectly accurate picture of the relative levels of financial exclusion across European Union countries. Although many of the discrepancies with national surveys can be explained in terms of differences in sampling or the timing of surveys, it does seem that Eurobarometer may slightly over-state the levels of banking exclusion.

**AN EXPLORATORY STUDY OF BRAND MANUFACTURERS' PERCEIVED VALUE OF THE
"TRIPLE POLE" APPROACH IN BARGAINING FOR VERTICAL COOPERATIVE SALES
PROMOTION CAMPAIGN: A PILOT STUDY IN GREECE AND CYPRUS**

Spais, George S.¹; Papakonstantinidis, Leonidas²

¹ Email: gspais@otenet.gr

² Email: lpap@ta-teikal.gr or papakon@gmail.com

Abstract

The research aim of this study was to explore brand manufacturers' perceived value of the "triple pole" approach in bargaining for vertical cooperative sales promotion campaigns. Our research intention was to test seven (7) research hypotheses based on a survey (pilot study) of 32 marketing, sales directors and other senior executives of brand manufacturers from Greece and Cyprus. Each research hypothesis was to test an alternative research model in order to investigate which model may predict better the perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns. The research results showed us that perceived value of considering the customer as the 'third pole in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaign was better predicted by model 7. 55.8% of the variance of the dependent variable is explained by the independents. Only bargaining problems related to the dominance of big retailers in bargaining situations influences the perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns. For each unit increase-improvement of perceived importance of bargaining that related to the dominance of the big retailers, there is an increase-improvement 0.542 of the perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns. No study, until now, has studied brand manufacturers' attitudes for the perceived value of considering the customer as the 'third pole' in a bargaining procedure for planning cooperative sales promotion campaigns and the group of attitudes that influence it.

Keywords: cooperative promotion campaign, marketing channel, bargaining solution analysis, triple pole approach, brand manufacturers and managerial attitudes

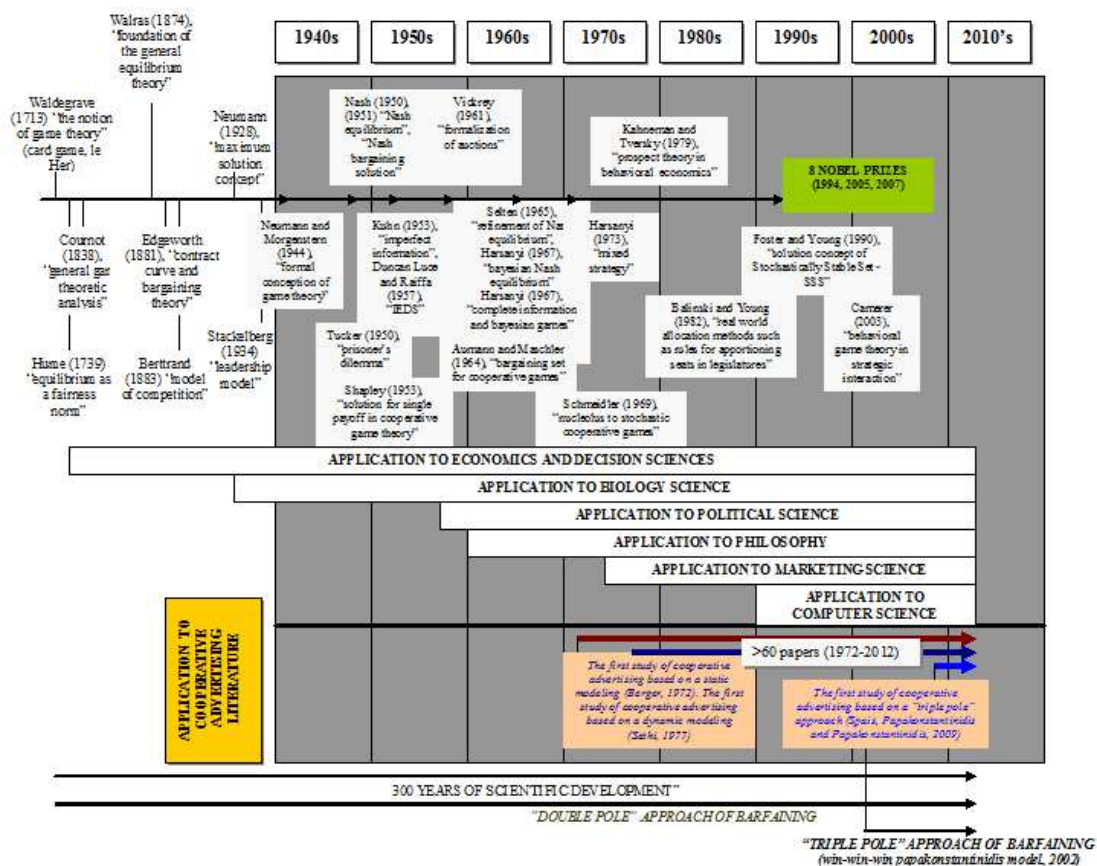

Acknowledgements: We would like to offer our warmest thanks to Professor Demetris Vrontis (President, EMRBI) and Dr. Yioula Melanthiou (Lecturer, University of Nicosia) for their contribution of promoting the questionnaire to brand manufacturers of Cyprus. We would like to thank our students: A.Zoannou, A.Liossi, S.Malapanis and N.Patelis for the contact and follow-up with the respondents.

Introduction

We strongly believe that the well known frameworks for the study of a cooperative marketing campaign process by Fux, Mathieu and Myrach (2007), Merzenich (2005), Schumacher and Meyer (2004) may be seriously considered in order to study cooperative promotion management process in vertical marketing channels in both planning and coordination level. The AMA Dictionary (http://www.marketingpower.com/_layouts/Dictionary.aspx?dLetter=V) lists the term “vertical cooperative advertising”, (which seems to be used in the broader sense for all promotional activities), defining that it is the advertising in which the retailer and other previous marketing channel members (e.g., manufacturers or wholesalers) share the cost (Spais, 2012). Yan (2010) argued that cooperative promotion plays a strategically important role in marketing programs. Very close to Yan’s thesis, He, Prasad and Sethi (2009) underlined that cooperative promotion is an important instrument for aligning manufacturer and retailer decisions in marketing channels. On the other hand, bargaining seems to be critical for marketing channel coordination, e.g., for vertical cooperative promotion (Ailawadi et al., 2009; Huang, Li and Mahajan, 2002) or resolving channel member conflicts as well as for setting trade terms such as transfer special prices and margins, according to Coughlan et al. (2001). There is a significant literature on constructs such as bargaining problem (Xie and Wei, 2009) and tendency to conflict (Zhuang, Herndon and Zhou, 2005). In contrast, the normative and behavioral principles governing marketing channel dependency and coordination regarding the tendency to sovereignty, tendency to improvement and mistrust are relatively unexplored. Encouragingly, as the literature reaffirms the critical role of bargaining in marketing channels (e.g. Buhalis, 2000; Coughlan et al., 2001, Huang and Li, 2001; Li et al., 2002; Iyer and Villas-Boas, 2003; Bontems, Dhar and Chavas, 2007; Spais, Papakonstantinidis and Papakonstantinidis, 2009; Srivastava and Chakravarti, 2009; Spais and Papakonstantinidis, 2011; Spais, 2012), we strongly believe that the triple pole approach of bargaining for cooperative sales promotion campaigns (including the customer as the “third pole”) in terms of bargaining solution analyses will receive a significant attention in the marketing and promotion management literature in the nearest future.

According to Huang and Li (2001), Li et al. (2002), Huang, Li and Mahajan (2002) and Yan (2010), cooperative advertising has been used by many industries for decades and continues to play a key promotional role for many manufacturers, retailers and retail customers. According to the examination of modern empirical evidence conducted by Spais (2012), a significant increase in spending volume is observed and that shows the overall increase in the significance of cooperative advertising. Probably this increase may be a logical and safe explanation of why more and more scholars, researchers, authors and thinkers, globally are highly interested in exploring the role and use of cooperative advertising in practice, the last years. Although literature clearly shows the raising issue of reinforcing customers’ participation in marketing management activities of customer-centric organizations (such as: idea generation, idea screening, concept development and testing, process design, test marketing, building promotion campaigns etc.), (e.g. Payne, Storbacka and Frow, 2008; Awa, 2010; Hu, Jianyou and Na, 2010; Spais, 2012) unfortunately there is no theoretical framework

including the customer (as a “third pole”) in a cooperative marketing or promotion planning process. The concept of the third “win” in a traditional “win-win” co-operative approach for cooperative marketing and promotion campaigns was presented for the first time in the marketing literature in 2009 (Spais, Papakonstantinidis and Papakonstantinidis, 2009). An examination of the historical evolution of bargaining and game theories (the last 300 years, from the first pioneers Waldegrave, Cournot, Walras, Edgeworth, Bertrand, Neumann and Stackelberg to Nash and Harsanyi and their influences to widely acknowledged scholars of the cooperative advertising literature such as Berger, He, Huang, Jørgensen, Prasad, Sethi, Villas-Boas, Zaccour (the last 40 years, see Spais, 2012) we can safely state that it is revolutionary approach, as the “triple-pole” approach is examined for the first time in the 300 years of scientific development of bargaining and game theories (see figure 1).

Figure 1 – Mapping the historical evolution of bargaining and game theories, the pioneers and influencers and their impact on different scientific fields and on the cooperative advertising literature

Research aim, research objective and initial assumption

The research aim of this study is to explore brand manufacturers’ perceived value of the “triple pole” (win-win-win) approach in bargaining for vertical cooperative sales promotion campaigns. The research intention is to test seven (7) research hypotheses. Each of them testing an alternative research model in order to investigate which model may predict better the perceived value of considering the customer as the ‘third pole’ in a bargaining procedure between 2 members of a vertical marketing

channel for cooperative sales promotion campaigns. The basic initial assumption of this study is that perceived value of considering the customer as the 'third pole' in a bargaining procedure for planning cooperative sales promotion campaigns is determined by the: a) perceived necessity of bargaining for the coordination of a marketing channel, b) perceived necessity of developing integrated bargaining solution analyses, c) perceived contribution of an integrated bargaining solution analysis to the sharing problem of cost and the determination of the promotion and pricing strategies for both parts and d) perceived importance of bargaining problems.

Theoretical framework

Theoretical implications and limitations of a "triple pole" approach to the marketing literature regarding to bargaining in cooperative marketing programs

The concept of including the third party, as the third "win" in a traditional "win-win" approach for cooperative marketing and promotion campaigns was presented for the first time in the marketing literature in 2009 (Spais, Papakonstantinidis and Papakonstantinidis, 2009). According to the authors, the importance of this theory is arisen from the transfer of the pure trust theory to a marketing context, which can be achieved in order to analyze marketing phenomena of bargaining especially in cooperative promotion programs characterized by conflict and mistrust. Marketing phenomena refer to understanding of the bargaining problem resolution and the types of negotiation in which the marketing channel member and the business dispute the price, which will be communicated and the exact nature of the transaction that will take place and eventually come to an agreement in terms of a promotion management strategy.

The theory considers the information accessibility and diffusion that characterize the modern marketing environment, and the complexity in the decision-making of marketing channel members values that the "third win" (the "C" factor: the customer) could unlock a series of obstacles. The individual (although his/her doubts) must believe that there is a "third" distinguishable part in the bargain. The 'win-win-win papakonstantinidis' theory supports the significance of the tendency to sovereignty, the tendency of conflict, which results from the combination of: a) the case of the distinguishable entity, b) mistrust of each distinguishable entity, and c) tendency to improvement in a vertical marketing channel.

Based on the assumptions of the 'win-win-win papakonstantinidis' conceptualization, the limitation in contexts such as the cooperative promotion programs, as identified in our previous study (Spais, Papakonstantinidis and Papakonstantinidis, 2009) is that utility assessment and cost-utility analyses such as costs/quality-adjusted expected profits model from the partnership for A and B factors and the demand model for C factor are frequently presented to demonstrate the value of many utility options in the marketing literature. However, utility indicators require various methods that introduce significant methodological challenges, which directly influence the results and ensuing cooperative promotion management decisions in vertical marketing channels.

According to Papakonstantinidis model's assumptions (2002; 2003; 2004a; 2004b; 2007; 2011), and their extensions in vertical marketing channels (Spais, Papakonstantinidis and Papakonstantinidis, 2009; Spais and Papakonstantinidis, 2011; Spais, 2012) the conditions describing the bargaining situations of the win-win-win papakonstantinidis model are summarized in Table 1:

Conceptual framework

Figure 1 presents the conceptual framework for brand manufacturer's perceived value of a triple pole approach in a bargaining procedure for planning cooperative sales promotion campaigns.

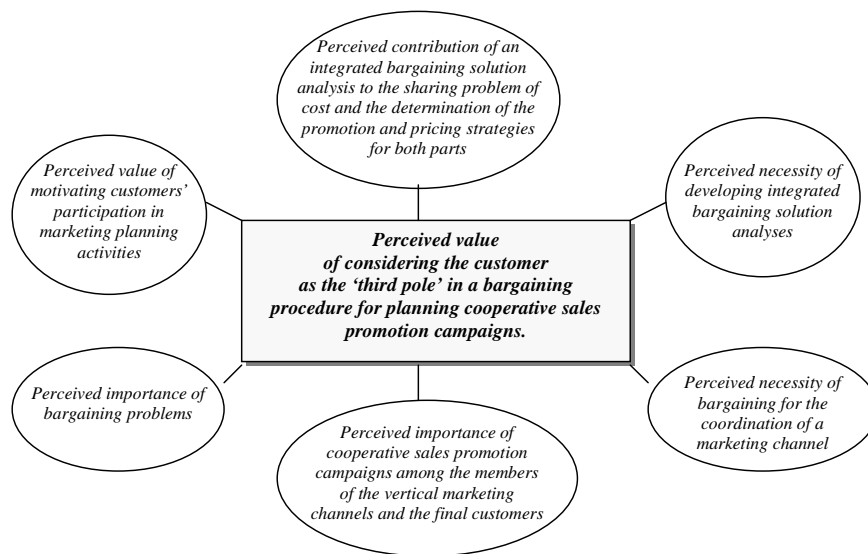

Figure 1 – The conceptual framework

Literature review

A review of the research activity for the bargaining solution analysis for vertical cooperative promotion management decisions

An analysis of 31 published research works in “cooperative advertizing” the last 38 years (1973-2011) conducted by Spais (2012) showed that the research activity about the topic was at a very low level at the decades '70s, '80s and '90s and was significantly increased after 2005. The recent empirical evidence of the last year (2011-2012) regarding to cooperative advertizing in vertical marketing channels as presented in influential journals may be grouped in the two (2) groups based on the research interest: i) bargaining in an asymmetric channel power context (e.g. Wang, Longfei and Huahua, 2011; Su and Mukhopadhyay, 2011; He et al., 2012; Zhang, Liu and Wang, 2012); ii) coordination of pricing, cost sharing and extra joint profit (e.g. Ahmadi-Javid and Hoseinpour, 2011; Sana, 2011; Seyedesfahani, Biazaran and Gharakhani, 2011; Ahmadi-Javid and Hoseinpour, 2012; Kunter, 2012).

<p>1. Bargaining is defined as a form of energy between two distinguishable entities with different expectations and controversial interests, where each part intends to sovereign. Practically, the social relationship "imitates" the natural relation, which is by nature conflictive; in order, the distinguishable entity acquires independent presence and action. This action is directed by the motive of gaining an individual profit. (Nash, Nasar and Kuhn, 2001).</p> <p>2. Win-win perception: It is based on when each side of a dispute feels they have won. Since both sides benefit from such a scenario, any resolutions to the conflict are likely to be accepted voluntarily. The process of integrative bargaining aims to achieve, through cooperation, win-win outcomes.</p> <p>3. Win-win-win perception: It is based on the assumptions of information accessibility and diffusion that characterize the modern globalized societies as well as the complexity in the decision-making values that the "third win" (the "C" factor= the customer) could unlock a series of obstacles.</p> <p>4. The individuals involved in a bargaining situation for cooperative sales promotion campaigns (although his/her doubts) must believe that there is a "third" distinguishable part in the bargain (based on behaviorist analysis through the "neural networks"). Sensitization is introduced (regarding the integrated information) as a main variable of the bargain (the "third invisible part of the negotiation"/ the "C" factor= the customer). "Sensitization" may concerned as information, thus changed the 2 parts imperfect information, into a complete information as Harsanyi's conditional probabilities claims.</p> <p>5. In a bargaining situation, there are two distinguishable entities with different perceptions, attitudes, expectations and interests. These distinguishable entities, with different expectations, should be motivated (for individual benefit), so that they are activated and they transform the opposite expectations in opposite interests and from there in opposite "strategies of victory, or sovereignty".</p>	<p>6. Tendency sovereignty and the tendency of conflict are strengthened because of the bargaining problems and according to the theory only a "third win" (the "C" factor: the customer) could unlock these series of obstacles. The win-win-win theoretical model suggests that information accessibility and diffusion is crucial because of the relation between knowledge and behavior (the "interaction on bargain-behavior"). The different examples of knowledge types' synthesis and the resulted 1-1 behavior may lead brand manufacturers to understand the bargain-behavior assumption, based on information given. From the other hand, brand manufacturers' information may be the dominant result of this cross-related knowledge types: socialization, sensitization, externalization etc.. Thus, the hypothesis of bargain-behavior interaction is very important in building the suggested "C Factor" following the Harsanyi's Bayesian Theorem original game can be replaced by a game "where nature first conducts a lottery in accordance with the basic probability distribution" (Harsanyi, 1967). This extension is mainly based on the "Harsanyi's transformation", with a difference: original bargain between two can be replaced by a game, where the C Factor first conducts a lottery in accordance with the basic probability distribution. In addition, the "C" factor should be seen as the result of a "new" suggested bargaining behavior, coming from sensitization process. In such a context, the C party/player is given in terms of a continuous sensitization process, tending to sensitization itself, inside the customers. The heart of the analysis for a bargaining solution in a cooperative promotion campaign must be the configuration of how the "sensitized game" (G**) is formed and developed.</p> <p>7. The "C" party/player (for customers) produces a new behavioral type that converges the interests of both sides. By converting a binomial distribution ($p, 1-p$) into a trinomial distribution, (p_1, p_2 and $1-p_1-p_2$) combined with 3 utility function "prices".</p> <p>8. Interaction on bargain-behavior is one of the prevailing assumptions of the model, in accordance to the literature that evidence the strong relation between knowledge and behavior.</p> <p>9. As the managerial attitudes of brand manufacturers for customers' participation in marketing planning activities impact the perceived value of the triple pole approach, this means that brand manufacturers see an adding value through the collaboration with the retailers, because there are strongly interested in accomplishing customer relationship goals. Based on this observation, we can safely interpret that the customers (as the "C" party/player) produce a new behavioral type that converges the interest of a brand manufacturer and motivate him for building marketing alliances in vertical marketing channels.</p>
--	---

Table 1 – The extended assumptions of the win-win-win spais and papakonstantinidis model and definitions

Based on a content analysis of 56 published research works (Spais, Papakonstantinidis and Papakonstantinidis, 2009), it seems that:

- Cooperative bargaining solution analysis results based on mathematical models can show us how to share the profit gain between the two parties in a vertical marketing channel and determine the associated pricing and advertising policies for both parties.
- Bargaining problems are the:
 - complex issue of promotion activities,
 - reputation that both parties bring to the bargaining table, and
 - perceived uncertainty in the lateral environment (competitive sector).
- There is a tendency to conflict in vertical marketing channels and it is about communication, which is the main source of conflict followed by different expectations and organizational structure.
- There is a tendency to sovereignty in vertical marketing channels as result of the growing dominance of large retailers, which alter the traditional channel incentives.
- There is a tendency to improvement for each member of the vertical marketing channel where bargaining without side payments is not effective as cooperation at reducing beggar-thyneighbor effects and it is a welfare-improving alternative to non-cooperation and is likely more practical in many situations.
- There is mistrust between the members of the vertical marketing channels.

Customer as the third “player”/“pole” of the bargaining solution in cooperative sales promotion management process between the business and the marketing channel member

According to Misra and Mohanty (2008), bargaining can be seen as the process of distributing the gains obtained from trade among the participants of the trade. In the present context, the gains from trade (between the business or the manufacturer and the marketing channel member) are the total marketing channel profits. Since the wholesale price determines the proportion in which the gains from the trade (total marketing channel profit) are split between the marketing channel members, this wholesale price turns into the decision variable that is bargained over by marketing channel members. An alternative approach to measure bargaining power based on a Nash Bargaining Model between manufacturers and retailers has been proposed in the literature (e.g. Iyer and Villas-Boas, 2003; Misra and Mohanty, 2008; Draganska, Klapper and Villas-Boas, 2010). An in depth literature-review clearly shows the raising issue of reinforcing customers’ participation in marketing management activities of customer-centric organizations (such as: idea generation, idea screening, concept development and testing, process design, test marketing, building promotion campaigns etc.), (e.g. Lovelock and Young, 1979; Bowen, 1986; Dabholkar, 1990; Wilkstrom, 1995; Sundbo, 1997; Youngdahl and Kellogg, 1997; Johne and Storey, 1998; Sheth, Sisodia and Sharma, 2000; Wind and Rangaswamy, 2001; Alam, 2002;

Galbraith, 2005; Hip and Grupp, 2005; Piller, 2005; Chen and Lu, 2007; Etgar, 2007; Lusch, Vargo and O'Brien, 2007; Fang, 2008; Payne, Storbacka and Frow, 2008; Awa, 2010; Hu, Jianyou and Na, 2010; Spais, 2012). Encouragingly, modern empirical evidence show the raising importance of the customer to be considered as the "third party-pole" in delegated bargaining in vertical marketing channels (between the manufacturer and the marketing channel member), (e.g. Bontems, Dhar and Chavas, 2007; Gabrielsen and Roth, 2009; Spais and Papakonstantinidis, 2011; Spais, 2012). Unfortunately, there is no theoretical framework including the customer (as a "third party" or "third player") in a cooperative marketing or promotion planning process. The concept of the third "win" in a traditional "win-win" approach for cooperative marketing and promotion campaigns was presented for the first time in the marketing literature in 2009 (Spais, Papakonstantinidis and Papakonstantinidis, 2009). The solution concept of this *triple win* model is based on a *co-operative approach* (in accordance to the typology of solution concepts for bargaining problems by Muthoo (1999)).

Methodology

The combination of research methods in our study was of high value. The investigation of managerial attitudes for integrated bargaining solution analysis for vertical cooperative sales promotion campaigns is almost at zero. One of the core themes was to investigate a very innovative concept and approach, which was the "triple pole" idea (considering the customer as a third pole in a bargaining situation). Although most research designs in many published works in influential journals follow guidelines for purity of method (e.g. Gable, 1994; Scandura and Williams, 2000; Olsen, 2004; Vaivio and Sirén, 2010), we strongly believe that the combination was essential and strong for our study in order to secure the validity of a very new research instrument and the alternative research models.

The study was conducted into two stages: i) in the first stage, we examined the two critical cases (in accordance to Flyvbjerg's conceptualization, 1991); and ii) in the second stage, we conducted a pilot survey, which was carried out at brand manufacturers from Greece and Cyprus. Critical cases for the study of promotion and promotion management phenomena seems to gain more and more the research interest by the members of the academic community for the marketing discipline as they realize the value of becoming critically aware of the practical wisdom of promotion events and relative managerial practices.

First stage: The examination of the two critical cases

Research method and unit of analysis

Studying brand manufacturers' attitudes for bargaining issues of vertical cooperative sales promotion campaigns and the "triple pole" approach is a non-researched area. In order to realize the concept, priorities, constraints and the value of a triple pole approach in an integrated bargaining solution analysis for vertical cooperative sales promotion campaigns, it is incumbent upon marketing scholars and researchers to take the above perspective, which allows these issues to be arisen. The use

of the case study is considered to be of high value in our analysis because in the empirical studies none of promotion phenomena are very well understood (Cutler, 2004). The research method of case study is introduced in order to reveal very new constructs and to attempt to establish an initial understanding of the constructs and their relationship with other constructs (Yin, 1994). Human activity is the basic unit of the analysis of the critical case. Incorporates notions of understanding such as *mediation, motivation and culture*.

Selection of a critical case and determination of data gathering and analysis techniques

We believe that the two (2) cases of cooperative marketing programs of HP and IBM may give valuable information (Spais, 2012). Information that may deepen our understanding of the characteristics of vertical cooperative sales promotion campaigns and, thus, the phenomenon studied can become more visible, as Stake (1994) argued. The different aspects of a context, from which a particular problem situation originates, can become increasingly visible and more accessible for a promotion management researcher (e.g. Spais, 2010; 2011).

Based on Uden, Valdres and Pastor's work (2008), we adopt the following linear process in order to gather the data in the critical cases presented online:

1. *Clarification of the purpose(s) of the activity system.* Clarification of the motives and goals of the activity system is very important. The purposes of this step are: a) to understand the context within which activities occur, and b) to reach a thorough understanding of the motivations for the activity being modeled and any interpretations of perceived contradictions.
2. *Analysis of the activity system and production of the activity system.* This step involves an in-depth definition of the components of the given activity, namely, the subject, object, tool, goal and result.
3. *Analysis of the activity structure.* This step involves decomposing each activity into actions and operations. An important key process here is to analyze the activity structure (all of the activities that engage the subject) that defines the purpose(s) of the activity system. The conceptual categories of Table 2 will lead the description of actions and operations of the activity structure.

Evaluation and analysis of the data

The data of activity structure analyses resulted from the performance of two (2) critical case studies analyses from September 1 to September 22, 2011. The cases are presented in Spais' study (2012) [in accordance with the methodological guidelines for qualitative content analysis in case study research of Kohlbacher (2006)] utilizing the conceptual categories of —activity system for the understanding the nature and the characteristics of cooperative marketing and advertising campaigns. The findings of the cases' analysis are presented in the following section.

Findings

Table 2 presents the summarized details of the two (2) cases of cooperative marketing programs based on the activity system structure in order to deepen the understanding of the characteristics of vertical cooperative sales promotion campaigns, in accordance to the unit of analysis described above.

Based on the above analysis, we can interpret and summarize the following findings regarding to crucial characteristics from the side of the successful brand manufacturers during the planning of cooperative sales promotion campaigns:

Successful brand manufacturers see an adding value through the collaboration with the retailers, because there are strongly interested in accomplishing customer relationship goals.

The most significant strategic factor that successful brand manufacturers consider is the increasing customers' participation rates through loyal customers, as the result of individualized marketing. Best practice can be found at cases of cooperative sales promotion campaign, where content of cooperative marketing campaigns is based on customer's socio-demographic and behavioral characteristics and his demands assessed in a continuous base.

The main objective for successful brand manufacturers is to approach customer's needs individually and to direct campaigns at specific target groups.

Because of an information overflow on the customer side, successful brand manufacturers see the relevance of marketing communication as a crucial success factor that requires innovative strategies towards a one-to-one marketing approach.

The successful brand manufacturers agree on how customer-oriented processes should be implemented and how responsibilities for complete, or partial, processes should be regulated.

Intervening conditions of cooperative sales promotion campaigns may be grouped into two sections: i) technological impediments; and ii) organizational impediments.

Three contexts may influence the decision selection for successful brand manufacturers among different cost effective promotional tools: i) environmental (e.g. market conditions); ii) organizational (e.g. size of the two parties); and iii) level of ICT inadequate knowledge and technophobia.

Case: Hewlett-Packard (HP)

Title of the cooperative marketing program: "HP Online-To-Store"

Background: HP is an American multinational information technology corporation headquartered in Palo Alto, California, USA that provides products, technologies, software's, solutions and services to consumers, small- and medium-sized businesses (SMBs) and large enterprises, including customers in the government, health and education sectors. Bill Hewlett and Dave Packard founded the company in a one-car garage in Palo Alto. Currently, HP is the world's leading PC manufacturer, operating in nearly every country. It specializes in developing and manufacturing computing, data storage, and networking hardware, designing software and delivering services. Major product lines include personal computing devices, enterprise, and industry standard servers, related storage devices, networking products, software and a diverse range of printers, and other imaging products. HP markets its products to households, small- to medium-sized businesses and enterprises directly as well as via online distribution, consumer-electronics and office-supply retailers, software partners and major technology vendors. HP also has strong services and consulting business around its products and partner products.

subject	tool	object	goal	result
HP	<p>Co-op advertising is a key strategic marketing platform, where manufacturers such as HP partner with retailers to drive sales. Google can help advertisers build, manage and measure results of a digital co-op marketing program, targeted at the vast and engaged online audience. HP partnered with a national retailer to launch the digital co-op program (APT). The campaign was conducted for 4 weeks in 2010.</p> <p>APT has partnered with over 50 global 2000 leaders to test proposed initiatives, learn from results, accurately predict the impact of decisions, and maximize profits.</p> <p><i>Test vs. Control Methodology</i></p> <p>1. Geographically diverse test markets spread across the country were served Google search ads for HP branded terms and non-branded keywords. The control markets were not served search advertising related to these keywords.</p> <p>2. To minimize noise, APT's software compares each test store's performance against a unique set of 10 control stores based on historical sales patterns, population density and geographic proximity.</p> <p>3. Using APT's sophisticated analysis</p>	<p>Google partnered with Applied Predictive Technologies (APT) to evaluate the sales lift with high significance.</p>	<p>Quantify the impact of an HP computing digital co-op search marketing campaign on in-store sales to make confident decisions about discretionary media and co-op budget allocation.</p>	<p>530% overall return-on-ad-spend for computing category (\$5.30 in sales for every \$1.00 of search media). Search ads targeted to top 25% of markets based on specific store attributes produced 1,090% return-on-ad-spend for computing category.</p>

	<p>software, sales in each test store were compared to its control store group to determine the impact of paid search advertising on store and online sales.</p>			
<p style="text-align: center;">Case: IBM Title of the cooperative marketing program: "Smarter Planet"</p> <p><i>Background: International Business Machines, abbreviated IBM and nicknamed "Big Blue", is a multinational computer technology and IT consulting corporation headquartered in Armonk, New York (USA). The company is one of the few information technology companies with a continuous history dating back to the 19th century. IBM manufactures and sells computer hardware and software (with a focus on the latter), and offers infrastructure services, hosting services, and consulting services in areas ranging from mainframe computers to nanotechnology. In a joint engagement, IBM and Nokia Siemens Networks designed and built a SOA-based service creation and delivery platform that enables Globe Telecom (from Philippines) to rapidly and cost-effectively create service offerings from reusable service components. Globe Telecom, the number two mobile communication services provider in the Philippines, with 27 million customers, recognized that the most effective way to attract and retain the value-conscious Philippine mobile customer was to spur action through time-limited marketing promotions. In such an environment, success comes to the fast, nimble and intelligent—defined by the ability to target market opportunities with tactical campaigns, monitor their effectiveness and fine tune them in short order. That is exactly how Globe Telecom—the number two provider in the Philippines, with 27 million customers—is approaching the competitive challenge. Globe specifically recognized that the most effective way to attract and retain the value-conscious Philippine mobile customer was to spur action through time-limited marketing promotions—for example, reload HSDPA service with PHP30 and get 24 hours unlimited SMS product. Call it opportunistic marketing in the extreme. While Globe’s marketing staff had no shortage of creative promotional ideas—or the energy to carry them out—the company’s heavy reliance on its traditional vendors (particularly IN) to develop new services put a major drag on its agility. Under a typical scenario, it took roughly 10 months and most often several hundreds of thousands of dollars to develop and bring a new service to market. Moreover, the fact that each of Globe’s lines of business operated its own service creation silo made the creation of bundled, composite service promotions equally complex due to integration requirements.</i></p>				
<p style="text-align: center;">Source: Globe Telecom: Gaining marketing agility with smart promotions Available: http://www-01.ibm.com/software/success/cssdb.nsf/CS/IST5-7Z7K7B?OpenDocument&Site=default&cty=en_us</p>				
subject	tool	object	goal	result
IBM	<p>IBM and Nokia Siemens Networks designed and built a SOA-based service creation and delivery platform that enables Globe Telecom (from Philippines) to rapidly and cost-effectively create service offerings from reusable service components.</p> <p style="text-align: center;">Solution Components Framework Service Provider Delivery Environment (SPDE) Software IBM WebSphere IBM Tivoli IBM Rational Servers IBM BladeCenter</p>	<p>Globe Telecom needed to reach a new level of agility in the creation and management of promotional service offerings.</p>	<p>Expected one-year payback period; 600 percent increase in promotion effectiveness; more than 95 percent reduction in the time and cost of developing new promotions</p>	<p>Globe is using the Toolbox to seize customer opportunities is through the intelligent sensing needs, and the ability to respond to it in a targeted, timely and compelling way. The key to opportunistic marketing is awareness. Using the Toolbox solution, Globe’s marketers can configure triggers that automatically detect when, for example, a</p>

Table 2 – Summary of data analysis

Second stage: Survey – pilot study

Participants, procedure and data collection

The survey was carried out at brand manufacturers from Greece and Cyprus (from February 6 – March 30, 2012). Our intention was to measure the perceptions and attitudes of those who were involved or could be involved in bargaining situations during the planning of a cooperative sales promotions campaign. Therefore, the adoption of the snowball technique was essential in order to identify the key informants.

In total, 32 marketing, sales directors and other senior executives were asked to participate, and five declined to take part in the study. The number of brand manufacturers from production sectors was about eighty-four (84.4%) and about sixteen (15.6%) from the service sector. Regarding to the companies size (based on the number of employees), about thirty-four (34.4%) were 10-19, about nineteen (18.8%) were 20-49, about nineteen (18.8%) were 50-199 and twenty-eight (28.1%) were over 200. About fifty-six (56.3%) had a previous experience in managing cooperative sales promotion campaigns and about forty-four (43.8%) did not had relative experience. About eighty-eight (87.5%) were strongly interested in developing a cooperative sales promotion campaign in the near future and about thirteen (12.5%) were not interested in developing a cooperative sales promotion campaign.

Data were collected by means of an on-line self-completion questionnaire (available on a SurveyMonkey's page). Prior to drafting the questionnaire, pre-survey interviews were in conducted in a group of five marketing directors that indicated "conceptual equivalence" of the construct studied.

Research instrument and measurement of variables

The questionnaire was considered as the most suitable research instrument in order to explore the managerial perceptions and attitudes regarding to: i) importance of cooperative sales promotion campaigns in vertical marketing channels; ii) role of bargaining in a vertical marketing channel; iii) importance of developing integrated bargaining solution analyses for cooperative sales promotion campaigns in vertical marketing channels; iv) sharing problem of the cost of a cooperative sales promotion campaigns and v) triple pole idea (including the customer as a third pole) in a bargaining situation between the brand manufacturer and the retailer. Unfortunately, the available research instruments in the literature could not serve accomplish the research needs of such exploratory study, so literature review findings and the findings of the two critical cases were considered for the content validity of the measured items included in the questionnaire.

The respondents were asked to indicate their degree of agreement and disagreement with each of the following series of statement. Each scale item has five (5) response categories ranging from strongly disagree and strongly agree. Items 1-7 (related to respondents' details and their intention to develop cooperative sales promotion campaigns) were measured using nominal scale.

The measured series of statement (S1-S12) were the following (denote that at the end of each statement, the variable is presented):

(S1): "A customer-centric organization must motivate customers' participation in marketing planning activities". [B]

(S2): "Cooperative sales promotion campaigns play a crucial role among the members of the vertical marketing channels and the final customers". [C]

(S3): "Bargaining is critical for the effective coordination of a marketing channel". [D]

(S4): "The development of integrated bargaining solution analyses for cooperative sales promotion campaigns in vertical marketing channels is essential". [E]

(S5): "An integrated bargaining solution analysis for cooperative sales promotion campaigns must solve sharing problem of cost between the two members of a vertical marketing channel and determines the promotion and pricing strategies for both parts". [F]

(S6): "Bargaining problems are related to the complexity and the difficulty of measuring the effectiveness of promotion activities". [G]

(S7): "Bargaining problems are related to the reputation that both parts bring to the bargaining table". [H]

(S8): "Bargaining problems are related to perceived uncertainty in the lateral environment". [I]

(S9): "Bargaining problems are related to tendency to conflict in vertical marketing channels because of different expectations and different organizational conditions and cultures of each part of the bargaining". [J]

(S10): "Bargaining problems are related to the fact that the last years more and more big retailers seem to increase their dominance in bargaining situation (against brand manufacturers) for cooperative sales promotion campaigns". [K]

(S11): "Bargaining problems are related to the lack of trust among the vertical marketing channel members". [L]

(S12): "Can the customer be considered as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel (e.g. between brand manufacturer and retailer) for cooperative sales promotion campaigns". [A]

Research hypotheses and the alternative research models

Based on the findings of the literature review and the critical cases analysis and their interpretation, we decided to test the following alternative research models and research hypotheses:

Model 1:

$$A=f(B, C, D, E, F)$$

Research Hypothesis 1 (H₁): Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 1.

Model 2:

$$A=f(G, H, I, J, K, L)$$

Research Hypothesis 2 (H₂): Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 2.

Model 3:

$$A=f(B, D, E, F, K)$$

Research Hypothesis 3 (H₃): Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 3.

Model 4:

$$A=f(D, E, F, K, L)$$

Research Hypothesis 4 (H₄): Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 4.

Model 5:

$$A=f(B, D, E, F, K, L)$$

Research Hypothesis 5 (H₅): Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 5.

Model 6:

$$A=f(B, C, D, E, F, K, L)$$

Research Hypothesis 6 (H₆): Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 6.

Model 7:

$A=f(B, C, D, E, F, I, K, L)$

Research Hypothesis 7 (H₇): Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 7.

Research results

Descriptive statistics

We start our analysis with the descriptive statistics of the measured items for the whole sample. The one-sample Kolmogorov-Smirnov test the distribution in almost all measured series of statement are not normal and nonparametric techniques must be employed to further analyze them. Characteristics of the distributions of the answers were obtained by calculating means, maximums, minimums and standard deviations for each item (see Table 3).

We are 99% confident that the true value of the parameter is in our confidence interval. Based on the confidence levels there is a statistically significant difference among the samples. The largest standard deviations were observed for statements (S): S8, S10, S6, S12 and S7. The statements (S6, S7, S8, S10) are related to three from six under examination bargaining problems [i) perceived uncertainty in the lateral environment; ii) the dominance of large retailers; iii) complexity and the difficulty of measuring the effectiveness of promotion activities; and reputation that both parts bring to the bargaining table] and S12 is about the idea of seeing the customer as the 'third pole' in a bargaining situation. Regarding to the skewness, there is clear statistical evidence of the nature of this non-normality, which is negative asymmetry ($S < 0$) for all measured items except for S1 and S11 ($S > 0$). Non-normal distribution of the eleven measured item can be attributed to the platykurtosis ($K < 1$) and the rest one to the leptokurtosis ($K = 1-3$).

Comparisons among the independent groups

Results based on Kruskal – Wallis test showed us that there are significant statistical differences for the grouping variable: 'size' (a. S1: "A customer-centric organization must motivate customers' participation in marketing planning activities", 0.050; b. S4: "The development of integrated bargaining solution analyses for cooperative sales promotion campaigns in vertical marketing channels is essential", 0.025; and c. S5: "An integrated bargaining solution analysis for cooperative sales promotion campaigns must solve sharing problem of cost between the two members of a vertical marketing channel and determines the promotion and pricing strategies for both parts", 0.05).

Table 3 – Descriptive statistics

The results from the two sample Kolmogorov-Smirnov test showed us that there are no significant statistical differences for the grouping variable: ‘previous experience in developing cooperative sales promotion campaigns’ except for S5: “An integrated bargaining solution analysis for cooperative sales promotion campaigns must solve sharing problem of cost between the two members of a vertical marketing channel and determines the promotion and pricing strategies for both parts” (0.050).

Frequencies and interpretation of the questionnaire results

The results of the survey are summarized in Table 4. Based on the questionnaire results, we can interpret the responses as follows:

- Considering the “triple pole” in bargaining for cooperative sales promotion campaigns, is an innovative idea and approach, surprisingly, the half of the respondents agreed that the

customer could be considered as the “third pole” in a bargaining procedure between two members of a vertical marketing channel. Considering also that almost all agreed that a customer-centric organization must motivate customers’ participation in marketing planning activities, we can safely state that the results are encouraging and it seems that there is a realistic basis of “triple pole” approach.

- The majority of the respondents agreed that cooperative sales promotion campaigns play a crucial role among the members of the vertical marketing channels and the final customers.
- Regarding to the role of bargaining, the respondents valued as critical the effective coordination of a marketing channel and they saw that the development of integrated bargaining solution analyses for cooperative sales promotion campaigns in vertical marketing channels was essential. Surprisingly, the significance of bargaining was recognized, as almost all respondents saw its unique contribution to the effective coordination of a marketing channel.
- Regarding to the bargaining problems, all measured problems were valued as important. Based on the number of responses (“agree” and “strongly agree”) the three most important bargaining problems were: i) the tendency to conflict in vertical marketing channels because of different expectations and different organizational conditions and cultures of each part of the bargaining; ii) the complexity and the difficulty of measuring the effectiveness of promotion activities; and iii) the increase of big retailers’ dominance in bargaining situation (against brand manufacturers). Surprisingly, bargaining problems that were related to the reputation that both parts bring to the bargaining table seemed not to be acknowledged as the most important, in opposite with the literature review findings.

Crosstab responses

The crosstab responses allow us to deepen our understanding about the beliefs of respondents who can see the customer as a third pole in a bargaining situation for cooperative sales promotion campaigns. The most significant crosstab responses and their relationships are summarized in Table 5. The bivariate nonparametric correlation tests (Kendall’s tau_b and Spearman’s rho correlation coefficients) are computed in order to identify if there is any association between the underlined variables measured at the interval level and at the ordinal level.

Table 5 helps us to deepen our understanding about those respondents who can see the customer as a third pole in a bargaining situation for cooperative sales promotion campaigns. Based on the above table, they agree [“agree” and “strongly agree”: about sixty-six (65.6%) and about twenty-eight (28.1%)] that a customer-centric organization must motivate customers’ participation in marketing planning activities. About fifty-nine (59.4%: “agree”) and about twenty-two (21.9%: “strongly agree”) agree that bargaining is critical for effective coordination of a marketing channel. About fifty-six (56.3%: “agree”) and about nineteen (18.8%: “strongly agree”) agree that the development of integrated bargaining solution analyses for cooperative sales promotion campaigns in vertical

marketing channels is essential. Fifty (50%: “agree”) and about twenty-eight (28.1%: “strongly agree”) agree that cooperative sales promotion campaigns play a crucial role among the members of the vertical marketing channels and the final customers.

Regarding to the bargaining problems, about sixty-six (65.6%: “agree”) and about nineteen (18.8%: “strongly agree”) agree that bargaining problems are related to tendency to conflict in vertical marketing channels because of different expectations and different organizational conditions and cultures of each part of the bargaining. About forty-one (40.6%: “agree”) and about thirty-one (31.3%: “strongly agree”) agree that bargaining problems are related to the complexity and the difficulty of measuring the effectiveness of promotion activities.

Based on the bivariate nonparametric correlation tests, there is no positive correlation for the underlined variables and there are not linearly related.

The Spearman’s Rho correlation coefficients among the variables are computed in Table 6.

Validity test of the seven alternative research models

In accordance with the linear relationship between a dependent variable (Y) and an independent variable (X) can be expressed by the equation $Y = a + bX$, where a is a fixed constant (called Y -intercept, which determines the value of Y when $X = 0$). The value of the dependent variable (Y) equals the sum of a constant (a) plus the value of the slope (b) times the value of the independent variable (X). The slope (b) shows the amount of change in Y variable for every one-unit change in X .

Based on the statistical evidence, one from the seven alternative research models (model 1) is found not valid. 23.2% of the variance of the dependent variable is explained by the independents. As $\text{sig}F = .202$, we have statistical evidence that the model is not valid.

For the second alternative research model, 45.2% of the variance of the dependent variable is explained by the independents. $F = 3.438$ with $\text{sig}F = .013$ show that the model is valid. Colinearity and autocorrelation diagnostics show that there are no colinearity problems, as $VIF = 1.548, 1.420, 1.115, 1.195, 1.567$ and 1.076 (as $VIF < 10$) and $d = 1.626$ for $\alpha = .05$, ($dU, \alpha < d$), which means there is no statistical evidence that the error terms are positively autocorrelated. In addition, $(4-d) > dU, \alpha$, which means that there is no statistical evidence that the error terms are negatively autocorrelated. As it nears to 2, there is no autocorrelation problem. For the third alternative research model, 49.0% of the variance of the dependent variable is explained by the independents. $F = 5.005$ with $\text{sig}F = .002$ show that the model is valid. Colinearity and autocorrelation diagnostics show that there are no colinearity problems, as $VIF = 1.331, 2.206, 2.433, 1.616$ and 1.120 ($VIF < 10$) and $d = 1.833$ for $\alpha = .05$, ($dU, \alpha < d$), which means there is no statistical evidence that the error terms are positively autocorrelated. In addition, $(4-d) > dU, \alpha$, which means that there is no statistical evidence that the error terms are negatively autocorrelated. As it nears to 2, there is no autocorrelation problem. For the fourth alternative research model, 50.2% of the variance of the dependent variable is explained by the independents. $F = 5.246$ with $\text{sig}F = .002$ show that the model is valid. Colinearity and autocorrelation diagnostics show that there are no colinearity

problems, as $VIF = 1.928, 2.458, 1.550, 1.121$ and 1.087 ($VIF < 10$) and $d = 1.833$ for $\alpha = .05$, ($dU, \alpha < d$), which means there is no statistical evidence that the error terms are positively autocorrelated. In addition, $(4-d) > dU, \alpha$, which means that there is no statistical evidence that the error terms are negatively autocorrelated. As it nears to 2, there is no autocorrelation problem. For the fifth alternative research model, 50.3% of the variance of the dependent variable is explained by the independents. $F = 4.216$ with $\text{sig}F = .005$ show that the model is valid. Colinearity and autocorrelation diagnostics show that there are no colinearity problems, as $VIF = 1.375, 2.266, 2.524, 1.705, 1.136$ and 1.123 ($VIF < 10$) and $d = 1.803$ for $\alpha = .05$, ($dU, \alpha < d$), which means there is no statistical evidence that the error terms are positively autocorrelated. In addition, $(4-d) > dU, \alpha$, which means that there is no statistical evidence that the error terms are negatively autocorrelated. As it nears to 2, there is no autocorrelation problem. For the sixth alternative research model, 52.6% of the variance of the dependent variable is explained by the independents. $F = 3.806$ with $\text{sig}F = .006$ show that the model is valid. Colinearity and autocorrelation diagnostics show that there are no colinearity problems, as $VIF = 1.503, 1.687, 2.373, 2.558, 1.710, 1.220$ and 1.194 ($VIF < 10$) and $d = 1.779$ for $\alpha = .05$, ($dU, \alpha < d$), which means there is no statistical evidence that the error terms are positively autocorrelated. In addition, $(4-d) > dU, \alpha$, which means that there is no statistical evidence that the error terms are negatively autocorrelated. As it nears to 2, there is no autocorrelation problem.

For the seventh alternative research model, 55.80% of the variance of the dependent variables is explained by the independents. $F = 3.633$ with $\text{sig}F = .007$ show that the model is valid. Colinearity and autocorrelation diagnostics show that there are no colinearity problems, as $VIF = 1.674, 1.692, 2.479, 2.585, 1.842, 1.226, 1.274$ and 1.253 (as $VIF < 10$) and $d = 1.539$ for $\alpha = .05$, ($dL, \alpha < d < dU, \alpha$), which means that the test is inconclusive. However, $(4-d) > dU, \alpha$, which means that there is no statistical evidence that the error terms are negatively autocorrelated. As it nears to 2, there is no autocorrelation problem.

Summary of the multiple regression analysis for the seventh alternative research model:

$A = f(B, C, D, E, F, I, K, L)$ and its interpretation

The regression equation is:

$\hat{Y} = -.972 + .019*B + .256*D + .301*E + .181*I + .542*K + .233*L - .228*C - .097*F$									$R^2 = .558, \bar{R}^2 = .405$
$se = (1.640)$	$(.285)$	$(.296)$	$(.266)$	$(.140)$	$(.146)$	$(.179)$	$(.221)$	$(.250)$	

The above estimates tell us about the relationship between the eight perceptions (independent variables) and perceived value of considering the customer as the 'third pole' in a bargaining procedure for planning cooperative sales promotion ("cooperative advertising") campaigns (dependent variable). These estimates inform about the amount of increase of positive perceptions in perceived value of considering the customer as the 'third pole' that would be predicted by 1 count increase in the predictor. Based on Table 9, the intercept is equal to $-.972$ (which means that the regression line intersects with the Y axis below zero) and slope for B equals to $.019$, which means that for each increase for B perception then perceived value of considering the customer as the 'third pole'

will be increased about 0.01 time. The slope for D equals to .256, which means that for each increase for D perception then perceived value of considering the customer as the 'third pole' will be increased about 0.2 time. The slope for E equals to .301, which means that for each increase for E perception then perceived value of considering the customer as the 'third pole' will be increased about 0.3 time. The slope for I equals to .181, which means that for each increase for I perception then perceived value of considering the customer as the 'third pole' will be increased about 0.1 time. The slope for K equals to .542, which means that for each increase for K perception then perceived value of considering the customer as the 'third pole' will be increased about 0.5 time. The slope for L equals to .233, which means that for each increase for L perception then perceived value of considering the customer as the 'third pole' will be increased about 0.2 time. The slope for C equals to -.228, which means that for each increase for C perception then perceived value of considering the customer as the 'third pole' will be decreased about 0.2 time. The slope for F equals to -.097, which means that for each increase for F perception then perceived value of considering the customer as the 'third pole' will be decreased about 0.09 time.

	<i>Hypothesis</i>	<i>Support</i>
H1	<i>H1= Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 1</i>	<i>not supported</i>
H2	<i>H2= Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 2</i>	<i>not supported</i>
H3	<i>H3= Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 3</i>	<i>not supported</i>
H4	<i>H4= Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 4</i>	<i>not supported</i>
H5	<i>H5= Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 5</i>	<i>not supported</i>
H6	<i>H6= Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 6</i>	<i>not supported</i>
H7	<i>H7= Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by model 7</i>	<i>supported</i>

Table 8 – Research results

Based on the above, only K variable influences the perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns. For each unit increase-improvement of perceived importance of bargaining that related to the dominance of the big retailers, there is an increase-improvement 0.542

of the perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns.

The t-statistics for the intercept and the regression coefficients are -.593, .068, -1.031, .866, 1.132, -.389, 1.294, 3.718, 1.306 accordingly. The constant and the regression coefficients (B, C, D, E, F, I and L) are statistically significant, the regression coefficient of K is not significantly statistically significant [as $Pr(-1.860 < T < 1.860)$], for 95% for one-sided and 90% for two-sided. Based on the ANOVA analysis we can confirm that independent variables interpret the 55.80% of the dependent variable (see Tables 7 and 8). The rest variance caused by the residuals. As $F > F_{.05}$, (3.633 > 2.3748) H_0 is rejected and this means that there is a difference in the variation of the following eight set of perceptions: B, C, D, E, F, I, K and L.

Summary of the research results and interpretation

Table 8 summarizes the research results and shows which research hypothesis is supported.

Based on the assumptions of the theoretical framework the research results may be interpreted as follows:

- Brand manufacturers' perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns is better predicted by the following perceptions and attitudes: i) customers' participation in marketing planning activities; ii) crucial role of cooperative sales promotion campaigns; iii) critical role of bargaining for the effective coordination of a marketing channel; iv) necessity of developing integrated bargaining solution analyses for cooperative sales promotion campaigns in vertical marketing channels; v) necessity of solving sharing problem of cost between the two members of a vertical marketing channel and determines the promotion and pricing strategies for both parts; and vi) bargaining problems related to the lateral environment, the big retailers' dominance and the lack of trust among the vertical marketing channel members.
- As the managerial attitudes of brand manufacturers for customers' participation in marketing planning activities impact the perceived value of the triple pole approach, this means that these brand manufacturers see an adding value through the collaboration with the retailers, because there are strongly interested in accomplishing customer relationship goals. Based on this observation, we can safely interpret that the customers (as the "C" party/player) produce a new behavioral type that converges the interest of a brand manufacturer and motivate him for building marketing alliances in vertical marketing channels.
- As underlined above, the most significant bargaining problems for brand manufacturers that significantly influence the perceived value of the triple pole approach are related to: i) the lateral environment; ii) the big retailers' dominance; and iii) lack of trust among the

vertical marketing channel members. This means that tendency sovereignty and the tendency of conflict are strengthened because of the above bargaining problems and according to the theory only a “third win” (the “C” factor: the customer) could unlock these series of obstacles. The win-win-win theoretical model suggests that information accessibility and diffusion is crucial because of the relation between knowledge and behavior (the “interaction on bargain-behavior”). The different examples of knowledge types’ synthesis and the resulted 1-1 behavior may lead brand manufacturers to understand the bargain-behavior assumption, based on information given. From the other hand, brand manufacturers’ information may be the dominant result of this cross-related knowledge types: socialization, sensitization, externalization etc. (Papakonstantinidis, 2011). Thus, the hypothesis of bargain-behavior interaction is very important in building the suggested “C Factor” following the Harsanyi’s Bayesian Theorem original game can be replaced by a game “where nature first conducts a lottery in accordance with the basic probability distribution” (Harsanyi, 1967). This extension is mainly based on the “Harsanyi’s transformation”, with a difference: original bargain between two can be replaced by a game, where the C Factor first conducts a lottery in accordance with the basic probability distribution. In addition, the “C” factor should be seen as the result of a “new” suggested bargaining behavior, coming from sensitization process (Papakonstantinidis, 2002; 2003; 2004a; 2004b; 2007; 2011). In such a context, the C party/player is given in terms of a continuous sensitization process, tending to sensitization itself, inside the customers. In accordance to Papakonstantinidis proposal (2011), the heart of the analysis for a bargaining solution in a cooperative promotion campaign must be the configuration of how the “sensitized game” (G^{**}) is formed and developed.

Discussion

The literature showed that cooperative advertising has been used by many industries for decades and continues to play a key promotional role for many manufacturers, retailers and retail customers (e.g. Spais, 2012; Yan, 2010; Huang, Li and Mahajan, 2002; Li et al., 2002; Huang and Li, 2001). Its role become stronger especially in periods of economic recession such as nowadays (as the successful case of the “MNG’s co-op contest” and its alliance with MultiAd Recas show us). This is proven by significant increase of money spent on cooperative advertising. (e.g Seyedefahani, Biazaran and Gharakhan, 2011). This increase in spending volume and the overall increase in the significance of cooperative advertising seems to motivate scholars, researchers, authors and thinkers, globally to explore more the role and use of cooperative advertising in practice, the last years (Spais, 2012).

In this study, we explored brand manufacturers’ perceived value of the “triple pole” approach in bargaining for vertical cooperative sales promotion campaigns. Our research intention was to test seven (7) research hypotheses based on a survey (pilot study) of marketing, sales directors and other senior executives of brand manufacturers from Greece and Cyprus. Each of them testing an alternative

research model in order to investigate which model may predict better the perceived value of considering the customer as the 'third pole' in a bargaining procedure between two members of a vertical marketing channel for cooperative sales promotion campaigns. The research results showed us that perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaign was better predicted by model 7. Based on the research results, the basic initial assumption of this study was confirmed. The perceived value of considering the customer as the 'third pole' in a bargaining procedure for planning cooperative sales promotion campaigns is determined by the: a) perceived necessity of bargaining for the coordination of a marketing channel, b) perceived necessity of developing integrated bargaining solution analyses, c) perceived contribution of an integrated bargaining solution analysis to the sharing problem of cost and the determination of the promotion and pricing strategies for both parts and d) perceived importance of bargaining problems.

The literature reaffirms the critical role of bargaining in marketing channels. An in-depth literature shows that there is a focus on constructs such as bargaining problem and tendency to conflict. In contrast, the normative and behavioral principles governing marketing channel dependency and coordination regarding the tendency to sovereignty, tendency to improvement and mistrust are relatively unexplored. Although literature clearly shows the raising issue of reinforcing customers' participation in marketing management activities of customer-centric organizations, unfortunately, there is no theoretical framework for the triple pole approach in a cooperative marketing or promotion planning process. Therefore findings and the research results of this study were interpreted in accordance to the assumptions of only available theoretical framework of the literature ("win-win-win spais-papakonstantinidis model", Spais, Papakonstantinidis and Papakonstantinidis, 2009; Spais and Papakonstantinidis, 2011; Spais, 2012). No study, until now, has studied brand manufacturers' perceptions and attitudes for the value of considering the customer as the 'third pole' in a bargaining procedure for planning cooperative sales promotion campaigns and the attitudes that influence it.

We strongly believe that this research try helped us to deepen our understanding about bargaining situations and marketing phenomena of bargaining for cooperative sales promotion campaigns in vertical marketing channels. Marketing phenomena related to marketing alliances in vertical marketing channels that are significantly characterized by conflict and mistrust. Definitely, the findings and the research results led us to increased comprehension and this will allow us to propose in future more realistic and applicable bargaining solution analyses for marketing and promotion managers. Of course, if we consider the latest major research interests that are developed in influential journals, then issues of asymmetric channel power and coordination of pricing, cost sharing and extra joint profit must be seriously considered in future research tries for integrated bargaining solution analyses for cooperative sales promotion campaigns based on a "triple pole approach". The study of retailers and customers' perceptions and attitudes based on surveys and critical cases for the "triple pole" approach of bargaining for cooperative sales promotion campaigns will offer an adding research value to the existed scientific knowledge.

Conclusion

We explored brand manufacturers' perceived value of the "triple pole" approach in bargaining for vertical cooperative sales promotion campaigns. Our research intention was to test seven (7) research hypotheses. Each of them testing an alternative research model in order to investigate which model may predict better the perceived value of considering the customer as the 'third pole' in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaigns. The basic initial assumption of this study was that perceived value of considering the customer as the 'third pole' in a bargaining procedure for planning cooperative sales promotion campaigns is determined by the: a) perceived necessity of bargaining for the coordination of a marketing channel, b) perceived necessity of developing integrated bargaining solution analyses, c) perceived contribution of an integrated bargaining solution analysis to the sharing problem of cost and the determination of the promotion and pricing strategies for both parts and d) perceived importance of bargaining problems. The research results showed us that perceived value of considering the customer as the 'third pole in a bargaining procedure between 2 members of a vertical marketing channel for cooperative sales promotion campaign was better predicted by model 7. No study, until now, has studied brand manufacturers' attitudes for the perceived value of considering the customer as the 'third pole' in a bargaining procedure for planning cooperative sales promotion campaigns and the group of attitudes that influence it. Encouragingly, the "triple pole" approach in bargaining for cooperative sales promotion campaigns in vertical marketing channels was evaluated by the practitioners as an approach of high value.

IMPACT OF INNOVATIVE TECHNOLOGIES IN TRANSPORT SERVICE ON CONSUMER BEHAVIOR– AN INDIAN CASE STUDY

Srinivasan, R.¹; Priyadarshini, S.²; Shrisha, S.³

¹ Indian Institute of Science, Bangalore, India.

² Indian Institute of Science, Bangalore, India

³ Indian Institute of Science, Bangalore, India

INTRODUCTION:

Public transport in India provides the vital connectivity to far flung areas. Transport demand in India has been growing rapidly. Today approximately 75% of transit ridership is carried by buses. The buses of today are usually modern and operate at reasonably good travel speeds, depending upon traffic conditions, number of stops and preferential treatment. In the ongoing search for ways to make public transportation networks more reliable and responsive, service providers are increasingly looking into intelligent transportation systems. KSRTC started its service with the objectives of providing “adequate, efficient, economic and properly coordinated road transport services” [1]. In this endeavour it has relied on innovations in technology and good quality service.

Application of technology in KSRTC bus services:

Different types of buses offer different level of services and customer’s choice of a travel mode often depends on their attitude and their perception towards bus services.

The KSRTC runs a fleet of buses of many types to cater to the needs of different sections of the society. Some of them are: Sarige, Rajahamsa and Airavat (Volvo) buses.

KSRTC’s *Airavat* (Volvo) is a premium bus service with high quality passenger amenities. It is equipped with modern technology and offers good service to customers.

The salient features of Airavat bus service are as follows:

- Full air suspension on all four wheels for comfortable journey.
- 45 ergonomically designed executive passenger seats, luxurious, comfortable and reclining.
- LCD TV provided for passenger entertainment
- Mobile and laptop chargers
- Front panel design modified to increase the driver vision area and aesthetic look of the bus.
- Computerized speed control.
- CRDI ignition system.
- Speed monitors and seat belts for safety.

KSRTC's *Rajahamsa* is a semi deluxe bus. It serves middle class people.

The salient features of Rajahamsa Executive bus service are as follows:

- Constructed on Ashok Leyland 244" WB chassis fitted with 165 HP engine.
- Chassis fitted with all Weveller suspension
- Fitted with improvised Hi-Tech reclining passenger seats of 43 seating capacity with 2x2 configurations.
- Provided sound proof driver partition.
- The interiors are covered with rexine cloth.
- Speed monitors

KSRTC's *Sarige* serves lower middle class people. It offers minimum facilities. It can be considered as low technology bus.

KSRTC is the first State Road Transport Unit (SRTU) in India to introduce:

- RDBMS based passenger seat reservation system in 1998-has helped in computerization
- Web site in 1997-has helped in enhancing awareness of services provided
- Computerized recruitment system since 1997
- E-tendering-has made processes transparent
- Oracle financials-has helped in implementation of ERP
- Electronic ticketing machines on all of its routes
- Web based passenger seat reservation system since 2006

Major IT enabled projects by KSRTC:

- Electronic bus ticketing machines –this has helped in reducing the queue length
- Any Where Any Time Advanced Reservation System (AWATAR)-this has helped in advanced confirmed ticketing
- Automated driving track for the selection of skilled drivers-this has helped in enhancing safety

KSRTC is launching new premium bus service. It is proposed to provide new features like Pantry, Chemical Toilet, Live TV (for each seat) with 77+ channels to choose, WiFi, GPS based Information System, etc.

KSRTC introduced Intelligent Transport Systems (ITS) help track and monitor the movement of buses on a real-time basis using the Global Positioning System (GPS); inform commuters about the bus routes and timings through LED display systems; provide instant access to information related to

bus schedules and fare details; establish two-way interaction between the driver and the central control station; and monitor breakdowns and accidents.

KSRTC has introduced Multi-Axle Mercedes Benz buses in 2011.

Thus KSRTC has capitalized on market conditions by adapting emerging and improved technologies in road transport.

OBJECTIVE:

The present paper looks at the impact of emerging technologies on consumer behaviour on one of the popular routes in the state of Karnataka, operated by KSRTC namely Bangalore-Mangalore. It looks at how the innovations in technologies and quality of service have impacted the customer's expectation and perception.

To arrive at the results SERVQUAL instrument has been used. The paper identifies the gap between perception and expectation of service provided by KSRTC as a result of emerging technologies.

METHODOLOGY:

The transformation from low technology buses to modern technology buses has resulted in improvement in quality of services offered by public bus transport.

The quality of service offered by different types of buses of KSRTC is studied to evaluate customer's satisfaction level using the framework given below.

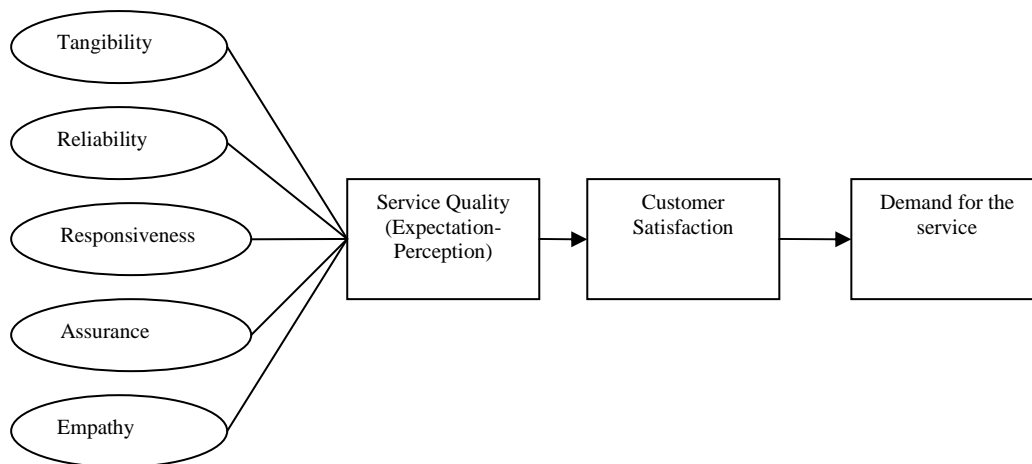

Fig 1: Conceptual Framework

The above conceptual framework makes use of SERVQUAL model and its five dimensions to evaluate commuter's service quality [2]. These are:

Tangibles – the physical facilities offered by bus service and appearance of materials available in bus

Reliability – the ability to perform the service accurately and dependably

Responsiveness – the willingness to help customers and provide prompt service

Assurance – the competence of the system and its security, credibility and courtesy

Empathy – the ease of access, approachability and effort taken to understand customers' requirement

Understanding the service dimensions has a major implication on the performance of an organization and its services since it helps the organization to take a re-look at the service mix offered based on its strength and to identify the gaps.

The quality in public transport stems from the ability of the respective operators to manage and further develop their services. Many operators and associated bodies worldwide employ quality assessment programs to assess and improve the services provided to the passengers. Such programs provide operators strategic tools that enable them to be closer to passengers and adjust the transportation service to their needs and requirements, while the knowledge gained from these programs feed with valuable data and facilitate their decision making process.

As per the hypothesis of our framework, better service quality helps to retain the satisfied customer which in turn leads to increase in demand.

This hypothesis is validated from the primary research conducted as part of this study.

For example: Analysis of the data collected in the survey indicates a positive correlation between the satisfaction level and preference for bus types.

The primary research showed that there is a significant relation between five dimensions of service quality and demand for particular type of bus (preference for bus type). Regression analysis was conducted to study the relation between these quantities.

The result of regression analysis is as given below:

Dependent variable: Passengers preference for a particular bus type (Demand for bus) (Y)

Independent variables: Tangibility (X1), Reliability (X2), Responsiveness (X3), Assurance (X4), Empathy (X5)

		<i>R</i>	<i>R Square</i>	<i>Adjusted R Square</i>
		.727	.529	.515

<i>Model</i>		<i>Sum of Squares</i>	<i>Df</i>	<i>Mean Square</i>	<i>F</i>	<i>Sig.</i>
1	<i>Regression</i>	76.920	5	15.384	37.905	.000(a)
	<i>Residual</i>	68.589	169	.406		
	<i>Total</i>	145.509	174			

Table 1: Regression results

The high value of R^2 shows that there is a significant relation between five dimensions of service quality and the demand for particular bus type.

It in turn says that, if the customer is satisfied by the quality of bus service then he will be loyal to that particular type of bus.

DATA COLLECTION AND ANALYSIS:

The study conducted in Bangalore-Mangalore route reveals the satisfaction level of commuters. Data with respect to the extent of service provided by the operators as well as various quality indicators were collected through a structured questionnaire from June-September 2011. The questionnaire considered five dimensions of SERVQUAL to find the level of satisfaction of customers towards the services offered by the bus operators. Likert scale ranging from strongly disagree (1) to strongly agree (5) is used to collect responses. The data thus obtained is processed with Statistical Package for Social Science (SPSS).

Demand Framework: This is presented in Fig 2

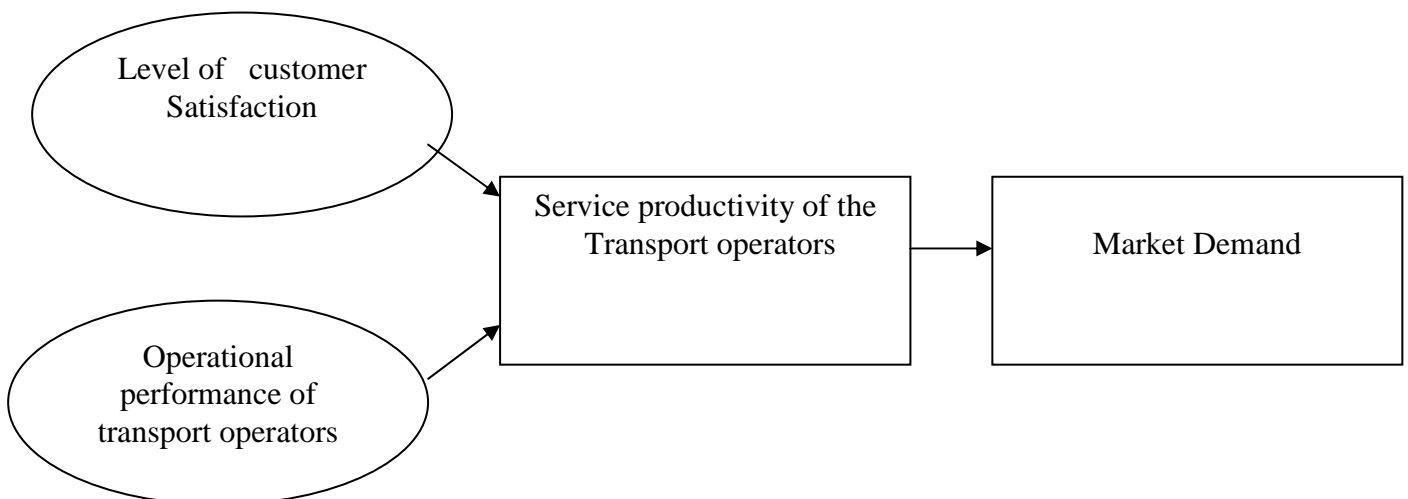

Fig 2: Demand framework

Data collected from passengers is analysed and discussed as below:

- The sample size of the survey is 175
- The demographic and travel characteristics are studied using descriptive statistics
- Reliability Analysis: Cronbach's alpha for perception obtained was 0.925 & Cronbach's alpha for expectation obtained was 0.929. This indicates that the items in the questionnaire have relatively high internal consistency and are highly reliable
- Chi Square Analysis: It is found that there is relation between preference of buses by passengers and satisfaction level of bus service. The survey shows that satisfaction level for KSRTC Airavat (Volvo) is quite high. On a scale of 0-5, 90% of the respondents indicated a

score ≥ 3 . Also, 75% of the respondents indicated during the survey that they prefer KSRTC over private buses when they had a choice.

The market demand for the bus service has been modelled as a function of customer satisfaction and operational performance of the transport operators.

This study also analysed the performance of KSRTC over past three to four years. The trend analysis showed that despite increasing losses and complaints, public service operator has increased the size of their fleet. Increase in travel demand led to introduction of premium service like air-conditioned, suspension buses.

Table 2 below gives fleet strength of all three types of KSRTC buses. It also provides profit and loss information, number of passengers travelled per year, number of trips performed, seating capacity, net revenue, number of accidents, number of complaints lodged and number of break downs.

Year	Destination	Effective Kms	Avg time (hrs)	Fleet Strength	Type of Buses	No of trip	Seating Capacity	Total Pax	Net Revenue	Cost incurred (Rs/Km)	Profit/Loss (Rs/Km)	No of Breakdowns	No of complaints	No of accidents
09-10	MNG-BNG-MNG	8573977	9.30	86	EX	80	56	1810400	150036861	17,34	0,16	40	16	21
09-10	MNG-BNG-MNG	10517387	9.00	83	RH	78	44	1793610	214288220	20,91	-0,54	39	21	16
09-10	MNG-BNG-MNG	7385063	8,30	51	VLV	48	44	1173840	255767498	35,86	-1,23	24	14	8

10-11	MNG-BNG-MNG	11244292	9,00	86	RH	80	44	2044000	247298470	23,66	-1,67	40	21	20
10-11	MNG-BNG-MNG	9059483	8,30	77	VLV	72	44	1944720	347298316	37,65	0,69	36	23	17

Table 2: KSRTC operator performance for the year 2009-11

The results of the operator performance analysis reveals that:

- In 2009-10 Express bus and Rajahamsa buses fleet were increased to 86 and 83 respectively. Express came out of loss because it reduced its incurring cost and made profit. Even though Rajahamsa's fleet was increased its net revenue remained low, so it incurred loss. Surprisingly Volvo hit loss for the first time, may be because of the increase in breakdowns.

The loss may be because of improper scheduling and wrong estimation of demand and idling of buses.

- In 2010-11 Express bus and Rajahamsa buses fleet were increased slightly. Both of them are running under loss. They have not been able to attract customers. People who cannot afford premium bus service are compelled to travel by ill maintained Rajahamsa and Sarige. They are left with no option. Passengers of Rajahamsa are middle class people. These middle class passengers can be charged slightly more to offer better services in Rajahamsa buses. Passengers of Sarige are lower middle class, so they cannot withstand the increase in cost. Volvo’s fleet strength increased by 25 with effective scheduling. This helped Volvo to capture market and attract passengers. It is providing better service with good amenities.

The demand for premium buses continues even in 2011-2012 term.

So we can conclude that increase in customer satisfaction and better operator performance results in increase in service productivity and it in turn increases the demand. It is also found that, customer’s perception about high technology buses are high and demand for those buses are also high.

COMPARISON OF SERVICE QUALITY GAPS:

The customer satisfaction gap is determined by finding the difference between passengers’ perception and expectation from the bus operators. The study reveals the gap among five dimensions of SERVQUAL. The analysis focuses on the mean gap scores on the expectations and perceptions scale for each of five dimensions and its variation among different types of buses.

Fig 3: Service quality gaps

Tangibility dimension varies drastically from Volvo Airavat to Sarige. That is, the appearance, maintenance of the bus and usage of modern technology varies from high score to low among Airavat Volvo, Rajahamsa and Sarige respectively.

Airavat is designed to offer comfortable service to its passengers with its improved and modern technical features.

During the survey commuters travelling in both premium and ordinary buses were asked to tick top 6 preferences among seventeen attributes which were mentioned in the questionnaire. The result shows that people's top priority is comfort, followed by safety, cleanliness, bus timing, seat, punctuality and cost. It also shows that passengers of premium buses expect comfort and safety over cost. But the passengers of ordinary bus keep cost as one of the top criteria to choose the mode of travel.

Tangibility is the most important critical factor that distinguishes the service quality amongst the buses.

Reliability is another dimension which changes significantly from Volvo Airavat, Rajahamsa and Sarige. Airavat Volvo buses are found to be most reliable as they operate more efficiently with better speed control- thus adheres to schedule and improve predictability of service.

Based on KSRTC's data for the year 2006-11, it is observed that both Rajahamsa and Sarige's rate of breakdown and accidents are more in current year (2010-11). This may be because of usage of low technology and hence reliability factor for Sarige is perceived to be low. *Reliability ranks second in terms of importance for determining the service quality perception.*

Responsiveness is the third dimension. From fig.3 it is seen that both Rajahamsa and Sarige employees' rate of response is low whereas it is high for Airavat buses. This is because high technology buses are more reliable, fast and accurate. Passengers can rely on the information provided on high technology buses as they are reliable. This increases customer satisfaction and reduces customer complaints.

Assurance is the fourth dimension, which is not showing much variation. From fig. 3 it is seen that there is no significant changes across different buses. So the level of assurance has remained almost same for all buses. *Assurance is not seen to be a critical factor influencing the preference of bus type among the passengers.*

Empathy is the fifth dimension. From the above fig 3, we could see the level of empathy is low for both Rajahamsa and Sarige. It is observed that empathy gap is high in Sarige when compared to other types of buses.

CONCLUSION:

- The demand framework (fig 2) shows that operator performance has considerable impact on the productivity and demand for KSRTC service. This can be viewed as a direct result of the consumer perception of service.
- Consumer perception of service has been studied based on the SERVQUAL factors resulting in the following conclusions.

Factor 1: Tangibility

Tangibility is an important service dimension. Since Bangalore-Mangalore journey time is long (~10 hours), it is clear that passengers prefer well maintained buses with comfortable seats and good service. It can be concluded that high technology modern buses often attracts passengers, thus bridging tangibility gap.

Factor 2: Reliability

Passengers prefer reliable services; so in order to improve demand for Sarige, reliability gap should be bridged. High technology buses are fast, accurate and dependable and hence reliable. It can be concluded that high technology buses are more reliable when compared to low technology buses.

Factor 3: Responsiveness

Communication between service providers and customers play an important role in deciding the rate of responsiveness. Responsiveness gap can be filled by active employees, who have willingness to assist customers quickly and help customers resolve their problems. Training employees to be more responsive to the passengers is a low investment process to bridge this gap. Also high technology buses are reliable and hence information given to customers regarding high technology buses is often accurate.

Factor 4: Assurance

It is found from the survey that safety is one of the top preferences of customers. So, it is bus operators' top priority to provide safe and secure bus journey. Assurance dimension of service quality is due to the behaviours of employees in communicating their credibility and instil trust in customer.

According to survey results, passengers across all segments of buses have almost similar perception about the level of assurance provided by the bus services. But we can observe that passenger's perception about high technology buses is slightly higher when compared to low technology buses.

Factor 5: Empathy

The basic target of the dimension is to afford more facilities for the current or potential customers and enhances the service quality, through personalized services. Better interaction with customers and increased awareness about special requirements of certain passengers like, giving special attention to women, children and handicapped can help reduce this gap. A study of the supply & demand to

ensure appropriate scheduling to meet the convenience of a majority of the passengers can also improve the perception of reliability.

Overall it could be concluded that, passenger's perception after availing the service from high technology buses are higher and are close to their expectations. This shows that quality of service offered by high technology buses is higher and this leads to passenger satisfaction which in turn boosts the demand for high technology buses.

Abstract

The paper investigates the models and tools commonly engaged in outdoor management development (OMD) in the United Kingdom.

The paper employs an interpretive methodology engaging participant observation and narrative techniques. A number of OMD providers were studied and this generated a rich body of data which is relayed and examined in the text.

In spite of extensive theoretical contemporary debates and developments in wider human resource development domains, the study identifies that many practitioners working in experiential course settings continue to engage a predominantly positivistic, well-rehearsed, over-used, and indeed ageing, collection of models. The paper identifies linear and modernistic assumptions on which such models are predicated.

OMD is a relatively longstanding form of training which continues to be used by a large number of individuals. The phenomenon therefore merits attention so as to better determine the social implications of the approach.

The paper offers an original and innovative consideration of the tools generally employed in OMD programmes.

Keywords: OMD, Effectiveness, Positivism, Modernism, Narrative.

Introduction.

OMD is a human resource development (HRD) approach that has been prevalent during the last seventy years in the United Kingdom. Its roots are located in military, youth movement and outdoor pursuits (Bank, 1994; Krouwel and Goodwill, 1994). The salient figure cited in the field is the German-Jewish educator Kurt Hahn who, together with funding from the Holt family business interests established the Outward Bound organization in 1941. Over the subsequent decades similar

organizations sprung up and an 'industry' was born. Over the last 25 years OMD has become a multi-million pound international industry (Jones and Oswick, 2007) and as such it warrants investigation.

This paper combines three objectives: (a) a descriptive overview of OMD tools, models and practices (b) a critical review of OMD tools, models and practices (c) empirical research into OMD tools, models and practices thereby recasting them from an 'interpretive' perspective.

OMD Literature – An Overview of its 'Technologies' - Tools, Methods and Processes.

The tools and models frequently engaged in OMD events have played an important role in creating the popular, if somewhat caricatured image, of much of the surrounding commentary - managers struggling up hills under heavy rucksacks, surmounting obstacles, building rafts and undertaking other physical tasks probably getting wet cold and muddy are the recurrent impressions for many people. The following quotation provides a useful overview:

A survey of a large number of employers who engage in OMD provides a useful overview of this form of management development (*Industrial Relations Review and Report-Employee Development Bulletin*, 1992a:16).

The review and report observes that although the nomenclature may vary OMD programmes are characterised as physical tasks performed in the open air. It states that group work is a key element in most programmes and that nearly all OMD programmes are residential. It is common for there to be ostensibly little similarity between the tasks set on OMD programmes and the tasks that participants in OMD programmes routinely perform in their workplace. According to the review and report typical OMD activities might include raft construction, canoeing, climbing, abseiling and orienteering. The role of the trainer in OMD programmes is to outline the goals of each activity and to ensure that sufficient attention is paid to safety guidelines. Review sessions guided by facilitators may occur after each activity either in the field or in the classroom and these sessions are seen as having a crucial role in eliciting learning from the field based activities and in applying this learning in the workplace. The review and report notes that some trainers believe that half of the course time should be spent in activity reviews (*Industrial Relations Review and Report-Employee Development Bulletin*, 1992a:16).

The review and report states that OMD courses vary significantly in terms of the demands that they place on participants. There is a tendency for courses to progress from short and relatively simple tasks to embrace longer more complex activities. The notions of challenge and apparent risk are consistent themes in order to ensure that the OMD activities are taken seriously by participants and to allow them to retain vivid memories of their experiences. At one end of the spectrum there are courses that are largely classroom based but which may include one or two short outdoor activities conducted at low level and on dry land whilst at the other end of the spectrum programmes exist which can be seen as survival exercises. In such programmes participants might spend several days and nights trekking, camping and fending for themselves in the open in addition to undertaking various challenges in the field (*Industrial Relations Review and Report-Employee Development Bulletin*, 1992a:16).

OMD and the Effectiveness Debate.

Within the literature (from both academic and practitioner sources) on OMD a large proportion of the debate around OMD has considered how much, or how little, “evidence” exists to confirm the *effectiveness* of the tools, methods and processes of the approach in achieving desired *training and development outcomes*. In addition, there is equally a strand that purports the superiority, or at least equivalence, to wider HRD alternatives (Clifford and Clifford, 1967; Hopkins, 1982, 1985; Hogg, 1988; Lucas, 1992, Bank, 1994; Krouwel and Goodwill, 1994; Beard, 2004; Burke and Collins, 2005). Some commentators point to benefits for particular aspects of development. For example, Bronson, Gibson, Kichar and Priest ([1992) have cited a range of commentators who focus on OMD’s positive impacts on teamworking including Krouwel (1980), Long (1984), Van Zwieten (1984), Wagel (1986), Galagan (1987), Gall (1987) and Malcomson (1988), Burletson and Grint (1996). This continues to be the case. (Beard, 2004). In addition, Jones and Oswick (1993:10) cite more than 200 benefits that are claimed by various writers to be associated with OMD.

However, Bronson *et al.* (1992) equally identify something of a credibility crisis relating to OMD. Whilst, there are many advocates in the form of convinced OMD practitioners and writers, elsewhere, others indicate that such “benefits” have not been “proven”. In this light, appeals for additional research (almost always positivistic in style) started at a relatively early date, *inter alia*: Hogg (1988), Crawford (1988) and Bank (1994). Moreover, arguably, there is little evidence to support the transfer value of experiences beyond the boundaries of the event. In addition, there is a great opportunity to investigate the ‘epistemological incongruences’ experienced once OMD attendees try to articulate their experiences in the workplace: a form of *reverse culture shock*. The reflective skills necessary for effective transfer of meaning beyond the event itself are often lacking, and indeed derided as being too abstract. This is seen still on a daily basis at centres.

OMD Tools – The Nexus to HRD Wider Trends and Fashions.

HRM-HRD practice and literature appear to have followed a seemingly ever-cyclical exploration of new models and ideas susceptible to fad and fashion (Swan, Newell and Robertson, 2001; Legge, 2005). Within that literature it is possible to underline a strongly repetitive positivist trend in the key arguments of large tracts of the epistemology (following Storey, 1989a,b). It has been argued that this predilection marries well with a general historical disposition in British thinking that tends to welcome pragmatic, experiential and empirical approaches akin to OMD (Stokes and McCulloch, 2007; Stokes, 2011a). Indeed, as Schön (1983; 1987) would argue this is due to a prevailing reliance on technical rationality in the management *sciences*. Indeed, it is that very terminology that can function as a barrier even to investigating the contribution that constructivism could make to our understanding of OMD. As management *science* attempts to quantify ‘outputs’ a form of intellectual gatekeeping has developed which works to determine the values of how knowledge is constructed and by whom.

A further element to note in relation to this is a latent, and often overt, anti-intellectualism amongst outdoor educators. Many practitioners responsible for the activities under review gravitate towards the outdoors with qualifications such as Mountain Leader or British Canoe Union and so on and so forth and subscribe to the primacy of being 'out-there-doing-it' at the cost of understanding the theory. Therefore, when working in OMD situations, the sense-making (Weick 1995; Stokes, 2011a) background against which the activities are interpreted is often lacking in the appropriate educational or psychological theory. What we are then also left with is a lack of intellectual tools for use in the outdoor environment. Indeed, by referencing an analytical technique of the 3is – Information-Inference-Implication there is little reflection on information in order to determine and distil experience (by for example, 6-9 line free writing as critical incident capture in appropriately structured journals). The older established 'technology' of OMD activities is accompanied by historically originated barriers inappropriate to a contemporary outdoor development. This is all too often witnessed in the trials and tribulations of OMD students who struggle to manage the inconsistencies between the two. In sum, the idea that OMD is experiential is also worthy of being challenged. Because the OMD 'technologies' that are commonly used come with prescribed outcomes, or outdoor epistemologies they need to be risk-managed, and, therefore, time-sensitive making the experiences are more akin to 'guided discovery' than experiential learning (Mosston and Ashworth, 2008).

OMD Courses: Tools and Methods – Representations in the Literature.

The discussion now considers the focal context of the discussion which embraces course types and processes and the tools and methods they engage. Some commentators have argued that there are essentially only three kinds of programme. These are: "endurance training", "outdoor training" and "development training" (Krouwel and Goodwill, 1994, pp.35-51). For Krouwel and Goodwill, "endurance training" – "is about pushing people to the *limit of their physical, psychological and emotional stamina.*" In the case of their "outdoor education" model they suggest that the activities are more complex than "mere survival" (*ibid.*:40), trainers are less confrontational and more "nurturing", "there is an attempt to review the activities and there is a body of non-military theoretical work underpinning the approach". Finally, "Development Training" consists of: "The application of outdoor solutions to personal and group development needs, ensuring that the major focus of the programmes is on meeting particular and stated aims" (*ibid.*:44). These forms of course typology are echoed in other writings, for example, Beeby and Rathborn (1983:174) also identify an alternative typology for OMD programmes. They categorise programmes as *Outward Bound*, *Adventure Education* and *Development Training*. The latter (*Development Training* sic:OMD) they declare as exhibiting three key characteristics: "(i) use of the outdoors; (ii) incorporation of process reviews; (iii) application of experiential learning methods".

Many OMD suppliers offer both standard courses and programmes tailored to a given company's development needs. Additional constructs for programmes have involved the juxtapositions suggested by Cacioppe and Adamson (1988, p.82), namely: *individual* versus *group*, *physical* versus *emotional* and *outdoor* versus *indoor*. Alternatively Calder (1991, p.21) citing Wagner, Baldwin and

Roland (1991, p.53) suggested a span of courses covering *wilderness, outdoor centered* and *high/low rope course* programmes. Within, these programme “types” it is possible to witness a range of activities. Krouwel and Goodwill (1994, p.54), following the route of a populist set of writings on OMD, provide what they consider to be an illustrative (and neutral) range of available “outdoor media”. The categories they employ, and examples within each, are:

Rock-Face Activities

Climbing, Abseiling, Mountain “Rescue” Tasks

Underground Activities

Caving, Mine Exploration

Water-Based Activities

Raft Building, Open Canoeing

Navigational Tasks

Expeditions - Wild Country, Expeditions - Low Level, Orienteering

Grounds Activities

Interactive but ‘exposing’ (e.g. ‘high ropes’ tasks)

Medium-Complex Tasks - ‘Across the Gap’ type tasks.

[Krouwel and Goodwill, 1994, p.54].

The list is basic in that it provides an impression of what might be considered the core, typical, physical elements of an outdoor experiential approach and rather echoes the period in which the list was drafted. Within individual programmes any range of scenarios can be set to problem-solving situations. For example participants might have to recover a canister of “lethal gas” on the slopes of the Brecon Beacons (Arkin, 1991:49). Alternatively, Blashford-Snell elaborates setting participants the task of capturing pythons in darkened rooms! (Blashford-Snell, 1991). In this vein, Peckham (1993a) categorises three types of programme experience. He cites these as “Mountain Top Experience”, “Now Get Out of That” and “Games and Simulation”. He suggests that the best programmes are those that combine “the best” elements from each. Interestingly, this might be argued as constituting a positivistic approach in that it seeks a *one best way* with which to optimise performance. Alternatively, many programmes describe more generally the use of “multi-layered problems” to develop participants (Wagner and Campbell, 1994:4).

So far, the argument has illustrated a range of possible programme typologies and activities. Within the commentary on OMD there has also been a range of attempts to distil the “essential characteristics” and *process* of the approach irrespective of programme “style”. It might be proposed that all the above definitions and categorisations offer bland or generic descriptions of what might present a meaningful beginning to a richer conceptualisation of OMD.

Cyclical, Linear and Dualistic Modelling in OMD.

The next stage of the discussion will seek to illustrate the ways in which the “process” (the dynamics and flow of OMD experience) has been discussed and constructed in literature and practice. Importantly, virtually all models and discussions of process in OMD literature are associated with a modernistic construct. Extensively commented models subscribe themselves into the representational forms of *cyclical*, *linear* and *dualistic*. This positivistically-related categorisation is common in OMD writing but is not explicitly acknowledged in the literature.

The first category of models that seek to fulfil that particular remit is a range of *cyclical* models. Kolb’s (1976) *Experiential Learning Model* is clearly the most heavily cited model in the OMD literature (*inter alia*: Alder, 1990; Krouwel and Goodwill, 1994; Bank 1994; Hopkins, 1985; Lowe, 1991; Peckham, 1993a,b; Tuson, 1994; Campbell, 1990; Ibbetson and Newell, 1996; Beard, 2005, p.344).

There are a number of models employed that are similar to Kolb experiential learning cycle. Perhaps one of the most frequently witnessed is the *Do-Review-Apply* framework (Arkin, 1991, 1995). Similarly, Alder, (1990, p.18) provides a cycle proposing that managers go through a process of Adhering - Adapting - Relating - Experiencing - Experimenting - Connecting - Integrating.

OMD “process” is alternatively presented as *linear* experience. The *Comfort-Stretch-Panic* (Arkin, 1995) model is one that seeks to chart individual self-control during experiences. A person is considered as normally residing in *Comfort* but can be *Stretched* in certain situations and circumstances. A key point of the model is not to push or pull the person into *Panic* as this would be perceived as being unproductive. The model can be seen as driving people towards some form of *optimum* position accepting that all three stages in the model will be completely relative and dependent on the individual. Moreover, a common pattern in the linear structures is a “before, during and after experience” temporal aspect. As already illustrated above, the adaptation of “mainstream” management commentary is common. One such instance is the “Skill pre-assessment, Skill learning, Skill analysis, Skill Practice and Skill Application” originally from Whetton and Cameron (1991). This is cited in Buller, Cragun and McEvoy (1991, p.58) and adapted to: “Needs analysis, Pre-Outdoor, Outdoor, Post-Outdoor and Evaluation”. Again, this embodies certain assumptions concerning the perception of time and the flow of experience in relation to it. Calder (1991, p.24) provides further examples. Linearity is strongly associated with a modernistic perspective (Burrell, 1997; Stokes, 2011a).

Conversely, *Dualistic models* (i.e. 2x2 box/grid form) are also popular in the OMD literature. Examples constitute, for example, Burnett and James (1994) “Loosely/ Tightly Defined Activities” versus “Low/ High Intensity”. In this model, the authors suggest that “Loose” Activities involve less technical activities with less risk. Alternatively, “Tight” activities involve technical input and some risk (for example, rock-climbing requiring instructors and “safety experts”). Activities are stated as “less intense” and tend to deal with “general issues” whereas “high intensity” activities are often confrontational. Snell and James (1994, p.324) advocate a Hard/Soft Teaching versus

Tangible/Intangible Subject. Here, examples of “Hard” teaching on a “Tangible Subject” are given as dealing with and mastering “specific techniques.” This is as opposed to, for example “Soft Teaching” on an “Intangible Subject” which is “Helping People to Learn to Think for Themselves... Self Awareness, Discovery Learning.” Again, dualisms are widely employed to represent theorisations cast in a modernist perspective.

Review as a Tool

At this juncture it is important to identify a further and perhaps vital ‘tool’ in OMD programmes – the post-activity review. This usually consists of the group sitting down with the facilitator and talking through what happened. While there is a small body of literature on this aspect it curiously represents one of the potentially key moments for sense-making and reflection on experience. Based on the literature, it seems reasonable to say that reviews have been underworked both in the study of them and more often than not in the lived experience of the reality (Hickman, 2012). Again, there is scope here to consider that often reviews are neither truly experiential nor well reflected upon. This is especially so with time-sensitive exercises where the capture of information as critical incidents is difficult, therefore precluding the value of any later reflection-on-action. Ideally, time sensitivities need to be reconsidered in the light of what we know about the function of human memory. For example, it might be posited that facilitators and researchers ask participants what they perceive might be useful as a starting point? For example, in sport the prevailing approach is to ask the athlete and then engineer around the response (Hickman, 2012).

Modernism, Positivism and OMD

The argument up to this point has sought to demonstrate various ways in which the broad OMD literature conceptualises the *experiences* of the approach. Perhaps a key point to make regarding the models used is that they are reductionist and exhibit positivist, deductive characteristics. While they are tools that enable one or two factors to be analysed, *ceteris paribus*, they simultaneously exclude a richer shifting picture that may be available. It should also be recognised that while many of the models appear to consider the development of individual or individuals from an altruistic view the submerged ethos (and not far below the surface) is one of corporate effectiveness. Most of the models, therefore, reside more comfortably within the modernist, positivistic and deterministic perspective. Statements that suggest that OMD should be based on “*sound learning theory*” (Buller, Cragun and McEvoy, 1991:58) seem only to serve to confirm this conclusion. To reiterate, deeper potentialities are ignored. For instance, there is little evidence showing how the experience correlates to organisational needs – a key point which could be returned to later in the context of Making A Deal with a Spy. Again, where and how has transfer value been studied? How has it been evaluated? Who has evaluated it? Indeed, the lack of sophistication is systemic and points to a rich opportunity for future research.

A few notable exceptions have come forward to challenge this hegemony (Burlinson and Grint, 1996; Stokes, 2000, 2008; Bell and Taylor, 2004; Hickman, 2012). Other, existing models seem to underline

that certain aspects (which they provide as “intangibles”) of the OMD experience may be difficult to present as neatly packaged conceptualisations (Snell and James, 1994).

An idea that emerges as a consequence of such an examination is that other forms of representing and presenting OMD and its processes may be possible. Of particular interest is the function of narrative and *stories to set the scene, portray events and analyse and relate understanding* (Long, 1987, Teire, 1994; Stokes, 2000, 2008, 2011). This is a very interesting strand of thought through which to pursue a re-evaluation of OMD tools and methods. And, this could, by way of radical example, be developed through the tool of free writing exercises of critical incidents.

Positivism has been widely employed as a methodological paradigm employed in OMD. Its epistemological and ontological stances are concerned with notions of objectivity, linearity (step-by step method process) and a belief in the possibility of determining through deductive reasoning and approach an ‘answer’ which will be ‘correct’ or ‘incorrect’. This can, for example, be contrasted with interpretivism whose inductive method makes sense of the research process through a subjective and descriptive approach to the research setting (Bryman and Bell, 2003, pp.13-15; Quinton and Smallbone, pp.17-18). Positivism is closely aligned with the wider ethos of modernism. Modernism seeks to apply scientific and empirical thought to all aspects of human life (*inter alia* architecture, art, urban planning, poetry, design) in the pursuit of a notional ‘progress’ (Lyotard, 1984; Clegg, Kornberger, and Pitsis, 2009). Perhaps this is a limitation of the existing tools of OMD. With a positivist approach and a right or wrong outcome, participants start trying to guess what the facilitator needs. Part of the problem with the extant tools is that the ‘facilitator’ is seen as separate to the action, and thus represents the externalised rightness and wrongness of outcome. Similarly the facilitator usually perceives themselves as separate to the group which causes problems in its own right. Participants might alternatively focus on their own perceptions and how these might inform their development and subsequent investment of learning beyond the event.

Many writers on OMD are critical of approaches they see as ‘anecdotal’ and are reluctant to acknowledge value in non-positivistic methodological approaches. Ironically, this occurs even where such anecdotal research findings are already self-evidently replete with positivism. For example, Cole (1993:12) has expressed concern over the “anecdotal” nature and the “paucity of research data [used] in attempts to evaluate the outdoors”. Moreover, Irvine and Wilson (1994:25) note: “the evidence in support of managerial and management learning through OMD regrettably is little more than anecdotal accounts.” There is, thus, the clear implication that positivistic research is frequently considered the only really valuable work carried out in relation to OMD.

The push to achieve validation of the usefulness and effectiveness of OMD approaches through positivistic stances has taken place hand-in-hand with an attempt to talk about OMD as an ‘industry’. It can be suggested that this is more concerned with an attempt to legitimise and gain authority for OMD as a training tool. Moreover, in young or emerging “industries” (sic:OMD) Aldrich and Fiol (1994:645) underline a “relative lack of cognitive and socio-political legitimacy”. OMD is a case in

point. These concerns have persuaded OMD to seek approbation (i.e. “socio-political legitimacy”) from the broader management development community through adherence to a perceived “business-like” normative modernistic and positivistic paradigm. Whatever idealism or altruism can be identified in personal development it is very hard to “get away from the need for a return”[i.e. see a positive impact on results and profit on the money invested in the training] (Campbell, 1990; Bratton and Gold, 2007, p.529) and this is yet a further reminder that places OMD increasingly in a market-related or industry arena. Even the few organizations originally founded as not-for-profit trusts (Brathay, Outward Bound, Leadership Trust) need to market and build turnover. This profit motive is, *prima facie*, an unavoidable feature of the modernistic-capitalistic paradigm (Clegg, Kornberger and Pitsis, 2009). Consequently, the implication also seems to be that any such “benefit” needs to be measurable and positivistically validated. In particular, this positivistic quest manifests itself as a search for optimised performance in the form of maximised profit, added-value or competitive advantage through the medium of a preoccupation with efficiency, effectiveness, outcomes and results. This, then, is seen by many as representing a corporate “imperative” for the contemporary organization. In an attempt to align itself with industry’s needs OMD has brought the conceptualisation of the outdoors for the purposes of development very much under the aegis of the Human Resource Management-Human Resource Development (HRM-HRD) domain (often to the exclusion of the experience of using the outdoors in other spheres, for example Outdoor Pursuits, Outdoor Education). OMD is generally seen as part of a company’s HRD overall provision. Therein, OMD forms part of the training and development suite of approaches. For HRD/HRM functions key contemporary issues with OMD revolve around resources. Due to time pressures, managers can no longer be expected to attend week or two-week long programmes. Commensurately, OMD extended programmes can be costly. This is not dissimilar, in fact, to the type of alliances by which sports coaching has arguably been hindered. In the search for legitimacy, coaching has allied itself to the sport sciences sometimes even referring to itself as ‘coaching science’ (which established its legitimacy in the 1970s through aligning itself with medicine and promoting the idea of sport science as a curative for performance malaise). Thus it has in this way hindered its own development as at coaching’s heart is human interaction which cannot be reduced to positivism. Overall, there is scope for less reliance on technical rationality and more emphasis on interpersonal skills: after all, most problems are not really of a technical nature – they are human.

Methodological Approach

Data collection took place in France and the United Kingdom in a series of episodes (1993 to 1996 and 2002 to 2005 and 2006 and 2008-2012.). In France, the twenty-seven field visits centred on academic networks (universities, *grande écoles*), training providers, business consultants and practitioners (aerospace, construction, finance and automotive). In the United Kingdom 13 training providers were visited and field observations were undertaken. A total of 4 providers have been visited in France. In addition, data observations were collected from three Arctic youth expeditions and a range of higher education programme events for aspiring outdoor practitioners.

The United Kingdom sample consisted of courses run by 13 companies locating in the north of England. The companies operated courses based in large and substantial residential complexes to micro-business (less than 10 employees). The courses observed included a variety of integral courses (all participants from one organization and are likely to know each other) and mixed courses (participants come from a range of different organizations and are unlikely to know each other prior to coming on the course).

In conjunction with a review of the literature the research process adopted an ethnographic approach (Waddington, 1994; Silvermann, 2001, pp.37-39; Bryman and Bell 2007, pp.315-339; Stokes, 2011b). The approach used was rooted in an interpretive evaluation of the data. With regard to methods employed these were semi-structured interviews and complete participant observation with the data being analysed using an inductive sense-making approach (Weick, 1995). This was governed by the conditions for access determined by the training provider. Ethical care for the course participants and respondents was a delicately managed and ensured often in the face of difficult physical and weather conditions and circumstances. The approach to analysis was emergent and thematic. Data analysis is still in progress at this stage of the research and this paper provides the initiation of a discussion.

Observations from the Field and Discussion.

Data analysis is ongoing and the argument below constitutes tentative findings. The literature analysis pointed up a positivistic conceptualisation of OMD's models and tools. In one sense this conceptual proximity between theoretical writings and practice is not surprising because many commentators tend also to be practitioners. However, in spite of this particular conceptual nexus, the research identified that a limited number of tools and models continue to be used in the field. Typically, the types of physical tools engaged included, for example, the pamper pole. This involves roping participants up for safety and inviting them to climb a large pole (10 metres in height) and jump for a trapeze. Equally commonly observed were problem-solving activities employing barrels, ropes and planks to surmount obstacles. This was often allied with a comparable use of these materials in assault type courses. A further common device used in OMD programmes in the field was the 'spider's web'. This is constituted of a series of elastic ropes strung between two poles or trees. The challenge is for a team of people to manhandle each other horizontally through the gaps in the web without touching it. Each team member has to be passed from sub-group of the team to another sub-group of the team. In general, it would be possible to categorise the programmes using these models as 'development programmes' (Krouwel and Goodwill, 1994, pp.35-51). These types of OMD 'technology' are available to most providers. However, large installations such as the pamper pole require a permanent site and costs and therefore typically it would be used by the larger provider.

Attempts by course facilitators to introduce theory into the field invariably involved the use of a number of repeatedly engaged models. These are nearly always discussed during review sessions taking place in the form of pre-briefing or debriefing sessions. Typically, three or four models were

commonly invoked. These included Belbin's "Team Roles" model, Adair's "Team, Task, Individual" Model and Maslow's "Hierarchy of Needs" Model and the "Comfort-Stretch-Panic" Model. Discussions with staff indicated that they generally take such models at face-value only:

'I find the model (sic: Maslow's Hierarchy of Needs) to show participants how they can move from one state to a different state in the programme' [OMD programme facilitator, 2005]

There was little evidence of any deeper questioning or exploration of the epistemological and ontological assumptions underpinning the models. Given this tendency there is a clear danger of calcification and growing staleness of programmes. It can be argued that the novelty of programmes survives because participants are new to the OMD approach. Where participants have already attended OMD-type programmes many providers are engaging the same dated tools and methods engaged elsewhere. The approach and experience risks becoming less useful for development and is more likely to cause participants to disengage and even become bored. While it can be argued that the dynamic between course participants will always vary and thereby produce a unique experience there are evidently limitations to such repeat experiences. However, comments from interviews with a range of staff at centres were not encouraging:

'I'm not sure that it [theory] would have great value for us – our clients look for real results, not theory' [OMD, Course Director, 2006].

'We have a lot of experience in what we do. I think we what we do is right for clients' [OMD programme facilitator, 2007].

There are clear strands of anti-intellectualism present in these data captures. It begs the question – where do ideas generate, with people or inanimate technology? Also this is reminiscent of the totalitarian ego and the fallacy of centrality, that is to say, if the Course Director is not aware of it how can it possibly have any value – the equivalent of erecting intellectual barricades. It is also the beginning of corralling people behind them and being the gatekeeper for 'appropriate' forms of knowledge. A few voices in the field saw this occurring but felt outnumbered by predominant viewpoints:

'Outdoor course students are very much focused on the technical aspects of approaches. It is a great challenge to make them think beyond that' [Outdoor, 2012].

Clearly, there is a need to recognise this situation and the emergence of a desire to address it. However, the repeated observations do not bode well as similar tools and methods and weak exploration of them both for trainers and the experiences of participants continues. There could, for example, be a useful role here for an industry body to take a lead in this situation however such a body does not, to all intents and purposes, exist.

There is value, therefore firstly, in expanding the repertoire of the practical tools actually engaged in the field. Secondly, there is scope to introduce greater theoretical analysis into the field. One source through which this may develop is through graduates from a small number of United Kingdom

university OMD-related programmes.⁵⁸ As was discussed above, the OMD literature also provides a number of possibilities and insights to this end but this corpus seems slightly disconnected from the field on which it comments. The hegemonic positivism of the literature also constrains the commentary to turning always towards simple categorisations, boxes and hence simplistic understandings of processes.

One suggestion to develop the current status quo may be possible in the application of more critical management approaches to OMD. Although positivism still maintains a significant influence over OMD conceptualisation, there is some evidence that this is a strand already fermenting over recent years. A characteristic approach of more critical thinking is the increasing use of narrative and story methods and tools on OMD courses [Gabriel, 2000; Czarniawska, 2004]. The research identified some use of stories within programmes. In the case of one provider, a highly elaborate narrative was created for a programme involving spies, clues, handovers, black-coated and sun-glassed double agents and so on and so forth. The facilitator suggested the beginnings of deeper questioning:

‘We find participants tend to handle task-driven behaviour excellently however we find we need to make them appreciate the theoretical and practical aspects of managing process which they tend to neglect’ [OMD, Course Director, 2006].

Based on this particular programme, the paper now offers a ‘story’ as an illustration and exploration of a possibility for an alternative kind of OMD programme. Moreover, it is interesting to consider the different ways in which to represent the perceptions of the candidates – all of which might constitute a challenge to corporate thinking. It is perhaps interesting that the business community promotes new terminology such as ‘blue skies thinking’ and ‘upstream thinking’ but seems more wary in its lived experience and reality.

The paper now moves to present an alternative approach to a majority of the extant tools used in the OMD sphere. The approach illustrated below draws on a range of critical and story and narrative spheres introduced above and begins to provide an illustration of alternative sense-making in action in relation to OMD.

Making a Deal with a Spy.

This was an unusual experience in that I arrived on a Sunday morning to observe a course that had already been running for two days. I pulled into the car park of the hotel where the programme was based. The mountain scenery surrounding the village was stunning and it was clearly going to be a beautiful day. I entered the hotel through the rear entrance and very quickly found myself in a large open-plan seminar room. In it were a number of people who looked conspicuously like course participants. Nobody was talking. They were all reading the Sunday morning newspapers. The

⁵⁸ A number of OMD university level programmes exist in the United Kingdom. These include programmes at Sheffield Hallam University and the University of Central Lancashire.

atmosphere seemed strange. Did these people like being with each other or did they communicate only when they had to? A brief enquiry confirmed that this was the group I was planning to meet.

The course director, Damien, arrived. He was a bald, bearded man in his mid to late- thirties. In a relaxed manner Damien called the group to draw up a circle of comfortable low-angled chairs. He made some remarks about the programme and that a message would arrive for them soon and this would begin to suggest a structure for the day's activities. Then he introduced me to the group. He allowed me to explain briefly to the group what I was attempting to do. I explained that I was a researcher and that I was interested in seeing such a programme in action.

"Are you going to join in with us?" asked one team member in a provocative way.

I hesitated and Damien interjected saying that we would see.

"Maybe he's a plant or a spy. We'd best keep an eye on him" said another.

This seemed all very light-hearted but I was questioned further at various points throughout the day by people seeking to confirm my "real" intentions and role.

A waiter brought in a briefcase. All eyes followed it across the room. There were humorous quips and remarks made as the case was placed on a desk in front of the group. Allegedly it had just been delivered by person(s) unknown at the reception. Damien, the facilitator, neither moved nor said a word. One member of the group finally decided to move forward and took the case, opened it and began to read out aloud the instructions. Ironically, given the earlier quips, it seemed that the whole day would lead to the possibility of meeting a spy and making a deal with him or her. A number of people in the room were now convinced that I *was* that "spy". With humour, I sought to deny this and deflect the attention.

In an atmosphere full of indifference and lacking momentum the group discussed the tasks. According to the instructions they had to complete a range of tasks in order to gather enough money to buy a final clue from a person(s) to be met in a location that they needed to identify during the course of the day. Money could be earned in two ways. These were by performing tasks in the seminar room or also by collecting clues in the surrounding countryside and in the grounds of the hotel. I decided to split my time spending some in the seminar room and then travelling in the van that was at the disposal of the group. After some rapid planning the group had to plan and allocate within time constraints who would, or could, do what. They agreed to meet at a time just before lunch in order to take stock of progress.

A section of the group had elected to do as many brief hotel-based tasks as they could from a sheet containing many possibilities. These included activities ranging from: dressing up as authentically as possible as an ancient Roman; two male group members acting out the fake orgasm scene performed by Meg Ryan and Billy Crystal in a busy restaurant in the film *When Harry met Sally*; polishing Damien's bald head and reading a short message backwards from the reflection; getting the whole team to graze like sheep (ultimately carried out on the rear lawns of the hotel). Damien had to

approve and “tick” off each of the group’s activities. He rejected the group’s first attempt to dress up a group member as a Roman using only items from the seminar room.

“Romans didn’t wear converse boots.” said Damien disparagingly to the first attempt.

The “Roman” was withdrawn for a major makeover!

“More commitment than that”, Damien muttered as he moved to another part of the room.

The activities away from the hotel involved physical aspects. The entire group had to do one of two activities. They either had to travel to a nearby lake and conduct a canoeing exercise under the guidance of an instructor. Alternatively, they had to climb the “pamper pole”.

Damien, the director/facilitator was staying noticeably calm and somewhat aloof. He was being very careful with information about the activities and played a form of “cat and mouse” game with information releases. He was very much in control and feigning indifference to the group’s indifference. He had quietly briefed me in on some of the background and rationale for the day’s activities. Apparently, they had seemed to be running out of momentum and interest and he was determined to force them to dig themselves out of that mind-set.

“They find task very easy, no challenge at all but they virtually ignore the processes”, said Damien.

They had, he claimed, very little awareness of the processes of relating to each other. Many group members seemed totally insensitive to how their actions and comments would affect or impact on other team members. Damien’s stock remark to questions from group members seemed to be a reciprocally nonchalant:

“It’s up to you”.

Finally, towards four o’clock in the afternoon the group had collected, as a result of the various activities, most but not quite enough money with which to rendezvous with the “spy”. Nevertheless, we all set off in the van to see what sort of deal might be arranged. As we pulled off the road into the old quarry that now served as a National Park car park there she was: black fish-net stockings, black stilettos, a black thigh-length leather coat and sunglasses. She was leaning, with one foot crooked, against a red sports saloon car reading a copy of the *Sud-Deutcher Zeitung*. She would have not looked out of place in a cold-war Berlin bar but we were in a car park in the Lake District surrounded by day-trippers on what was now a rather grey day.

“What do we do now?” said Dominic, one of the group members.

These fateful words seemed to nominate him to approach the spy and negotiate the information. This took place at a distance from the rest of the group.

Having cautiously approached the “Contact” or “Spy” she turned and snapped:

“Get in the car!”

He did so and the wheels of the car skidded on the gravel as the car roared out of the car park and down the road.

“What now?” was the question on everyone’s lips.

“How would James Bond, or Michael Caine handle this one” a voice laughed.

It was not long before the car returned. A deal had been struck. The “Spy” demanded that all the team take off their trousers in the car park in order to make up the “monetary shortfall” and complete the deal. This done, the “Spy” turned to look at me. I had been standing apart from the group with Damien, the Facilitator. I didn’t hear what was actually said but it was obvious that my trousers were part of the deal too. I laughed nervously in a hopeless attempt to diffuse the situation. The group members walked slowly towards me across the car park.

One of the group members said “They [the trousers] come off “voluntarily” or....”.

“Now hang on a moment folks...” I pleaded.

The trousers came off quite readily, the deal was concluded and the final clue was identified as being located in the garden of the hotel.

Back at the hotel, a quick search revealed a detonation device under a bush in a rockery and a set of instructions. The attached cable was unwound and a loud detonation of a charge revealed a sword bearing an inscription that provided the final answer to the challenge. A bottle of sparkling wine was also found at the site. This was not drunk but poured over the facilitator’s head after a short chase. Back inside a toast to the experience was drunk with “real” champagne. Only the end of course dinner and review was to come.

Reflecting on the Story

One of the aspects that seems salient in this account is the role of imagination. It seems apparent that that this group (of engineers and technicians) were unconvinced and unprepared to be engaged by many of the “games” and simulations they had experienced up to the point I arrived. Because of the mystery or nature of the day some of them seemed more motivated. Damien’s acted nonchalance seemed to make them concerned. He was playing the upset school teacher with whom the “pupils” had to win back favour. Maybe some members of the group put more into the day because it was the last one of the course. It is hard to say the extent to which the course participants were fired up by the fantasy world that had been created. As an observer, my mind was in full play as we entered the car park. Here was a role-play being played as completely “real” by the staff member dressed up as the spy. This included a gravel-showering wheel spin out of the car park. Humour and jokes alluding to spy films and books were plentiful. It seemed like each reference was weaving the “shared” narrative and the atmosphere in an ever more enriched fashion.

The image of the spy in the car park had surreal qualities. It provided such a disjointed image in the context of the mountain scenery and other visitors that it verged on the postmodern. “Normality”

seemed to have been dispensed with. Any construct was admissible and possible. It was unpredictable and exiting. This creative and fun aspect of the experience seemed to reinvigorate the response and spirits of all the team. It was akin to being in a theme park - a place where the boundary between fact and fiction blurred. The presence of the "Spy" was a recognised image but dislocated into another context. The images of the national park where the course was taking place and the usual office work context of the OMD participants seemed utterly disconnected and disjointed. This experience seemed to offer a completely fresh kind of uncertainty. The team were quite thrown by the twist of novelty being introduced not only in the task but a very different context.

Finally, linked to the penultimate point above, the degree to which narrative transfer was in operation in these experiences was intriguing. It is difficult to imagine that immediate lessons on how to deal with leather-clad spies or climbing telegraph poles would be useful back in the company. Perhaps, the emergence of a novel *lingua franca* would be a potential new and ongoing creation and secondary socialisation. Such consequences seem a long way from the OMD outcome-competency skills lists purported by older and long-standing approaches purported by, for example, Hogg (1988:90).

In summary, a further way forward to resolve the current challenges and increase the dissemination of new critical ideas would be for the establishment of an increased number of joint research projects between theoretical commentators and field practitioners. This would work to ensure that the situation that has occurred to present, whereby theoretical developments have little impact on practice in the field, does not continue.

Conclusion

The conceptualisation of tools and models in OMD borrows heavily from the modernistic convention of generic and homogenous experience couched within a positivistic style effectiveness corporate imperative (Stokes, 2011a). As Storey rightly points out, it has long been felt that management development cannot, perhaps, be seen as an end in itself (Storey, 1989a:5). This means that for many writers, development cannot be exploratory wanderings of self-discovery - it must always be a journey for a purpose – a corporate purpose. Within the modernist paradigm of management development this purpose is represented as modifying individual or group behaviour with a view to creating more *effective* and *efficient* managers.

"Some of these programs will be effective in developing management skills: others will not. As with many management development 'fads' - such as sensitivity training or management by objectives - outdoor training may be short-lived due to *poor application of otherwise good concepts and practices.*" (*ibid.*:58)[Emphasis added]

Concern with proof of effectiveness means that potentially rich data concerning the experience of OMD is configured into a template of preconceived rationale and this is reflected in methodological predilections. Many criticisms of "anecdotal", "testimony" [sic: narrative] approaches for their lack of

“rigour” are, however, themselves prone to using rhetorical or vague language associated with debatable “certainties”, “proofs” and mechanistic methodologies (Lucas, 1992; Irvine and Wilson, 1994; and Wagner and Campbell, 1994). In such “input-output” “before-and-after the black box” approaches it is possible to witness many of the flaws of quantitative approaches accompanied by few of the benefits. This concern, held in some quarters, is not new as Doughty’s comment below indicates:

“Those involved in the outdoor development training industry know that behind the *uniform face* that we inadvertently present are a *wide variety* of products, styles and standards. We also know that we could achieve much more if there was clarity about what it is we are offering and what it is our clients wanted. Perhaps we are clear in some instances but fear our ‘*conservative*’ clients would be inhibited by some of the more ‘*off the wall*’ processes and outcomes...”(Doughty, 1990:7)[Emphasis added].

In summary, OMD faces a serious set of issues in relation to the contemporary range of tools and methods it engages. Traditionally, it has not made timely and insightful use of theoretical commentaries on its process and activities. Positivistic structuring of theory and field, with its associated preoccupation on the corporate imperative of effectiveness, has not necessarily served OMD in a useful way. It is time to embrace a more eclectic and more critical approach.

APPLYING PORTER'S COMPETITIVENESS MODEL ON SMEs: THE CASE OF OCCUPIED PALESTINIAN TERRITORY (OPT)

Sultan, Suhail Sami¹

¹ Birzeit University. E-mail: suhail@msm.nl

Abstract

Palestinian industries are trying to move from totally depending on the Israeli economy to the gradual de-annexing stage, and hence building the independence stage and achieving a competitive advantage to the Palestinian industries that lead the economic process and sustain prosper and luxury to the people.

The main objective of the research paper is to discuss the competitiveness of small and medium sized enterprises (SMEs) working in the leather and shoe industry in the Occupied Palestinian Territory (OPT). The paper discusses the challenges facing the SMEs such as instability of economic and political environment, acquiring capital, bureaucratic rules and regulations, infrastructure availability, infrastructure cost, availability of technical qualifications and clustering in addition to the highly competition with the cheap Chinese products.

The main recommendations are: simplifying rules and regulations related to the SMEs' growth, providing and developing the infrastructure facilities and utilities at reasonable prices and adequate quantities and qualities, building up the human capacities through training, maintenance and laboratory testing, developing lending institutions and making easy access to finance, encouraging the diffusion of ICT into the different business functions of the industry, and encouraging the strategic cooperation and clustering in the industry.

Keywords: Occupied Palestinian Territory; Porter's Model and SMEs

Introduction

Porter (1990) has developed an innovative approach to strategic management. He argues that the essence of strategy lies in creating tomorrow's competitive advantage, based on strategic capabilities, faster than competitors. This is derived from the role that innovation and change play in a firm's performance. Some of the key objectives are to upgrade constantly through innovative practice, to improve the quality of the product or service, increase product development, drive down costs and improve service. These strategies then become a source of competitive advantage, whereby other companies are forced to improve or to withdraw from the market. Overall, Porter's (1990) Diamond of Competitive Advantage model is a method of analyzing the degree of advantage a firm holds in the market place.

In order to improve the competitiveness of small firms it is not only about understanding problems confronting businesses but also about better understanding of how to overcome these barriers. Although many factors are hypothesized to impact on business outcome, there is no consistent pattern to the characteristics, which contribute to business competitiveness, success and growth. This research

paper discusses the Porter's model on the small and medium sized enterprises (SMEs) working in the leather and shoes industry working in the Occupied Palestinian Territory (OPT).

The palestinian context

The Occupied Palestinian Territory (OPT) consists of two main areas. The West Bank is about 5860 square kilometer, and Gaza Strip is about 360 square kilometers. In 2010 the population was estimated by 4.4 million (63% in the West Bank and 37% in Gaza Strip). The macroeconomic situation continued to improve in the West Bank, but in Gaza the conditions remain difficult due to the Israeli blockade. Real Gross Domestic Product (GDP) in the West Bank and Gaza (WBG) is estimated at 6.8%, consisting of an estimated 8.5% growth in the West Bank and 1% in Gaza (World Bank 2010). The GDP composition by sectors is as follows: agriculture (5%), industry (14%), and services (81%).

The West Bank economy is growing and for the first time in years, it experienced positive real growth, estimated by 7% in 2009. This should be placed in the context of an economy recovering from years of protracted conflict during which per capita GDP fell by nearly a third since 1999. According to the Palestinian Central Bureau of Statistics, in the early of 2009 most of the growth took place in two sectors: real estate and community services, both of which grew by more than 24%. Public administration grew by nearly 9% and the construction by over 10%. Meanwhile, mining and manufacturing grew by only 2% and agriculture fell by more than 17%. This suggests that higher output was based on donor-funded sectors such as health, education, and public administration rather than private investment in productive sectors such as manufacturing, agriculture, and tourism. Since growth appears to be driven more by the enormous inflows of donor assistance than by improvements in investor confidence, there is a risk that it will not be sustained.

The expansion of by-pass roads is a major obstacle for the Palestinians in terms of land loss and the fragmentation of West Bank territory. Despite the fact that these roads reconnect the Palestinian communities, the Palestinians still suffer from the long time they spend on these roads. They emphasize the exclusion of Palestinians from the primary road network and thus undermine the West Bank's territorial contiguity. Under the Oslo Accords (1993), the Israeli authorities retain both civil and military control over areas designated as Area C, which make up more than 60 per cent of the West Bank.

Labor forced counts for almost 650,000. The employees distributed by sector are as follows: agriculture (17%), industry (15%) and services (68%). The unemployment rate decreased in Gaza Strip from 39.3% in the 4th quarter 2009 to 33.9% in the 1st quarter of 2010, whereas in the West Bank from 18.1% to 16.5%. Labor force participation rate for females remains low by about 15.5%, compared to 67.0% of men. Women's unemployment reached 26.4%. Jobs for women were primarily in the educational sector by 34.7%, followed by agricultural, foresting, hunting, and fishing by 20.5%; in addition to health by 9.4% (MNE 2010). The SMEs (enterprises that employ less than 50 workers) constitute 99% of the existing economic institutions and are the largest employers.

The leather and shoe sector used to be considered as one of the largest industrial sectors until the end of last decade. Currently the number of operating firms in the shoe industry is around 230 firms and 12 tanneries, were it is used to be around 1000 firms ten years ago. The sector employs about 2500 workers were it used to employ around 10,000 workers in the past. The total number of produced shoe pairs was about 13 million ten years ago, it is now about 4 million shoe pairs (PFI 2010).

The sector is composed mainly of tanneries and shoe makers. Tanneries are the major supplier of raw materials to the shoe making industry. Shoe makers produce casual shoes, tennis shoes, women and children, slippers and sandals. Little portions of the tanned leather are used for clothing industry and as covers for furniture.

Shoe making industry used to be one of the most Palestinian competent advantages. It was featured by its high quality product and by the large number of family members working in the industry. The industry started declining because of the free trade movements with countries like China and not because of quality. The industry used to depend on high quality natural leather and high skills of workers.

The industry used to have a huge production capacity at about 13 million shoe pairs. The shoe making was famous and capitalized on accumulated experience. The hand making shoes was another feature of this industry. The sector lacks the capacity in designing new models and prototypes. This industry needs upgrading of machinery and adapting to new technologies and computer based manufacturing techniques.

Palestine and Israel were the most important markets for this industry. Subcontracting agreements was one of the main features of the industry in nineties. Even though, a small percentage was directly exported to Jordan, Saudi Arabia and Germany before the intifada, some of the products sold to Israel were re-exported under Israeli brand name. This sector needs a sales and promotional campaign to resume business relations with European markets. It has great production potential and lacks marketing and business linkages.

The total investment of the sector has dropped from 220 million USD to seventy million USD. This drastic drop was due to the sharp decrease in demand due to political conditions and completion of imported goods, mainly shoes. The leather industry faces severe problems in supply of raw materials, availability of chemicals for tanning, shortages in modern production methods, environmental considerations, training and adapting new technologies, family business administrative problems. The industry of shoe making also faces problems of shortage of sales, maintenance and machinery problems, access to markets, local market unfair competition, lack of creative design specialists (PFI 2010).

Research problem

Since the Palestinian enterprises are working in unstable environment due to road blockage, obstacles of movement, the researcher finds that not all small firms are growth-oriented, and the

majority of owner-manager focuses on day-to-day survival. As pointed out by Storey (1994), the numerically dominant group of small businesses is those that they are small, and even if they survive they are always likely to remain small-scale operations.

The leather and shoe firms in the OPT draw their advantage almost from the basic factors of production, natural resources and inexpensive semi-skilled labor pool. This could be explained by the perceived irrelevance of environmental issues to small organizations, a lack of organizational capacity for change, and limited access to finance and information. As well, very few firms have direct access to foreign markets.

The experience shows that natural riches are neither necessary nor sufficient for economic prosperity and progress. The long-term benefits come not from the presence of natural resources themselves but rather from the value-added products and services developed around them. Alongside, copying or adopting policies that have been effective elsewhere rarely succeed.

Research objectives

The main objective of the research is to apply Porter's model on the SMEs working in the leather and shoe industry in the OPT, and recommend the most convenient strategies these firms could implement to build their competitiveness.

Research Questions

The main question of the research is:

(RQ): How can firms working in the leather and shoe sector in the OPT build their competitiveness in spite of the conflict environment they are working in?

In order to answer this main question, the research aims to discuss the following sub-questions:

(RQ1): How developed are the Porter's Model in the OPT?

(RQ2): Which type of strategies the Palestinian SMEs could implement to improve their competitiveness?

Research methodology

An academic literature and some business, and other appropriate literature sources search were conducted. As part of the literature review, books, journal articles, tertiary literature such as indexes and catalogues, company minutes, government surveys, CD-ROM in university libraries, Internet sites, chambers of commerce surveys and professional association surveys have been used. A combination of quantitative and qualitative methods is used in the research. Employing both qualitative and quantitative data offers an opportunity to probe deeply into the issues raised by the research questions. Although questionnaires may be used as the only data collection method, it is usually better to link them with other methods in a multi-method approach (Saunders and Thornhill 2000).

The area random sampling is used. The total population is the total number of firms working in the leather and shoe sector in the OPT. The total number is around 230 firms. A random sample of 100 firms was reached during the period (January –March 2012). The purpose of the survey is descriptive-exploratory with some explanatory analysis. The questionnaire consists of three parts. Part one covers the business environment (Porter's diamond and Porter's five forces). Part two covers the different scenarios of the generic strategies. Part four cover the firms' competitiveness by assessing the balanced scored card. The interviewees were asked about their competitive advantage by asking about the Balanced Scored Card (innovation, customer's satisfaction, internal business and financial performance) of their firms as an indication of their competitiveness (Kaplan and Norton 1992). The respondents were asked about the generic strategies (cost leadership, differentiation and focus). The respondents were asked to select the type of generic strategy that is mostly used by their firms. Furthermore, the respondents were asked to evaluate the different elements of Porter's diamond and Porter's five forces. These elements were also measured on a five-point scale (1 = very negative and 5 = very positive).

The scale items were tested on the reliability and validity of the final test to examine the consistency of the constructs and related the items. Cronbach Alpha was calculated as (0.94)..

Literature review

The literature presents the potential economic and social benefits of small businesses such as: creating jobs at low cost of capital, providing an opportunity to expand the entrepreneurial base (Zairi 1996), providing the required flexibility to adapt to market changes, providing support to large scale enterprises, and entering into market niches which are not profitable for larger enterprises.

Jones (2003) develops a conceptual framework for the competitive advantage in small firms. To be effective, Jones shows that the starting point for the SME must begin with the owner-manager establishing a broad strategic framework for the firm. He also ensures that organizational flexibility is the key source of competitive advantage for most SMEs. Jones argues that the best measure of competitive advantage for the SMEs is value-added rather than profit, return on investment or market share (Jones and Tilley 20023)

Competitiveness of a firm can be expressed in a variety of terms depending on the context. From an entrepreneurial perspective, a competitive firm needs to survive in the market, at present and the days to come, and to achieve market share and profitability. Competitive success can be measured by both objective and subjective criteria. Objective criteria include return on investment, market share, profit and sales revenue, while subjective criteria include enhanced reputation with customers, suppliers, and competitors, and improve quality of delivered services.

In his book "The Competitive Advantage of Nations", Porter developed the diamond model. Porter discusses four elements in this model: factor conditions, demand conditions, related and supporting industries, and firm's strategy, structure and rivalry (Porter 1990). As well, Porter's five forces model

(the entry of new competitors, the threat of substitutes, the bargaining power of buyers, the bargaining power of suppliers, and the rivalry among the existing competitors) are still used for the analysis of industry and firm. In order to measure the competitiveness at the firm's level, the concept of the Balanced Score Card is used. The four measures of the Balanced Score Card are: financial performance, customer's satisfaction, internal business, and ability to innovate.

Productivity and productivity growth determine the economic growth. Whereas, innovation is a key driver of productivity growth, and clustering supports both productivity and innovation (Porter 1990). Once a cluster is formed, the whole group of industries becomes mutually supportive. Thus, clusters can affect competition by increasing the companies' productivity, deriving the direction and pace of innovation.

De Soto (2000) answers the question why are the poor in third world countries rich in assets but they remain poor in capital?. He claims that the poor do not really own the property they work, because they are not registered as owning it, and because of this, they cannot turn it to capital. De Soto shows that it is legal title to property that transforms labor into capital and without title there can be no contracts with strangers. Thus, the market is restricted and the growth of wealth retarded (De Soto 2000).

FINDINGS AND DISCUSSION

Based on the results of the survey and the interviews, this section presents and discusses the main findings of the research.

In order to answer the first question: How developed are the Porter's Model in the OPT and what can be done in order to improve them?, the factor conditions, demand conditions, related and supporting industries, and the five forces were assessed as shown in table I and table II. Table I shows the average means of the factor conditions, demand conditions, and the related and supporting industries.

	<i>Factor, Demand, and Related and Supporting Industries</i>		
	<i>Factor Conditions</i>	<i>Demand Conditions</i>	<i>Related & Supporting Industries</i>
<i>Mean</i>	2.00	3.15	2.05
<i>Descrip</i>	<i>Low</i>	<i>Moderate</i>	<i>Low</i>

Table 1: Porter's Diamond

As shown from the above table, the factor and demand conditions are low. The SMEs in the OPT are suffering from acquiring capital, availability of information, bureaucratic rules and regulations, infrastructure availability, infrastructure cost, and availability of technical qualifications, in addition to the instability of economic and political environment. Moreover, the SMEs are suffering from the low demand of their products in the local and international markets and the weak image of the Palestinian product in general. Furthermore, these firms do not have strong relations with related and supporting

industries such as banks, insurance firms, research centers and universities, associations, and governmental institutes.

The leather and shoe SMEs in the OPT have to understand what is about their home nation that is most crucial in determining their ability, or inability to create and sustain competitive advantage. These firms gain competitive advantage where their home base allows and supports the most rapid accumulation of specialized assets and skills, and when their home base affords better ongoing information and insight into product and process needs. Moreover, the Palestinians should be aware that nations succeed not in isolated industries but in clusters of industries connected through vertical and horizontal relationships.

Moreover, the government and industry participants should act together, although the bulk of the responsibility has to be assumed by the government since the OPT is in the early stages of the development process. The firms, on the other hand, should take a more proactive role in education and development and promote industry-specific education and research institutions. Similarly, industry associations should participate in developing specialized skills, technology and infrastructure, and constitute a bridge between industry and educational institutions.

Analysis of the data shows that the family ties and individual relationship preferences in addition to the instability of the working environment are the reasons behind that. The firms' owners and their family represent the majority of the workforce. As a result, the informal relationships of the family dominate formal and explicit relationships. Thus, trust, loyalty and family ties are of prime importance to advancing the businesses.

Table II presents the means of the Porter's five forces. As noticed, there is a high threat in most of the five forces. The five forces determine the industry profitability because they influence the price, cost, and the required investment of the firms in an industry.

	<i>Porter's Five Forces</i>				
	<i>Rivals</i>	<i>Buyer Power</i>	<i>Supplier Power</i>	<i>Substitute Threats</i>	<i>Entry Threats</i>
<i>Mean</i>	4.10	3.95	3.88	3.00	3.15
<i>Descrip</i>	<i>High</i>	<i>High</i>	<i>High</i>	<i>Moderate</i>	<i>Moderate</i>

Table 2: Porter's Five Forces

Porter (1985) shows that the higher the power of buyers and suppliers, intensity of rivals, threat of new entrants and threat of substitutes, the lower the overall profit potential in the industry because new entrants bring new capacity and seek market share by pushing down margins. Powerful buyers and suppliers bargain away the profits for themselves. The presence of substitute products limits the price competitors and can charge without inducing substitution and eroding industry volume. Intense competitive rivalry erodes profits by requiring higher costs of competing or by passing on profits to customers in the form of lower prices (Porter 1985). On the other hand, Porter (1990) argues that the presence of domestic rivalry is an essential incentive for the creation and the sustainability of competitive advantage. A number of domestic competitors is not itself sufficient to determine success.

If there is no effective rivalry among competitors, the advantages of domestic rivalry are nullified. Domestic rivalry not only creates advantages but helps to avoid some disadvantages.

In order to answer the second questions: Which type of strategies the Palestinian SMES could implement to improve their competitiveness? the respondents were asked to select one choice from the eight-scenarios of the generic strategies. Table III summarizes the generic strategies that are implemented by the SMEs working in the leather and shoe sector in the OPT. Ten percent of the SMEs applies high differentiation and high cost strategy, and the same percentage applies high differentiation with low cost strategy while (55%) of them applies high cost and low differentiation strategy and (25%) applies low cost alongside with low differentiation strategy.

<i>Differentiation</i>	<i>Cost Leadership Strategy</i>	
	<i>Low</i>	<i>High</i>
<i>Low</i>	(25%)	(55%)
<i>High</i>	(10%)	(10%)

Table 3: generic strategies

Due to the instability of the environment, most of the SMEs are buying high volume of raw materials and extra number of spare parts which lead to increase the production costs. In addition, Palestinian SMEs mainly possess not up-to-date technologies and sell their productions in limited markets. Thus, Palestinian SMEs cannot compete by using the concept of economies of scale and low cost strategies.

	<i>Balanced Scored Card</i>			
	<i>Innovation</i>	<i>Customer Satisfaction</i>	<i>Employee Satisfaction</i>	<i>Financial Growth</i>
<i>Mean</i>	2.19	3.00	3.50	2.22
<i>Descrip</i>	<i>Low</i>	<i>Moderate</i>	<i>Moderate</i>	<i>Low</i>

Table 4: Balances Scored card

It is worth mentioning that most of the enterprises in the OPT are family businesses. The family businesses have unique working environment that fosters family-oriented workplace and inspire greater employee care and loyalty. In addition, they have more flexible work practices for their employees, and have lower recruitment costs. The family business in the OPT is one of the reasons that assists in the survival of the firms in view of the fact that these families are keeping their reputations and names by keeping their businesses.

Table IV presents the average means of the four elements of the balanced scored card: innovation, customer satisfaction, employee satisfaction and financial growth. As noticed, the means are almost "low to average" and this is not a surprising result since the business environment is not encouraging. In addition, the threats of the five competitive forces are relatively high and the SMEs themselves do not have a structured mode of setting suitable strategies.

CONCLUSIONS AND Recommendations

The main conclusions of the research are:

- Most of the firms working in the leather and shoe sector are classified as SMEs family administered businesses. This implies that efforts have to be devoted to enrich the family business administration tools and mechanisms and tackle small scale related problems in financing, promotion, technical assistance, raw materials and other business essentials.
- Factor conditions are weak. The SMEs in the OPT are suffering from acquiring capital, availability of information, bureaucratic rules and regulations, infrastructure availability, infrastructure cost, and availability of technical qualifications, in addition to the instability of economic and political environment.
- Inter-sector relations and inter-industry relations are weak. A large proportion of property in the OPT is not formally registered. This is due to the family ties and instability of working environment. However, complexity leads to uncertainty, increases transactions costs, and offers opportunities for fraud. In addition, longer and more expensive property registration is associated with weaker perceived security of property rights.
- Demand conditions are moderate. The SMEs are suffering from the low demand of their products in the local and international markets and the weak image of the Palestinian product in general.
- Palestinian SMEs are facing relatively high power of buyers and suppliers, intensity of rivals, threat of new entrants and threat of substitutes
- Most of the firms in the OPT are implementing the low price strategy which does not fit with the unpredictable environment these firms are working in.

The following are some important recommendations:

- Simplifying the rules and regulations related to the industry taking into account that the vast majority of the industry is categorized as family owned and managed small and medium size businesses.
- Providing and developing the infrastructure facilities and utilities at reasonable prices and adequate quantities and qualities. This might include: electricity, water, recycling, standards and roads.
- Investing in specialized human resources, encouraging employee training, forging closer ties with educational institutions and industry, emphasizing more practical orientation, promoting respectable and high quality forms of higher education besides the university, supporting research and development, and encouraging specialization amongst the universities.

- The SMEs should grant scholarships and research funds, increase investment in on-the-job training and put pressure on research institutions.
- Promoting new business formation and encouraging and facilitating international involvement of the firms.
- Developing lending institutions and making easy access to finance.
- Encouraging the diffusion of the ICT into different business functions of the industry.
- Encouraging the strategic cooperation and clustering in the industry. Clustering will help building the competitive advantage.

Although there were some programs to help this industry, the absence of a national strategy to improve the performance of the industry was clear and obvious. It is highly recommended to build a national team to develop this industry through crafting a national business strategy which guides its vision and development strategies for the coming decade.

ANNEX – QUESTIONNAIRE

Part I Industry Competitiveness and Macro-environment

1. Which of the following elements do you consider to be critical threats to your business?

	very Neg.	Neg.	Mod	Pos.	Very Pos.
- Acquiring Capital					
- Acquiring Information					
- Political and economic uncertainties					
- Bureaucratic rules and regulations					
- Infrastructure availability					
- Infrastructure costs					
- Inconsistent raw material quality					
- Technical qualifications					
- The market accessibility					
- Local demand					
- International demand					
- Product image in the international markets					
- Consumer awareness with regard to product quality standards					
-Sophisticated customers					
- Supplier buyer relationships have depended on the family and personal ties					
- Relationship with local banks					
- Relationship with insurance firms					
- Relationship with research and training centers and universities					
- Relationship with local manufacturers					
- Relationship with public institutes					
- Relationship with governmental institutes					
- Relationship with stone cutting firms in the same region					
- Relationship with firms from other sectors (design/ marketing)					

2. Which of the following industry structure do you consider to be the critical threats to the future of your business (Rank in order 1, area of major threat & 5, not an area of major threat)?

	Area of major threat			Not an area of threat	
	1	2	3	4	5
- The intensity of rivals					
- The power of buyers					
- The power of suppliers					
- The threat of substitutes					
- The threat of entry					

Part II Firm's Strategy and Performance

3. Which type of generic business strategy is most closely related to your firm's strategy (please only select one type)?

- Your firm is the low cost producer in the sector. The standard products are offered in a broad market area.	
- Your firm offers differentiated products, and they are produced at lowest cost. The products are offered in a broad market area.	
- Your firm is operating in one or a few specific market-niches and offers standard products. Within this market niche, your firm is the low cost producer.	
- Your firm is operating in one or a few market-niches. In these niches many differentiated products are offered and produced at low cost as possible.	
- Your firm is NOT the lowest cost producer in the sector. The standard products are offered in a broad market area.	
- Your firm offers many differentiated products, and you are NOT the low cost producer. The products are offered in a broad market area.	
- Your firm is operating in one or a few specific market-niches and offers standard products. Within this market niche, your firm is NOT the low cost producer.	
- Your firm is operating in one or a few market-niches. In these niches you offer differentiated products, your firm is NOT the low cost producer.	

4. How do you evaluate the following elements at your firm?

	very Neg.	Neg.	Mod.	Pos.	Very Pos.
- Percentage of new products of total turnover					
- Time necessary to develop new generation of products					
- Customer satisfaction					
- Your market share					
- Customer keep on					
- Your employees satisfaction					
- Employees keep on					
- Productivity of your employees					
- Return on Investment					
- Profitability					
- Revenue growth					
- Cost reduction					
- Exportation					

Part III Firm's Profile

5. What is the legal form of your firm?

Sole Proprietorship Partnership Company

6. What is the type of your firm?

Family Non-Family

7. Total number of employees: _____

8 .Year of Establishment: _____

9. Firm's Location:

City Village Industrial Zone

QUALITY IMPROVEMENT THROUGH CAPACITY MANAGEMENT: THE CASE OF HEBRON GOVERNMENTAL HOSPITAL

Sultan, Suhail Sami¹; Sultan, Waseem Idris²

¹ Palestine Polytechnic University. E-mail: sultan@ppu.edu

² Palestine Polytechnic University. E-mail: waseem@ppu.edu

Introduction

The nature of healthcare services where the highest degree of customers' contact makes it necessary to find out the best practices to improve the quality of service delivered. Hospitals are the main providers of health services and their operational quality is of great scientific, economic, and social importance (Wisniewski, 2005). Managing the operational capacity of Hebron Governmental Hospital in the Occupied Palestinian Territory (OPT), the largest and most occupied hospital in the governorate of Hebron, in order to improve the operational quality is important and of a major contribution to the quality of health services to the people of Hebron.

In the OPT, the patients in the Governmental Hospitals used to receive health care services as delivered i.e. value is measured in their minds as being recovery to what they paid for the Governmental Insurance System in the form of Salary Cut in advance. This attitude towards governmental health services is a reasonable cause to decrease their level of expectations.

None of the Palestinian hospital applies a quality control, or a medical quality assurance programs. This research will try to surface the need of applying these systems, and go in healthcare system beyond the minimum requirements for licensing purposes. The research introduces the quality of health care services as viewed by the patients. This will encourage both supplier and consumer to define and work forward to cover the patients' needs.

Research problem

Governmental Hospitals in the OPT operate at the limits of their effective capacity or even they operate over capacity in some of the hospital departments. The Governmental General Hospital of Hebron (Alia) is the most crowded one in the OPT, operating at 102% average occupancy rate.

The negative impact on the quality of the services delivered, and the outcomes of the hospital, due to the overload work pressure, pushes the state of service to: (1) unacceptable performance, (2) cut the scope of the service, or service overspill, and (3) the use of incompetent resource to undertake procedures that result in service failure. These short term policies used to cope with high demand mask serious unintended consequences and problems of quality.

Such a strong persistent demand of hospital care services in Hebron needs higher investment in hospitals (capital and skilled staff) in the long run. But in the short run it is a management challenge to respond to high patient demand pressure, while keeping on the good quality of the services delivered.

This should push managers to more emphasis on continuous process evaluation, to eliminate non-value added activities, to encourage communication, and to efficient utilization of resources.

Research objectives

The research aims at:

- Assessing the operational quality of the hospital care services delivered in Alia Hospital as perceived by the patients.
- Measuring the gaps and locating the largest gaps in the hospital's inpatient departments and in what quality dimensions?
- Exploring the informal practices and the weaknesses of the normal operating process/structure of the Emergency and Pediatrics departments in Alia Hospital and locating the resources bottlenecks and non-value added activities.
- Developing a proposed alternatives practices and procedures that improve resource utilization in the emergency department in terms of effectiveness and efficiency.

Research Questions

The main question of the research is:

(RQ): How does the state of operating over design capacity to cope with high demand affect the quality of the delivered healthcare services in the governmental hospitals?

In order to answer this main question, the research aims to discuss the following sub-questions:

(RQ1): How do patients evaluate the quality of healthcare in Alia Hospital?

(RQ2): What are the practices and activities that negatively affect quality while trying to cope with demand?

(RQ3): What are the practices and activities that if done would improve the score of quality?

(RQ4): What resources are needed to implement these practices?

Research methodology

There researchers were following these steps:

First stage: Literature Review:

All related literatures were reviewed. Different studies described the overcrowding phenomena in hospitals, their managerial solutions and models built a knowledgeable background to study and understand the normal operating state of Alia Hospital, and look forward to the model of "Best Practices". For this purpose observation technique and time study was conducted.

Second stage: Pilot Study:

A pilot study was conducted to 10 patients to test the reliability of the instrument. This instrument was used to measure service quality in the inpatient departments of the hospital. Validation of the

instrument was tested through six experts' opinion. They were kindly asked to evaluate the 34 item questionnaire. The Cronbach alpha values for reliability for each of the five quality dimensions in the SERVQUAL questionnaire exceeded the threshold of acceptance 0.70.

Third stage: Operational Quality Assessment:

- An expletory research approach to assess and measure the gaps of the operational quality in Alia Hospital. The size of the gap indicates where improvements should take place to bridge the gaps. The SERVQUAL gap analysis model which defines five dimensions of service quality to measure, and their SERVQUAL questionnaire is used as measurement instrument.
- Each question is a two section variable to ask the patient about his or her expectation and perception concerning that service issue. The patient was asked to express his or her expectation in a five point Likert scale to express the level of desire as (5) to "strongly want", and (1) to "strongly do not want". Also, the other section of the same question asked the patient to express the experience in the hospital about that service issue in a five point Likert scale as (5) to "strongly agree" and (1) to represent "strongly disagree".
- The questionnaire was headed by an introduction to kindly ask the patient to complete it, and to define him or herself in (11) demographic and situational questions. The questionnaire was tailed by other six questions to express some operational weaknesses (poor quality) she or he experienced while receiving the medical treatment.
- The thirty one items questionnaire was distributed to 118 patients in the end of August 2009 within two days. The sample was chosen randomly in all the departments.
- A statistical software package was used to analyze the data. Both descriptive and inferential statistics were used to describe the sample and calculate the average gaps in quality, while inferential statistics were used to test relations between variables; ANOVA test, Chi-Square test, and regression analysis were used.

Fourth stage: Whole Hospital Process / Structure Analyses:

An operational approach is adapted, and quantitative techniques are conducted to find out the actual whole hospital system represented in the patient's pathway from the very beginning of the patient's arrival to his/ her discharge. The whole hospital view followed in this stage may uncover areas for more detailed studies for improvement. The patient's pathway study may reveal locations where a more concentrated study is needed.

Literature review

Service quality is a function of the relationship between a customer's prior expectations of the service and his or her perception of the service experience both during and after the fact. Unlike product quality, service quality is judged by both the process of service delivery and the outcome of

the service (Fitzsimmons, 2006). This introduces the quality in services as value added activities, and the process of service delivery as root causes of delivering high or poor quality.

In general quality is the ability of a product or service to meet the customer needs. Ducker defines service quality as (what the customer gets out and is willing to pay for) rather than (what the supplier of the service puts in). Hence, service quality is often conceptualized as the comparison of service expectations with actual performance perceptions (Selcen, 2006). Since service quality is generally intangible, only three definitions of Garvin (1984) apply to service quality; an acceptable product at a reasonable price, innate excellence or providing what customer wants (Dorson 1996).

In health care context it is difficult for the patient to evaluate the technical side of quality, because of no technical expertise to do that. While functional quality of how to deliver the service can be evaluated by the customer. Measuring service quality is a challenge because customer satisfaction is determined by intangible factors. Service quality contains many psychological features e.g. the ambiance of the facility. In addition, service quality often extends beyond the immediate encounter because, as in the case of health care it has an impact on the persons feature quality of life.

The five dimensions of service quality as shown in figure below where identified in five principal dimensions that patients used to judge service quality – **reliability, responsiveness, assurance, empathy, and tangibles**, which are listed in order of declining relative importance.

Reliability: The ability to perform the promised service both dependably and accurately. Reliable service performance is a customer expectation and means that the service is accomplished in time, in the same manner, and without errors every time. Reliability also extends into the back office where accuracy in billing and record keeping is expected.

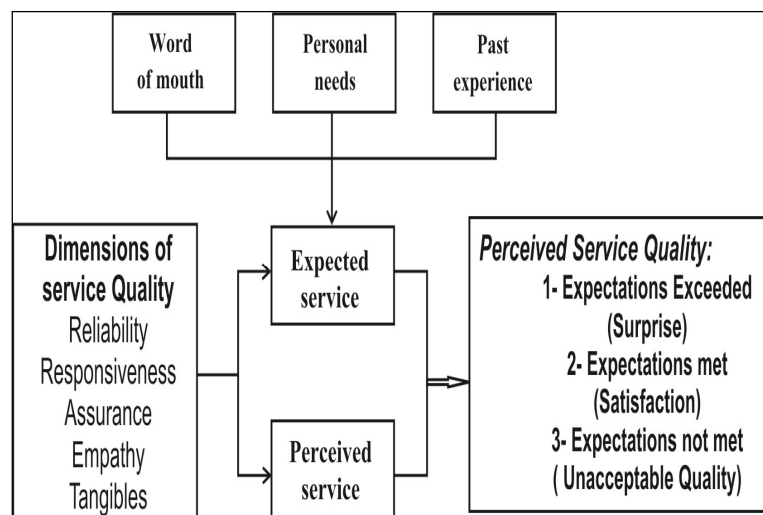

Figure (1): Five Dimensions of Service Quality

Responsiveness: The willingness to help patient and to provide prompt service. If a service failure occurs, the ability to recover quickly and with professionalism can create very positive perceptions of quality.

Assurance: The knowledge and courtesy of employees as well as their ability to convey trust and confidence. It includes the following features: competence to perform the service, politeness and respect for the patient, effective communications, and general attitude that the patient's best interests at heart.

Empathy: The provision of caring individualized attention to patients, it includes the following features: approachability, sensitivity, and effort to understand the patient's needs.

Tangibles: The appearance of physical facilities, equipment, personnel, and communication materials. The condition of physical surroundings is tangible evidence of care and attention.

Patients use these five dimensions to form their judgments of service quality, which are based on a comparison between expected and perceived services. The gap between expected and perceived service is a measure of the level of service quality.

SERVQUAL instrument is an effective tool for serving customer satisfaction that is based on the service quality gap model. It is used for measuring the five dimensions of service quality (i.e. reliability, responsiveness, assurance, empathy, and tangibles). This two-part instrument was developed in twenty two statements survey by the authors of the service quality gap model (Parasuraman, 1988).

To calculate the gap scores:

For each statement of the questionnaire:

Gap score = Perception – expectation (G=P-E)

(Very Good quality) 4 > G >= 4 (Very Poor quality)

Capacity can be measured in terms of beds and total work time available as a measure of overall capacity of a hospital. Most organizations operate their facilities at a rate less than the design capacity. They do so because they have found that they can operate more efficiently when their resources are not stretched to the limit.

Effective capacity is the capacity a firm can expect to achieve given the current operating constraints. Effective capacity is often lower than the design capacity to meet the needs of maintenance and standards of quality. The World Health Organization (WHO) recommends occupancy rate of 85% as effective capacity to design capacity ratio (Hung, 2009).

Research Limitation

The scope of the research does not include the outpatient services of the hospital, and contributes only to inpatient departments. Cross sectional data were gathered, although longitudinal data may be more accurate for long run analysis, but such data long term analysis are the concern of specialized centers in health care or the health authorities more than being as applicable to this research.

- Cross sectional data may explain or reflect the management response to some factors that affected the period of collecting data, that is, the operation mode of the hospital in that period.
- It was difficult to gather data from female patients or their relatives in the Obstetrics department due to cultural limitations and the nature of treatment (almost always emergency more than recovery).

Findings and Discussion

The last part of the questionnaire was implemented to investigate causes of poor quality in the hospital while asking about weaknesses the patient had subjected through the service delivery processes. They are labeled as (Q1 through Q6).

Q1: Investigates where is the most delay in the processes?

Results show three different places of high frequent respondents of delay in the service. Two of them (in the outpatient clinics, and the inpatient Department) delays getting served. While, the third shows a procedural delay in the registration process. Bottlenecks in the process of patient flow in the hospital are located in two different areas, the award and the registration department.

Q2: Investigates the cause of delay.

The most frequent causes of delay are “high demand, procedures, and absence of a doctor.” All these are operating capacity issues, they are if managed effectively will decrease delays and improve patient satisfaction. Results of question (Q1) are an answer to where the delay is experienced? Then both questions lead to process/structure study to find methods of improvement.

Q3: Investigates if patients experienced a medical service error, what is the root of the error?

Data shows that (10) patient out of (118) respondents had experienced a medical service error, (8.4%), most of the error – six out of ten are caused by the doctor:

- In Pediatrics Department- **Doctors** are the main cause of medical error.
- In Obstetrics Department- **Nurses** are the main cause of medical error.
- In Surgery Department- **Laboratory** is the main cause of medical error.

Questions Q4, Q5, and Q6 asked the patient to express his or her opinion about the degree of loyalty, satisfaction and the reliability of the applied insurance system respectively, of Alia Hospital services by either “yes” or “no”.

81.4% of the respondents are satisfied. 71.2 % of them are loyal to Alia Hospital, while 73.7% of them think that the used system of medical insurance is effective. This percent of unsatisfied patients is compatible to the results of gap scores.

Calculation of Gaps in Operational Quality:

Results show moderate deviation of the service delivered in all the dimensions of quality. It is worth to note that the largest average gap score is measured in the responsiveness variables (score is 0.982). More specifically, the gaps deal with quick response of nurses, the availability of easy method to communicate nurses, the availability of the needed drugs and between tangibles the cleanness of toilets scored also high. All these points share a common cause of high work pressure, and high service demand which already exceeds the effective capacity of Alia Hospital.

Emergency Department (ED) Process Analysis:

The ED works to provide emergency medical services either in the department itself or as an input stage to the inpatient departments when the initial diagnosis of the patient shows the need for admission. The ED works 24 hours a day, 7 days a week, in three daily shifts normally named A,B, and C shifts. The ED of Alia Hospital has an annual load to serve more than 115,000 patients, according to hospital statistical report 2009. Out of them 88000 patients didn't need admission. Which means that on average the ED serves 300 patients per day.

The present process flow of the ED is shown in figure below. It seems to be smooth and easy followed by the staff and the patients. But actually that is not the situation. Actual behaviors are discussed below.

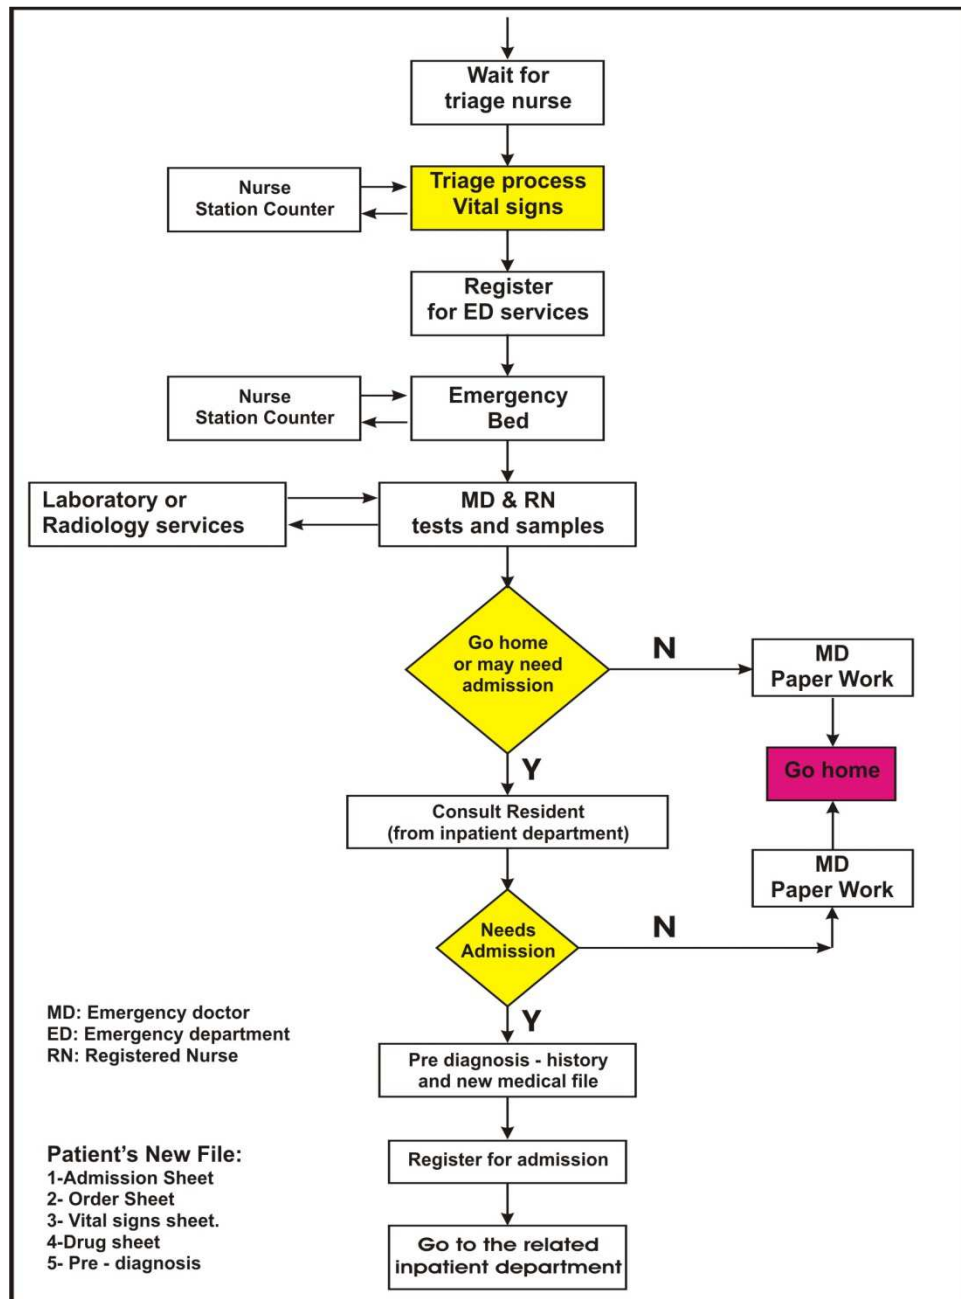

Figure (2): The Present Process Flowchart in the emergency department of Alia Hospital

While visiting the ED, the researchers observed the following behaviors and their negative consequences:

- Patient almost always start going to the nurse station, instead of triage station. This makes him or her wait for the nurse to guide him or her to the triage. This phenomenon is a layout weakness. The following negative consequences appear:
- The patient expends more time.
- More nurse time is lost.
- Continuous crowding in front of the nurse station.

- Patient finishes the triage stage and mostly, without knowing the next step, he or she goes to the nurse station again, instead of being registered and assigned for emergency bed number.
- When a patient is registered she or he tries to find an empty bed and waits or asks for service.
- Calling for a specialist for some cases takes a minute. But mostly there is a delay. This equally delays the usage of an emergency bed.
- The emergency staff is responsible to take the patient to the inpatient department. He or she serves all the patients and always comes late and delays the take off process of the patient from the ED. It is easily observed that this process is a bottleneck in the patient's pathway, which limits the operating capacity and delays patient flow.
- The lack of "Daycare Unit" in which patients stay for hours for more tests and observation, after that the decision is finally taken either to go home or needs admission. This unit has two major advantages related to workload:
 - It is a buffer stage that helps making load balance.
 - Decreases the number of inpatients, because initially all patients in this unit were inpatient, but now part of them may go home while others get admission according to the results of the additional tests.
 - Crowding in front of the stations in the ED causes the elimination of some steps in procedures, and damages patient individualization process.

To avoid these negative consequences a proposed process flow to the emergency department is shown in figure below. The management of non-value added activities which consumes 60% of the time is one of the outcomes of using the Management Information System (MIS) which simply means the use of computer to communicate and show instant operational data and consequently make situational-based decisions. Communication channel between triage and nurse station will help facilitate patient flow. Effective use of the triage stage will help decision making and smoothing patient flow.

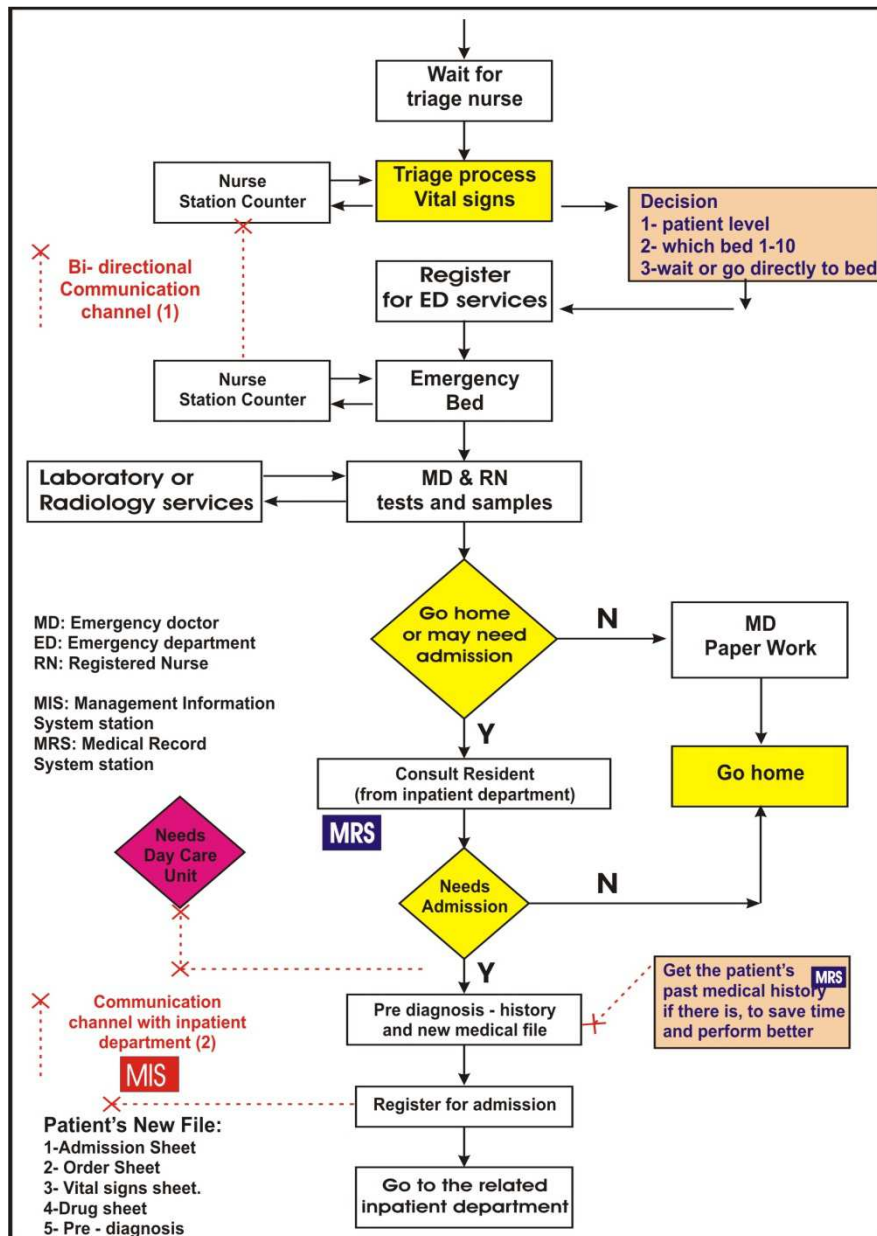

Figure (3): The proposed process flowchart in the emergency department of Alia Hospital

The detailed activities of the ED had been timely analyzed to find out which station is the bottleneck of the whole process. Knowing the average daily demand and the load work needed, the bottleneck will be assigned. The detailed calculations are shown in figure (4) below:

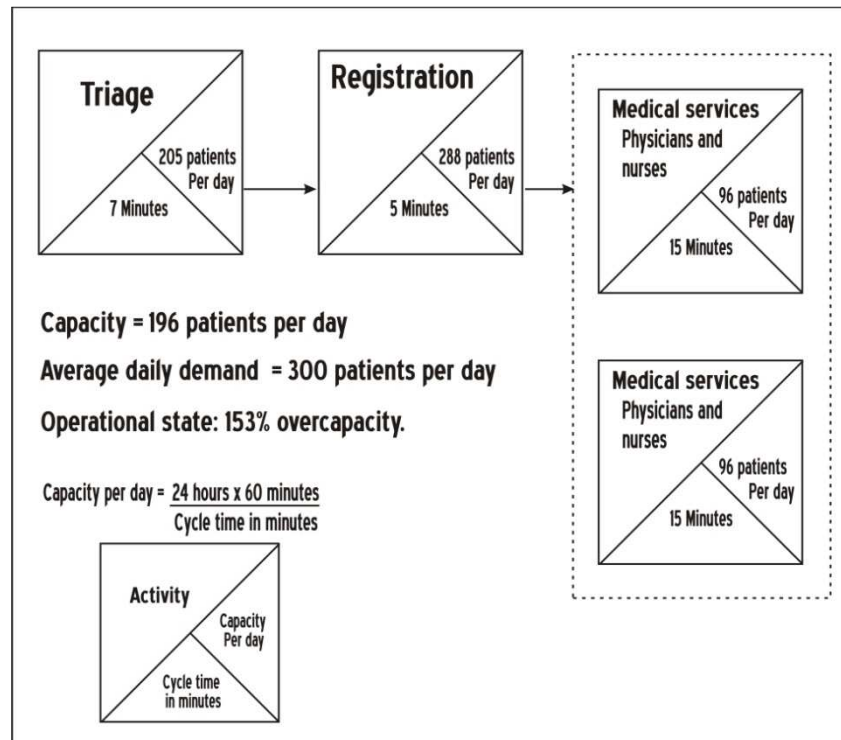

Figure (4): The activity time analysis of the emergency department of Alia Hospital

From figure above it is clear that the medical team of “one physician and one nurse” who work together and share some activities to serve the patient represents the bottleneck resource. The ED needs at least one additional team of a physician and one nurse to have a capacity of serving 288 per day instead of 192. But two additional teams will leave capacity caution and flexibility to manage break time, leaves, and vacations of the employees in one side and face surge in demand on the other side, and improve quality. Observations also depicted the need of layout redesign of the emergency department to facilitate the patient and process flow; this is out of the scope of this research.

Pediatrics Department Process Analysis:

The pediatrics department had delivered 27266 days of healthcare in 2009. It has 60 beds, and one equipped admission room of two beds. The department serves patients aged from one day up to 14 years old. On average the occupancy rate was 124.5%. Seasonality of the department is in winter mainly the months of December and January the peak demand is in these months, some days more than 100 patients are treated in 60 beds.

The actual process flow chart of the pediatrics department is shown in figure (5). Resources mainly nurses are fully utilized and even almost always over loaded in Shift A of work. All patients share one admission room services at the beginning, and then each patient is assigned to inpatient bed. There is no certain rule to assign a bed to a patient; it is only a nurse own decision.

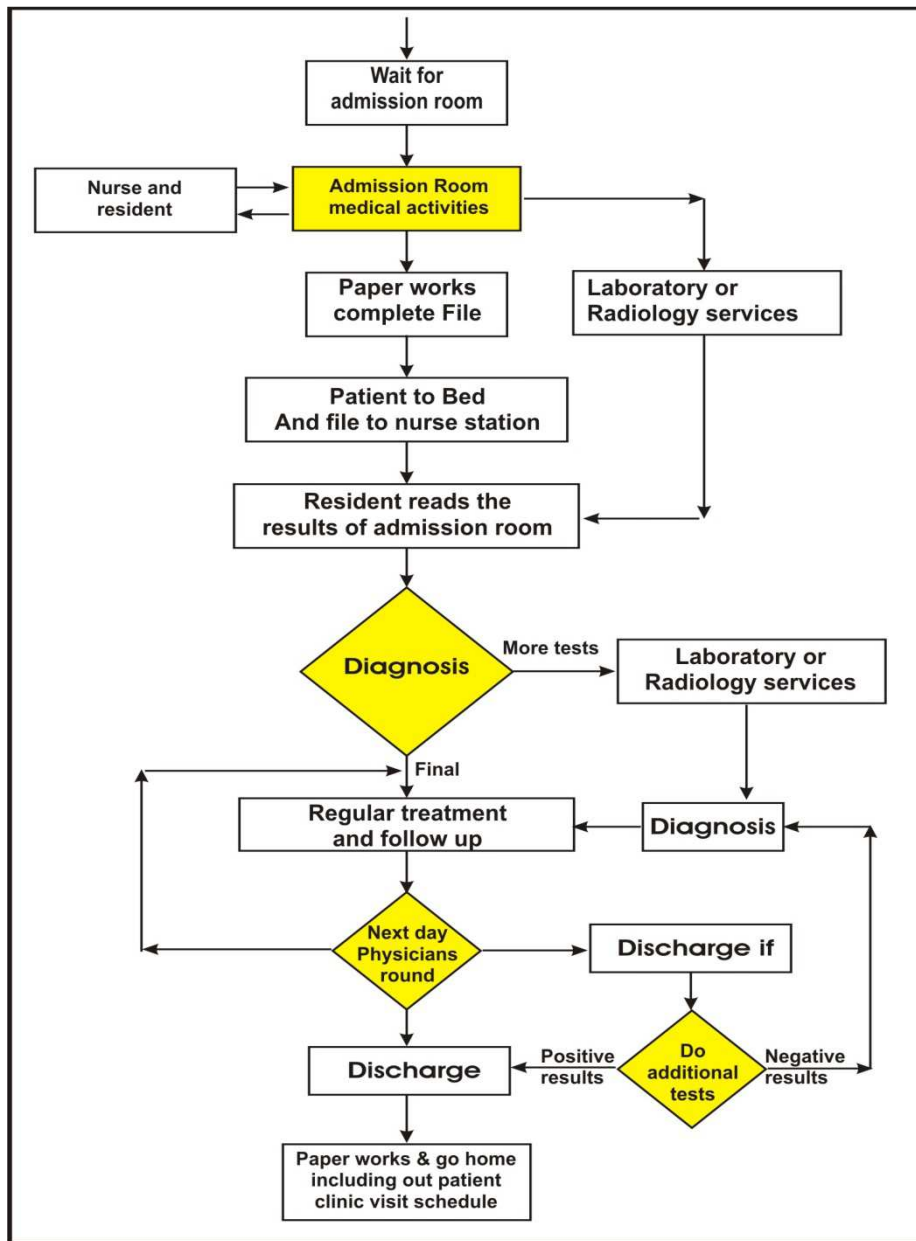

Figure (5): The actual process flowchart in pediatric department of Alia Hospital

The over load pressure on nursing staff leads sometimes to service scope cut and quality defects. Activities are done some times in parallel instead of sequentially to save time and procedures are broken other times, the lack of any quality audit in the process is of great importance, because of work overload pressure. In addition to the need of resources determined later in this section, and the necessity of quality audit in department to check the application of the procedures of each process. Figure (6) shows a proposed process flow that interacts effectively with both MIS and Medical Record System MRS, to balance the load and smooth patient flow.

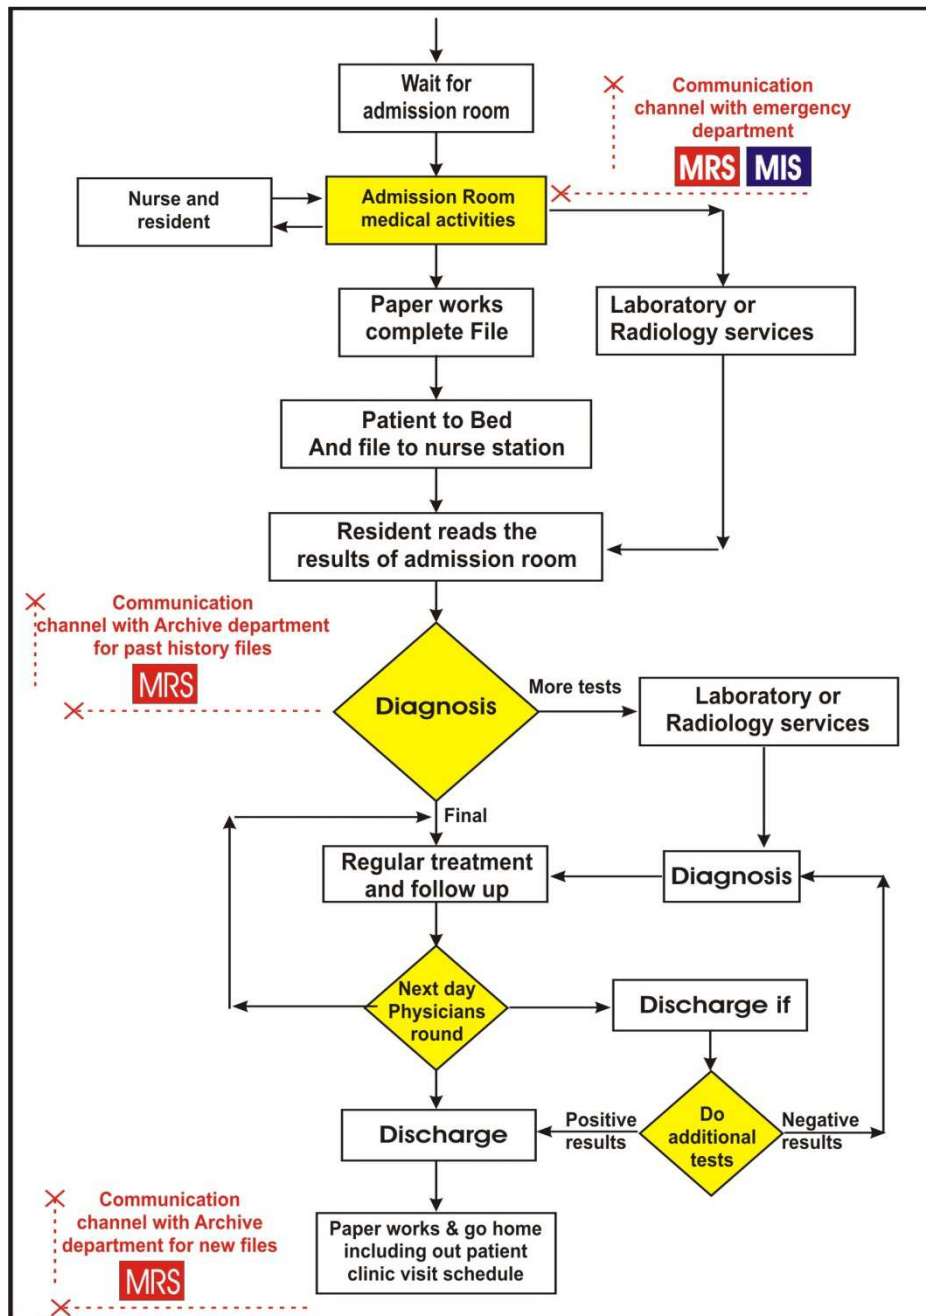

Figure (6): The proposed process flowchart in pediatrics department of Alia Hospital

This department suffers the economic pressure mainly represented in the lack of medical equipment, and the work overload pressure mainly on nurse staff. They perform a lot of activities, they are in continuous contact with patients, perform the doctors’ orders, apply regular follow up and medications, make beds, and do paper works. Lack of equipments in the department (insufficient number of pulse oxi meter, thermometer, and medical monitors are only in the AR, suction equipments, and sometimes drugs) represent the economic pressure that pushes the operating state of towards unacceptable performance.

The pediatrics department has the following main operating characteristics shown in table (1):

<i>Resource</i>	<i>Total for the 24 hours</i>	<i>Shift A</i>	<i>Shift B</i>	<i>Shift C</i>
<i>Specialist</i>	4	4	<i>One On call</i>	<i>One On call</i>
<i>Residents</i>	8	3	3	3
<i>Nurses</i>	19	<i>Two in ward Two in AR + Staff nurse</i>	<i>Two in ward Two in AR</i>	<i>Two in ward Two in AR</i>
<i>Beds</i>	60	60	60	60
<i>Rooms</i>	13	13	13	13
<i>Worker</i>	6	2	2	2

Table (1): Resources in the pediatrics department

These resources are responsible of the activities shown in the process flow above. Time analysis will be conducted to activities performed in the admission room and the must be done daily activities that serves patients in beds in shift A to calculate the minimum required staff of nurses and to compare it with actual one.

Through interviews and observation, queue was built in front of the AR, and in front of the nurse station. The admission room in four different time visits was out of doctor but only nurses, although a doctor is assigned to be there, this leads to resource bottle neck in the department represented by the nurses. For this reason the researchers followed the activities carried out by nurses, time analyses where conducted to determine the exact needs of nurses. It is worth mentioning that unbalanced distribution of total 196 nurses in the hospital is applied in the departments.

Table (2) lists the activities each inpatient should pass through in the pediatrics department in sequence. The table also shows who does the activity? How many employees are available? And average time for each activity:

	<i>Activity</i>	<i>Who does the activity?</i>	<i>Staff to do this activity...</i>	<i>Average time (min)</i>
1	<i>Admission room (cannula)</i>	RN	2	3
2	<i>Admission room (vital signs measurement)</i>	RN	2	3
3	<i>Admission room (sample for Lab.)</i>	RN	2	0.5
4	<i>Admission room (weight & dimensions)</i>	RN	2	0.5
5	<i>Admission room (drugs)</i>	RN	2	1
6	<i>Admission room (test & diagnosis).</i>	<i>Resident</i>	1	6
7	<i>Admission room (paper works)</i>	<i>Resident</i>	1	5
8	<i>Arrange for a bed</i>	RN	1	2
9	<i>Take patient to bed</i>	RN	1	3

RN: registered nurse.

Table (2): Activities conducted in the Admission room

Figure (7) shows the time needed to operate the admission room, assuming no other constraints the operating load is 91% of the design capacity but actual operating state showed patient queue in the admission room that is mainly because of:

- The resident doctor assigned to be in the admission room that puts the nurse in a position to do his job which overloads the nurse more and affects negatively the outcomes.
- Due to lack of nurses in the ward, nurses in the admission room share responsibilities with them. That reduces the nurse resource capacity and creates a bottleneck.

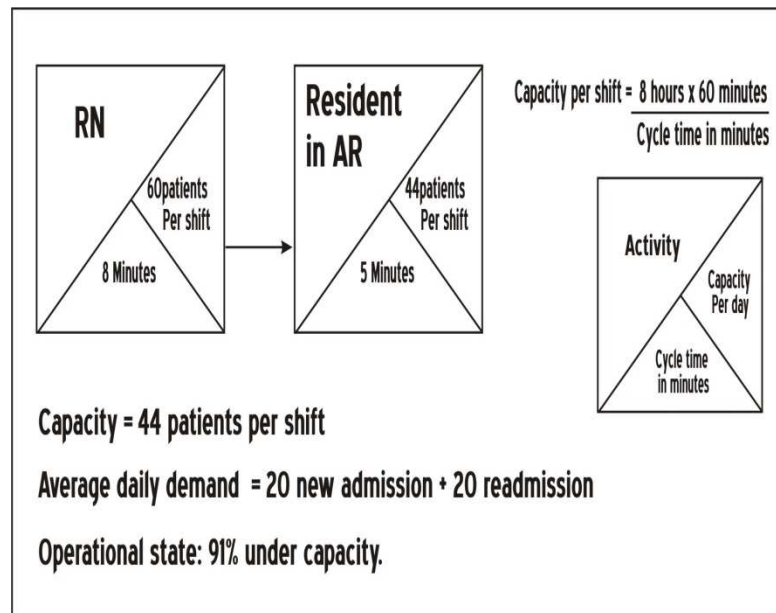

Figure (7): The activity time analysis of the admission room in pediatrics department of Alia Hospital

The justification of the lack of nursing staff in the pediatrics department was conducted by the researchers in three different approaches:

First: The number of human resources in this department is within the requirement of Ministry of Health (MoH) for licensing except for the nursing staff. The minimum requirement of MoH is three nurses per bed, which is the sum of one registered and two trained nurses. This condition puts the pediatrics department of Alia Hospital in need of $(60/5) \times 3 = 36$ nurses, to get licensed and operate normally in full load. But since Alia Hospital is a governmental hospital, this licensing criteria is ignored.

Second: Time analysis of the activities done by the nursing staff showed the need for additional staff. In shift A the total nurse hours needed to serve 60 patients were $(2160 \text{ minutes} / 60) = 36$ hours, the number of nurses in shift A should be 5 instead of 2 nurses, as shown in table (3) below:

It is clear that this department is 40% nurse staffed, that leads to dangerous consequences due to all the compensation intuitional policies followed to cope with continuous high demand.

<i>Activity in shift A</i>	<i>Nurse time needed to serve 60 patients (min) As it must be.</i>
<i>Shake hands with shift C 7:30 AM</i>	$60 \times 2 = 120$
<i>Bed making and dusting</i>	$60 \times 3 = 180$
<i>Injection 9:00 AM</i>	$60 \times 3 = 180$
<i>Medication and temperature measurement + signature</i>	$60 \times 5 = 300$
<i>Patients' files distribution for the morning round</i>	15
<i>The round outcomes duty / tests</i>	$60 \times 8 = 480$
<i>Discharge cases follow up</i>	$25 \times 5 = 125$
<i>Results of laboratory to resident doctors</i>	40
<i>Injection 1:00 PM</i>	$60 \times 3 = 180$
<i>Medication and temperature measurement + signature</i>	$60 \times 5 = 300$
<i>Paper works</i>	$60 \times 2 = 120$
<i>Shake hands with shift B 2:00 PM</i>	$60 \times 2 = 120$
<i>Total</i>	<i>2160 minutes</i>

Table (3): The time consumed to do the daily activities of nursing staff in the pediatrics department.

Third: The internal medicine department for example has 26 beds and served 7163 days of care in 2009. But 17 nurses are assigned to this department. It is a problem of resource structure in Alia hospital. The ratio of number of nurses related to beds is twice between departments, and to work load it is four times less in pediatric department.

When overload appears in this over occupancy rate, the problem of lack of nurses accumulates and makes the unintended consequences of care, by either eliminating some activities or follow the minimum legal requirement they are responsible for.

Conclusions and Recommendations

The Governmental Hospital of Hebron is over occupied. This state of work to cope with high demand leaves behind adaptive responses and practices that negatively affect the quality of care. Activities, processes and procedures were analyzed in the Emergency and Pediatrics departments. Results show weaknesses in communication, documentation process, resource allocation and layout.

Process analysis in the Emergency Department shows the need for process restructure to eliminate non-value added activities, and to increase the medical staff. The department also needs a daycare unit to balance load with inpatient departments, and to manage the triage unit.

Process analysis in the Pediatrics Department shows the need for more nurses, nursing staff reallocation, and additional primary equipment.

Based on the results' analysis, the following recommendations could be implemented to enhance the quality of healthcare in Alia Hospital:

- Developing a Medical Record System
- Activating the Triage Nursing Process
- Activating the day care unit
- A need to increase the number of medical staff
- A need to redesign the emergency department layout
- A need to reallocate and level the nursing staff efficiently and effectively
- Equip the hospital with modern equipment
- A need for effective communication system
- A need to implement a total quality system

THAI UNION FROZEN: THE SUCCES OF THAI FIRMS IN GLOBAL SEAFOOD VALUE CHAIN

Suthikorn, Kingkaew¹

¹ Thammasat Business School, 2 Prachan Road Bangkok 10200. Email: suthhikorn@tbs.tu.ac.th

Abstract

This article examines the path to success of a company from developing countries, Thai Union Frozen (TUF). The analysis is based on TUF expansion in canned tuna value chain to become one of the global leaders in the seafood industry. The economies of scale from its contracted seafood businesses provided necessary resources and capabilities to expand to higher value-added activities by acquiring international brands, Chicken of the Sea in 1997 as well as John West and other European leading brands from MW brands in 2010. It also expanded its distribution network through acquisition of a leading distributor in the US seafood market, Empress International in 2003.

Keywords: value chain, firms from developing countries, catch-up, value chain upgrading, Industry, seafood

Introduction

The various problems related to poverty, low productivity, an inadequate infrastructure and poorly integrated markets faced by developing countries are often exacerbated by the **under-development of the agro-industrial sector**. These countries fail to pay adequate attention to the value chain through which agricultural commodities and products reach the final consumers in both the domestic and international markets. This negligence has resulted in enormous potential **losses of value-added and employment opportunities**. While high-income countries, on average, add USD 180 of value by processing a ton of agricultural products, developing countries generate only USD 40. Moreover, 98 percent of agricultural production in high-income countries undergoes industrial processing; a significant difference from the mere 30 percent in developing countries. Despite their inadequate investment, it is estimated that between 40 and 60 percent of manufacturing value added is generated by the agro-processing industries in developing countries, and that processed agricultural products contribute significantly to their foreign income (UNIDO, 2008). With the increasingly integrated global economy, in which the large transnational corporations (TNCs) are the dominant force, it might be difficult for developing countries to develop its own national agro-food giants in order to become the core of the local industry, moving up the dynamic global value chains and creating spill-over benefits to various local entities (Nolan et al., 2007). The examination of Thai Union Frozen, which successfully moved up the value chains and become major player in the global seafood market, should therefore provide insights into the nature of this phenomenon.

Literature Review

The complexity and heterogeneity of the world of production and exchange have differentiated value chains, not only among various sectors, but also according to their national and local contexts. Since each chain has its own unique characteristics, their distinctiveness and wider relevance can only be effectively captured and analysed by understanding the broader issues involved (Kaplinsky, 2000; Kaplinsky and Morris, 2001). In particular, the ability of firms to catch-up in the value chains depends not only on their resources, such as the managerial, technological and marketing capabilities within the firms' internal value chains, but also a favourably external environment. These external factors include: 1) the government treatment of the industry; 2) the influence of various socio-economic factors at a particular point in time; and 3) the interaction between firms and various participants in both the upstream and downstream operations within a particular industry.

Kaplinsky and Morris (2001) define four important contributions of value chain analysis: 1) it can help to identify activities within the chain that are able to sustain high incomes. In particular, Gereffi et al (2001) define the income of different entities within the chain as either the profitability of these entities and/or the distribution of value added among these entities along the chain; 2) the value chain framework may assist in the identification of activities which are subject to the growing competition and those where entry barriers can be sustained or expanded in the future; 3) the analysis of power relations and institutions explains the behaviour of different entities within the chain and identifies those whose activities can be modified to produce a better outcome; and 4) the value chain analysis expands beyond the level of the firm or groups of firms into a network of institutions which support and influence the competitive performance of firms and their related industries. In summary, the value chain analysis allows researchers to identify different economic rents which are a result of the scarce attributes and barriers to entry in the industry. The analysis also helps to determine governance, a power relationship among different entities within the chain.

Since the early empirical study of the value chain in relation to global trade and the global production system by Gereffi and Korzeniewicz (1994), various researchers have employed the value chain framework to examine different industries, such as "Strategies for Diversification and Adding Value to Food Exports" (UNCTAD, 2000) and "Governance and Trade in Fresh Vegetables: the Impact of UK Supermarkets on the African Horticulture Industry" (Dolan and Humphrey, 2000). The principle of the value chain allows researchers to examine the globalisation of trade in products and services, providing valuable insights into the role of the leading firms in constructing these chains. These influential firms are predominantly located in developed countries; they are not only multinational manufacturers, but also large retailers and brand-name firms. Their businesses play a powerful role in determining what is to be produced, how, and by whom (Gereffi et al., 2001; Gereffi et al., 1994). The agro-food industry, in particular, the canned tuna and shrimp value chains were chosen for this study due to its complex nature and its relevance with many developing countries.

Methodology

The purpose of this paper is to examine the success of a firm from developing countries, Thai Union Frozen (TUF), in internationalising their operations, moving up the value chain and becoming global player in the seafood market. According to Yin (2003a), a case study is an empirical study which is set to examine a contemporary phenomenon within its actual surroundings. This is especially true when the boundaries between the examined phenomenon and its surroundings cannot be precisely drawn. The case study provides a multi-perspective, multi-dimensional analytical tool, allowing researchers to consider the actions not only of the main actors, but also of the relevant groups of actors within and outside the chain and their interrelations. For its robustness and vigour, the case study is chosen for this inquiry. This research paper uses a single case study design particularly, using one case study of Thai Union Frozen in the global canned tuna value chain. Although a case study cannot be generalised to all populations or universes, it still serves very well for developing theoretical propositions (Kaplinsky and Morris, 2001; Sjoberg et al., 1991; Stake, 1995; Yin, 2003a; Yin, 2003b). In order to ensure validity, this study collected data from various sources including the primary sources from semi-structured interviews with key informants in Thai agro-food industry such as Chief Executive Officer (CEO) and Chief Financial Officer (CFO) of TUF and also Vice president of SeaValue, another major canned tuna processor. Notes and audio records were taken during the interviews; audio records were used to cross-checked with information in the notes. The study also used secondary sources of information from various documents such as newspaper, company newsletter, and annual reports as well as other published documents.

The canned tuna value chain

This study is focusing on the global canned tuna value chain as it accounts for about half of TUF annual revenue. The global canned tuna value chain can be divided broadly into 3 parts, fishery, processing and retail and distribution (figure 1). The fishery part involves 2 main steps concerning 1) the process of catching tuna by fishing vessels and 2) trading by tuna traders before reaching processing facilities. The processing part includes 2 main steps. The first part is loining step in which whole fish is cooked, cleaned and cut into loin. The second part is canning in which loin is cut into pieces and pack into cans. There has been an increase in demand of loin as canneries in developed countries are changing from processing of whole rounded fish to tuna loin. This change provides canned tuna processors a significant cost reduction by shifting labour intensive loining step to developing countries. The retail and distribution part include activities involve transporting canned tuna products to overseas retailers and distributors before finally reach end consumers. Canned tuna products are mainly sold as national and regional brands as well as private label products.

The data collected from Thai Union Frozen and SeaValue, the major canned tuna processors are used to calculate the value distribution. The canned tuna processing capacity of these two Thai firms exceeds 80 percent of Thai canned tuna export, approximately 35 percent of global trade. The calculation is based on gross margin, the difference between average selling price and purchasing

price, in each step. From figure 1, the most value added activities of the value chain is retail and distribution in which 45 percent of value is created. This follows by 30 percent of processing and 25 percent of fishery.

Figure 1 The distribution of value along the chain based on gross margin

The fishery

The general structure of tuna fishery and trading is based on the contractual structure, in which operating funds of fishing vessels are provided by traders and in return they obliged to sell the products to their sponsors. Although, the tuna fishing industry is the least concentrated part of the value chain as there are numerous fishing vessels operating in different regions around the world. The imposed fishing quota and contractual structure of trading sector are important barriers to entry for new comers. When analysing the sector, several interesting characteristics are observed.

Firstly, tuna trading is estimated to be the most concentrated part of the value chain; the industry is dominated by the top three powerful trading firms. These trading firms include FCF Fishery from Taiwan, Itochu Corporation from Japan and Tri Marine from the US, respectively. They together control more than half of the global trade of cannery-grade tuna (Miyake et al., 2010).

Secondly, the roles of integrated tuna traders are beyond simple trading to management of the supply chain through to financing and other supports to vessels. Their influence can produce significant impacts on the supply of fish and its price. They can also act as reliable partners to provide crucial marketing links to operators and uninterrupted supply to processors. The corporate concentration in the trading segment, as evidenced by the decrease in number of sellers and multiple buyers, has resulted in price control and to the greater extent manipulation of trading price (Campling et al., 2007; Qalo, 2010).

Thirdly, although these top three integrated trading companies control more than half of global market for cannery-grade tuna, they do not own any international brands. This leaves them to rely on companies which own brands or distribution and retail channels for an access to end-consumers.

Processing

The world has observed the structural change in the global canned tuna processing sector. The drive for lower cost and higher productivity has transformed the industry from the stage, when most of processing occurred in developed countries in particular the main markets for canned tuna products, the US, Europe and Japan to the current stage, when most of the processing activities are taking place in developing countries, close to fishery sources and low-cost skilled labours. Developing countries such as Thailand and Ecuador, whose share of the global canned tuna export are 46 percent and 10 percent respectively, have become dominating force in the processing sector (Miyake et al., 2010).

Although, firms from developing countries are leading the global canned tuna processing, their activities are limited to supplying low value added, unbranded products to existing firms in developed countries. Despite its lack of manufacturing capability, firms from developed countries still retain control through their national, regional and global brands as well as access to distribution and retail channels.

Beyond the practice of locating canneries close to tuna fishery sources and low cost labours, many firms have considered increasing economies of scale as the most important factor for reduction of their production cost. Sharing national, regional and global brands, R&D activities and distribution network can significantly reduce production cost and increase firms' comparative advantages. Number of operating canneries in developed countries has reduced significantly as a result of merger and acquisition in the industry. For example, in France, the number of tuna processing firms has reduced from more than 200 in 1920s to the current number of around 15-20 firms. Another example by Carmona-Badía and Fernández González (2001) as cited in Miyake et al., (2010), the Spanish canned tuna industry also exhibit a similar trend as cumulative market share of the top ten firms has increased significantly from 30.5 percent in 1908 to 67.3 percent in 1995. At the same time, the consolidation process in the industry has resulted in the increase in productivity of the industry. For example Spanish production of canned tuna increased approximately fourfold from 60,000 tonnes in 1986 to 240,500 tonnes in 2004 (Campling et al., 2007; Miyake et al., 2010).

Retail and distribution

The globalisation and the larger size of the increasingly integrated global market have led to the surge in marketing and transportation costs. The larger investment costs are thus providing justification for mergers and acquisitions by the leaders in the industry. The synergies from combined operation allow them to lower their average production costs and compete against other players for gaining access to consumers. This consolidation trend can be observed in various markets around the world. In the US, the top three firms, Bumble Bee, StarKist and Chicken of the Sea hold approximately 75 percent of the market by volume and 85 percent by value. Similarly, in Europe, the combined sales by volume of the five leading companies including Bolton group/Trinity Alimentary, StarKist, Isabel Conservas Garavilla, SALICA Albacora and Jealsa, accounts for approximately 50 percent and the ten

leading companies' sale accounts for approximately 72 percent of the market (Campling et al., 2007; Miyake et al., 2010; Oceanic Development, 2005).

The market power of retailers, which is being exercised throughout the value chain, produces enormous pressure on the upstream sectors. Besides the competitive pressure from few dominating brands in the market, processors without strong brands are also being forced to respond to requirements of few dominating retailers in order to gain access to end-consumers (Campling et al., 2007; Miyake et al., 2010). The level of market concentration and important characteristics of the three parts of canned tuna value chain are summarised in table 1.

<i>Parts</i>	<i>Level of concentration</i>	<i>Important characteristics</i>
<i>Fishery: Fishing</i>	<i>Low (many fishing operators)</i>	<i>Fishing quota as barrier to entry</i>
<i>Fishery: Trading</i>	<i>High (three dominating traders)</i>	<i>Control more than 50% of the world market</i>
<i>Processing</i>	<i>Medium (Several regional and national players)</i>	<i>Several players from both developed and developing countries</i>
<i>Retail brands</i>	<i>High (Few national and regional brands)</i>	<i>Several companies control portfolio of different brands in different regions</i>
<i>Retail and Distribution network</i>	<i>High (Few global players)</i>	<i>Small and medium processors are forced to produce for retailers' private label products</i>

Table 1 Market concentration and important characteristics of different parts of canned tuna value chain

The case of Thai Union Frozen (TUF)

Thai Union Frozen is currently one of the most successful Thai companies. The company is a major seafood processor and brands owner in the world. The company is the world largest supplier of canned tuna and currently controls approximately 20 percent of the global canned tuna market. It sells around 50-60 percent of its products as unbranded products and the remaining are sold using its own brands. Approximately half of the company's revenue is from its tuna businesses and the remaining is from other seafood businesses such as processed shrimps (Thai Union Frozen, 2010a).

TUF was established as a small seafood processing company in Thailand more than 30 years ago. The company expanded to cover 2 main core businesses, canned tuna and shrimp products. It has expanded from a small contracted manufacturer with revenue of approximately USD 10 million in 1990 to become major suppliers for leading brands in major markets around the world before acquiring Chicken of the sea in 1997. Prior to the acquisition of its first global brand in 1997, the company was the second largest canned tuna processor in the world, employing more than 10,000

workers around the world and generating revenue of approximately USD 400 million (Pederson, 1999; PR Newswire, 2000).

The acquisition of Chicken of the Sea

In 1997, the company together with its local allies, Songkla Canning and Thai Ruamsin Pattana as well as US allies, Tri-Marine, one of the three leading tuna traders, and Ed Gann, an individual who operates a large tuna fishing fleet, acquired, Chicken of the Sea, the third largest canned tuna in the US market.

Chicken of the Sea was originated from Van Camp Seafood Company, a seafood processor found in 1914. The company created Chicken of the Sea as its brand in order to describe the taste of its tuna to consumers and adopted mermaid as its brand mascot in 1950s. Ralston Purina, a leading US processed food and pet food company, acquired Van Camp in 1963. The industry became less profitable as lower cost processors in Asia, in particular, Thailand and Indonesia have entered the market. Throughout, the 1970s to 1980s, the industry has observed several changes of ownership of major canned tuna companies. Van Camp Seafood was acquired by P. T. Mantrust Corporation, an Indonesian company, whose existing businesses include tuna fishing fleet and canneries in Indonesia. This USD 260 million acquisition is an early attempt by firms from developing countries to expand in higher value added activities in the canned tuna value chain (François, 1991 ; Pederson, 1999; PR Newswire, 2000; Wolf, 1988).

The acquisition gave this Indonesian company the widely recognised brand as well as access to existing distribution and retail network. However, the fully integrated business model did not sustained the difficult time of the market during 1990s. The high cost of fund for the highly leveraged acquisition of Van Camp by PT Mantrust has resulted in PT Mantrust and Van Camp facing cash flow difficulties. This allowed Prudential Life, a major creditor, to take control of the company. The company continued to operate with minimal expansion until 1997 when it was saved from bankruptcy by an USD 97 million acquisition by TUF and its allies. Tri Marine and Ed Gann are existing tuna suppliers of Van Camp. Their aim in this acquisition was to prevent the bankruptcy of its major buyer. On the other hand, Thai Union Frozen group' aim was to enter into higher value added activities through Chicken of the Sea brand and existing Van Camp's distribution and retail network (Pederson, 1999; PR Newswire, 2000; Siedsma, 1997). Thai Union Frozen in 2000 acquired the remaining stake from Tri Marine and Ed Gann and became a sole owner of the company (Tri Marine, 2000). The company later used Chicken of the Sea brand to cover its entire seafood products. Chicken of the Sea shared approximately 17 percent of the US canned tuna market in 2007. This compared to more than 35 percent of Starkist and approximately 30 percent of Bumble Bee (Kinsman, 2007) .

Expansions of production capacity and distribution network

The company also expanded its processing capacity by acquiring Bumble Bee excess production capacity in 1997. It also merges with its allied canned tuna processors. These include the merger with Songkla Canning in 1998. This merger enabled TUF to expand its processing capacity, revenue and

profit by around 30%. The company also merged with another canned tuna processor, Thai Ruamsin Pattana, in 1999. These events exhibit the company's intention to expand aggressively through consolidating its position in the local industry.

In 2003, TUF expanded further by acquiring Empress International, a major seafood distributor in the US. Through this acquisition, the company established the Xcellent brand for its business-to-business market.

The recent acquisition of MW Brands

In July 2010, the company has reached another important milestone in its quest to become a leader in the global seafood business. This is the acquisition of MW brands, one of the largest seafood processors in Europe. The acquired company is a vertically integrated business, which is headquartered in Paris. In 2009, the total revenue of MW group is USD 582 million with USD 732 million in asset. Its revenue is approximately four times smaller than TUF, which has approximately USD 2 billion in revenue, USD 100 million in profit and USD 1.1 billion in total asset at the end of 2009 financial year (Kate and Webb, 2010; Thai Union Frozen, 2010b).

MW brands' products portfolio ranges from tuna, salmon, mackerel, sardines, and several other seafood products. It manufactures and distributes various seafood products through its owned brands such as John West for different kinds of canned fish in the UK, the Netherlands and Ireland, Petit Navire and Mareblu for canned tuna products in France and Italy respectively and Hyacinthe Parmentier for canned sardines in France. The company is currently the largest player in canned seafood market in the UK, France, the Netherlands and Ireland and the third largest player in Italy. It controls approximately one sixth of the USD 3 billion combined market value of canned seafood products in these countries (Thai Union Frozen, 2010b).

The MW brands group is a result of several merger and acquisitions in the past; it was part of Unilever until the acquisition by Heinz in 1997. The company has been part of food giant Heinz until 2006 when it was packaged and sold for USD 522 million to Trilantic, a private equity arm of now-bankrupted Lehman Brothers. Trilantic was later taken over by its management in 2009. TUF has succeeded in bidding for MW from other bidders including private equity firms Blackstone Group and Permira Advisers and another rival canned tuna producer, Bolton (Ficai, 2010; Kate and Webb, 2010; Thai Union Frozen, 2010b).

MW brands' vertically integrated business operates its own fishing fleet and production facilities that are located in four different locations. MW brands' primary processing facilities locate in Ghana and Seychelles in order to take advantage of low operating cost and close proximity to raw material supply. The company also has further processing facilities in France and Portugal to take advantage of the close proximity to major European markets. The company also has its own distribution channels through its leading brands in the European market (Kate and Webb, 2010; Thai Union Frozen, 2010b).

This acquisition is a significant breakthrough of the company in the European seafood market. It would complement TUF’s strong position in the US and place TUF as one of the largest seafood company in the world. The company would achieve greater economies of scale and better negotiating power with suppliers, resulting in improved profitability. Currently, MW brands’ operating margin at 16.9 percent is currently two times higher than TUF’s 8.6 percent. The higher margin is due to the nature of MW businesses which are focusing on high value-added, high margin, branded products in the European market while a significant part of TUF products prior to the acquisition are sold as commodity, unbranded, low value-added products. The addition of high value added businesses, in particular strong European brands, to TUF operation would certainly improve the company’s future operating margin. Moreover, the company would gain a significant advantage from lower import duty to the European market. The fully integrated value chain with strong global presence, from fishing vessel, processing, distribution and branding, would allow TUF to weather market uncertainties, overcome risks associated with fluctuating commodities price and maintain high standard and low operating costs throughout its value chain (Bangkok Post, 2010; Ficai, 2010; Kate and Webb, 2010; Thai Union Frozen, 2010b).

TUF expansion timeline

The company has expanded rapidly over the past two decades from a small contracted manufacturer in 1990 to become the leader in the world seafood industry in 2010. The timeline of the company expansion in the global seafood value chain is outlined in figure 2. The revenue and profit at each important milestone are presented to provide references for the company’s expansion.

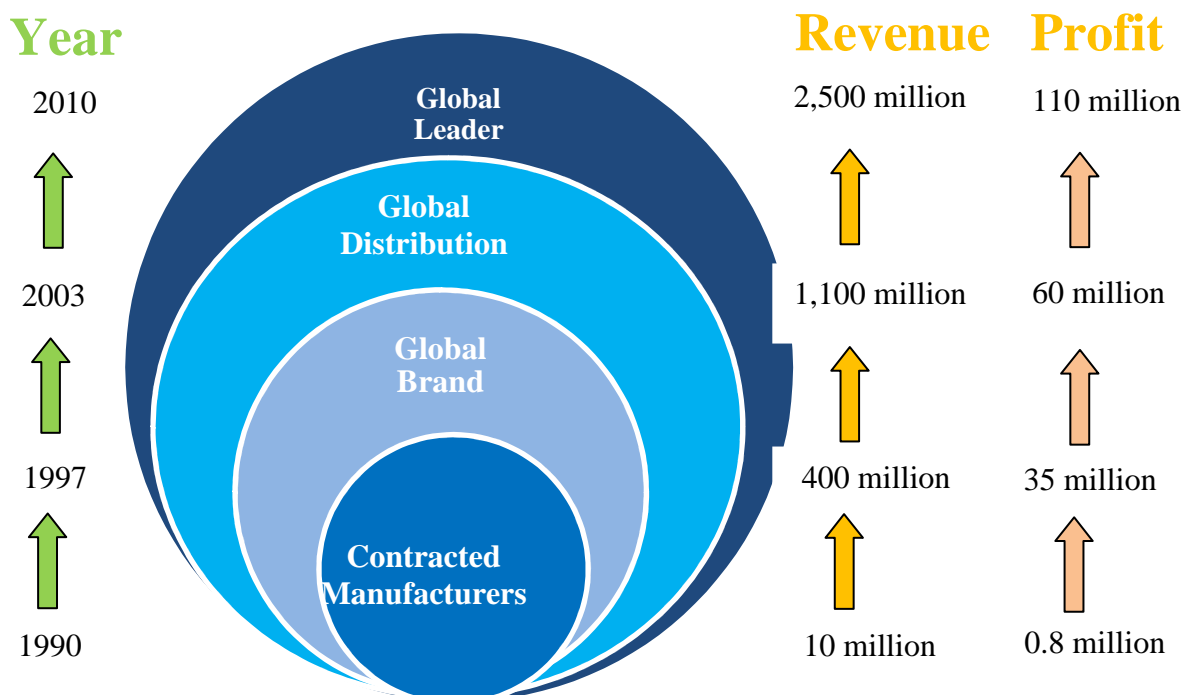

Figure 2 TUF expansions in the global seafood market (USD)

TUF integrated canned tuna value chain

The company operates as seafood processor with its own brands in Thailand, the US and Europe. In the canned tuna value chain, the company focuses mainly in processing and selling of the products through its own brands and distribution network as shown in figure 3. The company also owns a small fishing fleet. The integrated business allows TUF flexibility to manage its costs in the value chain and cope with fluctuation in price that commonly occur in agricultural commodities markets.

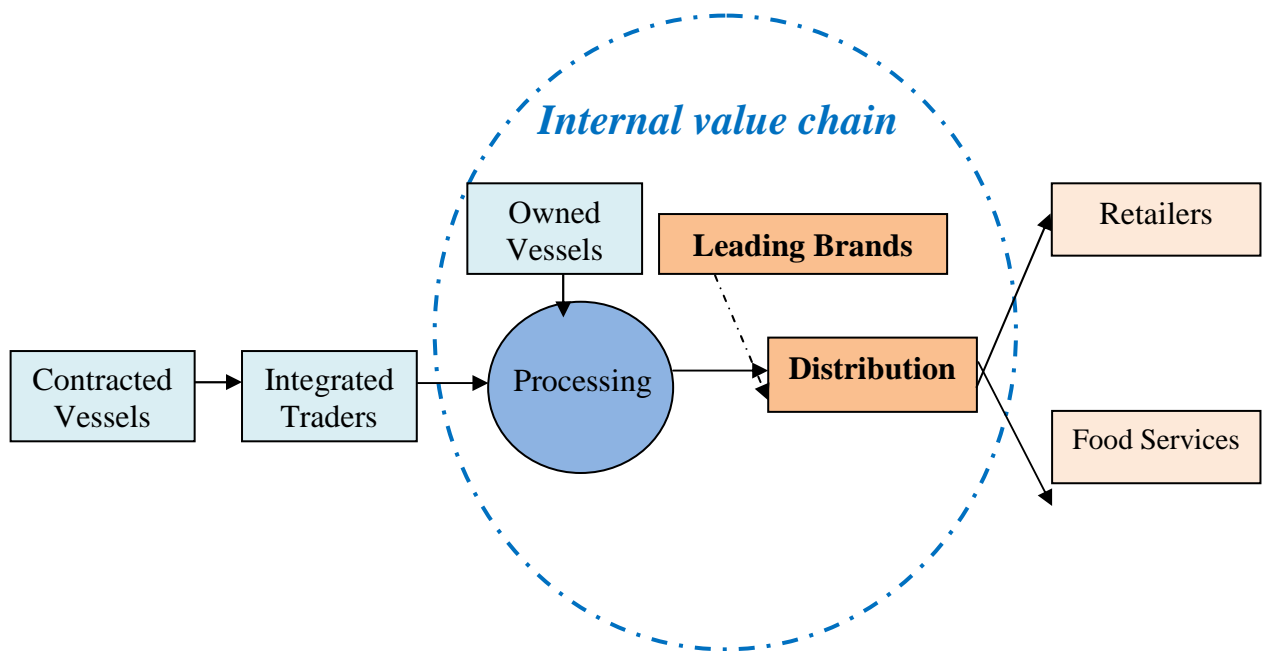

Figure 3 The canned tuna value chain of Thai Union Frozen

Discussions

The Strategy to move up the Value Chain

The company was originally set up to process various seafood products for export. Seeking the opportunity to expand in the value chain, the company utilised its existing operations in the seafood processing value chain to move into the new value chain, canned tuna processing. As stated by Gereffi et al (2001) and Kaplinski & Morris (2001) chain upgrading, in which a firm moves its operation to a new value chain, is one of the four methods that firms can improve their position within the existing or related value chains. TUF moved its focus to tuna processing in response to the changing trend in the global canned tuna industry, in which firms from developed countries are relocating or contracting parts or all of its canned tuna processing to overseas manufacturers in order to reduce cost.

From figure 1, the most value added part of the value chain is the retail and distribution segment. To capture value in this segment, processing companies such as TUF often consider acquiring brands and

distribution network. TUF has operated as contract manufacturer and gradually expanded its capacity, accumulated resources and capabilities, until 1997, when TUF together with its local and overseas allies acquired Chicken of the Sea. This is an important step of the company in moving up the value chain, to become brand owner and command higher bargaining power with retailers and suppliers. The company furthered its expansion by acquiring Empress International, leading US seafood distributor in 2003. In 2010, the company also acquired MW brands, a leading seafood European seafood company which owns recognised brands in Europe.

Beyond an Asian Institution Barrier

Several studies have observed that family owned companies in Asia view M&A as a result of power asymmetry in which more powerful companies attack on the weaker ones. They tend to preserve family ownership and control at any costs. This institutional barrier has long hindered the consolidation in several Asian countries including Thailand (Chew and Sharma, 2005; Suehiro, 2001; Yeung, 2000). For instance, the top ten leading chicken processors in Thailand, which together control more than 90 percent of the domestic market, have retained their market share at the same level for the past 30 years without any successful M&A attempts by any players. As mention during an interview with an executive in one of these companies, which together control more than half of the processing capacity in Thailand, *“These top ten chicken processing companies are family-run businesses, in normal situation, merger and acquisition are nearly impossible as protecting their family ownership in the businesses and passing them to the next generations are their priority. They would even consider to risk failing the businesses in their own hands as a better option than selling it to someone else”*

TUF has moved beyond this institutional barrier. It successfully merged with Songkla Canning, a major producer of canned tuna in Thailand, in 1998. The merger increased TUF canned tuna processing capacity by more than 30 percent. In an interview with a TUF executive about the acquisition, he stated that *“The success of this deal was due to our long history of business cooperation and friendship between leading shareholders of the two companies. Also we were able to convince them that the synergies created from combined businesses would provide higher profitability and as a result their return would be higher”*

Conclusion

The success of TUF can be used as an example of how firms from developing countries can move up the value chain and become global players. TUF has succeeded in expanding its manufacturing capacity and accumulating resources and capabilities before moving to higher value-added activities in retail and distribution segment through acquisitions of various international brands and distribution networks. The path to success of TUF also exhibits an interesting character as it has succeeded in breaking an institutional barrier, which commonly found in Asian businesses. This traditional barrier has prevented family-owned firms in Asia from consolidating their positions through merger and acquisition with other family-owned firms. TUF has successfully merged with two local canned tuna processors. The economies of scale from combined operations may be one of

the main reasons that enabled TUF to expand rapidly, move up the value chain and become the leader in the global seafood industry.

CORRELATES OF THE ECOLOGICALLY CONSCIOUS CONSUMER BEHAVIOUR IN GREECE

Tilikidou, Irene¹

¹ TEI of Thessaloniki, Department of Marketing, P.O. Box 141, 57400, Thessaloniki-Greece. E-mail: etilik@mkt.teithe.gr

Abstract

Presents the examination of the Ecologically Conscious Consumer Behaviour (ECCB) during the current economic crisis in Greece. Explores the influence of selected demographical, attitudinal and personality variables on all the types of ECCB simultaneously, namely Pro-environmental Purchasing, Recycling, Post-purchasing and Non-purchasing Behaviours. All the ECCB types were found to be positively related to consumers' education, attitudes towards recycling and locus of control over politics, while they were found to be related negatively to environmental unconcern. Strong inter-relationships among all the ECCB types were also revealed. Further analysis is needed in order to estimate more accurately a tension of decline in the results of this study in comparison to previous measurements of ECCB in the same geographical area. Might this tension be attributed to the current economic crisis in Greece?

Keywords: Ecologically Conscious Consumer Behavior.

Introduction

There have been many claims, so far, that environmental problems in overall bring forward a constantly worsening ecological crisis (Peattie, 1995; Shrum & McCarty, 2001; Jackson, 2005: 119). There has been a long debate, too, with regard to who was to be blamed. Economic growth has been assigned as a major part of the blame of environmental deterioration (Kilbourne, 1995; Peattie, 1995, p. 8). Marketing activities have been blamed (not always unreasonably) as being the driving force to over-consumption (Kilbourne, 1995; Peattie, 1995, p. 24; Van Dam and Apeldoorn, 1996). The marketing academic community has paid little attention at the ecologically related research and strategy (Schlegelmilich *et al.*, 1996). The findings of the ecologically related research have never formulated a global clear profile of ecological consumers (Shrum *et al.*, 1995). In fact, fragments of ECCB have been examined under various theoretical frameworks over time (Tilikidou, 2001; Gilg *et al.*, 2005).

In Greece, the ecological marketing research was introduced in middle nineties, rather late in comparison to other western communities (Tilikidou, 2001; Fotopoulos and Krystallis, 2002). During the last few years, a serious economic crisis burst out and everything started to change. Beyond everything else, this era brings forward a research challenge to try and understand the impact of these new conditions on Greeks' pro-environmental behaviours.

So, this paper presents the results of a research study that aimed to examine the Greeks' Ecologically Conscious Consumer Behaviour (ECCB) during the current economic crisis. The focus of this study

was to reveal some of the factors that might be found able to affect ECCB either positively or negatively.

Literature Review

During the nineties, the ecological marketing research - reflecting the mounting of public concerns - began to expand (see among others: Pickett *et al.*, 1993; Shrum *et al.*, 1995; Schlegelmilch *et al.*, 1996). While during the seventies ECCs have been suggested to be the Ecologically Concerned Consumers (Kinnear *et al.*, 1974) during the nineties they have been renamed to Ecologically Conscious (not only concerned) Consumers (Roberts, 1996).

After 2000, the main research direction was to examine not only concerns but actual behaviours, mostly pro-environmental purchasing behaviour (see among others: Bhate, 2002; Fraj and Martinez, 2006; Cleveland *et al.*, 2005). There are some studies focusing on intentions, e.g. Follows and Jobber (2000); Carrus *et al.*, (2008). Davies *et al.*, (2002), though, claimed that the assumption that intention is a significant factor to predict behaviour should be abandoned. There are very few studies, which examined non-purchasing behaviours, e.g. Fraj and Martinez (2006). There are also some studies, which examined purchasing and post-purchasing behaviours simultaneously, e.g. Thøgersen and Ölander (2002 and 2003), Korfiatis, *et al.* (2004), Cleveland *et al.*, (2005) and Webb *et al.*, (2008). However, the fragmentary approach is still the rule. In most studies, one pro-environmental behaviour is examined separately from another one, usually under a diverse theoretical framework (Gilg *et al.*, 2005). With reference to the theoretical framework there are a few studies which followed Ajzen's theory of planned behaviour (for example, Kalafatis *et al.*, 1999) while there are also a few studies which focused on willingness to pay more for an environmentally friendly alternative (for example Laroche *et al.*, 2001).

With regards to the determinants of ecological behaviours, a thorough look at the research findings of the nineties indicated that: a) demographics could provide useful information but no worldwide accepted demographic profile of ECCs had been ever revealed (Shrum *et al.*, 1994; Tilikidou and Zotos, 1999), b) the psychographic profile of ECCs was rather vague (Ebreo and Vining, 2001; McCarty and Shrum, 2001), c) a certain link, usually moderate (Hines *et al.*, 1987) was being found between specific attitudes and a specific ecological behaviour (Martin and Simintiras, 1995), d) environmental knowledge had been examined only in a few studies (Arbuthnot, 1977; Antil 1984; Schlegelmilch *et al.*, 1996). In overall, previous research results provided a mosaic of somehow unclear and sometimes contradictory pictures. Place, time and methodology (sampling and variables measurement) have been usually considered to be significant reasons of the observed discrepancies in the results (Antil, 1984; Shrum *et al.*, 1994; Schlegelmilch *et al.*, 1996; Tilikidou, 2001, p 56).

Later, after 2000 the picture has started to change to an extent. Attitudes have attracted most of the researchers' attention (Follows and Jobber, 2000; Fotopoulos and Krystallis, 2002; Korfiatis *et al.*, 2004; Carrus *et al.*, 2008). However, research focusing on values has been considerably broadened, for example in the works of Thøgersen and Ölander (2002 and 2003), Follows and Jobber (2000) Fraj and

Martinez (2006), Gilg *et al.*, (2005). There are also a number of researchers, who adopted the investigation of the locus of control over politics (Cleveland *et al.*, 2005; Carrus *et al.*, 2008). As expected, demographics are never absent in any research effort.

In overall, the researchers conclude that behavioural change is a very complex phenomenon (Thøgersen, and Ölander, 2002 and 2003; Tadajewski and Wagner-Tsukamoto, 2006; Jackson, 2005, p. 18). There are still many unanswered questions, such as the gap between the strong positive attitudes and the limited growth in the ecological products market or in recycling compliance. Assumed impacts of the current economic crisis should be added to the picture making the research area more complex.

With reference to Greece, Tilikidou (2001) made an effort to examine all types of ECCB simultaneously. Indeed, it was revealed that there is a considerable segment of Ecologically Conscious Consumers (ECCs), who were found to be at the same time engaged in purchasing, post-purchasing and non-purchasing pro-environmental behaviours. ECCs were also found to be well educated people, earning rather respectable incomes and highly concerned, generally towards environmental problems and more specifically towards recycling (Tilikidou, 2001, p. 186).

Theoretical Framework and Research Objectives

The theoretical framework that guided the investigation in this study aimed to overcome the fragmentary examination of the various ecologically related behaviours. In this study, ecological behaviours have been assumed to be conscious, not fragmentary not circumstantial. This is why they are all together examined under the broad concept of ECCB. ECCB is assumed to consist of four distinct, though inter-related, types, namely **Pro-environmental Purchasing Behaviour, Recycling Behaviour, Pro-environmental Post-purchasing Behaviour** and **Pro-environmental (Non-purchasing) Activities**.

Moreover, the theoretical framework, following previous theoretical suggestions (see among others: Schlegelmilch *et al.*,1996; Roberts and Bacon ,1997; McCarty and Shrum, 2001; Tilikidou, 2001) was based on the assumption that the included in ECCB behaviours might be influenced by demographical, attitudinal and personality variables.

In an effort to verify the above theoretical framework the following research objectives were set:

- To examine to what extent Greek consumers adopt each one of the behavioural variables (the four ECCB types)
- To investigate the impact of demographics on each one of the behavioural variables
- To investigate the impact of each personality variable on each one of the behavioural variables
- To examine the relationships between each behavioural variable and each one of the attitudinal variables, namely consumption oriented environmental attitudes as well as specific recycling attitudes

- To reveal inter-relationships between and among the ECCB types

Methodology

Sampling

A survey was conducted among the households of the urban area of Thessaloniki, Greece during the spring of 2011. Respondents were approached through personal interviews taken by senior marketing students. The sampling method was a combination of the two-stage area sampling and the systematic sampling (Tull and Hawkins 1993, p. 544; Zikmund 1991, p. 471). A structured questionnaire was administered to an adult person of each of 509 households and provided 500 usable questionnaires. The final sample was 460 as 40 more questionnaires were excluded from the sample due to the high Social Desirability scores (above 6). However, even in the purified sample, the SD level was found to be 4.5, a value that is acceptable but not low enough yet. Issues concerning SD are going to be presented below in the Results section in further details.

Variables Measurement

Firstly, with regard to **behaviours**, the four types of ECCB were measured by the following constructs:

Pro-environmental Purchasing Behaviour, in one multi-item measure of 27 items, (Cronbach's $\alpha=0.9161$). The scale has been initially developed by Tilikidou (2001) while in this study the construct was lengthened in order to encompass some new ecological offerings in the Greek market, such as electrical equipment, more organic food products etc. **Recycling Behaviour** with 6 items (paper, aluminum, plastic bottles, glass, batteries and packaging) measured on a 5-point percentage scale from 0=*Not at all* to 4=*More than 81%* of the material used. Besides recycling, there are some other pro-environmental behaviours, which concern the already used products. These might be the reuse, maintain or donate some of the already used products and therefore expanding products' life-span and producing less litter (Peattie, 1995, p. 89). So, a separate scale, the one of **Pro-environmental Post-purchasing Behaviour** was created consisting of 5 items (Cronbach's $\alpha=0.7543$). The fourth ECCB type concerns the **Pro-environmental Activities**. These are some distinct activities, which are not directly related to purchasing or post-purchasing choices, such as not throwing rubbish on the ground or not making noise. The relevant scale was initially developed by Tilikidou and Delistavrou (2008). In this study a number of these actions were added in the scale, such as voluntary work for ecological groups, use public transportation instead of a private car etc. So, Pro-environmental Activities were measured in one multi-item measure of 13 items (Cronbach's $\alpha=0.8138$). With the exception of Recycling, all the other behavioural scales were measured on a 5-point frequency scale from 0=*Never* to 4=*Always*.

Secondly, with regard to **attitudes**, it was decided to employ two sets of attitudes. The scale of **Environmental Unconcern** was adopted from Tilikidou and Delistavrou (2005a). It is a scale of negative attitudes, it contains 18 items and provided a Cronbach's α of 0.8633. Also, specific

Recycling Attitudes were employed to explore their impact on recycling and post-purchasing behaviours. The Recycling Attitudes scale contains 19 items, (Cronbach's $\alpha=0.9130$) and was adopted from Tilikidou and Delistavrou (2008) with minor phrasing changes. Both the attitudinal constructs were measured on a 5-point Likert scale from 0=*Completely Disagree* to 4=*Completely Agree*.

Thirdly, with regard to the **personality variables**, previous research indicated that they should be socially oriented in order to be able to indicate any impact on pro-environmental behaviours (Tilikidou, 2008, p. 262). Therefore, two sets of opposite-to-one-another values were chosen, namely universalistic values versus power as well as collectivistic versus individualistic values. So, **Universalism**, 6 items, adopted from Schwartz (1992), Cronbach's $\alpha=0.8699$ and **Collectivism**, 4 items, adopted from Shrum and McCarty (2001), Cronbach's $\alpha=0.6932$ were chosen. Both these variables aim to examine "*people's concerns about other people's problems and well-being*". Also, **Power**, 3 items, Schwartz (1992) Cronbach's $\alpha=0.8116$ and **Individualism**, 3 items, adopted from Shrum and McCarty (2001), Cronbach's $\alpha=0.6044$ were chosen. They both concern mostly those "*people, who are focused just on their own well-being*". In addition, two variables which had indicated relationships with pro-environmental behaviours in the past were added in the inventory. These were materialistic values and locus of control over politics. **Materialism** represents "*the satisfaction in life and happiness derived by the possession of material goods*" (Richins, 1987, p. 352; Ger and Belk, 1996).

As environmental protection needs drastic decrease of over-consumption, the pro-environmental behaviours should be negatively affected by consumers' bond to material goods and pleasures (Moisander and Pesonen, 2002). The scale of **Materialism** contains 21 items, it was adopted from Ger and Belk (1996) and provided a Cronbach's α of 0.7346. Further, the **Socio-political Control Scale** of the **Spheres of Control** was adopted from Paulhus (1983) and it was added in the investigation. This measure examines "*the consumers' perceptions about their own ability to affect and control the national and global socio-political evolutions*" (Robinson *et al.*, 1991, p. 428). The scale contains 10 items and provided a Cronbach's α of 0.7607. All the above mentioned constructs were measured on a 5-point Likert scale from 0=*Completely Disagree* to 4=*Completely Agree*.

Fourthly, with regard to **demographics** **Gender, Age, Education, Occupation** and **Income** were measured on the N.S.S.G. scales. In an effort to capture the actual consumption level of each household (which cannot be described solely by the level of income) variables examining the **members of family, number and size of houses, cars owned** and **monthly expenses** were added in the inventory.

Last, it has been mentioned above that the most usual limitation in any self-reported survey is the effect of social desirability on the attitudes and behaviours under examination (Robinson *et al.*, 1991, p.17) especially in topics such as environmental protection (Tilikidou and Delistavrou, 2004). Therefore, special effort was taken to estimate the social desirability level in the sample of this study and then eliminate its effect on the variables under examination. In order to do so, following Strahan and Gerbasi (1972) the sorted version (10 items) of Crowne and Marlowe (1960) **Social Desirability**

(SD) scale was added. The scale is measured on a 0 to 1 basis providing scores from 0 to 10. A range from 0 to 5 represents acceptable SD level, while a value above 6 represents a non-acceptable SD level. Cases of respondents indicating an SD level larger than 6 were removed from the sample.

Results

The **demographics** of the sample were tested through chi-square with regard to the population parameters and no statistically significant differences were found.

	<i>Theoretical values</i>	<i>Mean</i>	<i>Std. Deviation</i>	<i>Categorical Mean</i>	<i>Cronbach's alpha</i>

Table 1: Descriptive Statistics

The *descriptive statistics* (Table 1) indicated that the sample obtained rather low scores in all the behavioural variables (rows 1 to 4) and moderate scores in the attitudinal variables (rows 5 and 6).

In Table 2 ANOVAs for each one of the four behavioural variables across each one of the demographics are presented (just the statistically significant results). These ANOVAs illustrate that the higher Means in all the behavioural variables are obtained by consumers of the higher educational level; also by consumers who belong in large families (more than 5 members) and spend for food and clothes rather more money than their counterparts do.

Table 2: ANOVAs of the ECCB Types across Demographics

Then the partial *Pearson's correlations* (with control for Social Desirability) were calculated for all the pairs of the behavioural, the attitudinal and the personality variables. With regard to **Pro-environmental Purchasing Behaviour** correlations indicated statistically significant ($p < 0.001$) negative relationships, moderate with *Environmental Unconcern* ($r = -0.322$) and weak with *Materialism* ($r = -0.178$) and Power ($r = -0.140$). They also indicated positive, moderate relationships with *Recycling Attitudes* ($r =$

0.479), *Socio-political Control Scale* ($r = 0.414$) and positive, weak relationships with *Universalism* ($r = 0.101$) and *Collectivism* ($r = 0.193$).

With regard to **Recycling Behaviour** statistically significant ($p < 0.001$) relationships were found, negative and almost moderate with *Environmental Unconcern* ($r = -0.289$) and weak with *Materialism* ($r = -0.161$). Positive relationships were indicated between *Recycling Behaviour*, moderate with *Recycling Attitudes* ($r = 0.518$) and *Socio-political Control Scale* ($r = 0.314$) and weak with *Universalism* ($r = 0.170$) and *Collectivism* ($r = 0.215$).

With regard to **Pro-environmental Post-purchasing Behaviour** statistically significant ($p < 0.001$) relationships were found, negative and moderate with *Environmental Unconcern* ($r = -0.295$), while negative and weak with *Materialism* ($r = -0.131$) and *Power* ($r = -0.144$). Positive moderate relationships were found with *Recycling Attitudes* ($r = 0.388$) and with the *Socio-political Control Scale* ($r = 0.319$), while a positive and weak relationship was found with *Collectivism* ($r = 0.156$).

With regard to **Pro-environmental Activities** statistically significant ($p < 0.001$), relationships were found, negative and weak with *Environmental Unconcern* ($r = -0.194$), positive and weak relationships with *Collectivism* ($r = 0.145$) and with *Recycling Attitudes* ($r = 0.256$), while a positive and moderate relationship was found with the *Socio-political Control Scale* ($r = 0.438$).

All behavioural variables provided impressive relationships between pairs of them. **Pro-environmental Purchasing Behaviour** provided statistically significant ($p < 0.001$), positive and quite strong relationships with *Recycling Behaviour* ($r = 0.560$) with *Pro-environmental Post-purchasing Behaviour* ($r = 0.626$) and with *Pro-environmental Activities* ($r = 0.764$). **Recycling Behaviour** was found to correlate moderately with *Pro-environmental Post-Purchasing Behaviour* ($r = 0.431$) and with *Pro-environmental Activities* ($r = 0.439$), while **Pro-environmental Activities** was found to correlate rather strongly with *Pro-environmental Post-Purchasing Behaviour* ($r = 0.598$).

Then, *multiple regression analyses* were performed one for each behavioural variable of ECCB (as dependent variable) versus the attitudinal and the personality variables (as independent variables). The demographics were not included into the analyses as they were measured on nominal or ordinal scales. The stepwise method was chosen and revealed that the interaction between the *Socio-political Control Scale* (SC), *Environmental Unconcern* (EU) and *Collectivism* (Co) can explain the 17.9% (adjusted R square) of the variance in **Pro-environmental Purchasing Behaviour (PPB)**. The interaction between the *Recycling Attitudes* (RA), *Universalism* (U), *Power* (P) and the *Socio-political Control Scale* (SC) can explain the 32.2% of the variance in **Recycling Behaviour (RB)**. The interaction between the *Recycling Attitudes* (RA), the *Socio-political Control Scale* (SC) and *Universalism* (U) can explain the 19.6% in the **Pro-environmental Post-purchasing Behaviour (PpPB)**. The interaction between the *Socio-political Control Scale* (SC), *Collectivism* (Co), *Universalism* (U) and *Recycling Attitudes* (RA) can explain the 19% in **Pro-environmental Activities (PA)**.

The resulting equations are:

$$\text{PPB} = 34.581 + 0.326 \text{ SC} - 0.233 \text{ EU} + 0.114 \text{ Co} \quad (\text{Rsquare} = 17.9\%)$$

$$\text{RB} = -8.640 + 0.656 \text{ RA} - 0.132 \text{ U} + 0.099 \text{ P} + 0.091 \text{ SC} \quad (\text{Rsquare} = 32.2\%)$$

$$\text{PpPB} = 3.204 + 0.482 \text{ RA} + 0.167 \text{ SC} - 0.172 \text{ U} \quad (\text{Rsquare} = 19.6\%)$$

$$\text{PA} = 8.341 + 0.362 \text{ SC} + 0.124 \text{ Co} - 0.262 \text{ U} + 0.233 \text{ RA} \quad (\text{Rsquare} = 19.0\%)$$

Discussion – Limitations

The results of this study indicated in overall that consumers of Thessaloniki Greece adopt pro-environmental behaviours rather occasionally or even rarely. It is not statistically safe to generalize this estimation to the whole population of Greece although Thessaloniki urban area has been many times found representative of the country with reference to households' surveys. The results of this paper bring forward several points of discussion, which might also be considered limitations of the present study.

Firstly, it is to be noted that no positive relationship between any pro-environmental behaviour and the level of **Income** was indicated in contrast to what has been the rule in previous research results. In this study, a number of actual consumption parameters (e.g. size of house, cars, monthly expenses etc.) were examined in order to understand better the actual financial conditions of the households. The relevant findings indicated that consumers, who enhance most of the pro-environmental behaviours belong in large families (more than 5 members), spend more than 1000€ in food and less than 500€ in clothes. These findings are to an extent in line with those of Gilg's *et al.* (2005) in U.K. Families like these should by no means be considered as "rich people", who constantly over-consume, live in luxurious houses, travel a lot, drive expensive cars etc.

With regard to the personality variables, **Locus of Control** over politics was found to be the main consumers' motivation towards pro-environmental change. The examination of the pairs of opposite variables (universalism – power, collectivism – individualism) was not found to be a "good idea". The correlations of these variables, with each one of the pro-environmental behaviours, were found to be either non-significant or weak.

Further, the variable of **Materialism** did not illustrate an impressive impact on pro-environmental behaviours in this study. The relevant findings are in contrast to previous research results in the same geographical area (see: Tilikidou, and Delistavrou, 2004, 2005a and 2008). It might be claimed that consumers were used to feel "over-consumers" and ready to reduce their overall consumption until 2008. At present, in the era of Memorandum, large portions of the population lose their jobs or face drastic decrease in their incomes. Even well educated people, who were used to earn rather respectable incomes during the past, at present time face serious difficulties to satisfy even their basic needs. They do not feel "over-consumers" any more. They do reduce their overall consumption due to financial reasons. They cannot afford ecological alternatives if they are more expensive than the conventional products.

In addition, the fact that the locus of control over politics was found to be the stronger influential factor on pro-environmental behaviours might be attributed to the same evolutions. No-one is happy with politics and politicians these days. **Ecologically Conscious Consumers** fairly enough believe that it is their own responsibility to take action to affect political decisions, either financial or pro-environmental.

Conclusions and Implications

Those Greeks, who were found to get engaged more often in ECCB than their counterparts do, were also found to be well educated people, holding high positive attitudes towards recycling and low level of unconcern towards the problems of the environment, while they expressed a high level of locus of control over politics and politicians.

Pro-environmental behaviours were found to be closely related to one another. The relevant findings should be seriously taken into consideration by managers of ecological products, by managers in charge of recycling programs and by executives working with the ecological groups and organizations. In fact, they should all be aware that they share the same target group, that of Ecologically Conscious Consumers (ECCs). Further research should clarify the characteristics of ECCs. Managers should carefully study the relevant findings and accordingly choose the most appropriate strategies. Further data analysis might provide evidence with reference to the number and the size of the ecologically related consumers' segments in the Greek market and hopefully formulate a more detailed profile of ECCs. In the end, further discussion should focus on the impact of the economic crisis on ECCB. After all, are ecological behaviours a luxury or a necessity?

MUTUAL STRATEGY RELATIONSHIP OF EILAT VS. AQABA AS TOURISM DESTINATION

Tirosh, Nathan¹

¹ Department of Tourism and Hotel Management, Kinneret College on the Sea of Galilee, Israel. Email: ntirosh@galilcol.ac.il

Abstract

Aqaba and Eilat are neighboring cities located in the north part of the Red Sea, operate as tourism destination and logistic. Over the last decade Aqaba experienced rapid development as to Eilat with no substantial change. The objective of the research is to determine the strategy of both cities and to indicate future mutual implications. The research applies the Tourism Area Life Cycle (TALC) model and the SWOTCLOCKTM approach. Results show that the 'Leading Strategy' of Eilat is RESPONSE as to LEVERAGE strategy of Aqaba. Findings based upon analysis of empirical data, prove validation and compatibility between the TALC model and the SWOTCLOCKTM approach and enhance knowledge in the field of strategy formulation and tourism. Future studies and researches are recommended to be run.

Keywords: SWOTCLOCKTM, TALC, Leading Strategy, Eilat, Aqaba

Introduction

The Peace agreement between Israel and Jordan signed on October 26, 1994 created a new situation which was supposed to leverage prosperity of both countries. The Red Sea is one of the areas with greatest potential for achieving a common vision of peace, security, and economic prosperity. Eilat and Aqaba are located in the northern part of the Red Sea next door to each other. Over the Period of 2000-2011, Aqaba accelerated development processes of tourist infrastructure and Mega Projects, while Eilat experienced only a minor development.

Eilat is the southernmost city in Israel, with a population of approximately 60,000 people, spanning an area of approximately 11,000 acres. The city combines desert environment, Sea & Sun, and marine activity of coral reefs and underwater wildlife. Tourism industry is the main source and important city's economy. Tourism development started in the 1960's and in the 70s the development was dramatic with incoming tourism of approximately 250,000 tourists per year, an increase in the number of hotel rooms to 2,550 and charter flights reached 13 flights per week. Eilat in 2011 runs 9,500 registered rooms in 49 Hotels, serving as 6.7 million bed-nights a year of domestic and incoming tourism at a proportion of 6:1 consecutively. Shopping centers, restaurants, nightclubs, pubs and cafes provide entertainment facilities. Tourist attractions nearby and daily travel to Masada, Dead Sea and Jerusalem are also available.

Aqaba is located in place of the ancient town of Ayla. The city is known for its tourist activity but also the city's export to the phosphate industry and the southern region administrative capital of Jordan. The city covers an area of approximately 375 square kilometers and its population in 2009 is estimated at 103,000 people. In the 70s it was mainly a tourist destination for backpackers, and during the 80s it started to be a tourist destination for northern Europe tourism. Aqaba "Oasis Golden Triangle" vision, combines heritage sites (Petra), Culture and Desert (Wadi Rum) and Sea & Sun leisure and diving activities. In early 2000, Aqaba was declared as economic free zone and the Aqaba Special Economic Zone Authority (ASEZA) was established with full autonomy and responsibility. In 2006, the Authority reported 432,000 tourist visits, of which 293,000 Jordanians (68%) and the rest incoming tourists. Results in 2010 indicate 503,551 tourists including 208,959 Jordanians (41%) and 294,592 (59%) incoming tourism. Aqaba airport serves about 230,000 passengers, of which approximately 150,000 tourists. Today there are 35 hotels in Aqaba, including 5 international brand hotels, 20 diving clubs, and 18 tourist agencies. More than \$20 billion invested in developing Aqaba's massive Mega Projects in tourism infrastructure and logistics. Among the leading projects to be mentioned are Saraya Aqaba, Ayla Oasis, Tala Bay, Marsa Zaied and other development such as Port

Relocation, Aqaba Container Terminal (ACT) and the expansion of King Hussein International Airport (KHIA)

Literature Review

The Tourism Area Life Cycle (TALC) and the SWOTCLOCK™ models

Universal system is a dynamic system that meets developmental processes and revolutionary change over time. (Stansfield, 1978) was among the first that research on tourism development, proposing a model which describes the development of a tourist site in several stages. (Plug, 2001) suggested that access to attractive tourist region is under different types of tourists. (Butler, 2006, 2008, 1980) adopted the Product Life Cycle (PLC) model of (Vernon, 1966), and offered to run the Tourism Area Life Cycle (TALC) model. (Butler, 2008) argues that the TALC approach which is characterized by "S" curve is a viable and sustainable development of heuristic explaining the tourist destination in subsequent development stages. However there is some criticism (Lagiewski, 2006) which requires the execution of empirical studies further validate the model. Still exist a number of factors difficult to measure and understand their impact. All of these can create a situation of chaos which affects the properties of the classical of the "S" curve (Lundtorp, Wanhill, 2001, 2008). (Cole, 2009) examines different approaches relating to the equation describing the behavior of the "S" curve in a chaotic state. In the Caribbean for example the balance of investment return is in the range of 20%-30% of the investment, similar to the global positioning of this parameter (Rohlf, 2003). Especially for Foreign Direct Investment (FDI), investors expect a reasonable return against the risk level of their investments. Investors expect to have public subsidies, support to capacity suitable and growth rate of arrival of tourists. Although the private sector is the leading cause for tourism development, public sector plays a key role especially with regard to investment in tourism infrastructure. This is expressed especially in the first stage of the takeoff and the starting operation (Wanhill, 2005). Survey conducted in the Caribbean showed that when the government declares tourism "national priority" and when the percentage of occupancy is approaching a level of 80%, the private sector was encouraged to contribute to the growth of tourism industry (Russel and Folkner, 2004). Involvement and influence of the public sector take-off phase is particularly important although not always driven by the tourist motives are pure, but also by social constraints, economic crisis, and other infrastructure development. As tourist destination becomes more and more attractive to visitors, tourist activities support the cause to the local population to be increasingly involved in the industry. The creation of business support tourism growth is tremendously influenced under the Carrying Capacity constraint, and the density of visitors (Mesa, 2004), (Dwyer, Edwards, Nistilis, Roman, Scott 2009). An empirical study of the TALC model was done by (Karplus and Krakover, 2004), examining the Dead Sea tourism development over the period 1974-2000. They found that new investment in building hotels, effect bed-nights occupancy and have changed the trend towards regeneration (rejuvenation).

SWOT approach (Strengths, Weaknesses, Opportunities, Threats) has emerged in the 70s and continues in the 21st century, as a generic typology system formulation of corporate strategy.

(Weinrich, 1982), and (David, 1986) presented different models to deal with the problem of subjective data. (Rowe, Mason, Dickel, Snyder, David et al. 2007) developed the SPACE model relies on the principles of GSM model designed by (Christensen, Berg and Salter, and David et.al.2007). One of the challenges was the need to quantitative the database. (Chang and Huang, 2006) noted that in previous years SWOT concept was introduced mainly under qualitative terms and only a small number of cases had examined in quantitative terms. (Shrestha, Alavlapati and Kalmbacher, 2004) presented a quantitative application of the Analytic Hierarchy Process typology (AHP) to SWOT model. (Yuksel and Dagdeviren, 2007) argue that it is difficult to isolate the importance of influential factors. The problem still exists resulting that factors value are determined subjectively factors by experts. Applications of quantitative approaches are more feasible in the private sector where there is an available database. Such is the case where (Amin, Zhang and Razmi, 2010) design a business strategy based on quantitative analysis of supplier selection, including the implementation of AHP, ANP approaches in combination with linear programming. External and internal factors as well as the priority and relative weight were determined by experts and subjective evaluation of decision makers. (Tirosh, 2010) presents a modification of the traditional naïve SWOT model by the SWOTCLOCKTM model and the definition of the “leading strategy” derived from 4 possible strategies:-GROWTH-RESPONSE-SURVIVAL-LEVERAGE. Significant contribution of the typology is that the ‘Leading Strategy’ is changed over time scale in very similar transitions and order of the stages of the TALC model (Butler, 2000).

The tourism industry applies and implements the SWOT model in various fields. (Karadakis and Kaplanidou, 2010) dealing with a qualitative examination of factors that could leverage mega sporting event of the Olympic Games in Athens in 2004. Another attempt to apply the SWOT model is done by (Phu-ngamdee S, 2010), developing a strategy to promote the tourist destination of Wai Pra Kao Wat in Bangkok, and the qualitative study indicates the possible implementation strategies outlined. (Mahmoudi, 2011) examines the obstacles and tourism development strategies of two villages in Iran. Again, qualitative analysis indicates the six possible strategies for developing rural tourism.

Eilat – Tourism Surveys

Since the 80s of the previous century there were some surveys which dealt with tourism development dilemmas in the city of Eilat. (Breitman, 1993) presents the main problems and the risk of a crisis as a result of a quantum leap in the number of hotel rooms, the coast of Sinai, port, airport, environment and interaction between residents and the tourism industry.

The report indicated Jordan's intention to build approximately 8,000 hotel rooms for the year 2003. Trend of tourism development in Egypt and Jordan highlighted as a tourism threat to Eilat. (Sheinin, 2009) offers “Eilat 2030” strategic plan for long-term. Tourist development will cause an increase in number of visitors to 7 million visitors, hotel rooms to 35,000 and a local population of approximately 150,000 inhabitants. Realization is that tourism potential will be possible only by developing a unique tourism Value-Added product in the RED SEA coast. Support of the Israeli government, investment in

infrastructure development, relief bureaucratic barriers and encouraging private entrepreneurs for investment is necessary. (Adler, Chomsky and Warshawsky, 2009) indicate Aqaba as a "New player in the Red Sea" which competes on price and product. Eilat must upgrade its existing Value Added under the new "Eilat +" branding. This added value will rely on: "Holiday + Urban culture", "Vacation + Environment" and "Vacation + Underwater World". Eilat as the urban center of the Red Sea will combine exotic desert experience with urban leisure, switching itself to be the "Riviera of the Red Sea". (Gal, 2010) indicates that new developments and massive changes in the region and Aqaba, create an opportunity with enormous potential for rapid development for Eilat. Therefore, it is recommended among other things, to remove borders barriers for tourists, and maintain a regional cooperation of synergy in the Red Sea region.

Aqaba – Tourism Surveys

(Ministry of Tourism, 2004) focused on achieving three main objectives:- Positioning international destination with quality products, Increasing awareness of the city as a base for holidays and dive center and Increasing Length Of Stay (LOS). Due to a difficult economic situation in 2008 and tough competition in the Red Sea region, it was an urgent need to increase the existing room occupancy mainly because of new hotels and the creation of appropriate differentiation with Egypt and Eilat. Five stars Hotels alone cannot attract tourists to come and Aqaba cannot succeed unless it can provide a diverse experience and unique destination that can compete in the global markets. As a result, a strategic marketing plan (USAID-Aqaba, 2009) identified several weaknesses in Aqaba, particularly in Human Resources (HR), tourist attractions and activities, quality service, dirty beaches, nightlife and markets. It is necessary to develop Aqaba as a tourist destination which still cannot be materialized because of relatively small number of suitable hotels and other facilities. (USAID-ACED, 2010) examines the previous strategic plans, focusing on factors including extending LOS, which remained unchanged (1.9 bed-nights/visitor). Recommendations emphasis on creating high-quality tourism products differentiation, Meetings, Incentives, Conferences & Exhibitions (MICE) center, golf course, water park and aquarium, highlighting the urgent need to develop the city center, fort, heritage sites, shopping street, nightlife activities and efficient transportation. The program aims itself to attract tourism market segments of the North and West Europe, Russia and Middle Eastern countries and the traditional domestic market. Aqaba is still perceived as the port to Petra and tourists are complaining about the lack of tourist attractions. KHIA is currently utilized only approximately 25% of its capacity of one million passenger movements annually, and it is proposed to run Low-Cost flights to attract more incoming tourists. Aqaba coast diving activity is the tourism core product, affecting LOS to increase. Despite the potential of this product, the industry suffers from a small number of divers, and clubs need to improve infrastructure and safety standards. Israel is named as a major market segment of Aqaba divers. The program emphasizes the development of tourism product in the city itself supplements the Mega - Project system that prevail and the need to develop human capital and jobs creation. The main concern of the residents of Aqaba is that the city will continue to remain only a "gateway" for tourists on their way to Petra and Wadi Rum. United Nations World Tourism

Organization (UNWTO, 2009) notes in his report, the market share of incoming tourism from Israel, as one of the most important market segments of Aqaba, counted about 16,727 bed- nights of Israelis in 2009, and significantly increased in 2010. For the Israeli market, Aqaba operates as a tourist destination that is competitive with Egypt and Turkey and the increase in the number of tourists from Israel justify the marketing effort.

Research Methodology & Approach

Eilat and Aqaba are tourist destinations almost identical geographic environment and tourism. Different developments cause great interest to engage. Of this dilemma of the dichotomous situation derived the research question: 'What is the strategy of Eilat and Aqaba, and which is the future perspective implications. The study focuses on the strategic positioning dilemma of Eilat and Aqaba as tourist destination neighboring to each other, in two separate states. The study applies the SWOTCLOCKTM (Tirosh, 2010) and the TALC (Butler, 1985, 2008) models. The research operated personal meetings and interviews with stakeholders from Eilat and Aqaba, including a structured questionnaire. Hebrew version was translated into English and back into Hebrew for validation. Questionnaires were processed by the SPSS program for significance (OneWay ANOVA, 't-test'). Sample size calculation was performed using the

G*Power3 software. Empirical data concerning trends of hotel rooms in Eilat and Aqaba, moves of passengers at the terminal boundary Rabin, and incoming tourists at 'Uvda' airport had been collected. Regression analysis was applied to test validity and compliance significance between the 'Leading Strategy' determined by the SWOTCLOCKTM model and related characteristics of the TALC model. The sample size in Israel combines 53 questionnaires and in Aqaba 12 questionnaires, which was completed by some of Israelis and Jordanians of the Ministry of Tourism, local municipalities and authorities, hoteliers, travel agents and attractions managers. The small sample size in Jordan is affected by the Geo-Political complex situation in the region, the Arab Spring phenomenon and the sensitive relations between Israel and Palestinians.

Research Findings

Determination of the Mutual 'Leading Strategy' of Eilat vs. Aqaba

The Leading Strategy derived from the SWOTCLOCKTM model reflects a vector equivalent determined by the relative 'power intensity' of four vectors:- Strengths(S), Weaknesses(W) as internal vectors and Opportunities(O) and Threats(T) as external vectors. The nature and behavior of each vector is reflected by some factors. The list of the external and internal factors is subjectively determined with reference and prior review. (Bernroider, 2002) examined in his study a list of influencers and defined subjectively, factors that can lead to business success or failure. List of factors in the research reflect infrastructure "hard" components of the tourism product. Level of impact of each factor (Weighted factor) is determined in the questionnaire under the total sum of 100% condition of all the factors. Next step is to determine the current strategic position for each factor.

Intensity of impact positioning is done on a scale of three levels:- high, medium and low for each factor of (S), (W), (O), and (T). Questionnaire given score is transformed on a relative scale 0-6. Score value of '3' indicates the median score representing an indifferent state of "lack of expression of a position". When an external factor of OPPORTUNITY is positioned "medium", it is transformed to '5' score. In a similar way, for THREATS position "high", the assigned transformed value is '0' score on the relative scale. Positioning is done similarly for the internal vectors STRENGTHS and WEAKNESSES. Results of the statistical analysis of relative weight and positioning of the impact factors listed in Table No. 1 :-

		Weighted Factors (sample average)			Strategic Position (sample average)		
		Aqaba	Eilat	Sig Between Countries	Aqaba	Eilat	Sig. Between Countries
Internal Factors	Hotels Infrastructure	17.1%	15.2%	0.014	4.5	4.81	0.002
	Pricing	9.2%	14.0%	0.062	2.83	2.91	0.001
	Tourist Attractions	10.1%	11.1%	0.001	1.17	3.58	0.0001
	Air port	9.1%	10.1%	0.002	4.25	2.17	0.0001
	Quality of service	10.8%	9.7%	0.001	3.25	3.11	0.012
	Infrastructures	9.8%	9.7%	0.001	3.58	2.28	0.028
	HR skill	8.6%	7.8%	0.001	1.58	2.10	0.008
	Tourism Events	5.4%	7.7%	0.014	0.92	3.53	0.0001
	Tourism services	9.2%	5.9%	0.001	1.92	3.25	0.013
	HR availability	6.3%	5.4%	0.01	1.83	1.66	0.015
	Market Share	6.1%	4.4%	0/01	1.33	2.71	0.016
	Total (%)	100%	100%				
External Factors	Domestic Demand	19.4%	16.4%	0.071	4.75	4.94	0.001
	Incoming Demand	22.8%	14.0%	0.001	4.42	4.53	0.015
	Security	11.8%	12.4%	0.014	2.83	0.74	0.001
	Neighboring Competition	4.7%	11.2%	0.001	3.00	0.80	0.0001
	Tourism Ministry Policy	7.8%	10.6%	0.077	3.75	3.66	0.016
	Competitors Infrastructure	4.1%	9.4%	0.001	3.90	1.23	0.0001
	Government policy	12.7%	9.2%	0.052	5.08	2.70	0.0001
	Investors Willingness	8.8%	8.2%	0.018	4.00	3.04	0.027
	Ecology	6.6%	5.5%	0.01	3.67	2.63	0.022
	Illegal Immigration	1.5%	4.0%	0.001	1.60	1.66	0.015
	Total (%)	100%	100%				

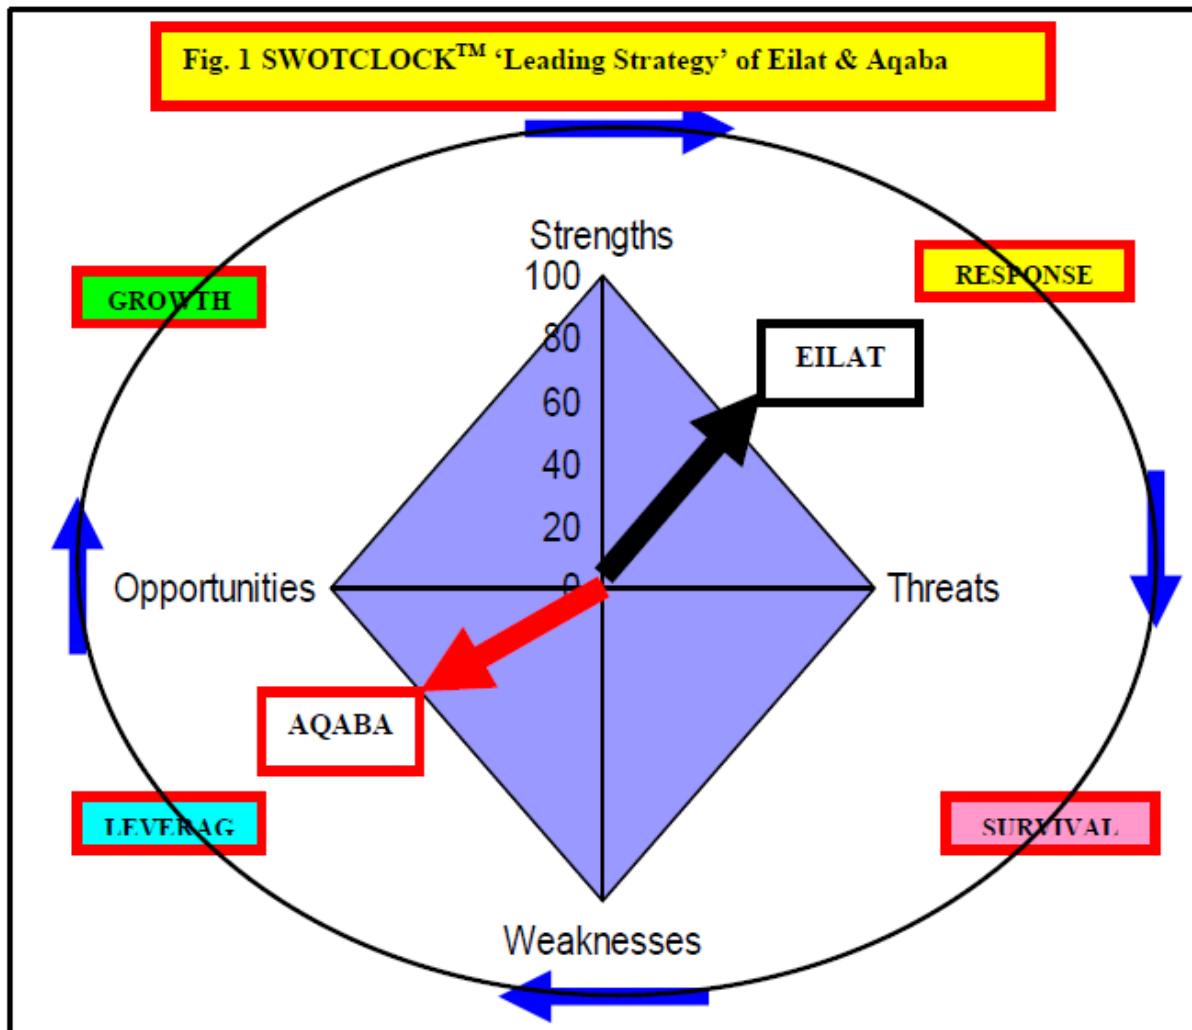

The results presented in the table reflect the differences in perception of the relative weight and positioning, which was accepted level of significance in the 't test', between the two populations. The 'Leading Strategy' is determined by the equivalent vector of the calculated relative vector positioning of the internal vectors (S), (W), and the external factors (O), (T). The product of the relative weight (100%) in formation of the indifferent '3' score position, is: - 300. When the vector value of the product of internal factors is greater than 300 (positive value), it means that the organization is 'stronger' than

'weaker' and vice versa when it is less than 300 (negative value). When the vector value of the external environment is above 300 (positive value), it means that there are more 'opportunities' than 'threats' and vice versa. Equivalent vector of internal and external factors determines the 'Leading Strategy'.

Processing questionnaire study points to the mutual status of the 'Leading Strategy' of Eilat and Aqaba is shown in Table No. 2:-

Table No. 2:- The Leading Strategy Position for Aqaba & Eilat		
	Aqaba	Eilat
Value of Internal Factors Vector	(27.50)	6.15
Value of External Factors Vector	113.50	(23.61)
Value of Leading Strategy Vector	116.78	24.19
Slope of Leading Strategy Vector	0.2423	0.2628
Leading Strategy Position	LEVERAGE	RESPONSE

It was found that the 'Leading Strategy' of Eilat is RESPONSE and LEVERAGE for Aqaba. Figure No.1 shows the mutual 'Leading Strategy' position of Eilat and Aqaba in 2011.

The difference in the strategy between Eilat and Aqaba is significant in the 't test', for the internal factors of 'Strength' and 'Weakness' ($p=0.043$), and also for the external factors of the 'Opportunities' and 'Threats' ($p=0.001$). As a reflection of the RESPONSE strategy, Eilat finds itself in the process of strategic drift without actually meets all the practical processes of tourism development. Aqaba is experiencing a strategic process of LEVERAGE, which over some several years, is expected to be changed into a GROWTH strategy.

The recommended sample size by the G*Power3 software was calculated, based on the results of the 't'-test, and the difference between the average amount of internal and external factors that determine the 'Leading Strategy'. The calculation was performed for the case where the sample size of Eilat and Aqaba will be equal ($n_1=n_2$). The calculated sample size ($p<0.05, 0.95$) is 101 questionnaires to both populations. It is recommended to run an intermediate sample of 80 questionnaires from each group, and to determine to what extent it is necessary to further increase the study sample up to 101 questionnaires.

Analysis of Empirical data

The SWOTCLOCKTM model assumes that there is compatibility with the developmental stages of the TALC model. The second research question concerns the degree of compliance between the models. Empirical analysis can indicate compatibility between stages in the TALC model to those of the 'Leading Strategy' position according to the SWOTCLOCKTM model. Initial assumption of TALC (Butler, 1980) was conducted by a linear function and then logarithmic. (Lundtorp and Wanhill, 2001) exerted a logical function to describe the development of tourist sites. They presented further theoretical development of the model logarithmic and noted the 'inflection point' and the transition from stage to stage in the TALC model. (Berry et. Butler, 2008) presents a case study of the development of the tourism website at Cairns, Australia by polynomial regression operating at a high correlation ($r = 0.955$) over 20 years period data. As the number of observations is increased, reliability and significance of results will also be higher. (Karplus and Krakover, 2005) examined the possibility of giving effect to the TALC model by running regression multivariate stochastic logarithmic based on large empirical database of bed-nights and investment in the Dead Sea.

Validation and compatibility analysis between TALC and SWOTCLOCKTM models is based on empirical data. Number of hotel-rooms is one of the most important criteria that indicate directions and trends in the development of tourism matching with the 'Leading Strategy'. Database was provided by Eilat's Hotel Association and official available data of Aqaba only from 2004, including hotel-rooms in projects under construction, scheduled to be completed by 2015. Trends in the development of hotel-rooms are shown in Figure No. 2 :-

The chart clearly shows the compatibility of TALC model characteristics with the SWOTCLOCKTM model. Eilat has high matching polynomials ($r^2=0.8747$) fit. This behaviour explains a trend change from RESPONSE to LEVERAGE 'Leading Strategy'. Since early 2000 Eilat hotel-rooms were in a steady state, very similar to the 'maturity' stage of the TALC model. A slight upward change of hotel-rooms in 2011 may indicate a trend change from RESPONSE to LEVERAGE. Hoteliers in Eilat do not initiate new hotels if there is no feasible ROI in a reasonable time. Domestic tourism market share is approximately 85% of the total hotel occupancy rate of about 70%. Without significant increase in incoming tourism, hotel-rooms will remain at the same level and Eilat will be stuck in a steady state of stagnation. Aqaba is characterized by a significant exponential fit ($r^2=0.9112$), under a rapid increase process of hotel-rooms development. This behavior explains a sequential move from a RESPONSE strategy experienced until 2004, into a LEVERAGE strategy until 2011, followed by a possible GROWTH strategy towards 2015-2017. This nature is identical to the TALC characteristics of 'exploration'/'involvement' and 'development' sequence of the TALC model. If the development trend of hotel-rooms in Eilat and Aqaba will continue to exist without substantial external and internal interferences, number of hotel-rooms in Eilat & Aqaba towards the period of 2017-2020 is expected to even, and can become a significant threat to Eilat. Results of the empirical analysis correspond to the characteristics of the TALC model and thus, support and confirm the basic assumptions of compatibility to the SWOTCLOCKTM model.

Stakeholders in the study highlighted the growing trend of Israeli tourism, particularly minorities, to Aqaba. This trend is mainly influenced by a common language, similar culture and a sense of comfort that minorities feel their vacation in Aqaba. Results of the analysis are shown in Figure No. 3:-

Despite the small sample size (as from 2004), a higher correlation of the respective exponential fit ($r^2=0.5309$) is found. Under the TALC model, there is a clear transition process from 'exploration'/'involvement' up to 2010 and possible move to 'development' stage towards 2015. This situation fits with the SWOTCLOCKTM model, where transition is from SURVIVAL in 2004 into LEVERAGE in 2011, and the possible GROWTH strategy later on. Rabin border crossing terminal is an important junction which can indicate and explain the level of attractiveness of Jordan and Aqaba tourist destinations for Israelis. Figure No. 4 shows the trends of Israeli passenger traffic at the border for years 2001-2011 (source:- Israel Air Port Authority). Exponential approximation fit ($r^2=0.9087$) and values of the regression line were significant ($p=0.001$), reflect a process sequence of 'exploration'/'involvement' until 2011 and possible 'development' stage toward 2015. This behavior fits with the RESPONSE, LEVERAGE and GROWTH strategy sequence of the SWOTCLOCKTM model.

Arrange transition periods according to the characteristics of TALC model matches the order of the transition of the 'Leading Strategy' principles of the SWOTCLOCKTM model. Airport is an important link of the Supply Chain system in the tourism sector, reflecting the attractiveness of a tourist destination. Incoming tourism to Eilat is via 'Uvda' airport, whilst Eilat airport serves domestic tourism. Figure No. 5 shows result of incoming tourism charter flights arrival trend analysis over the period 1993-2011 (source:-Israel Airport Authority).

The analysis points to the polynomial approximation at high correlation ($r^2=0.8875$). The period during the years 1993 to 1998 enjoyed a growth in incoming tourism to under GROWTH strategy ('development' strategy under TALC model). Then the first intermediate period (1994-2000) was held under the downward trend in RESPONSE strategy that matches the placement of 'stability'/'stagnation' according to the TALC model. Trend of this decrease were due largely to the decline in the attractiveness of Eilat incoming tourism, the influence of geo - political, security, terrorism, and competition. This trend continued and operated under a strategic SURVIVAL strategy ('stagnation' under the model TALC) as from 2002 until 2009. As of 2010, can be diagnosed by a change in trend and the start of transition to the driving strategy of LEVERAGE, which corresponds to entry of 'rejuvenation' stage of the TALC model. Compliance order sequence crossings between the models, validates the SWOTCLOCKTM model principles.

Summary, Conclusions and Recommendations

Research questions focus on the mutual strategic positioning dilemma of Eilat and Aqaba's tourism. The two typologies:-TALC model and the SWOTCLOCKTM model, treat the dilemma in two different systems and approaches, which challenge the research in terms of study design, execution, analysis and presentation of results and conclusions. The 'Leading Strategy' of Eilat and Aqaba in 2000-2011 is described in Figure No.6.

Figure 6: - Leading Strategy Mutual Relationship development of Eilat vs. Aqaba

In 2011, Eilat is a clear process of stagnation and erosion characteristics appropriate the 'RESPONSE' Leading Strategy'. However, the 'Leading Strategy' of Aqaba is LEVERAGE, based mainly on tourism development of Mega Projects in infrastructure and hotels of international chains. Until 2011 the Israeli government refrained from promoting tourism infrastructure development. Bureaucratic processes that last a long time period are one of the main obstacles to promoting mega tourism infrastructure projects in Eilat. If no action is taken integrative, Eilat can very quickly find itself in a SURVIVAL. In 2011 some signs point out a strategic change process toward LEVERAGE strategy, including the government's decisions to promote the construction of the airport in Timna and return Eilat into the National Priority Areas system. Eilat could lose its competitive advantage unless renewed intervention of the Israeli government, developing tourism infrastructure on a national scale, changes in regulatory, financial support and attracting FDI and domestic investment will take place. Eilat has to make itself competitive differentiation for and pass as early as possible into a LEVERAGE strategy. This can be done through a differentiation program focuses on re-branding process "Eilat +", and completion of the addition of at least approximately 2,500 rooms in 2015 to 2017. This is a realistic, feasible and possible goal to achieve. Availability of professional HR is also one of the factors affecting the current strategic position of RESPONSE and reduces the willingness of entrepreneurs to build new hotels. In order to meet strategic LEVERAGE expansion and the absence of suitable and immediate alternatives, the Israeli government must permit the entry of foreign workers in an orderly manner in the hotel industry and to deepen local reserve training programs in HR.

Aqaba tourism development LEVERAGE 'Leading Strategy' relies on a clear policy of the Hashemite Kingdom through ASEZA. Aqaba is in a process of development of hotels, particularly of international brands, which is expected to reach approximately 8,000 rooms in the years 2015-2017,

and even equal to Eilat in 2020. This is the time where Aqaba can close gaps and create a "threat" to Eilat, particularly Sea & Sun leisure activities. This development can turn Aqaba to a leading player in the Red Sea area as Sinai. While some projects can be identified in slowing the development and completion of the projects is lengthened (SARAYA project), the trend of leveraging continues. Hotels infrastructure in Aqaba is indeed necessary but not sufficient. Unlike domestic tourism in Eilat reaching a level of 85% of all tourists, domestic tourism in Aqaba contributes about 40% occupancy in hotels. Therefore, the development of tourism hotel infrastructure and the ratio of:- 1:2.5 between domestic and incoming tourism, creates a challenge which requires effort in developing new markets and continued growth of incoming tourism. At the end of 2011, a switching process that focuses on the "Nature - Heritage - People" triangle under the LEVERAGE strategy needs to improve the tourism product, develop infrastructure complements of small businesses in tourism and strengthen the human resource for local need. Completion of Mega Projects carried out in Aqaba, is designed for 2017-2020. At that time, this is expected for Aqaba to find itself in a transitional phase to a GROWTH strategy. Aqaba is looking for new market segments, expanding existing segments, operates with greater intensity of charter flights, to increase the current occupancy rooms, and to run tough competition with Eilat in those market segments on price and the tourism product. Although some events like the "Arab Spring" phenomenon can also affect partially the slowdown and the completion of projects, on the long run projects will be completed and will fit with the tourism plan for sustainability.

Dichotomous situation between Eilat and Aqaba presents high interest to explore. The "Red Sea Riviera" vision can not become real, without free access and easy move of tourists in the region (Aqaba, Eilat and Sinai). Such a vision relies on both tourism synergy and differentiation. Eilat should be different from its neighbors, rely on values of culture, sports, nature and western urban environment, which will complement the Sea & Sun differentiation of Aqaba as a competitor arises. Tourism development process can act as an opportunity to both Aqaba and Eilat. Creating a system of cooperation between the two cities, will create a synergetic process of tourism and economic development.

The results determine the mutual 'Leading Strategy' of Eilat and Aqaba in 2011, and empirical analysis confirms and approves compatibility and validity between the characteristics of the TALC model stages, and those of the SWOTCLOCKTM model hypothesizes. Further similar research by 2015 is recommended to be run, as appropriate comparison to the 2011 study. Such research will enrich the knowledge and understanding of mutual strategic change processes and emphasize validity and compatibility of the SWOTCLOCKTM model with TALC model, beyond of what has been shown in this study. The results also encourage studies into tourism destinations facing similar dilemmas such as the Masai Mara in Kenya vs. the Serengati National Park in Tanzania and the Dead Sea area where both Israel and Jordan operate very similar tourism system.

Abstract

Many organisations now have to operate in highly uncertain environments. Global competition drives organizations to reduce their capital employed and cut costs through lean manufacturing, outsourcing and extended supply or to grow by entering new markets, introducing new technologies, building unique alliances. And all this is happening at a much faster speed than even ten years ago.

On a journey towards excellence, learning from past performance is always beneficial. However the applicability of the learning rapidly diminishes in a continuously structurally changing environment. One key (implicit) assumption of the theories and practices of TQM and Business Excellence is that the business environment is relatively stable and predictable. However, this is no longer the case and therefore we must also accept that much of our current theory and practice is no longer as effective as in the past. In particular, we need to develop a strategic and practical approach to sustaining business excellence to support executives and their organisations that face uncertainty and instability in their particular market environments.

Our approach is an application of well-tested theories of complexity analysis using Simons' Four Levers of Control model. It analyses all the organization's systems and structures which might be driving the behaviour of the people involved and examines the degree to which these systems and structures support or undermine efforts to maintain business excellence. It then considers how this situation can best be managed now; what needs to be changed in which direction in the future; and how and when this can best be achieved, given the operating environment of the company.

Keywords: Management Control; Uncertainty; Simon's Levers of Control, Quality Management

INTRODUCTION

The quality management discipline is strongly rooted in business practice. This link with practice has resulted in quality models (like the Business Excellence Models) that appeal to managers and, as a result, have been used widely. Since these quality models make common sense, most people will not question their benefits for improving organisational performance. However, the quality management

discipline has not developed any theories about how different organisational contexts may influence the way in which quality models are used. Research has shown that a universalistic approach is inappropriate because quality management is in fact context dependent (Sousa and Voss, 2001). The management control discipline has acknowledged the importance of the business context already more than a decade ago, and can provide important insights for quality management. In this paper we will discuss these insights and argue why they can benefit quality managers.

A small group of quality experts (most notably Deming, Juran, Feigenbaum, Crosby and Ishikawa) substantially influenced the early development of quality management (Kruger, 2001; Sousa and Voss, 2002). Although these experts developed implementation plans for quality management they did not develop scientific theories (Bryce, 1991; Dean and Bowen, 1994; Dale et al., 2001). Elements of scientific management theory (Taylor, 1911; Rogers and McIntire, 1983; Shafritz and Ott, 2001) can be found in their thinking about quality (Bryce, 1991, Wilkinson et al., 1998).

Following on from the early thinking of the experts, which focussed on problem solving and improvement of products and processes, quality management systems have been developed that have a broader view on quality management and that have a more preventive focus. Quality management thinking has evolved from a narrow focus on statistical process control to a variety of technical and behavioural methods for preventing problems to occur and improve organisational performance. The ISO 9000 series and the Business Excellence Models have proven to be very popular in business practice. These models prescribe certain actions and behaviours that should lead to excellent quality and performance (Dean and Bowen, 1994). However, these models do so without explicitly stating a theory that underlies these prescriptions. If management models are prescriptive, they tend to be contingent (i.e. sensitive to variation in the organisational context). However, it is generally assumed that quality management recommendations are context independent and therefore implicitly universal (Spencer, 1994). The quality management discipline pays little attention to the boundary conditions for the applicability of quality models, nor does it pay attention to how variation in organisational settings might be reflected in quality management implementation (Sitkin et al., 1994). Therefore, it seems that a contingency approach is necessary in quality management. Contingency thinking is based on the proposition that an organisation's relationships with other organisations, as well as its relationship with its total environment, depend on the specifics of the situation (Hodge and Anthony, 1988).

Sousa and Voss (2001) have shown that quality management is in fact context dependent. Therefore, the quality management discipline is in need of a model that explicitly takes the business context into account when providing directions for the use of quality management. Sitkin et al. (1994) argued that it is necessary to search for a model outside the quality field.

CONTROL SYSTEMS

It can be argued that quality management can be seen as a management control system since it is aiming to control an organisation's processes and to improve these processes in response to all kind of

changes and developments (technological; economical, social etcetera). This view of quality management as a management control system is further strengthened by the conclusion of Merchant and Simons (Merchant and Simons, 1986) that definitions of management control generally contain two key concepts: "A focus on the behaviour of organizational participants and a concern with the effect of this behaviour on organizational outcomes". Therefore, a logical place to look for a model is in the field of management control.

Although there currently is a large amount of literature on management control, it has only received serious research attention since the second half of the twentieth century (e.g. Arrow, 1964; Anthony, 1965). However, the concept of control has been around for much longer than that. Control is seen as the central idea of Taylor's scientific management (Gigliani and Bedeian, 1974; Otley et al., 1995). The strong link between management control and scientific management indicates that the roots of management control and quality management are closely related, since the early thinking on quality management was also similar to many of the scientific management ideas (Bryce, 1991, Wilkinson et al., 1998). The focus of the early management control research is similar to quality management research as well. Both dealt with real problems, and were aimed at understanding and solving these problems (see Dean and Bowen, 1994, Otley et al., 1995). However, there is also a major difference between management control and quality management. Research on management control has been contingency-based for a relatively long time, while research on quality management has been dominated by a universalistic approach (Dean and Bowen, 1994).

One of the most important themes in management control research is the explanation of differences in management control systems between organisations operating in different environments (Chenhall, 2003; Speklé, 2001). Extensive research has been done on the effects of differences in the nature of the environment, technology, firm size, structure, strategy and national culture on the effectiveness of management controls systems (Chenhall, 2003; Speklé, 2001; Marginson, 2002; Mundy, 2009). Most of this research has focused on the effects of the external environment and corporate strategy on management control systems. It is believed that certain management control systems are more suited to certain environments and strategies than others (Chenhall, 2003). Simons (1987; 1990; 1991; 1994) has conducted important research in this area and developed his 'Four Levers of Control Model' (Simons, 1995) on the basis of this research. We aim to make use of the long experience with contingency-based research in the management control discipline, by introducing this leading management control model to the field of quality management. The model is accepted in the management control field, however, it has not been used before in the field of quality management. Still, Feldman (2004) claims that the model's adequacy for analysing important real world phenomena means that it is appropriate to use it outside its original field.

SIMONS' CONTROL MODEL

Simons' Four Levers of Control Model is displayed in Figure 1.

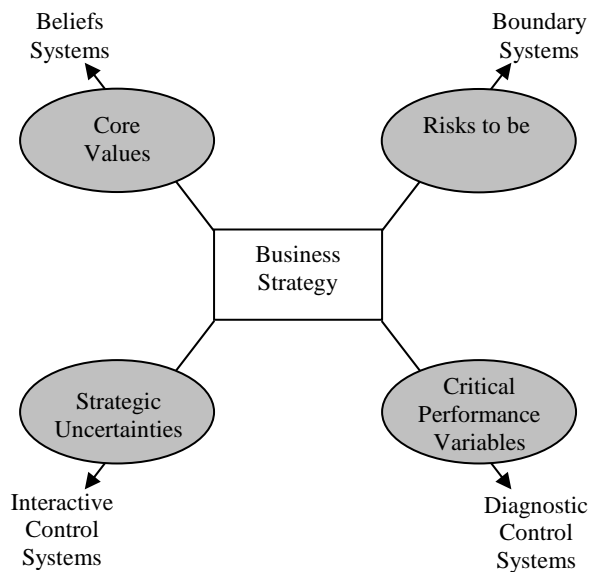

Figure 1. *Simons' Four Levers of Control Model (Simons, 1995)*

Simons' Four Levers of Control Model is used to balance control mechanisms in an organization in order to realize the business strategy. The model distinguishes four different types of control mechanisms: (1) beliefs systems, (2) boundary systems, (3) diagnostic control systems, and (4) interactive controls systems. Two of these four levers increase individual freedom (i.e. beliefs systems and interactive control systems), and two restrict individual freedom (i.e. boundary systems and diagnostic control systems). The four levers are explained below.

Beliefs systems

Beliefs systems are used to inspire and direct the search for new opportunities. "A beliefs system is the explicit set of organizational definitions that senior managers communicate formally and reinforce systematically to provide basic values, purpose, and direction for the organization" (Simons, 1995, page 34). Managers use beliefs systems to indicate to subordinates in what direction they want the organization to go. A beliefs system is created and communicated through such documents as credos, mission statements, and statements of purpose.

Boundary systems

Boundary systems are used to set limits on opportunity-seeking behaviour. "Boundary systems delineate the acceptable domain of activity for organizational participants" (Simons, 1995, page 39). Boundary systems define the limits within which the management wants employees to operate. These limits are based on defined business risks and strategic choices. Boundary systems are communicated through rules, codes of conduct, limitations, and minimum standards.

Diagnostic control systems

Diagnostic control systems are used to motivate, monitor, and reward achievement of specified goals. "Diagnostic control systems are the formal information systems that managers use to monitor organizational outcomes and correct deviations from preset standards of performance" (Simons, 1995, page 59). Diagnostic control systems are essentially feedback systems, which are fundamental to traditional management control. Diagnostic control systems have three distinguishing features: (a) the outputs of a process can be measured, (b) the existence of predetermined standards against which actual results can be compared, and (c) any deviations from these standards can be corrected. Because of these three features, they are designed to ensure predictable goal achievement. Diagnostic control systems are communicated through profit plans, budgets, targets, and quotas.

Interactive control systems

Interactive control systems are used to stimulate organizational learning and the emergence of new ideas and strategies (Locke and Latham, 2006). Based on the unique strategic uncertainties they perceive, managers use these systems to activate search. Interactive control systems focus attention of employees and force dialogue throughout the organization. They provide frameworks, or agendas, for debate, and motivate information gathering outside of routine channels. These control systems stimulate search and learning, allowing new strategies to emerge as employees throughout the organization respond to perceived opportunities and threats.

RESEARCH METHODOLOGY

An analysis of an organisation's quality systems by means of Simons' control model enables managers to look at quality from a different perspective. The model makes it possible to take strategic aspects and characteristics of the business environment into account when assessing an organisation's quality management systems. As such, it helps managers to make the switch from a universalistic approach, towards a context dependent approach to quality management. By determining in which of the four levers each of the existing quality systems fits, an overview of the dominant levers emerges. Management can then assess whether their use of each of the levers fits the environmental uncertainty and complexity. Given the fact that the business environment evolves over time, the dominant focus in terms of the control levers may be out of sync with the business environment. Simons' control model then makes clear which type of quality systems is overrepresented in the quality strategy, and which type of quality systems is underrepresented, and therefore needed for future business success.

OBSERVATIONS

Using the Simons levers of control framework as a paradigm for quality management, has lead to a number of observations. These observations are now summarized.

What needs to be controlled has changed

Management control systems have been traditionally concerned with control of the organization's main operational processes; i.e. getting supplies in, using the supplies to produce the goods/service at right costs, and getting finished goods to the customer on time. In stable situations such control of operational processes was regarded as being key for organizational success. Because in stable situations other possibly important processes such as those influencing key relationships with customers, suppliers, investment partners, and employees depend on the organization providing what they say they would, when, where at right price and agreed quality. Well controlled operational processes enabled this to occur.

However, organizational success in unstable or uncertain situations is not just dependent upon good control of operational processes. In unstable environments relationships with customers, suppliers, investment partners and employees become much more important. These relationships no longer just depend on whether you provided what you say you would when and where. Competition, innovation and market instability also influence those relationships. So, these relationships with customers, suppliers, investment partners and employees are no longer stable.

A technical process can be controlled. There is a discoverable relation between cause and effects. So control can be based on careful rational analysis and logic, like controlling a thermostat. Consequently, the source of research ideas in operational control will be technology and engineering science. A relationship cannot be controlled in such way. It involves people who may at times act rationally and predictably but on other occasions can appear to be driven by totally different motivations. Such a situation cannot be controlled in the same way. It has to be managed rather than controlled. No clear thermostat type approach is possible. So, the source of research ideas in managing relationships will be psychology and sociology. What needs to be controlled for many organizations has expanded from just operational processes to include also the processes involved in forming, developing and maintaining some key relationships.

What kind of control systems will be needed to manage key relationships?

There are many different kinds of control systems in the literature. For example Simons has proposed there are four categories: diagnostic, boundary, interactive, beliefs. Traditionally these four have been collapsed into two: hard and soft control systems. Research on organizations in the kinds of uncertain situations as described above, where relationships are important has shown that softer control systems become more important than they are in more stable environments (Chenhall, 2003). But that all four kinds of systems are still used, even in these uncertain situations. So, all four kinds of control systems will be used in unstable environments.

When are control systems powerful?

The aim of a control system is to influence behaviour in the desired direction. It influences behaviour through motivating the individuals involved to act in this way. Psychology tells us that

most forms of control systems can be potentially powerful motivators of behaviour. To be potentially powerful they need four attributes: clear goals, measurement systems, feedback, linked rewards (Feldman, 2004). And the measurement of progress toward the goal must also be relatively short. Too long a period of time before the amount of progress toward the goal measured will weaken the power of the control system (Jaques, 1951).

The control system might have potential power but whether they are actually powerful or not depends on whether motivational triggers are actually used (i.e. are clear goals set up and committed to; can progress be measured in the short term; are such measures of progress in place and used; and are rewards/punishments linked to progress). This setting of goals, measuring of progress, feedback and linking to rewards all requires much management time and effort. Management time and effort is always a scarce resource and this is especially so when management is under pressure in unstable and uncertain situations. So, we could hypothesize that management will only devote their scarce resource of their own time and effort if they are highly motivated to do so. Therefore, in complex and uncertain situations where management time and effort is limited, managers may well use control systems because they have been schooled to do this and it is expected of them by others. But this will only be a formality. Management will only use the potential motivational power of the control systems on the processes they consider really important.

What relationship processes will managers regard as important?

Managers will regard as important those relationships which they expect to impact the achievement of their goals the most, and which would be the most difficult and costly to replace (based on switching costs models, see Klemperer, 1987).

In uncertain situations, managers will only use the potential power of their control systems on what they perceive to be important relationship processes. On what they perceive to be unimportant relationships, they will use control systems but they will not use them powerfully.

CONCLUSION

What do leading European companies see as the major challenges they are experiencing in managing quality in their organizations today? Our research findings - based on interviews over a period of three years with three companies: Novaled (Dresden), Trimco (Ljubljana), Dubai World (Dubai) - indicate that uncertainty is a key issue and leading companies realize that they have to be more aware these days of uncertainties in relation to their key processes.

In order to manage the crucial uncertainties it is not enough to measure and control what is going on now. Moreover, management's time and attention, which are scarce, have to be devoted to these uncertainties in interaction with the other players that are involved in those key processes. From a management control perspective, this means that besides the diagnostic control systems that are most of the time well developed in organizations, there is a need to pay attention to the more interactive control systems. The balance between diagnostic and interactive control systems will have to shift in

the direction of the interactive systems or the diagnostic systems have to be used in a more interactive way.

Crucial processes in an uncertain environment have to be managed through the use of all four levers of control according to Simon's model, however, the interactive control mechanisms are becoming more important. Quality Management approaches should therefore cover not only the tools and instruments to measure and control performances in order to find deviations from the goals, but should also include methods to stimulate and improve the more interactive management activities in order to be able to cope with the uncertain environments.

Because quality management approaches are build on the plan, do, check, act cycle and imply measurement and control, there is a need to rethink the tools and techniques or to rethink the use of tools and techniques that are in place to measure, monitor and improve activities and processes. In the diagnostic approach we assume that we know what our targets are, how we can define our goals etcetera. However, in an uncertain world our references to judge our performances are becoming less certain and more difficult to define in advance. Communication and interaction with all key players will become more important than to create progress.

Abstract

The present paper deals with the Public Private Partnerships in French law and practice, focusing particularly on cultural projects.

First of all, it is significant to investigate in which cases a PPP contract is administrative and localize the differences between PPP and concession contracts. It is noteworthy that the French PPP legislation could positively influence the Greek one, thanks to its completeness and consistency, regarding, for example, the dispute settlement procedures between public and private sector.

PPP is only chosen in case that its excellence among the rest types of public contracts is proved through a preliminary assessment. The competent agent investigates if appropriate criteria are fulfilled, followed by a comparative evaluation of economic efficiency and risk allocation. In France, there are several examples of cultural PPP projects, which, although occupying a small sector in the pie chart of French PPP projects, are very useful case studies for countries like Greece, with no alike experience yet. It is remarkable that most of them are characterized by innovation, indicating that partnership agreements do not simply constitute one more procurement process of common public projects (infrastructure, etc.) but they can also propose pioneering ideas, such as computer services, enhancement of the protection of natural heritage and ecological building construction.

It is highly recommendable on international scale to systematically correlate, in law as well as in practice, sponsorship contracts to PPP contracts. Besides, PPP should respond to needs in scientific research, security guarding services for museums and archaeological sites as well as sustainable development projects.

Keywords: Public Private Partnership (PPP) Contracts, French legislation, Cultural technical works and services, Contracts Law, Museums, Cultural sponsorship

INTRODUCTION: A COMPARATIVE ANALYSIS OF FRENCH PPPs

Public-Private Partnerships (PPPs) are first met in the 4th century BC, with a great civil engineering project for the people of Eretria, in Greece: They hired a foreign engineer, Chairephanes, in an attempt to drain a marshy area, which the contract calls the "lake of Ptechai", situated rather far from the city, at the heart of their territory. This is the first project according to the "Build Operate and Transfer

(B.O.T.)” model, whose financing was undertaken by the contractor and his partners, who would take advantage of the land for ten years.

In more recent times, PPP constitute a new model of public procurement in which public and private sectors are contracted with a view to realizing a public project or service. They have been introduced in the French legal order by Ordinance No. 2004-559 of 17 June 2004 and its implementing decrees. It is about administrative contracts under which the granting authority grants to a private entity -through a special company called "special purpose vehicle" (SPV)- the right to carry out the design, construction (or renovation/refurbishing), financing, operation, maintenance and management of public service assets.

According to the Green Book of the European Commission, published in 2004, the characteristics of a PPP are the following:

- The long-term contract
- The private sector financing (sometimes with the public support)
- The risk allocation between the two sectors.

The hypothesis of the present paper adopting the comparative methodology is that the French PPP system could contribute to the evolution of other national systems like the Greek one, due to its important experience in the cultural and other fields and to the more comprehensive character of the French legislation.

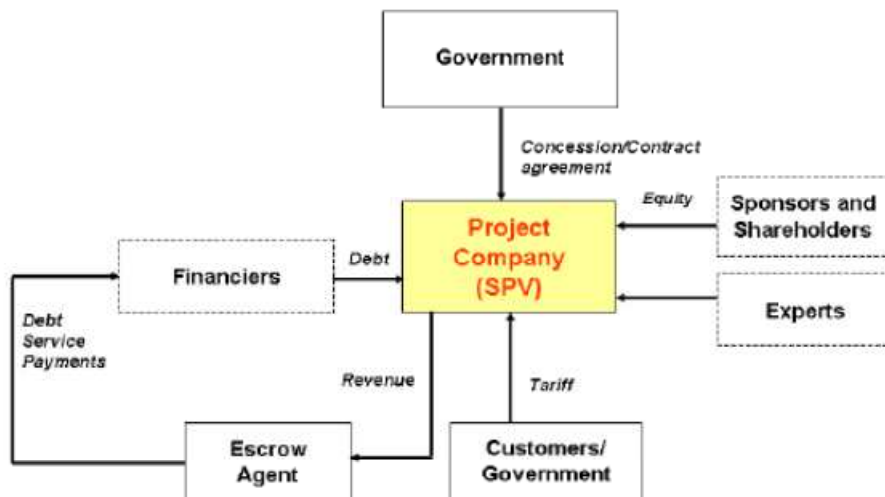

Figure 1: Typical structure of a PPP project

(A guidebook on PPP infrastructure, United Nations 2011,

http://www.unescap.org/ttdw/common/TPT/PPP/text/ppp_guidebook.pdf)

A COMPARATIVE OVERVIEW OF PPP AND CONCESSION PROJECTS

The concession is a form of delegation of a public service which is defined by article 3 of Law No. 2001-1168 of 11 December 2001 (MURCEF) as a contract under which a public authority delegates the operation of a public utility or infrastructure to a public or private entity whose revenues must substantially derive from the end-users of this utility or infrastructure. The legal framework for these types of contract is mainly the Sapin Law (Law No. 93-122 of 29 January 1993).

Despite the PPP and concession contracts similarities, such as the common public tender projects and the risk allocation between public and private sector, there are some significant differences too:

a) All concession agreements are traditionally ratified by law and therefore have to be approved by the parliament. Such ratification is not required with regard to PPP contracts, as Greek PPP Law 3389/2005 determines their minimum content, is quite explicit and flexible, thus limiting the need for deviations through parliament ratification and resolves issues which traditionally required special legislative regulations.

b) The use of a SPV for the project by the successful bidder is a legal requirement under Law 3389/2005, whilst this is not the case in concession contracts, albeit usual in practice.

c) Any collateral provided by the SPV for its financing is excluded from the insolvency assets of the SPV and cannot be used for the satisfaction of any other creditor. There is no similar provision in the law for concession contracts.

d) All disputes arising from the execution of a PPP contract are resolved through arbitration. There is no specific provision to that effect in the law of concession agreements and therefore the means of resolution of potential disputes must be resolved on an ad hoc basis. However, in practice, all concession agreements include a detailed arbitration clause.

PPP MODELS - PPP ADVANTAGES & DISADVANTAGES

PPP categories & models

According to the Green Paper published in 2004 by the European Commission there are two *types of PPP*:

- *Contractual PPPs, which have a specific objective and limited duration. Each PPP contract responds to very precise needs, therefore there are various kinds of contractual PPPs.*
- *Institutionalized PPPs, which imply the establishment of an entity held jointly by the public partner and the private partner. The joint entity thus has the responsibility of ensuring the delivery of a work or service for the benefit of the public. The establishment of an institutionalized PPP can be done either through an entity where public and private sectors jointly participate or through private sector buying and owning shares in an existing public company. Usually the public partner controls the company either as shareholder or through special rights it may hold and the private partner operates the service. This kind of*

cooperation between public and private partners can be very positive since the public partner keeps control over the infrastructure service, it may allow for service adjustment over time according to changing needs, conflicts are resolved internally and the public partner acquires know-how from the joint work with the private party. In France, mixed companies resemble to the institutionalized PPPs, while this type doesn't exist so far.

The most popular *PPP models* are cited below:

- BBO (Buy-Build-Operate)
- DFBT (Design-Finance- Build-Transfer)
- BTO (Build-Transfer-Operate)
- BOT (Build-Own-Transfer)
- BOOT (Build-Own-Operate-Transfer)
- DBFOOT (Design-Build-Finance-Own-Operate-Transfer)
- DBO (Design-Build-Operate)
- DBFO (Design-Build-Finance-Operate)
- BOO (Build-Own-Operate)
- BFOO (Build-Finance-Own-Operate)
- BLT (Build- Lease-Transfer)
- BLOT (Build-Lease-Operate-Transfer)
- BRT (Build-Rent-Transfer)
- LDO (Lease-Develop-Operate)
- LRO (Lease-Rehabilitate-Operate)
- DBFOM (Design-Build-Finance-Operate-Maintain)
- LROT (Lease-Renovate-Operate-Transfer)
- OMM (Operate-Maintain-Manage)
- MOO (Modernize-Own-Operate)
- MO (Modernize-Operate)

In French law there are three categories of partnerships:

- Public-private partnership: The present paper deals with this category.

- Long term administrative lease: It is a long-term lease granted by a local authority which entitles its private sector holder to proprietary rights on public land used for performing a public service.
- Temporary use authorization: This category is similar to the previous one. The temporary use authorization originally related to the State but it was then extended -with some restrictions- to the local authorities too.

According to private partner's payment mechanism, PPP projects are separated in two categories:

- *Reciprocal projects*: The principal repayment comes from the fees paid by the end-users for the use of the infrastructure or service provided. The height of the fees, the collection mechanism and the payback period are defined in the partnership contract. In some cases, the projects are *partially reciprocal*, as the private partner may be additionally reimbursed from the public entity (*sponsored PPP*).
- *Non-reciprocal projects*: The principal repayment of the private partner is made from the Contracting Authority through regular payments, called *availability payments*. These payments are linked to the project's provision within deadlines as well as to its quality level, which means that the licensee is fully rewarded when his performances are superior to contractual standards (*administrative PPP*).

PPP PRE-CONTRACT PHASE

Preliminary assessment

In France it is compulsory to compare alternative contractual options in order to justify the use of a partnership contract. The assessment process is held in two stages. In the first stage an examination of the three following criteria takes place (Lichère et al., 2009):

- Complexity, usually for cultural projects
- Urgency
- Efficiency, inserted with the article 2II of Law 2008-735 and resembling to the British PFI/PPP *best value for money*.

The second stage consists of a comparative analysis, including financial efficiency and risk allocation, in order to come up with final decision of the implementation in the PPP formula. By the end of the preliminary assessment, a relevant report justifies the choice of the procurement process.

PPP advantages & disadvantages

<i>Advantages</i>	<i>Disadvantages</i>
<i>Efficient and cost effective delivery of projects</i>	<i>Insecurity (Lack of co-operation between the two parties)</i>
<i>Value for money</i>	<i>Poor value for money (Drafting, negotiating, consulting costs)</i>
<i>Normally speedy delivery of projects (Private sector management skills allow the project to be delivered ahead or on time)</i>	<i>Higher capital cost (Higher private borrowing)</i>
<i>Risk allocation (Risk transferred to the party which is best able to manage it)</i>	<i>Lack of contestability and competition (Few companies can technically and financially support PPP projects, therefore enjoying a monopoly)</i>
<i>Efficiencies from integrating design and construction of public infrastructure with financing, operation and maintenance/upgrading</i>	<i>Public sector staff concern (If a PPP replaces a public facility, this may result in concern about the public sector staff's terms and conditions of employment)</i>
<i>Long-term nature of contacts (Incentivation to achieve better whole life costing)</i>	<i>Architects' marginalization (Absence of law relevant to their reimbursement)</i>
<i>Effective utilisation of state assets to the benefit of all users of public services</i>	<i>All taxpayers are charged with non-reciprocal projects cost (either they use them or not)</i>
<i>Output based specification (Contrary to the restrictive input specification of the conventional procurement)</i>	<i>Deficient output-specification</i>
<i>Innovation and diversity in the provision of public services</i>	
<i>Reduction on the public treasury (PPP's help reduce the capital demands on the public treasury for infrastructure development)</i>	
<i>High Tech projects (Private sector know-how)</i>	

Table 1: PPP advantages-disadvantages

PPP administrative bodies

In France, Decree N° 2004-1119 (modified by Decree N° 2011-709) provided for the creation of a specialized governmental taskforce (MAPPP), which was established by the Minister of Economy and Finance. MAPPP is a light structure with 8 staff members, set-up in May 2005 with a scope consisting in any sector, for the whole public sphere. It has been assigned a three-fold mission on partnership contracts:

- Information and promotion, through its interactive website and participation to industry events

- Support to implementation through assistance to public procuring authorities in preparing & negotiating PPPs and methodological standard-setting
- Validation of preliminary assessment (required for State-sponsored projects).

Similar bodies have been established by the Ministry of Defense, the Ministry of Justice (*AMOTMJ*) and the Ministry of Health (*MAINH*) (Réseau RAMAU, 2009).

In Greece, the administration bodies are ICPPP (Inter-ministerial PPP Committee), which is equivalent to MAPPP, and SSPPP (Special Secretariat for Public Private Partnerships), which was set up with the adoption of Law 3389/2005 in order to provide ICPPP with the necessary support (Maniatis, 2008).

General principles applied during the selection of the SPV

- Equal treatment
- Transparency
- Proportionality
- Mutual recognition
- Protection of the public interest
- Protection of the rights of private individuals
- Free competition
- Protection of the environment and sustainable development

Criteria for contract award

Contracts are awarded by the contracting authority either on the criterion of *most economically advantageous bid* or on the criterion of the *lowest price*.

When the contract is to be awarded to the most economically advantageous bid, the contracting authority will examine and take into account, not only the economic parameters -which is the case of the lowest price criterion- but also various other parameters of the contract scope, such as quality, price, technical merit, aesthetic and functional characteristics, environmental characteristics, running cost, cost-effectiveness, after sales service and technical assistance, delivery date and delivery period or period of completion and so on. These criteria must be clearly specified by the contracting authority, along with the relative weighting assigned to each of these.

Contract award procedures

There are four types of contract award procedure:

Open procedure

In this case, any private entity may submit a bid, provided that it may be qualified as able pursuant to the requirements of the invitation to tender.

Restricted procedure

In case of restricted procedure, any private entity may request to participate, provided that it is qualified as able. In the second stage, only these private entities meeting the qualification criteria are invited by the contracting authority to submit a bid.

Competitive dialogue

The competitive dialogue is a new procedure introduced by EU Directive 18/2004. In case of particularly complex contracts, for which the contracting authority considers that the use of the open or restricted procedure will not permit the awarding of a particular contract, it may use the competitive dialogue procedure. It is widely used in France while in Greece the restricted procedure is usually chosen.

Negotiated procedure

The contracting authority may use the negotiated procedures in the following cases:

- a. After the use of another type of procedure.
- b. In exceptional cases involving works or services whose nature or various non-definable factors do not allow prior overall pricing.
- c. In the case of service contracts, particularly intellectual services contracts.
- d. In the case of work contracts for works performed exclusively for purposes of research, testing or development and not with the aim of ensuring profitability or recovering research and development costs.

PPP POST-CONTRACT PHASE

Contract clauses

According to the Ordinance of 17 June 2004, a partnership contract must include various clauses relating to the duration of the contract, the risk allocation between the public authority and the private sector, the performance objectives assigned to the private sector, its remuneration, public service obligations, the public authority's control of the implementation of the contract, sanctions and penalties, modification or termination of the contract and dispute resolution. Regarding the disputes arising from the PPP contracts, it is remarkable that French law allows their settlement, not only through arbitration -which is the only method provided by Greek Law 3389/2005- but also in administrative courts and through alternative methods of prevention and resolution, such as mediation and conciliation. The Ordinance itself and the guidelines published by the Ministry for Economy detail the content of the contract clauses, but standard forms have neither been developed nor are contemplated.

Risk allocation

The principle is that risks should be transferred to those who are able to control or mitigate them at the lowest cost. The public authority should not transfer to the private partner risks that are under the authority's control, nor should it assume risks that are out of its control. In the design of a contract, it is crucial to identify and allocate risks before the procurement stage. This should be done by constructing a risk matrix.

<i>Category of risk</i>	<i>Description and likely effect</i>	<i>Allocation</i>
<i>Developmental risk</i>	<i>Insufficient preparatory tasks and project planning leading to delays in procurement and financial close</i>	<i>Government/ implementing agency</i>
<i>Sponsor risk</i>	<i>Financial strength (ability to participate with equity, can arrange third party equity, financially solvent and financial requirement does not exceed capacity, can provide limited recourse, if needed)</i>	<i>Government/ implementing agency</i>
<i>Cost overrun risk</i>	<i>During the design and/or construction phase, the actual project costs exceed the estimated cost</i>	<i>SPV/PP (can pass on to EPC contractor)</i>
<i>Category of risk Description and likely effect Mitigation measures Allocation Time overrun risk</i>	<i>Takes longer time to complete the project</i>	<i>SPV/PP (can pass on to EPC contractors)</i>
<i>Input supply risk</i>	<i>Raw materials and inputs not supplied in time or of less in quantity or of low quality, price escalation of inputs</i>	<i>SPV/PP (may pass on to input suppliers/ EPC contractor)</i>
<i>Operating risk</i>	<i>Factors negatively impacting upon operation and available capacity such as, unreliable/ untested technology; increased cost of operation, lower capacity; nature and cost of O&M; inefficient operation</i>	<i>SPV/PP/ O&M contractor</i>
<i>Demand/ revenue risk</i>	<i>Insufficient demand and/or revenue (due to low demand, leakage, competing facilities, capacity, price setting, augmentation)</i>	<i>SPV/PP; Government in case of PFI type or projects with off-take agreements with government</i>
<i>Change in tax rates</i>	<i>Changes in tax law or policy that have negative effect on the private party, its assets, or the project</i>	<i>SPV/PP if changes were foreseeable and not discriminatory, otherwise government</i>

<i>Repatriation of capital and profit</i>	<i>Unable to repatriate capital or profit, currency convertibility and transfer</i>	<i>SPV/PP</i>
<i>Force Majeure Natural events</i>	<i>Flood, earthquake, cyclone etc; closure of operation and negative effects on assets and project</i>	<i>SPV/PP</i>
<i>Category of risk Description and likely effect Mitigation measures Allocation Force Majeure- Political events</i>	<i>Change in law, expropriation, revocation of licences, permits etc, civil disturbance, war, non-default termination of contract.</i>	<i>SPV/PP</i>
<i>Dispute between parties</i>	<i>Non-compliance of contract provisions, or difference in interpretation of provisions</i>	<i>Government/ SPV/PP</i>

Notes:

EPC = Engineering, Procurement and Construction; IA = Implementation Agency; O&M = Operation and Maintenance; PP = Private party in contract with the IA or Government; SPV = Special purpose vehicle.

*Table 2: Risk matrix
(Quium, 2011)*

PPP & CULTURE

PPPs in culture

Nowadays, it is getting more and more obvious that there is a crucial link between culture and economics. Cultural goods need economic support and a country's economy can be significantly improved by cultural heritage projects.

Cultural heritage in Greece is protected by Law 3028/2002 and in France by Decree 2004-178, while a public establishment (*ÉMOC*) is responsible for the supervision of all cultural projects. In French and Greek legislation, there are various common practices, such as the adoption of Greek law 3658/2008, regarding measures for the protection of cultural goods (from criminality) and the relevant stricter penal provisions in the French legal order.

Below there is a chart of the distribution of PPPs upon sector in France.

Figure 2 : French PPP projects distribution upon sector

Although the cultural projects are limited in comparison with those of the rest sectors, they still occupy a 14% of all the PPP projects and could therefore constitute a reference point for countries like Greece, with only one, non-cultural, PPP project completed so far.

PPP failure: Palace of Versailles

In early 2007, the first French cultural PPP contract in IT services was signed between the Palace of Versailles and Unilog. This project concerned the enhancement of computer system, mainly for the ticket reservations. On May 28th, 2008, the direction of the public institution decided to break the contract due to continuous failures of the private company. There were several problems in the computing system, such as very slow booking system, scarcely updated website, long visitor queues, absence of touch screens etc.

Although the French Ministry of Culture had promised the obsolete computing system replacement and a real technological revolution, in fact, Unilog proved unable to manage the new technological tools. The causes of this failure are, on the one side, the company's lack of know-how, on the other side, its acquisition from Logica, which created a climate of uncertainty to the employees, a lot of whom did not hesitate to leave the company at that crucial moment. Following the contract dissolution, the French institution undertook the ticketing system and by the end of 2008, it was completely restored.

This PPP project, despite its unfortunate ending, is worth studying, since its innovation covers many aspects, as follows:

- It is about a PPP project in the cultural field, so far unknown in countries like Greece, which could be encouraged to use the PPP tool in order to preserve and reclaim its cultural heritage.
- The scope of the contract, being a service provision, is innovative itself. Furthermore, a possibility of virtual museum guiding would constitute a real innovation and example for imitation for many museums.

- The public partner of the project was a certified museum, under the official label “Museum of France”. It is obvious that France is very well organized in museums matters, which could be taken into consideration by the Greek authorities that should avoid cases of private collections being self-proclaimed “museums”.
- The gardens of Versailles palace have been inscribed in the UNESCO World Heritage List, which indicates that the notion of heritage covers inter alia the physical heritage related to human intervention. France as well as other countries, like Greece, should promote their physical heritage, preferably as “open museums” and in combination with museums of conventional type.

Successful cultural PPP projects

The first cultural PPP project in France consists in the construction of the “Théâtre de l’Archipel” in Perpignan, which was inaugurated in October 2011. The project for this new cross-border Catalan theatre was carried out jointly by Perpignan and the city of Salt in Spain in order to offer to the public a shared season of shows and co-productions, as well as a cross-border festival. The theatre’s mission is to open its doors to all audiences, thanks to a varied programme of performing arts, classical, contemporary, or current (theatre, music, dance, circus, and opera).

Moreover, the construction of the Museum of Civilisations from Europe and the Mediterranean (*MuCEM*) in Marseille, planned to open in 2013, includes the Fort Saint-Jean, a sort of “museum-walk”, connected to the main building through a bridge. The Biarritz Marine Museum is another PPP project, inaugurated in December 2011, which constitutes a scientific approach of oceanography. The heat balance of the building is noteworthy, as it needs no winter heating or summer airconditioning.

Besides, a PPP service has to do with the digitisation of cultural works, available in the site <http://gallica.bnf.fr/>. Over the last years, the National Library of France (BNF) has contracted with various private partners with a view to digitising French cultural heritage works, such as newspapers, magazines, audiovisual material, photographs, manuscripts, coins, medals and musical scores.

There are a few more projects, such as the renovation of the zoo in the Parc de Vincennes, which is planned to be completed in April 2014 and the museum Camille Claudel in Nogent-sur-Seine.

Cultural sponsorship in Law and Practice

Definitions of sponsorship vary and the practice has been described as “an investment in cash or in kind activity, in return for access to the exploitable commercial potential associated with that activity” (Fabien, 2010). In Greece, the aforementioned Law 3525/2007 defines cultural sponsorship as a pecuniary or non-pecuniary economic benefit consisting in kind, immaterial goods or services, for the enhancement of concrete cultural activities or purposes of the sponsee. Sponsors’ motive is to strengthen their corporate image through the identity of social responsibility. They may also take a profit from the consequent tax exemption, as it happens in most countries of the European Union and of North America (Maniatis and Kapralou, 2012). Anyway, the sponsor acquires no right to interfere

into the form or the content of the activity on the matter, in virtue of the principle of the independence of the producer involved.

It is to signalize that the question of the law success or dysfunctions for cultural sponsorship has not received considerable research attention. This lack of in-depth analysis may be partly attributed to the fact that some countries have recently adopted the relevant legislation. France, contrarily to other countries, such as U.S.A. and United Kingdom, ignored for a long time the private sponsorship and institutionalized it very recently, let alone in a relevant “shy” way (Mirieu de Labarre, 2006). Nevertheless, cultural sponsorships in France have been particularly successful, consisting even in rewards for information to the authorities investigating crimes related to cultural heritage and artistic treasures. In this context, it is highly recommendable on international scale to systematically correlate, in law as well as in practice, sponsorship contracts to PPP contracts. National PPP legislations, such as the French law and the Greek one, could include a detailed reference to sponsorship or the interested states could adopt a single law including PPP contracts and sponsorship ones.

This is plausible particularly for cultural projects needing financial back from big enterprises, such as programmed archaeological public excavations that are dissociated from contracts methodology not only of PPP model but also of public works one. For instance, in Greece, although Presidential Decree 99/1992 refers to archaeological excavations through either direct execution or contract award, the second alternative is very rare.

Sponsorships could support culture in other ways too, for example in the offer of a reward to potential informants of cultural law crimes. The Greek State has recently promised this kind of payment in order to receive information regarding the National Gallery theft, occurred in January 2012.

CONCLUSION: TOWARDS A NEW PARADIGM OF CONTRACTS LAW

It is obvious that the French PPP system could contribute to the evolution of other national systems like the Greek one, especially in the cultural field, therefore the paper hypothesis has been verified. It is advisable for Greece to adopt elements from the French legislation, for example the alternative methods of dispute prevention and resolution in addition to arbitration. Due to their innovative nature, PPP projects could include computer services, security services for museums and archaeological sites, scientific research, sustainable development and enhancement of the protection of natural heritage and ecological building construction. Finally, it is very significant to enhance both French and Greek laws by correlating them with the Cultural Sponsorship Law with a view to encouraging private financing of cultural projects, among which are the archaeological public excavations, that could promote cultural heritage and boost the economy. As a result, it is worth making the step towards a new paradigm of the Contracts Law...

PENETRATION AND EXPANSION OF FOREIGN BANKS IN SOUTH EASTERN EUROPE: THE CASE OF GREEK BANKS

Vasiliadis, Labros¹

¹ Department of Business Administration, Department of Accounting, T.E.I. of Chalkida, Greece. Center of Education for Adults, Greek Ministry of Education, Chalkida, Greece. M. Kakara 63, Chalkida, 34100, Greece. E-mail: labvas@yahoo.gr

Abstract

This research aims to examine how Greek banks penetrate and expand into South Eastern European (SEE) countries.

Empirical data were collected by using secondary and primary data sources. Primary data sources included semi-structured interviews with managers from the banks' headquarters as well as managers of their activities in the region.

The theoretical view relies on the firms' internationalisation and business network theories and the varieties in the behaviour are explained by the degree of business commitment and knowledge. The analysis of the Greek banks' behaviour, concerning their penetration and expansion in the region, reveals that commitment and knowledge also have political dimensions, which complement business commitment and knowledge.

The study contains several shortcomings. The empirical study, for example, contains only two cases, which naturally raises the problem of generalisation. Further, the theoretical view may contain conceptual elements, which hinder more specific observations.

Based on the findings, the outcomes of this paper add new knowledge to the Greek banks' internationalisation, for the better understanding of market entry and expansion, offering managerial implications for management of political relationships.

The paper reports on the findings of the one of the first in its kind research study carried out in the Greek banking sector's presence into SEE countries. The findings that emerged set the foundation for helping the various stakeholders in the sector to contribute towards building strong presence in the region to help them sustain the fierce competition from foreign banks.

Keywords: Greek Banks; penetration; expansion; South Eastern Europe; internationalisation process.

Introduction

Multinational companies, in their aim to expand their global presence, market share, increase profitability and overcome problems related to saturation of existing markets, continually seek for opportunities and growth (Vrontis and Kitchen, 2005). Several of the largest Greek banks have begun to view penetration and expansion into SEE countries as a way to enhance profitability by exploiting their skills more fully.

A study by Blomstermo et al. (2006) on entry mode choices of service firms has shown once more that internationalisation processes of service firms differ from those of manufacturing firms. The study aims to add new insights to existing knowledge on internationalisation processes of service firms (banks), using business network theory.

Researchers in the field of banking have given their attention to aspects like contestability in Eastern European banking and competition in bank services (Yildirim and Philippatos, 2007). Regarding internationalisation of bank services, aspects like entry mode choices (Álvarez-Gil et al., 2003), FDI motives and growth (Tschoegl, 2002) and trends and obstacles have been the concern of researchers. Further, researchers have described motives and activities of banks in emerging markets, like the transition markets in Eastern Europe (Miani and Sagan, 2006). These are very important studies, given the increasing activities of banks in these challenging and fast-changing markets (European Central Bank, 2004).

The second contribution aiming this study is to provide an analytical view on the internationalisation of Greek banks in these changing contexts. Thus, it is studied how two Greek banks penetrate and expand into new emerging markets in SEE countries. It is discussed how the penetration and expansion of these two Greek banks into these transition markets evolve the internationalisation of the firm affect the evolution of business networks at both levels and how they impact knowledge levels and behaviour. Then it is investigated this process empirically. Comparing the two firms' penetration and expansion processes allows studying how their behaviour can be explained, given the different business environment they were confronted with from their first entry in the region. The results reveal the need to add another dimension to the model: commitment to and knowledge of management of political relationships.

Literature Review

In emerging markets like SEE countries, business networks had to be developed more or less from scratch after the fall of the Comecon network and the Soviet Union. Following Johanson and Mattsson (1988), this study distinguishes four theoretical situations dependent on the degrees of internationalisation of the firm and the market (see Figure 1).

		Degree of Internationalisation of the Market	
		Low	High
Degree of Internationalisation of the firm	Low	(1) The Early Starter	(2) The Later Starter
	High	(3) The Lonely International	(4) The International Among Others

Figure 1. A two-dimensional topology of entry strategy and internationalisation.

The degree of internationalisation of the firm is determined by the bank's degree of commitment and knowledge about the market of entry (Johanson and Vahlne, 1977; Johanson and Mattsson, 1988). The degree of internationalisation of the market, however, refers to the position of the bank in relation to other firms in the market of entry, here the emerging markets in SEE. Next it will be discussed each of the four resulting situations separately (The early starter, the lonely international, the later starter, the international among others).

The early starter (1)

The degree of internationalisation of the focal firm as well as the market in general is low, in this situation (1). This means that the firm and also its competitors have little knowledge about foreign markets. As the level of uncertainty is high, the firm refrains from entering into a new market with large commitments but instead builds up knowledge through an incremental entry process. Firms in this situation can, for instance, manage their uncertainty by cooperation with local firms that have market knowledge. For a bank that would like to be close to its customers, but with a lack of sufficient knowledge to make the large commitment of developing a local network itself, cooperative strategies with agents can be a solution. The counterpart in the local market increases the firm's capability to solve different known and unknown problems related to the specific market circumstances. When the counterpart has a good market position, for example through strong distribution or financial connections to others in the local market, the early starter firm can gain an opportunity in filling the market holes (Ghuri et al., 2006). In doing so, it also raises obstacles for competitors wishing to follow the early starter into the market.

The lonely international (2)

The firm, in that situation (2), is highly internationalised but its market environment is not. The firm has built a large market commitment and has extended its market activities, but its competitors are far from this stage. The focal firm has knowledge and experience of where and in what they have to invest. More important for international banks is the relationship experience with different market actors. They have to understand different local institutions and cultural differences and to act directly with the foreign market actors. Their position of being alone depends on how they can manage the financial network in the local market. The timing of building and maintaining its relationships in the local network is of vital importance for the firm's penetration and expansion. This is particularly so because of the nature of the product exchanged in the bank industry: the low level of product complexity can easily open the doors for competitors and push the firm to Situation 4. However, highly internationalised firms have access to more resources, partly through their more extensive network of partners and customers, and have also acquired capabilities for the development of new services in several countries. These advantages will strengthen the ties between the lonely international and its local partners, which can allow the firm to maintain its lonely position at the market.

The later starter (3)

In that Situation (3), the market is highly internationalised but the focal firm is not. For entering, late starter firms may observe and copy how other banks have penetrated and expanded or they can be pulled by their network partners. The decision to penetrate and expand requires the firm to undertake risk and commit resource to build new 'second-hand' relationships. The market share of the later starter cannot be high, as the market is already occupied by competitors with a tightly structured network. A very tight local network structure forces the late starter into the development of specialised products to avoid high levels of competition.

International among others (4)

In that Situation (4), both the firm and the market are highly internationalised and are predominantly confronted with high levels of competition. Because of the fact that banking networks across borders are highly related in that Situation, a highly internationalised bank can easily move from one country to another: using its knowledge and experience in one market to gain a position in another. For example, the knowledge and experience from other markets can speed up the agency phase and result in further market commitment (Blomstermo et al., 2006). Because of the nature of their products, banks can increase their commitments internationally more easily than industrial firms: coordination between different international units and diffusion of new and specific service happens at a higher speed. On the other hand, internationalisation in banks consists of other aspects that can hinder this speed: economic or political risks or crises, for example, can rapidly affect the financial assets of the firm globally. Banks can spread their risk in different countries with different conditions: issues like size of the bank and the specificity of its service products are of vital importance

for strengthening its market position. In order to reach such a major position, banks often join actions with others: mainly through mergers and acquisitions.

Methodology

In order to understand of how Greek banks penetrate and expand into SEE countries and how the environment influences the entry and expansion behaviour of those enterprises, it was conducted an in-depth study of two Greek banks' entry processes in these emerging markets. They were selected two large-sized Greek banks that are both confronted with a saturated home market and have started to internationalise more extensively during the 2000s. The case banks did not want to disclose their names in this study, and therefore, their anonymity was guaranteed by using fictitious names in presenting them. Both banks were selected because they have started activities in SEE as part of their increased internationalisation strategy. This will allow to research whether developments in the environment influence the banks' entry and expansion strategies. The banks, that have been called 'Epsilon' and 'Omikron', started to invest in the region shortly after these markets opened up for foreign investment.

Data was collected through interviews with managers from the banks' headquarters as well as managers of their activities in the region. In order to verify and complement the reports achieved through the interviews, it was further studied publicly available resources such as press releases and annual reports. The cases were separately analysed comparing the results in a cross-case analysis.

Findings (in table)

Analysis

Considering the firms' degree of internationalisation, two case banks of this study represent an Early Starter (Epsilon) and a Late Starter strategy (Omega), respectively. Epsilon's entry strategy shows that it invested widely in developing relationships with government and other institutions. This is in accordance with the Early Starter pattern. Because Epsilon lacks experiential knowledge of the SEE markets and cannot use existing network relational paths, it hires local people to develop such network relations. From a country's experiences it seems that hiring the person with the right connections at the Central Bank smoothes the entry process. In other country, the early investment in developing network connections results in bank's strong position in several institutions. Epsilon also achieved a strong position in the developing business networks in the markets it entered. The bank's managers relate that their early positioning in the market resulted in attracting clients like large multinational companies, whose 'own' banks were not yet present in the region.

Although Epsilon internationalised in other regions before entering SEE, it adopted a gradual and risk-avoiding approach to enter these markets. It preferred to enter through a branch, i.e., avoiding the control of the local Central Bank and only established subsidiaries when forced by local government. In congruence to Johanson and Mattsson's Early Starter, Epsilon offered only simple and standard products in the new markets. The bank expanded its product offerings only after increased its local

market knowledge and the market showed a certain level of development. Also, Epsilon extended its focus to other target groups, including groups that are more difficult to reach and that demand a higher level of local commitment, such as private households.

	<i>Epsilon bank</i>	<i>Omikron bank</i>
<i>Exploration stage</i>	<i>Greenfield entries (branches) Opportunistic entry in general; expand if successful Local personnel for links with local institutions.</i>	<i>Greenfield entry preferred but not possible in general Local personnel for links with local institutions.</i>
<i>Penetration stage</i>	<i>Banking licences granted smoothly because of the successful integration in institutional network Products: simple package Clients: large multinationals.</i>	<i>Difficulties in obtaining banking licences in general for branches because of the less immediate success with integration in institutional network: need to acquire local bank in a market; adapted business concept in another market Products: simple package Clients: local companies and multinationals in some industries.</i>
<i>Expansion stage</i>	<i>Expansion also to serve local companies; preferably, acquisition of local company or otherwise expand offices Expansion of product package when market is "ready" Expansion to retail banking for private households eventually.</i>	<i>Expansion to serve more client companies in some industries; growth mainly through local clients Expansion of product offering on demand of and in cooperation with clients Expansion to retail banking only for private persons in some industries.</i>
<i>Result</i>	<i>Respectable market shares in general.</i>	<i>Small market shares in general, but higher in some industries.</i>

Table 1: Case summaries

Johanson and Mattsson suggest that Early Starters attempt to solve their lack of market knowledge and uncertainty in foreign markets through cooperations with local companies. In contrast, Epsilon has not established such cooperations in its first stage of penetration, but instead acquired local knowledge through hiring local managers in important positions. In a next stage, expansion was eventually furthered through acquiring a local bank. This acquisition offered to the bank the network of offices that it needed to expand to target groups like private households. Epsilon's Early Starter strategy has proven to bring the bank success because it has provided the bank with a strong position in networks of customers and regulators. Epsilon has followed a gradual expansion pattern with extensive investments in building a network position, but like Johanson and Mattsson reasoned, this has given it a beneficial position in facing the competition of later entrants.

Omikron bank (the second case) has been one of those later entrants. Omikron set its first steps in the region, when banks like Epsilon had already been present and had already built their network of relationships. This is like the highly developed international context that confronts the Late Starter

according to Johanson and Mattsson's model. In a country of the region, Omikron in order to receive a banking licence is required, against its preferred entry strategy, to make an acquisition. In other country, its withdrawal is partly the result of the market already being taken by competitors and not allowing enough space for another player. Finally in other country, it is the bank's uncertainty about the high level of political risks that stalls further expansion. To build network relations, Omikron joins the lobbies of united international banks and also, like Epsilon, hires local managers with extended networks. To build profitable banks in the region, Omikron further cannot rely on its client network of foreign investors alone. In contrast to Epsilon, Omikron is forced to reach out to local companies, also small- and medium-sized companies, to start up their business.

Omikron's entry strategy is in accordance with the gradual approach predicted by the theories (Johanson and Mattsson, 1988; Johanson and Vahlne, 1977). Before entering SEE, Omikron collected information about these markets from several areas, including competitors that already had entered them. Further, Omikron's preferred entry strategy is through a Greenfield office, i.e., an entry mode that demands fewer immediate investments than an acquisition. Like Epsilon, Omikron started with simple banking products first, adding products and developing new ones in cooperation with clients over time.

Besides the heterogeneity in the commitment of these firms because of their degree of internationalisation, it was also found an interesting homogeneous behaviour towards actors. This aspect considers the type of commitments. As the cases manifest, the firms' resource commitment and organisation can be divided into two types. These two types are business commitments, which were related to the business relationships, and the other was the political commitments, which considered the political actors and bureaucrats. As the cases and also the figures illustrate, there was a clear difference between these two types of the firms' commitments. Both firms, specifically in the penetration stage, were faced with the problem of, for example, having to obtain a licence. These two different commitments developed hand-in-hand, but demonstrated different degrees of internationalisation.

The two banks had two types of commitments, as illustrated in Figure 2, which varied depending on the degree of internationalisation. In the first stage of internationalisation, for example, both firms were in cell 3 as the first commitment was to solve the political and bureaucratic problems. But, as the case of Omikron manifested, the firm in the expansion stage considered the business commitment to be high and the political commitment was less. If a firm like Omikron conducts a high investment in the political arena for penetration and is not able to move from cell 3 to cell 2, then the only option is exit. Besides the fact that firms hold commitment towards two different political and business markets, the degree of commitments in these two types does not follow similar development. While one is high in one stage, the other can be low and vice versa. In severe conditions, like mergers and acquisitions, both types may stand in cell 4, as the firms require a high level of investment for the businesses and at the same time resolve the political and bureaucratic demands.

		Low	High
Internationalisation and Political Commitment	Low	1	2
	High	3	4

Figure 2: Types and degree of commitments

Conclusions

The analysis of the Greek banks' entry and expansion into new emerging markets like SEE countries contains several interesting conclusions:

- The first one concerns the internationalisation process model's ability to analyse the firms' entry strategies and expansion in new emerging markets. The empirical study contains facts showing the slow progress in their internationalisation. It is true that firms entered into these markets at different times but their expansion followed the same slow progress in the increasing knowledge and commitments. Epsilon's Early Starter has benefited from being one of the first movers: it has gained a very strong position in the local business networks. These strong network relations have been shown to support the success of the bank. Omikron, in contrast, has been much less successful in reaching its targets: it has been confronted with higher levels of competition from local business networks resulting in lower chances of starting with a portfolio of foreign investors. This conclusion supports those believing in internationalisation process model and business network. Since the number of cases in this study is few, further empirical studies on new emerging markets using internationalisation process view can increase knowledge. Further studies can aid managers in their decisions on entry and expansion strategies, as following the gradual process in their market operation contains lower risk than rapid high investments in new risky emerging markets.
- The second conclusion raises questions on definition of the market in the theoretical sense. Specifically, it relates to new emerging markets like SEE countries, as these markets change drastically in their political and business fields. The internationalisation model emphasises

on commitment and knowledge for managing the business markets. Actors like customers, competitors and suppliers define a relationship network of a market. These actors are limited by relationship commitments and knowledge. The employment of the business network for these two firms shows new facts besides these explanations. As the cases manifested, the firms' network contained two different types of actors: Business and Institutional. This conclusion verifies the results from other studies (Welch and Wilkinson, 2004), which express the decisive role of the institutional political actors in business network. This conclusion resides on the presumption that political actors belong to a different market because their function is different. Therefore, it can be stated that business firms, specifically those acting in new emerging markets like SEE countries, are functioning in two interrelated markets: the business and the political. The entry and expansion behaviour of the firms relies on how these firms can manage these two markets. Further research can aid the deeper understanding of how actors in these markets impact on firms and assist managers to understand how they can manage their internationalisation in new emerging markets.

- The third conclusion relies on the rule of incrementality in the commitment and knowledge. Based on the cases, it can be concluded that there are differences between the two types of business and political commitment and knowledge of the firms. Besides that, the degree of commitment in these two types can vary at different stages of internationalisation. A deeper understanding of the types of commitments at different stages of internationalisation may provide a better understanding of why some firms do not succeed: this is not because of the degree of internationalisation of the businesses, but because of the hindrances created by political actors in entry or expansion stages of internationalisation. This is an extremely important issue since the political and institutional systems in new emerging markets are not so stable.

FLEXIBILITY IN DISTRIBUTION FOR MAXIMIZING CUSTOMER SATISFACTION

Verma, Sanjeev¹

¹ Assistant Professor (Marketing), NITIE, P.O.NITIE, Vihar Lake, Mumbai-400087. E-Mail: sanjeevnitie@gmail.com

Abstract

With the globalization and fast changing consumer preferences, marketers have to look for innovative ways to gain sustainable competitive advantages. The innovation may come from new design concept or bringing changes in the existing system for better productivity and cost reduction. This paper brings some innovative ways to bring flexibility in existing distribution practices for enhancing customer satisfaction. Various changes in distribution environment and their impact are discussed in this paper. This paper will provide direction to distribution professionals on emerging challenges and possible strategies with customer centric approach.

Keywords: Customer Satisfaction, Distribution, Flexibility, Strategic Planning

INTRODUCTION

In the globalized economy where the pace of change is unbelievable and the preferences of customers are changing every day, it becomes imperative for industry to become more customers responsive and quick for enhanced customer satisfaction. Today's customer is not satisfied with only product quality but they want empathy and responsiveness. Distribution is the management of inventory to achieve customer satisfaction. It is not surprising, therefore, to find distribution in the limelight. Today, many companies are discovering that distribution is not a necessary evil, but rather, a major frontier for both customer service enhancement and cost reduction. Unfortunately, in many companies, the distribution systems are not prepared to meet the demanding needs of the customer, the pace of change or the true integration of the distribution function. Distribution managers are usually working with inadequate systems that are not designed for today's marketplace. Typically, today's distribution systems do not have the flexibility and modularity to handle the breadth of distribution variety. The challenge confronting many companies, therefore, is the desire to enhance customer satisfaction by improving distribution.

NEED FOR STRATEGIC DISTRIBUTION PLANNING

Distribution is one of the four aspects of marketing mix and is the key element to provide sustainable competitive advantage. Distribution intermediary generates and manage a great deal of information and have the two-way relationship with their producers and customers. Since each customer and manufacturer contact point generates and disseminates information, the distribution intermediary many a times acts as supply chain's information manager. The distributor often has the advantage of forming strategic alliances with its customers, which can lead to efficiencies in supply chain information management not achievable with retail customers.

Basically, a distribution network is a series of nodes and transportation links. Distribution networks can range from direct shipments from the source to demand points for job shop items to complex multi-site networks. The design of a distribution network is dependent on factors such as the type of products, range and volume of products, geographic spread of service area, the level of service required, and the number and type of customers. Although distribution operates in a dynamic environment, it is challenged by business issues such as the global marketplace, the level of government involvement, the environment, and the issue of energy. At the same time, the customer requirements of increased pace, variety, and adaptability while reducing costs must be understood. Of course, these issues impact the internal pressures of distribution requirements to centralize, utilize third parties, improve information systems, increase productivity, and more fully utilize people. Therefore, the only way to enhance distribution excellence is to pursue the integration of distribution by applying strategic planning.

Strategic planning encompass stocking points, transportation, inventory management, customer service, and information systems and the way they relate in order to provide the maximum return on investment. Strategic planning acts as a guard against unpredictable change in requirements and lead time. Strategic planning is directed at forecasting future needs far enough in advance of the actual requirements to allow enough lead time to efficiently meet those needs. In fact, the only way to survive the rapidly changing distribution environment today is to have good strategic plans that address the future needs of distribution and the factors influencing distribution.

FACTORS AFFECTING CHOICE OF DISTRIBUTION

Some business leaders and managers view the global marketplace as an economic, government, or political issue. Besides influencing other business decisions, global marketplace is a distribution issue. In fact, in today's world there is no choice but to understand the global strategy implications on all distribution decisions. As shifts occur in the world's trading patterns, this changes the distribution requirements, alters the location and number of warehouses, increases pipeline inventories, and creates new transportation opportunities and problems. The challenges in global distribution network can be utilized for advantageous proposition by understanding the complexities of global distribution and then designing the strategic plan for global distribution that will make the distribution network transparent to domestic or global conditions. The scientific and systematic approach to global marketplace becomes an asset to a company, as opposed to an excuse for adopting inefficient global distribution.

Another global trend is the intervention by governments to deregulate many activities, most notably transportation. Many developing and developed countries have embrace deregulation across the transportation field. Nevertheless, significant regulations still exist in areas such as the commercial driver's license, safety inspections, and drug testing, regulations are growing. It is important that distribution professionals understand that just government involvement will not create the desired

impact on distribution, distribution leadership has an obligation to have alignment with government policies to improve on delivery time and reduction in turnaround time.

An issue that is closely tied to the issue of government involvement is the issue of reverse distribution. Reverse distribution is the task of recovering packaging and shipping materials and backhauling them to a central collection point for recycling. In reverse distribution, the product manufacturer is responsible for taking back all the pallets, cardboard boxes, stretch wrap, shrink wrap, strapping, bandings etc. used to protect the goods during shipment. Handling the mechanics of reverse distribution will require significant attention by distribution professionals. Not only will they need to understand a diverse set of state and central laws, but they will have to deal with backhauls, with handling the waste packaging in their warehouses, and with the customer satisfaction issue of recycling. So, although the environmental issue to date has not been a major distribution concern, it will become a major concern as regulations are passed to force us into reverse distribution.

Special functions like packaging, unitizing, pricing, labeling, kitting, and delivery requirements are becoming a part of distribution department which was otherwise viewed as manufacturing operations. Systems and procedures are required to be put in place to handle information consistent with the desires of the customers. No matter what the customer requests, distribution professionals are expected to handle them efficiently and effectively. At the same time, customers should make to understand and accept the need to pay for special services, and it is from this perspective that they will make their requests.

FLEXIBILITY IN DISTRIBUTION FOR ENHANCING CUSTOMER SATISFACTION

With the overall change happening in environment related to distribution function, managers should adopt more flexible approach to customize their solutions for enhanced customer satisfaction. The three most important aspects of flexible distribution are versatile equipment, versatile systems and multi-skilled employees.

The design, specification, and implementation of versatile equipment are required to achieve flexible distribution. Warehouse storage rack and material handling equipment as

well as transportation equipment should be selected with sufficient versatility to handle today's distribution requirements and future requirements. Similarly, versatile systems have an impact of adapting customer labeling, automatic identification, communications, and documentation requirements. Lastly, we must have multi-skilled personnel to achieve flexible distribution. Overly restrictive work rules, excessive job classifications and labor grades, and insufficient training have often resulted in a lack of flexibility in distribution. Multi-skilling eliminates barriers between tasks, and workers better understand the implications of their performance. Throughout distribution organizations, there is a need to destroy the traditional barriers between tasks.

The channel decision plays a very important role and there is a form of trade-off between costs vs. efficiency. Most consumer goods manufacturers could never justify the cost of selling direct to their consumers, except by mail order. In practice, if the producer is large enough, the use of intermediaries (particularly at the agent and wholesaler level) can sometimes cost more than going direct. Many of the theoretical arguments about channels therefore revolve around cost.

However, many suppliers seem to assume that once their product has been sold into the channel, into the beginning of the distribution chain, their job is finished. Yet that distribution chain is merely assuming a part of the supplier's responsibility; and, if he has any aspirations to be market-oriented, his job should really be extended to managing, albeit very indirectly, all the processes involved in that chain, until the product or service arrives with the end-user.

An effective channel management can greatly improve operating efficiency: for example, inventory service levels can be raised if costs are shared and delivery times shortened through co-operation. The consumer characteristics and product characteristics in terms of value, destiny, and shelf life should be considered for better and profitable results. Multichannel and distribution through technological mediums should be encouraged for reducing cost and maximizing satisfaction.

The ERP packaged solution for the wholesale distribution industry provides a single, integrated platform that solves the vexing problems posed by multiple vendor and heterogeneous IT environments. Built on open standards to facilitate future growth and flexible extensibility, this packaged solution provides streamlined functionality that improves visibility, reduces cost, increases productivity, and helps you regain control of your business processes.

A multimodal transport system integrates different geographical scales from the global to local. With the development of new modal and intermodal infrastructure, urban regions have a growing accessibility to the international market; several parameters of regional transportation are transformed, or at least significantly modified.

CONCLUSION

There exists an accelerating rate of change in all aspects of human endeavor -social, political, economic, technological, ecological and psychological. It is not surprising that the reduction of lead times, shorter product lives, and increases in inventory turnover are resulting in significant increases in the pace of change in distribution. Distribution must be more responsive because of the demands being placed upon them by customers. Inventory turns must be increased not only because inventories are expensive to carry due to investment, space, and handling, but increasingly due to obsolescence. As technology continues to explode, product lives get shorter and shorter. Warehouse operations and systems must be put in place to handle increased levels of cross-docking, to address supply chain management, and to support continuous flow of distribution. All of distribution must focus on being responsive, on adapting to an ever increasing rate of change, and on working smarter, not harder.

THE OEM-OBM DEBATE: FACTORS INFLUENCING CHINESE FIRMS' BRANDING DECISIONS IN THEIR INTERNATIONALISATION PROCESS

Wilson, Ian¹

¹ Staffordshire University Business School, Leek Road, Stoke-on-Trent. ST4 2DF. U.K.

Abstract

A key international marketing decision for many Chinese (and firms from other emerging markets) is whether to internationalise their own brands - labelled by the Chinese as OBM (Original or Own Brand Manufacturing) - or to be international players by acting as contract manufacturers (labelled by the Chinese as OEM (Original Equipment Manufacturing) for foreign brand owners (FBOs).

The paper discusses some of the extant research on the advantages and disadvantages of each business model and then focuses on primary research conducted amongst 8 Chinese firms in electronics and textiles and the OEM-OBM decisions they face. In so doing, it discusses some of the factors influencing such decisions and proposes a framework for reviewing them as firm and environmental circumstances change.

Keywords: OEM OBM Internationalisation brand China

Introduction

The emergence of Chinese brands into international markets is a topic of importance for both the Chinese and their potential Western competitors. For the Chinese, it is a question of acquiring competitive strengths, exploiting market opportunities and it is also a question of national pride. For Westerners, there is the likelihood of more competition from some strong players and, in some situations, the likelihood that erstwhile collaborators will become future competitors. As yet, few Chinese brands have established themselves as major players on a global basis but firms such as Haier, Galanz and others have become significant forces in some product sectors and market segments in some country markets. A key international marketing decision for many Chinese (and firms from other emerging markets) is whether to internationalise their own brands or to be international players by acting as contract manufacturers for foreign brand owners (FBOs). This paper focuses on the development of Chinese firms in electronics and textiles and the decisions they face in international markets, particularly whether to pursue an OEM or OBM strategy and discusses some of the factors influencing such decisions.

Moving from OEM to OBM is a critical decision facing a number of Emerging countries at this time. In 2002 the China Brand Strategy Promotion Commission was established to help advance top Chinese national brands. The reasons are clear. According to Business Week 2003 (Fan, 2006), the world's top 100 "consumer and retail goods brands which rely on overseas production" achieved sales of US\$3,500 billion while the top 100 OEMs in the Asia Pacific region, which supply those companies, achieved a sales turnover of only US\$84 billion. Further, on average, the gross margin on

OEM products was 19% while on OBM goods it was 27% (China Daily, 2008). At individual firm level, it is estimated that 60% of the price of an iPhone 4 is for Apple's design and engineering, marketing costs and profit while 31% is for components and only 1% for soldering, assembly and packaging by the Chinese OEM.

While evidence for the precise figures may not be perfect, the general picture is clear and movement from OEM towards OBM has been apparent for some time in some (but relatively few) cases. For example, the Hong Kong Trade Development Council reported in 2003 that many firms planned to develop ODM (Original Design Manufacturer) business. This was driven by the desire to shift the basis of competition from price to design, to respond to customer needs and as a preparatory step to building brand names (HKTDC, 2003). Gereffi and Memedovic (2003) report that The Republic of Korea is the most advanced among East Asian NIEs in developing OBM production and brands.

Literature review

The literature review examines the advantages of an OEM branding strategy in facilitating the export of Chinese made products. It then addresses the wider issues which impinge on the OEM-OBM debate and some of the pathways available to firms which wish to develop from an initial OEM base. It then examines some of the dangers of not shifting strategy and, subsequently, the problems associated with shifting.

Although it may not be seen as a branding decision by the firms themselves, the choice of an OEM business model is a decision not to brand products and which will also largely determine its initial foreign market entry mode strategy (Wilson, 2006). In the first instance, this is likely to be through passive exporting (Clarke and Wilson, 2009) i.e. FBOs seeking OEM suppliers may contract these to manufacture products for them.

A firm with an unknown brand name, perhaps based in a country with negative country of origin cues, will find it difficult to market to foreign countries. OEM branding is one strategy which bypasses these hurdles. It reduces the costs of marketing dramatically and endorses the product with the customer's brand name. Very importantly, the product is sold through the customer's already established marketing channels. There may be further advantages for the contract manufacturer if the customer provides assistance with technology or perhaps insists on quality controls which improve the manufacturer's quality standards. Large volume orders with programmed delivery schedules may also result in the manufacturer being able to hone their processes so as to further reduce costs and become even more competitive.

Relationships built will increase the manufacturer's learning about its customer and their markets. This may encourage the OEM to then engage in active exporting. Ultimately all this learning, together with the credibility and references resulting from having already sold in the market should make it easier for the contract manufacturer to later supply the market on an OBM basis should it wish to.

Hobday et al (1998) also discuss the contribution made by OEM business as a mechanism for Taiwanese and Korean firms to overcome entry barriers into foreign markets and force continuous improvements in contract manufacturer quality. Goldstein et al (2006) and Yang (2006) also emphasise the benefits of the OEM system in having to conform to the QA systems of the GPN (global production network) flagship firms.

Van Grunsven and Smakman (2005) studied the 'pathways' taken during the 1980s and 1990s by firms in the Singapore garment industry. They identified 7 development trajectories amongst the 57 firms analysed and found that OEM strategies inevitably resulted in internationalization as foreign buyers seek sourcing opportunities. However, whilst a few OEM firms had added the production and marketing of their own brands, OEM supply remained the basis of their business. Some of the OEM firms had added additional services, effectively moving towards an ODM situation. Amongst the limitations in moving from OEM to OBM, they identified the difficulty for large firms in returning to short runs and the 'credibility gap' between design, marketing and retail on one hand and manufacturing on the other.

However, Hobday et al (1998) report that many firms wish to break out of their OEM role and transform from latecomers to leaders. Yeung (2007) describes three corporate strategies of leading Asian firms. Firstly, some firms have moved from being subcontractors to become 'strategic partners' of the lead firms in global production networks (GPNs). Secondly, some firms have chosen to develop expertise in niche sectors such as specialized components. Thirdly, some firms have chosen to make the 'quantum leap' to become GBOs (global brand owners).

Child and Rodrigues (2005) classify Chinese internationalization routes as partnerships (either through OEM arrangements or J-Vs); acquisition of foreign brands, technology and market position; and organic international expansion, as illustrated by Haier. Additional to the advantages noted earlier of the OEM route, they refer to the opportunity to preserve their independence, benefit from scale economies and achieve a reputation for manufacturing excellence which may (as in the case of Galanz) confer sufficient bargaining power that they can badge their products as 'made by Galanz' whilst also branded by the GBO.

In contrast to the advantages of OEM, Lee and Kim (2004) suggest that, because they did not shift from an OEM to an OBM strategy, Korean toy producers have all but disappeared. From 700 OEMs a few years ago, only OBM Aurora and two ODMs remain. They could not compete with Chinese OEM producers. A second risk is that low margin business coupled with a possible reliance on the customer for product improvement means the manufacturer will lose the ability to create and maintain a product edge and become dependent on low price for winning orders.

The academic literature seems to give less coverage to the challenges posed by moving from OEM to OBM. The costs of switching from OEM to OBM must not be underestimated. For example, the possible additional costs – both monetary and time - of building a brand overseas, compared to contract manufacturing on an active or passive exporting basis, are likely to include R&D, product

development, name search and registration, international market selection, market entry mode selection and implementation, marketing channel selection and management, marketing communications and marketing planning. On top of this, a number of other factors are necessary for success. Wreden (2005) claims that many Asian firms switching from OEM to OBM need to develop an understanding of branding and to see it as an investment rather than just a cost. He suggests that they tend to equate branding with advertising rather than the “ability to develop emotional and experiential ...relationships with customers”.

The options facing a firm which wants an OBM strategy are whether to follow a single or multi-brand strategy and whether to retain an OEM strategy as well. TCL, for example, has several brands whilst Haier has its one corporate brand. The arguments for each strategy have been extensively documented. One key advantage of multiple brands is that it allows more market segments to be targeted and therefore potentially greater sales. Retaining an OEM strategy also means more opportunity provided that the OEM and OBM options target different segments.

However, the OEM plus OBM option raises the danger of the firm’s business model being “stuck in the middle” in a Porterian sense (Porter, 1988) if the same SBU (strategic business unit) is engaged in both types of activity. This is because OEM requires an emphasis on low costs while OBM requires additional expenditures usually necessary to create differentiation. The managerial skills and employee attitudes are also necessarily different. The Taiwanese laptop computer firm Acer resolved the conflict by deciding to focus on R&D and marketing and outsource its manufacturing to other OEM firms (Yang, 2006). A different approach was taken by Asus by allocating its OEM business to a wholly owned subsidiary. Nevertheless, other Taiwanese firms such as Arima, Clevo, Elite and Twinhead continue to house OBM and OEM business in the same organization (Yang, 2006).

Methodology

The area within China selected as the sample frame has been referred to (Yang and Hsia, 2007) as the Greater Suzhou Area (GSA) and is a relatively new industrial cluster within the Yangtse River Delta. It includes the cities of Suzhou and Kunshan, Suzhou itself being under one hour from Shanghai by fast train. The area has been a major recipient of cross border investment from the Taiwanese IT industry, seeking primarily a lower cost base but also opportunities to sell in the mainland Chinese market. Five firms were interviewed in the electronics industry, including makers of computer products and other consumer durables, of which four were Taiwanese owned. The other three firms were in the textile industry, one of which was Singaporean owned.

The industries selected are characterised by the Chinese OEM – Western OBM model. The selection of the specific firms was driven by convenience. They were all identified as being of sufficient size and experience to be able to comment on the research issues. The number of employees in the GSA sample varied from 200 to around 100,000. An obvious limitation of the research is the limited sample size and the consequent omission of very large and very small firms. Responses from large OEMs are likely to differ significantly from small OEMs. For example, some OEMs are now so large and so

expert in quality mass manufacturing and technology development (for example, Foxconn and Quanta) that they are probably in a very powerful position relative to brand owners. Nevertheless, the prime purpose of the research is to raise and conceptualise the relevant issues, not to quantify them.

The interviewees were either the Chief Executive, the Chief Financial Officer or Product Marketing Managers. They were chosen on the basis of their knowledge of the research issues. A translator was present at all times but six of the interviews were held in English directly with the respondent and two relied on the translator. The discussions were held in the company premises and lasted between one and three hours.

The respondents were provided with a limited briefing in advance but it was emphasised that the purpose of this was not to direct the conversation but to allow any form of preparation which they might consider relevant. Indeed, the respondents were encouraged to take the discussion in directions which were most pertinent to them. In this sense, the research was largely inductive with the hope that it might lead to some generalisations for theory development (Pressey and Mathews, 2003). This approach leaned towards Glaser's perspective that the researcher should start with no pre-suppositions (Easterby-Smith et al, 2002)

Primary Research Findings

Firm 1 started selling Chinese brand clothes in the early 1990s making rapid progress and building its first factory in early 2000s and expanding capacity greatly in 2005. Recently it obtained approval to produce for a number of famous Western brands so that currently, some 40% of sales are for export of these via the GBOs. Of the 60% sold in China, 95% are Western brands but, again, they are sold through to GBOs and through their marketing operations in China. 5% of sales are Firm 1's own brand which it would like to sell in foreign markets. Firm 1 has its own design centre in China which includes European staff and designs for both European and Chinese markets. The problem is a limited knowledge of the European market and the marketing channels. Management also believes that the firm is not yet big enough but anticipates it will be in the future.

Firm 1's management has the energy and resources to further develop its own brand portfolio. The motivation to do so is partly that OEM offers limited profit and development opportunities but also for the personal esteem which comes from ownership of a successful brand. Firm 1 is also interested in acquiring Western brand names either under license or by acquisition of production assets. One idea is to export semi-finished products to be finished abroad and then imported back into China in order to exploit the price premium associated with a Western country of origin (COO).

Firm 2 is a major supplier to two GBOs of clothing products for sale in Greater China only. Firm 2 is free to sell to other customers abroad and is currently talking to a third GBO which identified them because of their industry reputation. However, the existing GBOs do not want Firm 2 to manufacture for Chinese brand owners for the Chinese market. One of the GBOs is worried about industry

legislation in China and so is encouraging Firm 2 to open a new factory outside China. Additional drivers are lower costs and bias against products 'made in China'.

Firm 2 said that their only focus is on manufacturing and that they were happy with the margins made. Moreover Firm 2 believed that the GBOs are re-assigning more margin to the manufacturers as they seek to enhance their brand image via quality and greater attention to supply chain corporate social responsibility issues. Firm 2's plan to remain as an OEM does not preclude it from building a B2B brand within the OEM business and it has been rewarded for quality by one of the GBOs allowing it to attach a 'made by Firm 2' label to garments produced.

Firm 3's parent company is in Singapore and manufacturing only is undertaken in China. Sales from Chinese production are 80% to the USA and 15% to Europe. It does have a design function in Singapore but most business is still according to the GBOs designs. Although it sells to around 10 GBOs, it is a strategic partner to one.

Firm 3 would like to do OBM for the Chinese market. Firstly because of a belief it would give them more control over their business, secondly because a lack of knowledge of Western markets and tastes and concern about customer reaction there to 'made in China'. However, management thinks OBM would be problematic because of the likely reaction by GBOs and the prevalence of counterfeiting, making it unprofitable to invest in brand building.

Firm 4 provides a variety of OEM products and services ranging from assembly only to manufacture of complete products with or without design or procurement and has no plans to change. The reasons are that, firstly, they specialise in manufacture and have key competences in product knowledge, manufacturing processes and cost down; secondly, as an OBM they would have to bear the market risk e.g. unsold inventory; thirdly, OBM would bring them into conflict with their current clients. However, in terms of new growth directions, Firm 4 is now considering an own brand consumer electronic product which will not compete directly with existing GBO customers for that product. This might be achieved by customisation for specific final customers or marketing to different geographical territories. In either instance, Firm 4 would consult with its GBO customers first.

Firm 4's business strategy involves choosing a product category in which to compete and then select customers, which would normally be GBOs. For example, Firm 4 would not select cell phones or lap top computers because there is no margin in OEM. Secondly, the customer would be selected on the basis of market standing (share), growth expectations, and management competences, particularly financial skills. Using this approach means that international market selection is based on targeting individual customers rather than countries.

Firm 5 is a Taiwanese company which has done OEM business for many years and moved to China for lower costs. TV sets are produced only for a Taiwanese – North American JV and branded on an ODM basis. Computer screens (which they regard as complete products) are sold to many GBOs. 100% of production is exported and they seek new customers and new countries. They also wish to grow via NPD.

If Firm 5 had sufficient funds, they would consider OBM but currently have decided to focus on OEM. OBM would take 3-5 years to achieve brand awareness and cost too much in advertising and after sales service. They also doubted whether they would have the design expertise to meet consumer tastes. Management felt a further requirement for OBM would be the need to embrace CSR practices. Interestingly Firm 5 prefers to sell to manufacturers rather than distributors because of a belief that the latter can help Firm 5 improve its image. However, Firm 5 will sell to distributors if those distributors have their own brand.

Firm 6 manufactures a range of products including vacuum cleaners, central vacuuming, kettles, bikes, electric bikes (developed for China and now exported to Italy), humidifiers, fryers. 99% of vacuums are exported, of which 66% to Europe, 20% to USA and the rest to another 65 countries.

Firm 6 was originally state owned but was privatised and began its new life with exports on an OEM basis being initiated by a French importing distributor some 14 years ago. Most customers (around 200) today are distributors but more and more supermarkets are buying direct including leading retailers in the US, France and the UK. Firm 6 also exports to some GBOs. Since 1997, Firm 6 has undertaken R&D and, from 2002, has increasingly worked with customers on joint design. Working with confidentiality clauses, this helps both parties in that Firm 6 upgrades its technology and foreign partners get exclusive products. This type of project business now accounts for over 50% of sales.

In the Chinese market (which accounts for only 1% of sales) they sell under their own brand. Firm 6 would like to do OBM in export markets as well but believes that the costs would be too high, particularly establishing a selling network, developing relationships with retailers and advertising. Management also believes that Chinese brand names are not popular. Despite current design capability, R&D is still the biggest hurdle. Firm 6 needs to develop new product concepts in order to give people a reason to change from the brands they know.

After an estimated 10 years Firm 6 may have enough money, design capability, people and after service to be able to build their own brand and Firm 6 will probably focus on export OBM unless OBM performance in China has improved by then.

Firm 7 began with OBM in Taiwan but because Taiwan is small they accepted OEM orders. Later, under pressure from OEM customers, Firm 7 separated OEM and OBM businesses in terms of manufacturing plants and business decisions. This arrangement is advantageous with OEM generating volume and bargaining power with suppliers while OBM generates higher profit margins. However, within Firm 7, some believe that OEM customers are not completely satisfied and a full split may take place later.

Firm 7 makes for GBOs, sometimes undertaking R&D and sometimes not. In terms of product categories, Firm 7 makes OBM notebooks, cell phones, big screen TVs and computer motherboards. Recently, they launched an own branded laptop designed for global markets beginning with the USA, followed by China and Japan.

All OBM products are made in China while plants in North and Central America just produce for OEM. Firm 7 has sales companies abroad e.g. in Russia and India which only sell OBM products. Sister companies seek OEM business in these countries.

Firm 8 started as OEM with a gross margin of 3-4% but after 20 years switched to OBM and achieve a gross margin of 10%. Now they need to raise volume to increase profits. 30% of current sales are made in China, 40% in Europe and 10% in South America. Their plan is to sell to more and more countries. For Firm 8, OEM is really just assembly. Firm 8's objective is to rival the industry majors and it sees R&D as the mechanism.

In summary, the primary research generally confirmed the existing literature in terms of the difficulties faced in shifting from OEM to OBM and within this, the specific problems of building brands internationally. Additionally, however, it did highlight a broader range of issues affecting this decision which are summarised in the next section where research conclusions are made in two areas. These are, firstly, the present status of the firms in terms of OEM-OBM and intended future pathways; secondly, the factors which influence the OEM-OBM decision.

Conclusions and discussion

Whilst there are no absolutely clear dividing lines, the firms in the research could be broadly grouped as follows. One firm is already OBM only having been established specifically for this purpose. Three are currently largely doing OEM business and plan that this will continue to be the predominant focus. The reasons are that they have developed their core competences in manufacture and in the provision of associated services. However, even one of these firms has recently introduced a new product under its own brand name. Four firms are predominantly doing OEM business but would like to make a positive move into OBM as well. OBM is seen as offering a number of financial and, interestingly, psychological benefits for the brand owner.

The advantages of the OEM model in terms of facilitation of foreign market entry, volume sales achieved with limited expenditure and, often, assistance with technology and quality enhancement are clear. But so are the risks of OEM and, conversely, the benefits of OBM and there does seem to be a natural progression towards OBM. Nevertheless, the OEM-OBM choice for any particular firm seems to be influenced by a number of factors. These are discussed below and summarised in the decision model in Figure 1, adapted from Wilson (2005, p.15).

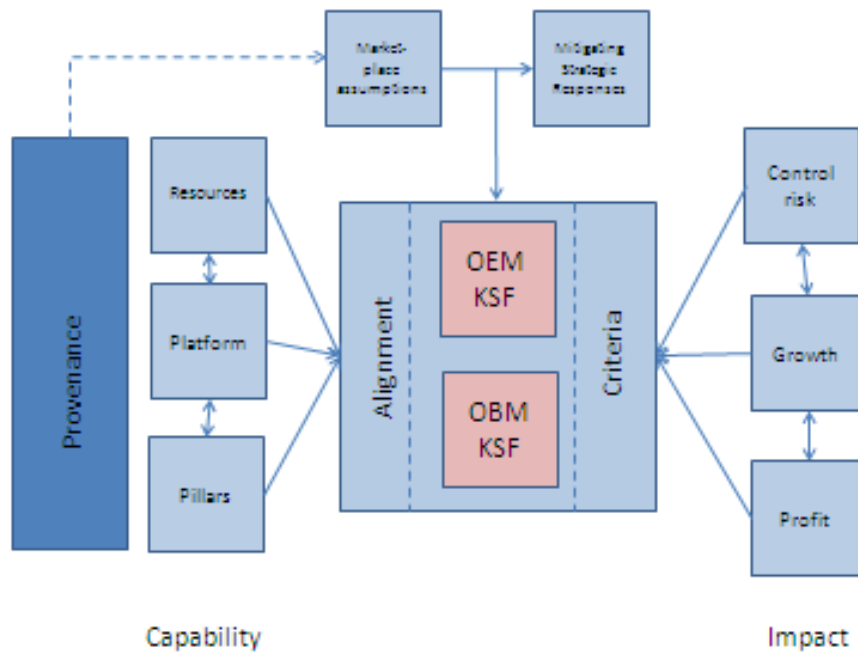

Figure 1 Factors influencing the OEM-OBM decision

Provenance in this context refers to the origins and early experiences and values of the firm. Thus, Firm 2 was founded on OEM and sees its success as evidence for its ability to build a differentiated and profitable B2B brand within the competitive market for outsourced sports clothing. Platform here is largely a combination of vision and mission which help define the future domain, direction and ambitions of the firm. Thus the personality and values of the founder of Firm 1 have strongly influenced its growth ambitions and the prestige perceived to emanate from consumer brand ownership. Firm 4, by contrast and notwithstanding a planned limited foray into OBM, has publicly articulated its mission “to be one of Asia’s top OEM service providers”. Pillars are the underpinning distinguishing capabilities and competences within the firm which lead to its competitive advantage and/or superior customer value. Firm 4, for example, focuses on advanced process engineering amongst its pillars which also allow it to provide its customers with feasibility studies of proposed new designs. People in Wilson’s original model are replaced with overall Resources. Cost is a major issue in moving from OEM to OBM and inhibited Firm 5 but Firm 7 possessed sufficient resources to overcome this constraint.

According to Leinward and Mainardi (2010), who refer to the concept as the “coherence premium”, successful performance requires a firm to align its “internal capabilities with the right external market position”. In the case of the OEM-OBM decision, this means matching the above internal firm factors with the key success factors required of the two alternative business models. For OBM these would

include product innovation, brand building skills and market, customer and channel expertise. For OEM, they would include lean operations, for example.

However, the research also suggested that, in addition to this core alignment process, several firms were concerned about the influence of a variety of other factors. These have been labelled “market-place assumptions” and sometimes result from a firm’s prior experiences. For example, Firm 3 was discouraged from OBM because it feared conflict with current customers, because it assumed its lack of understanding of Western culture would prevent it from designing suitable products and because it assumed that any successful brand it managed to build would suffer from counterfeits.

Equally, firms have a certain amount of choice about alternative strategic responses which may moderate, mitigate or eliminate the impact of these assumptions. As examples, the fear of conflict with existing FBO customers assumed to result from moving from OEM to OBM can possibly be avoided by using “RCSTP” strategies which refer to marketing to different geographical Regions, selecting different product Categories, and using different Segmentation, Targeting and Positioning strategies. Firm 4’s foray into OBM, for example, will be based on choosing geographical territories and product categories in which its current customers do not compete. Firm 1 has engaged European staff to bring Western cultural understanding into its design capability while Firm 6 has engaged in joint NPD research in its attempt to bridge this assumed gap. As a final example, Firm 1 has considered the licensing or acquisition of foreign brand names as a strategy for coping with the assumed negative attitudes towards Chinese brands.

Having considered the above influences, perhaps the ultimate criteria for choosing between OEM and OBM will be the short and longer term impacts on growth, cash flow-profit and control-risk. Different firms see the two options in a different light. Thus Firms 1 and 5 see growth coming from building consumer brands while Firms 2 and 7 see much opportunity within the OEM market. Likewise, for some firms, OBM offers more control over their destiny through a reduction in the risk of price-based customer defection while others see more control arising from the careful management of OEM business without the risk of brand building failure, greater stockholding and debtor expenses. In terms of shareholder returns, some firms see OBM as offering higher profits through better margins while others see OEM as providing improved cash flow with the opportunity for improved or, at least, adequate margins.

While in the short and medium term, the reality is that a capabilities-driven strategy provides coherence, in the longer term, firm internal factors such as resources and competences change, as does the external competitive and collaborative and environmental context, such that the OEM-OBM decision or the OEMplusOBM decision will need to be continuously monitored and perhaps revised.

**AN INVESTIGATION OF TALENT MANAGEMENT (TM) IN PRIVATE ELECTRONICS
ENTERPRISES IN WENZHOU, P.R. CHINA**

Ye, Hongkai¹; Zhang, Crystal²

¹ Leeds Metropolitan University/ PhD Student;

² Leeds Business School, Leeds Metropolitan University. Email: c.zhang@leedsmet.ac.uk

Abstract

The major purpose of this research is to explore the talent management practice in Chinese private companies in the electronics industry and to provide a broader understanding of current talent management research with emphasis on Multinational Enterprises in China. This research focuses on exploring how the senior managers define “talent” and “talent management” in Chinese private companies; whether they perceive any fundamental differences between talent management and traditional human resource management; and the current practices of adopting talent management in Chinese private companies. In addition, the impact of industry segment on the practice of talent management is examined and discussed.

A case study approach with semi-structured interviews has been adopted in this research. Six Chinese private companies in the electronics industry have been selected for the case study. The interviews were conducted with senior managers and HR managers for each company in Wenzhou, P.R. China. Based on previous research, the interview questions focus on the definition of talent and talent management; the perceived differences between talent management and human resource management; why and how the organisations adopt talent management; and the different application of talent management practice in different industries in China.

This research shows that there is an understanding on the increasing importance of talent management practice and policies in future organisational development. Chinese senior managers from private enterprises perceived a definite difference between talent management and human resource management. In addition, there has been diverse perception on talent, talent management from different industry.

This study looked at a small number of companies in China. A larger sample from other industries will help build a comprehensive picture of TM in China.

This research enriches the research data of talent management in Chinese companies, especially, in the private sector and the electronics industry. The comparison of talent management within different industry types will provide significant meaning for the development of talent management.

Keywords: talent management, human resource management, private sector organisations, China.

Introduction

Talent management (TM) has attracted increasing attention from academics and practitioners since a group of McKinsey consultants coined the phrase “the War for Talent” in 1997 (Iles et al., 2009; Collins and Mellahi, 2009). Organisations worldwide have come to realise that the knowledge, skills, and abilities of their talented employees represent a major source of their competitive advantage (Guthridge et al., 2008; Collings and Mellahi, 2009). Indeed, even during the financial crisis, talent remained a critical agenda item focused on the highest achievers and the overwhelming majority of firms still intend to focus on top talent, with nearly half the companies planning to sustain or increase learning and development expenditures (Beechler and Woodward, 2009). Without a doubt, TM will become more important in the age of knowledge economy. Academics have responded by identifying a wide research agenda to further the theoretical and empirical development of TM as part of human resource management (Hughes and Rog, 2008; Iles et al., 2010).

Definition of TM

It is necessary to define ‘talent’ before studying TM, because it could influence how talents are identified and how TM approaches are underpinned. The McKinsey report referred talent as “the best and brightest” and their “A-level” employees who rank in top 10 to 20% of the organisation (Beechler and Woodward, 2009). However, a high potential performer would also be “those people who are defined as talent for the purpose of the organisation – be it top performers, high potentials, senior managers suitable for director positions, or people suitable for critical roles in the organisation” (Blass, 2007). Indeed, Ulrich (2006) defined talent as the multiplication of the 3Cs – competence of the individual, commitment to the work and the company and real contribution through meaning and purpose of the work. However, it is difficult to make a specific definition for every organisation as different organisational demands would determine the different understanding of the word “talent.” Indeed, a Chartered Institute of Personnel and Development (CIPD) report has observed that “TM requires HR professionals and their clients to understand how they define talent, who they regard as the talented and what their typical background might be” (Iles et al., 2010). Talent could therefore be either the elite of the organisation, or people with specific skills important to the organisation.

Talent management and human resource management

Just as there is no specific definition for “talent,” there is also no specific description for “talent management,” as can be seen in the debate in the literature regarding this topic (McDonnell et al., 2010). Hartmann et al. (2010) claim that TM can be distinguished from traditional HRM by using more strategic and future-oriented, as well as to be in line with the overall corporate strategic goals. For Boddy (2008), HRM is the effective use of human resource in order to enhance organisational performance. Iles et al. (2010) propose TM as the next stage of HRM. Blass (2007) indicates “most TM processes and systems fall within the domain of HRM and line management. Whereas, it remains some difference within function and focus point.” Indeed, TM is the “additional management processes and opportunities that are made available to people in the organization who

are considered to be talent" (Blass, 2007) and the "identification, development, engagement/retention and deployment of those employees who are particularly valuable to an organisation - either in view of their 'high potential' for the future or because they are fulfilling business/operation-critical roles" (Iles, 2008).

A broad review of the literature on TM by Lewis and Heckman (2006) concluded that the main components of TM include strategy sustainable competitive advantage, strategy implications for talent, talent pool strategy, talent management systems and talent practices. As such, TM is very similar to strategic HRM, which is the planned pattern of human resource (i.e. workforce) and human resource management (i.e. functional) deployments and activities intended to enable the organisation to meet organisational goals and objectives (Way and Johnson, 2005). Chuai et al. (2008) mention that both TM and HRM see that placing the "right" people into the "right" roles is an important means of integrating people practices with organisational goals, including individual development. TM requires not only the buy-in of HR department and line managers (as does HRM), but also the support of the senior management team, as it is assumed that TM will fail if it is viewed purely as an HR initiative (Chuai et al., 2008). A difference of TM to strategic HRM is also in the words "high potential." These suggest the future possibilities of the people in the organisation, which in turn requires a strategic thinking in human resource management and organisation.

Talent pool

Talent pool, as its name implies, is diverse talent in reserve. Collings and Mellahi (2009) use the term talent pool to refer to the pool of high potential and high performing employees that the organisation can draw upon to fill crucial talent positions. Employees from all parts of the organisation may be identified as "talent" and therefore be included in the corporate talent pool (Makela et al., 2010). Collings and Mellahi (2009) identify the key of strategic TM is the development of a talent pool to fill critical positions. Thus the talent pool becomes an important component of TM. It also becomes a key element to distinguish TM from traditional people management. Although vacancy-led recruitment is similar in meaning to talent pool, talent pool involves the proactive identification of employees with the potential to fill key positions that may become available in the future.

The identification process of talents is the key step of establishing a talent pool, followed by the need to activate and develop the potential of talents identified (Makela et al., 2009). Colling and Mellahi (2009) also recognize that "the talent pool should be focused on managing the risks and costs associated with outcomes that are difficult to predict (such as openings and vacancies). Risks include the potential mismatch between employees and skills, i.e. too few employees to meet business demands or too many employees resulting in redundancies; and the failure to retain talent, resulting in a loss in the investment in development initiatives (Colling and Mellahi, 2009). These challenges are illustrated, and indeed exasperated, by the volatile nature of the global economic climate in the modern age.

Talent management in China

China is often thought of as a market with near limitless potential (Ahlstrom et al., 2001). It has enjoyed nearly three decades of economic growth with an average of around 10% per annum since the reforms policy in the late 1970s (Chuai et al., 2008). The large domestic market has attracted a tremendous amount of foreign investment, such that China is now one of the world's largest recipient of direct investments from abroad (Björkman et al., 2008). With increasing competition between state-owned, private and foreign companies, the attraction and retention of talent in China has been considered to be one of the most challenging tasks in HRM practice due to the severe shortage of talent in the labour market (Scullion and Collings, 2011).

It was suggested that the shortage of managerial/professional talent could hold back China's economic growth (Zhu et al., 2011). Although the automobile industry has become a pillar industry in the China economy, it is reported to be already short of 800,000 automobile professionals (Mao et al., 2009). Furthermore, the skill shortage is especially severe in the managerial sector, where it is estimated that China will need over 75,000 qualified managers in the next ten to fifteen years – compared to the paltry 5,000 currently available on labour market (Hartmann et al., 2010). The talent shortage will be a real challenge for the organisational development for Chinese companies. 44% of Chinese executives in a recent survey reported that insufficient talent was a major barrier to expansion and continued growth will increase demands for talent at a time when multinationals are increasingly competing with local state-owned and private firms from the same talent pool (Zhu et al., 2011).

Nonetheless, there are other TM issues emerging in China. Ahlstrom et al (2001) described some of these: a) workers laid off from state-owned enterprises have little experience of a competitive labour environment and often exhibit poor work habit; b) Chinese labour market also placed strong constraints on labour mobility, requiring a special permit to live in certain cities to obtain housing, food, or other benefits, although these rules are starting to be relaxed; c) it is difficult to identify a pool of qualified workers; d) Chinese students are normally discouraged from expressing themselves thus affecting the training performance; 5) the appraisal system cannot be systematically implemented. More recently, Zhu et al (2011) added that there was also an imbalanced economic development among regions, a lower qualification of the current human capital, an incomplete labour market system, an under-developed managerial labour market and lack of innovation in HRM. Furthermore, it would appear that Chinese companies were increasingly looking abroad to recruit talent with managerial capabilities (Zhu et al., 2011). For example, from the 1.52 million managerial employees, less than 1% had a postgraduate degree qualification and only 11.4% had bachelor degree qualification (Scullion and Collings, 2011).

In response to these issues in talent, the Chinese government unveiled a new National Medium and Long-term Talent Development Plan (2010-2020) to develop "favourable policies in terms of taxation, insurance, housing, children and spouse settlement, career development, research projects, and government awards for high-calibre overseas talents who are willing to work in China" (People's

Daily Online, accessed 2010). This was closely followed by the rapid development of business school and MBA/EMBA delivery and nationwide short-term executive management training programme (Scullion and Collings, 2011).

Research

This section outlines the methodology adopted and first overview of the findings from an initial Wenzhou-based pilot study carried out during 2010. The objectives of the research were to understand the definition of talent and talent management and its relevance to China in a small sample of large and medium private Chinese companies in Wenzhou, Zhejiang province.

These companies were chosen on the basis that they are likely to be more advanced in their thinking and approach to human resource management and to the implementation of a talent management strategy. Historically, the private sector in Wenzhou has served as a role model for privatisation in China (Krug and Hendrischke, 2001), and thus our intention is that this project would lead to a better understanding of the role of TM for Chinese private sector as a whole.

Research method

During 2010, a number of large and medium private enterprises were approached in Wenzhou, Zhejiang province, PR China. Zhejiang Province played a leading role in the privatisation of enterprises since the early 1980s (Huang et al. 2008) when the 'Wenzhou Model' was first propagated as a model for privatisation (Krug and Hendrischke). The six companies (A, B, C, D, E and F) were chosen from the electronics industry, and were listed in the list of China's Top 500 private companies.

Data was collected using semi-structured interviews conducted with senior managers and HR managers. All the interviews were conducted face-to-face and in Mandarin, with a typical duration of about 1 hour. Questions covered the following subjects to elicit detailed information on:

- a. the definition of Talent and TM in Chinese private companies;
- b. whether TM is different from HRM, from a Chinese private company's point of view;
- c. the current status of TM in Chinese private companies.

Recorded interviews were translated to English during the analysis process.

Overview of Research Findings

Defining Talent

Defining the talent can provide an orientation for TM practice. The abilities of managers, especially from senior management, in defining talent will influence effectiveness during operating TM practice. Interesting and dynamic points of view were revealed in our interviews. In line with the debate about a definition for talent, our samples of six companies supported both sides of the argument, with the exception of 1 company (D) who took the holistic view and viewed talent as a *“high*

value and high performer who possess distinctive skills and competences... but talent also could be everyone when they can fit in a right position”.

2 companies (A and E) viewed talent as

“The elite group of human resource. They can be the kind of person who possesses professional and innovation skills, and have the potential to be high value or top performer. They also can be someone who has already been recognised high value or top performer elsewhere.”

Company A

Furthermore, both companies did not use educational level reached or qualifications obtained as a benchmark for identifying talent.

“Talent can also be those who did not have a high education background. There are many entrepreneurs from Wenzhou who dropped out of school, after their times at the primary school. They should also be recognised as talent”.

Company A

In agreement with the other side of the debate, the remaining 3 companies (B, C, and F) claim that anyone and everyone is a talent.

“If you look at it as a whole, every employee (of this company) is our talent, even the lowest manual worker. Nowadays, it is difficult to recruit a well-trained manual worker, and therefore, a well-trained manual worker also means a lot to the company. Our company will treat every employee as talent”.

Company B

Caveats to the definition of talent were also added, as some companies believe that job position and morale an important aspect to be considered.

“Everyone can be talent...(but) Talents only can be called talent when they are in the suitable position”.

Company C

“Talent not only has outstanding skills but also need to have occupational morale.”

Company E

All of the above descriptions of talentshow that every company should cherish every employee. Furthermore, they should precisely deploy their employees in order to stimulate their potential talent to achieve maximum value. This point emphasises the importance of implementing TM practice in throughout the organisation in order to improve efficiency and productivity. The comment from Company Eabout considering morale is worth noting - evaluating the morale of talents may be useful so as to avoid high turnover during implementation of TM strategy and improved deployment.

Defining TM

4 companies interviewed broadly considered TM as part of human resource management. For example, Company A identified TM as *“a part of HRM,”* while Company B said that *“TM and HRM have similar content.”* Moreover, Company D proposed that *“TM can be considered to be a sort of upgrade to normal HRM or its evolution.”*

However, it would also appear that TM was considered to be a specialist area important to the organisational strategy. For example, Company E pointed out that *“HRM is broader and TM is more specialised”* especially in attracting, recruiting and retaining staff. Company A gave the example of their use of TM for attracting talent to Wenzhou by setting up a subsidiary company in first tier cities such as Beijing to increase awareness and prestige. As a result, advice from TM would receive more attention than from HRM during decision and strategic meetings.

“Recently, our Company’s TM has more specific plan in attracting, selecting, recruiting, retaining and developing than traditional HRM, focus on talent in key position.”

Company B

These interview data about the similarities of TM with HRM are in agreement with data from multinational companies operating in Beijing (Iles et al., 2009).

Current status of adoption of TM

All of the companies interviewed except for E have declared having a TM policy in their organisation, with the earliest adopter from 1991. Company E, the only one without a specific TM strategy, admitted discussing the possibility of TM in their agenda, but without did not go through its implementation. All the companies with TM reported to have achieved impressive results from their TM strategy.

The challenge of talent shortage was considered to be a crucial problem in all companies interviewed. More specifically, they mentioned a shortage of trained and even untrained manual workers. As Wenzhou is not a first tier city such as Beijing or Shanghai, and not even a second tier city, it has more difficulties in attracting a limited number of talent to it. Indeed, as paraphrased by Company B, *“the geographical position of Wenzhou has influenced the company to attract talent.”*

These are some of the examples of the companies in implementing a TM strategy to overcome their geographic weaknesses.

“Because of difficulties in attracting talent, our company has set up multiple solutions for retaining talent. For example, our company will help employees to solve family issues, especially for those coming from outside of Wenzhou. We have established a school for the children of our employees and provided working opportunities for their partners so that their family can stay together. We also offer them a stake in the company through share options to improve their loyalty.”

Company B

“Our company has set up a research lab in Shanghai to increase awareness of our company in a first tier city. This should attract more talent to us, and improve the research and development of our products. We have also started to outsource some of the projects to other companies, as a way to use their specialist talent.”

Company C

Conclusion

The paper has explored TM practice through semi-structured interviews with the senior management of six of Wenzhou’s private companies in the electronics industry. The preliminary data reveals a snapshot of the state of talent and adoption of TM practice in China. Overall, all companies had a conceptual understanding of talent which reflects the debate in academic research. Talent was seen as an important factor for their companies’ growth and expansion. In most of the cases, TM was considered to be a subset of HRM, albeit a specialist area which can influence the organisational strategy. One final factor of note is that all the companies interviewed predict a future shortage in trained or untrained labour – this in a country considered by the West to be full of cheap and numerous labour. In preparation for this, and also to compensate for their geographic weakness, most of the companies interviewed have already adopted a TM strategy to attract and retain their employees. Although TM in the companies interviewed is still nascent and lack a systematic approach in identifying and developing talent, our initial analysis points to the conclusion that TM will indeed become an important focus of Chinese HRM in private enterprises in the war for talent. Further research will be required to confirm this conclusion and follow its development in China.

Abstract

The aim of this paper is to investigate how non-oil international organisations (NOIO) in Libya assess Management Training and Development Programmes Needs Assessment (MTDPNA). This study aims to outline the current MTDPNA situation in Libya. Therefore, in order to understand the whole view of MTDPNA processes in non-oil international organisations (NOIO) in Libya. The study population consisted of all managers in 19 international and joint venture organisations, where the questionnaire was distributed on the (150) managers.

The findings of the study showed that, performance and experience were the most common MTDPNA measures. Likewise, poor performance, lack of knowledge, and introduction of new work methods were the most common MTDPNA indicators. Certain factors were also found that may have a positive or negative influence on MTDPNA such as; organisational sectors, size, and ownership. Customer dissatisfaction, poor service quality, low profitability, and lack of knowledge were the most used positive indications for the hotel sector, services, manufacturing, and joint venture organisations.

Finally, the researcher recommends that MTDPNA should be conducted at different times, and different methods should be used to collect the relevant data rather than direct observation or performance appraisal information. Also, decisions in regards to MTDPNA have to be based in a systematic way rather than targeting single or a group of individual. Similarly organisations are advised to provide MTDPNA to all management levels equally rather than aiming MTDPNA at middle or lower managers

Introduction

This paper investigates management training and development programme needs assessment (MTDPNA) in Libya as it is an important or key stage of an effective training programme, undertaken by any organisations in determining the type of T&DP to be provided to their employees or managers. And also to ensure that resources are utilised efficiently, training needs are assessed to identify who needs to be trained and the type of training programme they require (Holten et al., 2000). To provide some important information in regards to the topic in the country of study (Libya), this paper will briefly discuss management training and development programme (MTDP) in general, and MTDP practice in Libya;

Management training and development programme (MTDP)

MTDPs are described as a way of producing any opportunity for learning that helps to assist the process of achieving change (Whetherly, 1998). Stewart (1996, quoted in Younes, 2007, p. 25) and De Silva, (1997) point that; training and development are considerate for the purpose of the organisation, which has the aim of ensuring that the contribution of both individuals and groups to the accomplishment of the organisation objectives is maximised throughout the development of knowledge, skills and attitudes.

All development and training programmes should be tailored to meet both the needs of the individual and that of the company. MTD is a long-range process that requires time and results cannot be expected quickly (Reitsma, 2001). Therefore, any organisations that use MTD as a strategic implement, is to help the organisation meet its short and long-term targets. (Reitsma, 2001)

Besides, training and development can help any organisation in optimising the use of human resource, which further helps workers to attain organisational and individual goals. Basically training can be seen as an activity that modifies employee's behaviour which leads them to improve the skills for doing their work. Development is a long process that increases the skills and abilities to do a particular job (Piyali et al., 2011). As a practice, management training help modify employee's performance at work, in addition to the manager learning values themselves (Anderson, & Gilmore, 2010). Bass and Vaughan (1966) argue that, people cannot be brought together into an organisation to achieve a general purpose without training taking place. There must be different types of training provided for managers, programmes should be developed for individual managers however a situation might arise from time to time for specific programmes for groups of managers; needs to be identified from the company's corporate plan or by an assessment.

Management development is frequently considered essential for training managers who are supposed to be responsible for the future success of organisations (Mighty and Ashton, 2003). Although there are many purposes of MD; Winstanley et al (1996) identified five objectives of MD:

- A device should be made to engineer organisational change
- To approach following company achievement

- To change attitudes
- To assist in changing the role of line managers, and that
- A tool should be created in search of quality, cost reduction and productivity (Winstanley et al., 1996).

However enthusiastic a training officer may be, MD is not something that can be achieved by extensive use of external courses. It is a long process involving forecasting, recruiting and promotion policies, training, appraisal, salary policies and even organisational planning (Roberts, 1974). As a result, MD has five basic principles: it is essentially providing the opportunity for managers to develop themselves. The process can only take place in a favourable organization environment. MTD have similar purposes; the only differences between them are the learning methods used to implement them. For instance, MT is the use of session, lectures, and workshops, MD utilize learning centres, work rotation, and self-initiated. (Al-Khayyat & Elgamal, 1997)

Management training and development programmes in Libya (MTDPL)

Libyan is an Arab Country, famously known as a gateway between Africa and western countries. It has a long Mediterranean Coast of about 2,000 km and occupies nearly 1,774,440 sqkms; with a population approximately of 5.7 million inhabitants, 5.3 are Libyan and the rest are from different nationalities (NBI&D, 2006). Islam became the basic fact of life in Libyan society. The vast majority of Libyan's follows the Koran and the Hadith (the swords of Prophet Muhammad) (Gamal, 2008).

On 24th December 1951, Libya became an independent country referred to as the United Kingdom of Libya; although its economy was not performing well. It had budget deficits and was based on the limited productivity of a traditional agriculture sector. The discovery and exploration of oil after 1960 was the turning point; and the capital of the country increased rapidly; hence the increase in resources that transformed the economic performance significantly (Aagnaia, 1997).

MTDP is new in Libya; it was only introduced in the country after independence between 1953/54 to improve employee's skills and knowledge in the field of accounting and public administration. Subsequently the school of public administration was opened to train employees and impart managerial skills (Aagnaia, 1997).

The government realized that education had to be developed because of the effects it had on all other aspects of life; with particular interest is management skills in organisation, with many management training and development centres established; some in partnership with international training and development centres. This follows the notion that, the need and importance of MTDP can only be seen in their role in developing individuals, by enhancing them with capacity and skills to improve their management efficiency. To date MTDPs have become one of the major challenges within the human resource management (HRM) or development effectiveness system in Libya.

Therefore, MTDPNA require more attention, as it is the key centre of the training and development cycle as follow:

- MTDP needs assessment (MTDPNA)
- Design and develop MTDP
- Deliver and implementation of MTDP
- Follow-up and evaluation of MTDP

Subsequently, MTDP stages are an on-going research in general. However, this paper will only look at management training and development programme needs assessment in Libya (MTDPNA) as a vital platform if implemented correctly within the selected organisations.

Management training and development programme needs assessment in Libya and the Arab state (MTDPNA)

MTDPNA could be defined in Libya and Arab organisations as the most unconsidered stage of T&D cycle. For instance; Kuwaiti organisations do not use any systematic methods or approaches to implement training needs assessment, according to Abdalla and Al-Homoud in (1995). Agnaia (1996) point that, to implement training assessments in Arab organisations; the main sources must come from supervisors and participants.

Libya is one of the Arab countries, but very few empirical studies have investigated MTDPNA. Agnaia (1996) found that, training needs assessment was exposed to the visions of bosses and supervisors rather than trainees themselves (managers or employees) in Libyan public sector and private organisations. Agnaia affirmed that, whoever is in charge of MTDPNA implementation sent their employees and managers to the programmes without any systematic approach, because they were missing the skills and abilities to perform their tasks and duties.

Another empirical investigation by Etturki (1985) has found that, MTDPNA were conducted mostly at the lower managerial level rather than other senior level of management. (Agnaia, 1996; Etturki, 1985)

Other empirical literature on Jordan private and public sectors, found that, one-third of the organisations conducted MTDPNA at lower managerial level, but without practical and organisational analysis (Alhyasat, 2011; Altarawneh, 2009; and Abu-Doleh, 2005).

However, in the banking sectors, TNA was frequently conducted, represented by (77%), and only (16%) stated that their banking conducted TNA rarely. The banking organisations in Balqa Governorate in particular have highly conducted TNA to their employees (Alhyasat, 2011; Altarawneh, 2009; &Abu-Doleh, 2005).

Thus, Training needs assessment consists of three level of analysis: organisation analysis; operations, task, or work analysis; and individual analysis (Yaw Chen & Sok, 2007). Conducting a systematic

needs assessment is a crucial initial step to training design and development and can significantly reflect to the overall effectiveness of training and development programmes (Arthur & Bennett et al 2003).

Kaufmann, et al. (1993) suggest that, the principle for needs assessment is to identify performance gaps, to prioritise them and to address the most significant ones, whereas needs analysis is to investigate the reasons for the gaps (Holton, E. et al, 2000)

Nowadays, MTDNA has become the concern and very important aspect for every manager to develop personnel and institutions in Libya and the Arab region in general. That could help in identifying issues in the implementation and the follow-up of MTDP for more effectiveness (Abdel, 1993; and Muhammad & Rashid, 2011, p.440). Therefore, MTDNA need to form part of the organisations process in Libya and the Arab world organisations, and must be conducted on a methodical needs analysis basis.

MTDNA can be effective if institutions embrace the working environment, as there are some factors both internal or external that can impact on the programmes negatively or positively even if MTDNA was conducted correctly (Agnia, 1996).

This paper will also look at some internal factors that might have some influence on MTDNA such as; sectors, sizes, and the ownership of the organisations which will be discussed more within the results sections.

Methods and procedures

Specified the important of MTDNA in Libya, it was decided to look at non-oil international organisations (NOIO) in Libya in different sectors, size, and ownership. This paper was conducted aiming to answer the following questions:

- What are the current MTDNA applied within the NOIO in Libya?
- How MTDNA was conducted and implemented?
- Was it effective?

To answer the above research questions, a questionnaire survey was conducted to achieve the objective of this study. As emphasized by many researchers questionnaires are the most broadly used data collection method in a survey strategy, therefore, a questionnaire is a data gathering tool that many researchers apply to collect required data. Gray (2006) & Breakwell et al, (2000) defines questionnaires as “research tools through which people are asked to respond to the same set of questions in a predetermined manner”, and are useful for asking a large number of people. Questionnaires should be applied when they fit the objectives of the study tools (Gray, 2006 & Breakwell et al., 2000).

Questionnaires were distributed to all managerial level in nineteen NOIO in Libya. The sample includes firms from different sectors: 47.3% were manufacturing (MS), 11.3% from construction

sectors (CS), 17.3% from service sectors (SS), and 7.3%, from hotel sectors (HS), as well as 16.7% from banking sectors (BS). 86% of them are joint venture organisations (Jvo); while others are international organisations (Io) represented by (14%) respectively. In regards to size of the organisations, 38.7% of them were small sized organisations (S), 23.3% were medium organisations (M), and 38% of organisations were large sized organisations (L).

In total, 150 managers were participated between September and November 2011. All managers in each organisation were asked about MTDPNA. 97.3% of participants were Libyan, and only 2.7% were from foreign nationals.

The questionnaire of the study consists of two forms of questions: personal information and measurement questions. The collected dataset is analysed in a number of phases:

- The responses of questions are correctly recorded and categorized.
- The dataset was entered into computer via statistical package SPSS and checked by the researcher and volunteer for error issues.

Deferent SPSS statistical tests were applied in analysing the data to achieve findings, such as Wilcoxon signed ranks test, proportion test, and frequencies. The research employed a Likert scale. The reason behind using the scale is because this scale is well known in Libya and has been used in other studies in Libya; therefore using the same scale can help the researcher compare validity.

As a result, the researcher codes the responses accordingly: Strongly disagree = 1 (STD), disagree = 2 (D), uncertain = 3 (U), agree = 4 (A), strongly agree = 5 (STA). Therefore, using more than 5 will make respondents bored and it will take longer to answer the questions especially within the Libyan case.

The following shows how to define the extension of these scales, so that researcher can measure the response to each item. The extension is determined by $5-1 = 4$, and in order to identify the length of each scale (statement) the researcher compute $4 / 5 = 0.80$. Now, the upper limit for each cell is determined by adding 0.80 to the code of agree, uncertain, disagree and strongly disagree. The following show the range of each scale:

- 1 to 1.80 represents strongly disagree to each item of dimension.
- 1.81 to 2.60 represents disagree to each item of dimension.
- 2.61 to 3.40 represent uncertain to each item of dimension.
- 3.41 to 4.20 represents agree to each item of dimension.
- 4.21 to 5.00 represents strongly agree to each item of dimension.

In order to assess the level of agreement, a set of statistical hypotheses will be tested as follows: When the range lies between 2.61 and 3.40 which represents uncertain, then a clear interpretation should be provided by the researcher.

In recording the outcomes, the researcher highlights only the significant scorers, which reflect the positive and the negative answers.

Empirical analysis and finding

As far as MTDPNA is concerned in this study, this section is divided into two main parts: first part of the section examined the current situation of MTDPNA in NOIO in Libya, and then looked at the conduction, methods, criteria, involvement on making decision of MTDPNA, the overall picture after MTDPNA. The second part of the same section, investigated some factors that may influenced MTDPNA positively or negatively.

MTDPNA in non-oil international organisations in Libya

The main appearances of the research managers by the questionnaires are analysed as follow. The majority of the participants were male (91.3%). Female were few in this study mostly, and managerial level in specific (8.7%) due to religious and background.

Most of managers were Libyan nationality (97.3%), and other nationals were represented (2.7%) individually. 74.3 of managers were holding undergraduate certificate, followed by (35.3%) with collage certificate. 36% of them were in head of department position, and 30.7% were supervisors. While only 12% were head of unite, and 21.3% were in senior positions.

38.7% and 38% of the organisations were between small and large sized organisations represented (1 to 300, and 701 or more), and only 23.3% were in medium size represented (301 to 700). 47.3 of managers were from manufacturing organisations, followed by 17.3 were from service sectors, and 16.7% from hotel sectors. 86% of organisations were joint venture organisations, and only 14% were international organisations.

As can be presented from table I, about 110 out of 150 (73.3%) of the participants reported that their organisations conducted formal MTDPNA, and they adopted it annually represented (52%) correspondents.

Although, these finding contradicts with other studies (Abdelgadir, 2001); it revealed that small and medium sized organisations sometimes do not see MTDPNA as an important aspect of MTDP, but large sized organisations view MTDPNA as a crucial step of the programmes. (Abdelgadir, 2001, pp.71-72)

Strongly disagree		Disagree		Uncertain		Agree		Strongly agree		P-value
F	P	F	P	F	P	F	P	F	P	
3	2.0	21	14.0	16	10.7	71	47.3	39	26.0	<0.001

Table I: Conducts formal MTDPNA

In support of the above finding, managers were asked which methods that their organisations used to implement MTDPNA. It has been cited that MTDPNA is done according to what the department

needs and face-to-face interview were the most applied methods (68%). While group interview with the manager or supervisor and questionnaires were the least used methods (20%); only 39.4% agreed with the methods, and the rest were either uncertain or disagreed (60%).

Managers were also asked if they agreed with some criteria used for MTDPNA. The most common one was performance followed by, experience and qualification. However individual interests were not taken in to organisations account as one of the important criteria applied. According to Grant (2002), individual interests are often used by some organisations that have a large number of workers to ask them to enrol training courses. This approach is often criticised for not being able to measure the truth, because sometimes employees write what they want instead of what they needs (cited by Yu-Hui et al., 2006, p.430).

Criteria	Strongly disagree		Disagree		Uncertain		Agree		Strongly agree		P-value
	F	P	F	P	F	P	F	P	F	P	
<i>lack of knowledge</i>	14	9.3	0	0	13	8.7	44	29.3	19	12.7	<.001
<i>lack of skills</i>	1	.7	8	5.3	15	10.0	48	32.0	23	15.3	<.001
<i>poor performance</i>	2	1.3	7	4.7	17	11.3	46	30.7	22	14.7	<.001
<i>introduction of new work method</i>	2	1.3	8	5.3	20	13.3	35	23.3	29	19.3	<.001
<i>low profitability</i>	10	6.7	21	14.0	29	19.3	13	8.7	6	4.0	<.001
<i>frequent employees transfer to other division</i>	10	6.7	29	19.3	20	13.3	14	9.3	6	4.0	<.001
<i>no criteria</i>	0	0	0	0	0	0	1	.7	9	6.0	<.002

Table II: Criteria used by your organisations to indicate the need for MTDPNA

However, the researcher provided some criteria, and asked participants again if their organisations used them to specify MTDPNA as shows in table II above. According to the reply of participants to the above question, the most applied indicator by all organisations was lack of skills. This indicator was used by 47.3 per cent of the organisations. Another indicator used by 45.4 per cent of the organisations was poor performance.

Other indicators were applied by organisations ranged from 6.7 per cent to 42 per cent, as presented in table II above. (The percentage provided is the combination between strongly agreed and agreed)

In general, the most applied indicators were lack of skills, followed by poor performance. However, when poor performance in respects to the organisations performance as whole, cannot be an indicator for MTDPNA, since improving organisational performance has nothing to do with T&DP

(Altarawneh, 2005, p.229). Certainly, these organisations have to give more attention to the rest of the indicators to have an effective MTDPNA.

When the researcher asked all managers, what extent do they agree with the statement that “Providing MTDPNA to lower and middle level managers can increase their performance”, participants replied their answers in different ways, which are presented in table III.

Strongly disagree		Disagree		Uncertain		Uncertain		Strongly agree		Median	P-value
F	P	F	P	F	P	F	P	F	P	4.0000	<0.001
2	1.3	6	4.0	25	16.7	73	48.7	43	28.7		

Table III: “Providing MTDPNA to lower and middle level managers can increase their performance”

From the above table III, 48.7 per cent of managers agreed, and 28.7% strongly agreed that providing MTDPNA to lower and middle managers can increase their performance, which has a clear indication that their top managements were supporting the above statement which can reflect positively to the organisational performance as whole. Top management in organisations need to support all levels of managerial, and provide MTDPNA equally. With regards to the overall picture of MTDPNA, managers were asked if they agreed with the overall picture after their organisations implement MTDPNA. The mine outcomes are revealed in table IV below.

Strongly disagree		Disagree		Uncertain		Uncertain		Strongly agree		P-value
F	P	F	P	F	P	F	P	F	P	.766
5	3.3	34	22.7	46	30.7	52	34.7	12	8.0	

Table IV: Overall picture that the organisation has after implementation of MTDPNA

The data in table IV indicated that 34.7 per cent of managers agreed with the overall picture in regards to MTDPNA. Another significant percentage, which has to be taken in consideration, was (30.7%) of managers were uncertain if MTDPNA was effectively implemented or not.

Factors that may influence MTDPNA in non-oil international organisations in Libya

This paper as mentioned previously, is also investigating factors that may influence MTDPNA positively or negatively.

Therefore, MTDP can be more effective if organisations take internal or external factors into their account. However, this paper will test the internal factors as shows in figure I, such as organisational sectors, size, and ownership that may influence MTDPNA negatively or positively. The researcher again analysed the same questions above to find out if there is any correlation between the factors and MTDPNA as presented below.

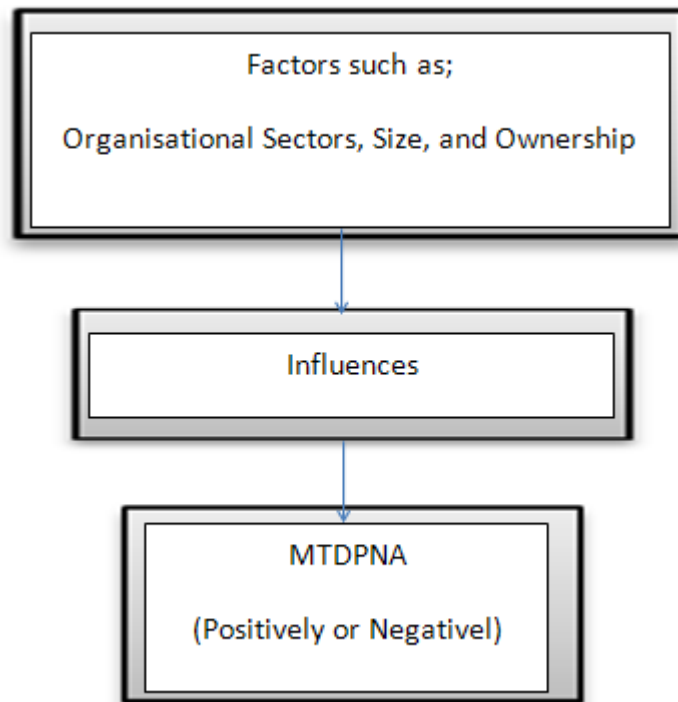

Figure I: factors that may influence MTD PNA positively or negatively in non-oil international organisations (NOIO) in Libya

Direct observation was the only methods applied and influenced positively in hotel sectors in relations to sector influence, as they used this method more than any other methods to implement MTD PNA as shown in table V. This answer was given when the researcher asked participants which methods their organisations used for MTD PNA.

Chi-square crosstabs table test showed that, this method was highly statistically significant as the p-value was (0.032) which is less than .05. This information seem to be consistent with a study done by Al-Ali, (1999) as he reported that, in Kuwait government sector direct observation was one of the most used data collection methods in TNA (59.2%).

Contrary to these results, Agnaia (1996) in his paper found out that, 71 and 51 % of fourteen oil companies in Libya were using MTD PNA methods based on documents, records, and consultation.

It could be argued that, only hotel sectors used direct observation as the data collection methods for MTD PNA, because hotel sectors have high level of employment, therefore, a big number of employments will make it hard for any organisations to monitor MTD PNA.

Whereas researcher tries to look at the negative side, direct observation and performance appraisal information or result were the two unimplemented approaches by the majority of the organisations in regards to the sectors, the size, and the ownership of the organisations. Similarly, a fieldwork research conducted by Agnaia observed that, the selected companies never use any systematic methods to

identify MTDPNA; they were only using methods on documents, records, and consultation. (Agnai, 1996)

Chi-square crosstabs table test presented that, performance appraisal information or result, and direct observation were statistically significant, as the p-value were (0.032, 0.045) and (0.042 and 0.033) which were less than .05.

In relation with the above finding, the researcher asked managers to rate to which they agree with criteria used MTDPNA. The finding indicated that the influence is positively strong in NOIO in Libya, in terms of experience, as managers strongly agreed and agreed that, their organisations within the ownership factor used experience as criterion for MTDPNA.

However, in regards to the other two factors (sectors and size) performance, experience, qualification, and individual interest were not the most used criteria in MTDPNA, which have negative influence on them. In supporting the negative influence finding Grant in 2002 stated that, even though individual interest method has often used by some organisations that have a large number of employees to ask them to list training courses; this method is also criticised for not being able to measure the facts; because sometimes employees write what they want instead of what they needs (cited by Yu-Hui et al., 2006, p.430).

Table V: Summarised the results of the positive & the negative influence of all factors on MTDPNNA

Participants were asked to rate the some criteria provided by the study based on how their organisation uses them to indicate MTDPNNA.

According to the response of managers to the question, table VI below; indicated that the most common criteria used by all organisations were not clear as most managers were between uncertain and disagreed; if their organisations used some criteria as an indication for MTDPNNA, which gave positive image to all organisations in relations to the influential factors. Customer expressed dissatisfaction with all sectors except hotel; highlighting poor quality service and low profitability by small and large sized organisations; with frequent employees transfer to other division by all sized organisations, and lack of knowledge by international organisations.

	Org Sector, Size & Ownership	Strongly disagree		disagree		Uncertain		Agree		Strongly agree		Median	P-value	influences

Table VI: Summarised the positive influence results of the criteria used by their organisations to indicate MTD PNA in relation to all factors

Two tests were used to examine the influence, which is Kruskal-Wallis Test to test the sectors and the size of organisations, and Mann-Whitney U test to test the ownership of the organisations, and all of them show significant p-value. But, from the negative perspective, no criteria were found as an indication for MTDPN.

No positive influence was found, but only negative influence was found in respects to the factors that might influence MTDPNA in NOIO in Libya, when managers were asked who is usually involved in the decision to assess MTDPNA as presented in table VII below.

The crosstab chi-squared test shows that, there were highly significant results where the p-value in (Your supervisor = .034 & <.001), (HR department = <.001, .033, & .038) and (Training managers = .025).

The majority of managers acknowledged that, supervisors in all organisational sectors and joint venture organisations were not involved in making decision for MTDPNA. However, HR department was not also involved in all aspects ranging from; organisational sectors, size, and ownership.

Whereas training managers in ownership of the organisations was negatively influenced, participants stated that their training managers were not involved as well for making decision to assess MTDPN.

Looking on, this research demonstrates a clear focus on where MTDPNA are now within the selected organisations, indicating that, MTDPNA has become the main concern for all decision makers. This finding could be linked to some scholars as they suggest that, frequently decision makers of organisations avoid TNA, as they believe that TNA is a costly approach to use. Nevertheless, not application of MTDPNA systematically is a huge mistake (Iqbal and Khan, 2011). Using MTDPNA will reduce the gap between the current practice of MTDP and desired performance. Hence, providing relevant programmes for managers can avoid the wastage of time and money.

Conclusion and suggestions

From the argument of MTDPNA above, it can be considered that, MTDPNA is the first and the most vital step of MTDP; with direct influence and effect on management. In the case of this study in Libyan organisations, it is clear that questionnaires result indicate that the organisations performed some aspects of MTDPNA, because most Libyan organisations were conducting MTDPNA regularly represented (73.3%) respectively. That said, the methods, the implementation, the managers who involved in making decision, and the criteria applied to indicate MTDPNA were not achieved systematically. In context of the above finding, Agnaia, (1996, p.17) revealed that, participants always criticize MTDP, as the content of the programmes are not matched their needs. Participants mentioned that when organisations provide the programmes, they have to take into consideration participants needs to obtain organisational objectives more effectively. However, participant's interest is not always measure the reality; for managers occasionally draw down what they want rather than what they needs (Yu-Hui et al., 2006, p.430).

Thus, it is suggested that, methodological and systematic thinking within the decision makers in NOIO in Libya can perfectly lead to the right plan and implementation of MTDPNA.

The above finding led the researcher to provide the following suggestions:

- MTDPNA should be conducted at different times and used different methods to collect the relevant data rather than direct observation or performance appraisal information or result, which some organisations implement to be able to contain any critical needs.
- Decisions in regards to MTDPNA have to be based on systematic way rather than personal or group of individual.
- MTDPNA have to be provided to all management level equally rather than to middle or lower managers.

To sum up, more attention should be given to MTDPNA in all NOIO in Libya, which determine the gap between what is happening now and what is supposed to happen in future. Again, from the above finding, we can demonstrate that, lack of communication or involvement between managers who needs to be trained and the decision makers were noticed. Decision makers sometimes avoid MTDPNA, as they think that it is a costly approach to implement (Iqbal and Khan, 2011).

Therefore, If MTDPNA has not been explained and implemented systematically; MTDP can lead to costly mistakes, and hardly applies. Therefore, NOIO in Libya have to have sort of bridge to discuss MTDPNA at all managerial level to obtained an effective MTDP. Abdalla, and Al-Homoud (1995) assert that "the absence of systematic needs assessment is serious drawback on the organizations' management development efforts .Needs assessment determines the gap between the current and desired performance and it is impossible for the organizations to improve competence without such knowledge. This knowledge may also help reduce training costs by placing managers on relevant programmes" (Abdalla, & Al-Homoud, 1995, p.19)

Further research

As MTDNA is the most crucial stage of the training cycle. This research has exposed only the recent situation in NOIO in Libya on MTDNA, further study can be extended to cover local organisations in Libya, as well as North African region, or Arab region as whole. Another limitation is reliance only on managerial level, further study can be implemented to address the entire population.

Abstract

The study looks at the Spanish hotel industry in 2009, one year after the beginning of the financial crisis. First, the subprime crisis did not reach Spain because its banks had focused on retail banking and abstained from purchasing structured mortgage products. However, during the crisis, the Spanish economy suffered, due to its side effects.

Domestic as well as foreign tourism form a major component of the Spanish economy. Within Europe, Spain has the highest number of hotels and restaurants. Nonetheless, due to the recession following the 2008 financial crisis, international tourism to Spain declined, and spending by international as well as domestic tourists deteriorated. The research focuses on hotels in Madrid. Madrid was chosen as a location because it benefits from leisure as well as business travel. In total 134 hotels were surveyed (67 % of the population).

The study provides insight into the preparation for different types of crisis. Critical events come in different forms. Common causes during the last decade have been natural disasters (volcano eruption in Iceland and Chile, devastating tsunamis in Japan or Thailand), terrorist attacks (9/11, the bombing of the Madrid or London underground), epidemics (Avian flu, ebola) or economic crises (2008 global financial crisis, Euro crisis). Given the changing nature of the events, several forms of crisis plans have to be prepared. As the 2011 Japanese tsunami and the subsequent events in Fukushima showed, level of crisis readiness and reaction can differ. Whereas thousands of Japanese people successfully fled to higher grounds and thus saved their lives while tsunami and the following inundations destroyed their homes, TEPCO's response was insufficient and inadequate (Hatten & Post, 2011). Crisis awareness and crisis management become more and more necessary for the tourism industry. Kash & Darling (1998) underline that it is no longer a question when a company will be hit by crisis but rather on how well prepared it is in order to deal with the crisis.

Service industries and here especially tourism is a sector very vulnerable to critical events that initially had nothing to do with it. The terrorist attacks of 9/11, the Madrid or London metro bombings were not aimed at tourists but affected tourism subsequently. Thus, crisis anticipation and crisis preparation becomes necessary for the tourism sector both on a national and an individual company level.

The participants of the study were asked to judge the importance of the four critical events natural disaster, terrorist attack, epidemic or economic crisis to their businesses. Subsequently,

they indicated the impacts that the 2008 financial crisis had on their establishments and the measures they undertook to combat this crisis. Measures to combat the crisis can be classified in proactive (i.e. sales-increasing, marketing) or reactive (i.e. cost-cutting, operational improvement) and others. Literature on company performance in crisis times show that reactive measures are those that in the long run are the least successful ones while proactive ones help the companies to stay in the business (Pearce and Michael, 2006). In the study, remarkable differences were visible. For instance, hotels judging a natural disaster as most damaging for their business were most likely to prepare for a crisis. This, given the frequency of natural disasters, is understandable. Thus, hotel managers increase their crisis awareness. On the other hand, hotels considering an economic crisis as most damaging for their business rather focus on short term measures and re-adjusting their expectations.

Keywords: tourism, financial crisis, hotel, crisis management, crisis preparation

A HOLISTIC APPROACH IN IMPLEMENTING ISO MANAGEMENT SYSTEM STANDARDS

Al Rashed, Husam¹; Elmeligy, Osama²

¹ Husam Al Rashed, CEO Shabakah Net, Riyadh, kingdom of Saudi Arabia, Email: husam@shabakah.com.sa

² Osama Elmeligy, Chairman TOTAL, Cairo Egypt, member of ISO/TC176 /Strategic planning group, Email: osama@total.com.sa

Introduction

The organizations which are unsuccessful in bringing their operation under control and fail to comply with ISO Management System standards, will pose an offensive risk to business which is no longer acceptable in the current environment. The traditional way that organization normally uses to comply with ISO standard, is just taking ISO requirements and guidelines and implementing them in their processes. By using this traditional approach most of the organizations fail to achieve their goals due to failure of reengineering the processes and tailoring to their needs.

Approach

To tackle this issue we suggest using HTP model to analyze and reengineer organization business processes and using as holistic appraisal for ISO requirement instead of traditional ISO gap analysis. This comprehensive model, enables organizations not only to easily pinpoint into the root causes, but to help them to find the best solution to overcome their long standing problems that impedes their operations, alignment with their strategy, managing their risks, optimizing their business process, managing their quality programs, handling organizational behavior anomalies, and technological firefighting due to accidental architectures and infrastructural setups.

The model comprises of following ten interrelated perspectives:

Ergonomics: This perspective analyses the degree to which a workplace environment fits the process.

Strategy: This perspective analyses and evaluates the effectiveness of long term business direction and plan in order to achieve desired business goals and objective.

Risk: This perspective identifies the possible occurrence of negative results, or negative implications.

Quality: This perspective analyses and evaluates the alignment of business process to organization's quality program and overall improvement.

Internal Process This perspective analyses and identifies how a business process will fit with in internal processes and the degree of effectiveness.

Finance: This perspective analyses and identifies how the process will effectively fit with in the budget and other financial perspectives.

Customer: This perspective analyses and evaluates the business process from customer perspectives and the degree to which potential customer expectations and behavior is affected.

Organization Behavior: This perspective analyses and evaluates the business process and their alignment with organization behavior perspective such as employee resistance to change factor.

Organization Knowledge: This perspective identifies the knowledge required to operate the business process.

Technology: This perspective analyses and identifies the technology changes and their effect on the business process.

Conclusions

Holistic approach in the implementation of ISO Management System standards can deliver tangible improvements and add value to the business, it furnishes the organization to optimize their operations, and promote a pragmatic innovation programs that optimizes customer enticement and satisfaction, elevate their revenue streams, optimize their profitability, boost their strategic sustainability, and minimize long term cost streams.

Abstract

The Web 2.0 is creating new dynamics of empowerment for stakeholders, thanks to the increasing of information carried by the online applications. The combined use of ICT with the new web applications shifts social interaction dynamics where users play an active role in the exchange and creation of online content. Web 2.0 has changed the average web user from a consumer to a content creator, especially Social Media. SM can be defined as a set of internet based applications that builds on the ideological and technological foundations of Web 2.0, allowing the creation and exchange of User Generated Content (Kaplan et al, 2010). SM are user-friendly, scalable mobile-based technologies that allow the sharing of user-generated material (Kaplan, Haenlein, 2011), representing an opportunity for firms and individuals to engage in social interactions. Social Networking tools boosting the culture of participation and transforming user in prosumer, who creates contents shared with corporate producers and other prosumers. Customers participate in co-creating value for enterprise (Vargo, Lush 2004) thanks to the increasing of co-participation, interaction and value fulfilment (Cova, White 2010). This stakeholders empowerment is called consumer-generated content and encompasses a variety of forms and types of website (Gretzel, 2006), such as online-customer reviews (Liu et al., 2011) and e-WOM (Chatterjee, 2001; Van Riel, Fombrun, 2007). CGC play an increasingly important role in decision-making processes and consumer purchase decisions (Payne et al., 1991; Haubl, Trifts, 2000; Chen et al., 2008, 2009). So, SN have transformed the relationship between company and consumer that develops interactively (Coyle, Thorson 2001; Kaplan, Haenlein 2011). Consequently, firms have to take into account the prosumer to build loyalty and trust (Morgan, Hunt, 1994) that contribute to the reputation development (Freeman, 1984; Coombs, Holladay, 2006; Van Riel, Fombrun, 2007; Hawabhay et al., 2009) and boost strong consumer-relationships (Armstrong et al., 1996; Peppers et al., 1997).

Consequently, we assume that participatory tools (SN) boosts communication and by drawing on the wealth of knowledge generated by customers, could be able to influence the firms ability to identify new patterns of value co-creation. Based on previous works (Aiello, 2012; Cacia et al., 2010; Singer et al., 2009) the research aims to map the tourism industry operating on the web to highlight the tools used and the role of SN in e-commerce policies.

Some SNs are dedicated to particular topics, sharing knowledge or purchasing of products and services, transforming how users research and decide on travel plans (i.e. Yahoo's

TripAdvisors's Inside, VirtualTourist's Trip Planner, etc.) (Vickery et al., 2007). To date, many firms instead of investing cash in advertising to become known, prefer to allocate these monies to their consumers to bring new users through WOM (Robles P., 2010). The methodology is based on: survey of the literature on key models and tools for performance, reputation/presence analysis concerning SN; data collection and mapping about the Italian tourism industry on the web through SN.

SM has changed marketing and the relationship between companies/retailers/consumers and consumers/consumers, shortening the distance not only in terms of cost and time, but also of emotional closeness in the relationship. If all players share information every day through SM channels the relationships become stronger and therefore the link to the brand is strengthened (Morales et al., 2012) and business prospects increase. Countless people are creating sizable returns from SM sites such as Twitter and Facebook.

In our view a SM marketing strategy, when well executed, will substantially increase marketing ROI and performances. So, we aim to analyze the performance deriving from the link between reputation and presence in SNs, through the study of "alert", in order to 1)examine how and whether business performances benefit from the use of Web tools and of the instruments for monitoring the out-out communication (Camisani et al., 2010); 2) draw a Web policy of companies and of their own performances; 3)analyze models and instruments for measuring reputation noticed in the literature and verify whether business performances may depend on a functional model - centered on three dimensions: a) presence and correlated reputation on SN, b)monitoring (through the alert) of the out-out communication, c) specific characteristics of the activities.

Building on those arguments, we endorse the idea by which the analysis of the SN diffusion across the Italian touristic company can provide valuable information about the strategic dynamic of the business and its developmental stage. The empirical research aims to contribute to the development of knowledge in the Italian tourist industry and, in particular, to the definition of new development paths.

RELIGIOUS AND SUSTAINABLE TOURISM IN CATHOLIC TIBET (CHINA)

Ambrósio, Vitor¹

¹ Escola Superior de Hotelaria e Turismo do Estoril, Portugal. E-mail:vitor.ambrosio@eshte.pt

Abstract

This paper will explore the creation of a Pilgrims' Road in Catholic Tibet in China as part of an action plan developed by a Non-Governmental Organization (NGO), Acting for Life's Tourism Ethics and Development Pole, contributing to sustainable tourism development in the northwestern Chinese province of Yunnan.

The paper's first part will focus, on one hand, the geographical situation of the villages where the project will take place, on another, the socio economic situation of the Catholic Tibetans who will profit from the project's implementation.

The second part will describe the field research and the contact with this ostracized population, during November 2011, in the catholic Tibet.

The third part will present propositions for a Pilgrim's Road in the catholic Tibetan region considering its development as a tourism destination for Allocentric tourists and Catholics coming for religious and humanitarian purposes. Two of the strongest variables considering the development of itineraries/programs in the area are the catholic villages (mainly located along the rivers banks) and the mountains of unique beauty. On the opposite side lodging is the weakest variable since it is not possible to find good lodging according to European standards.

Conclusions will point out the tourism sustainability of this project based on Acting for Life's financial support which will help Catholic Tibetans to improve lodging conditions, to create a track on the Tibetan mountains which will preserve nature and to generate extra income for the local population.

MOBILE MARKETING: A NEW PROMOTIONAL CHANNEL

Amirkhanpour, Monaliz¹

¹ PhD Candidate, Faculty of Business, Education and Professional Studies, University of Gloucestershire, UK. E-mail: monaliza1983@yahoo.com

Abstract

As a significant element of the promotional mix, direct marketing is a basic form of marketing that occurs directly between the manufacturers and customers without the presence of an intermediary (Turban et al., 2009). The emergence of Internet and Communication Technologies (ICT) has reshaped direct marketing into what is known today as online marketing which uses the Internet to communicate with the potential customers (Krum, 2010). Direct marketing uses various types of channels to address the target customers. Some of these channels include direct selling, direct mail, telemarketing, telemedia, TV marketing, E-mail marketing, social media marketing, and mobile marketing. Varnali et al. (2011, p. 59) states that “explicit permission results in perceived user control which increases the likelihood of positive feelings and confidence about the outcome of engaging in any kind of marketing activity” that may be in the form of E-mails, social media, and mobile marketing which is the focal point of this research. As a result, these marketing activities are influenced by permission in order to guarantee their success within the target audience (Carroll et al., 2007).

Permission-based marketing is defined by Kotler et al. (2009, p. 129) as “a type of marketing which seeks permission in advance from consumers before they are sent marketing communications where such communications may be distributed through E-mails, mobile phones, and interactive digital television.” According to the Mobile Marketing Association (MMA, 2011), “permission marketing aims to change the advertising paradigm from interruption to communication because it enables the brands to move from a broadcast monologue to a dialogue that offers to continue a deep engagement with the loyal customers.” Consequently, permission marketing guarantees the fact that consumers will pay more attention to the specific marketing message as compared with the traditional and unsolicited direct marketing approaches (Godin, 1999). This is further supported by the fact that permission marketing directs the businesses to treat their target customers respectfully by asking for their consent either by E-mail or by phone before sending them marketing messages (Gilbreath, 2010).

From the viewpoint of Dushinski (2009, p. 3), “mobile marketing connects businesses and each of their customers through their mobile devices at the right time and at the right place with the right message and requires the customer’s explicit permission and/or active interaction.” Mobile marketing has to be implemented with the definite permission and consent of the end-users in order to succeed and if done correctly it will soon be deeply intertwined into the daily life of people (Krum, 2010). Additionally, the emergence of mobile as a desired promotional channel for many consumers has enabled the marketers to upgrade the level of permission-based marketing. The MMA (2011) emphasizes that the mobile channel is

the best medium for permission-based marketing because it allows the brands to deal with each target customer as an individual. Similarly, Hopkins et al. (2012) believes that mobile devices are becoming an integral part of the daily life of people and points out that “the technology will only continue to improve over the next few years since the mobile devices will be the primary tool for connection to the Internet for most people in the world by the year 2020.”

Mobile marketing is quickly becoming one of the ‘go to’ marketing strategies for businesses both small and large as it is one of the most innovative ways to market a specific product or service to potential customers who are eager to use their mobile phones to stay connected with the brands they love and to receive communications that enhance their lifestyles. Much of today’s mobile marketing is delivered through the messaging channel; as smartphones and tablet PCs become the predominant mobile devices, the transition towards using mobile apps, the mobile web, and other mobile functionalities will lead to increased interactivity. This clearly requires an appropriate framework which will incorporate value exchange via mobile network operators. Moreover, mobile marketing initiatives should be carefully planned in order to avoid wasting time and money and most importantly damaging the company’s image.

Therefore, the aim of this research is to develop a specific marketing framework exclusively made for ‘mobile’ as a new element of the promotional mix; this framework will be highly significant for mobile marketing strategy planning as well as creating value between the marketers and consumers.

**AN EXAMINATION OF THE EFFECT OF GENDER BALANCE GUIDELINES
ON THE NUMBER OF WOMEN DIRECTORS ON AUSTRALIAN
CORPORATE BOARDS**

Ayson, Sharon¹

¹ Senior Lecturer in Management, University of Newcastle, Australia, Graduate School of Business, Sydney CBD Campus. Email: Sharon.Ayson@newcastle.edu.au

Abstract

Globally the role of women is changing. In the public and private sectors there have been a number of arguments and suggestions advanced with regard to increasing women's representation on corporate boards. Traditionally, corporate director's positions have been viewed as the domain of those whose social and business networks are well established. These networks feature business elites and members of the top echelons of society who wield various levels of power and influence. Boards have been viewed as arenas which promote the interests of the "old boy's club" and where women experience apparent barriers to entering corporate boards and gaining top management positions.

The arguments advanced to remedy the lack of women on corporate boards have included business case arguments, societal arguments and individual career arguments. As indicated by Huse, Neilsen and Hagen (2009) affirmative action, justice in society, democracy, participation opportunities and gender equity are the societal arguments advanced. The notion of the glass ceiling is presented as the individual case or career argument. Van der Walt and Ingley (2003) have provided the business case arguments of how and why women improve the performance of corporations when they are included on boards. Adams and Flynn (2005) have outlined the main business case arguments based on the view that women bring different qualities and skills than men, that women represent a significant portion, approximately half, of the knowledge base in society, that many more graduates are female, currently 58% in Australia, that women are the main customers in many industry sectors and an understanding of those customers and their expectations can be provided by women, and that men can be "too comfortable" with each other and hence not ask the "hard" questions resulting in a passive board.

This paper presents the recent initiatives implemented in Australia to increase the number of women on corporate boards. Then using interview data and corporate documents, the views of women directors from ASX 200 companies are presented regarding the introduction of gender balance guidelines which took effect in Australia from 1 January 2011. An analysis of the ASX 200 board composition following the introduction of gender balance guidelines to identify change follows. The existence of a typology of directors which includes business directors, professional directors, 'Golden Skirts' and 'Gold Sacks' (Huse 2011) is introduced and discussed. Explanations for the changes in board composition following the implementation of the ASX gender balance guidelines are presented using team production theory.

The gender balance guidelines have resulted in women being appointed to independent director positions. Their appointment has been based on competence not independence. Whilst there has been an increase in the number of women appointments to ASX200 boards rather than an increase in the total number of women being appointed and “new blood” being introduced, it is a case of existing ASX200 women directors increasing the number of boards that they sit on. Success breeds success – women who fit in with board arrangements and the dominant agenda are recommended by their male peers for other board positions.

This study offers insights to corporate governance agencies, corporate boards and corporations on the effectiveness of introducing gender balance guidelines in order to affect an increase in the number of women directors who sit on the boards of public corporations.

**TRANSFER PRICING AUDITS PERFORMED AT COMPANIES GRANTING INVESTMENT
INCENTIVES IN THE FORM OF A TAX RELIEF
(CASE OF THE CZECH REPUBLIC)**

Baluchova, Daniela¹

¹ University of Economics, Praha, The Czech Republic. Email: baluchova.daniela@gmail.com

Abstract

The inflow of foreign direct investments is considered as a key driver of developing country's economy due to transfer of know-how, creation of new jobs and related spill-over effects. Many countries including the Czech Republic therefore implement packages of investment incentives (e.g. fiscal exemption or reduction, financial support etc.) to make their jurisdiction more attractive for foreign investors and so to promote the economic growth. In this context, a tax relief, also called a "tax holiday" have encouraged much dispute in regard to (un)fair tax competition resulting from a different approach of national governments to the determination of tax liability among countries (Romancov, 2010). With globalization of international economy resulting in the increase of intra trade within multinational companies, the interconnection of capital flows etc., more attention is paid to transfer pricing regarded as a key instrument for tax optimization. Pursuant to the fact that a jurisdiction enabling tax holiday can be considered as a temporary tax paradise, tax authorities around the world have adopted various restrictions in order to prevent transnational companies from deliberate profit shifting linked with potential tax evasion.

The Czech Republic as a member of the OECD follows the principles and recommendations issued by the organization. In July 2010 the OECD released the Transfer Pricing Guidelines for Multinational Enterprises and Tax Administrations (further the "OECD Guidelines"). The OECD Guidelines is not legally binding; however, their principles are considered as essential instructions that tax administrations in many countries wish to observe. Moreover, OECD Guidelines is also seen as an interpretation of Article 9: Associated Enterprises OECD model treaty for the avoidance of double taxation. Basic rule in the Czech tax system for pricing the transactions between related parties is defined in Section 23 (7) of the Income Tax Act No. 586/1992 Coll., as further amended (further the "ITA"). Pursuant to this rule, the prices agreed in related party transactions have to be at arm's length.⁵⁹

Arm's length principle

"Where prices applied between related parties differ from prices agreed between independent entities in common business relations under the same or similar terms

⁵⁹ Principles for transfer pricing of the OECD Guidelines have been defined by the Czech tax system on the instruction of the Ministry of Finance in the Decree No. D – 332: Communication by the Ministry of Finance in respect of international standards application in taxation of transactions between associated enterprises – transfer pricing ("Decree D-332").

(conditions), without such difference being properly documented, the tax administrator (financial office) shall adjust the taxpayer's tax base by the ascertained difference."

Regarding the Czech tax legislation related to investment incentives, in addition to general conditions enacted in Investment Incentives Act⁶⁰, special conditions for the drawing of investment incentives were defined in Section 35a of the ITA. Among them, companies that have received the investment incentives in the form of tax relief are strictly obliged to comply with the arm's length principle. Breaching this condition may result in a retroactive withdrawal of entire investment incentives, and an imposition of a related penalty for all the periods the tax relief have originally been utilized. Furthermore, the number of years opened to a tax audit is extended in the event of the drawing of investment incentives.

Assuming that lower tax revenues due to granted tax incentives should be compensated by other source of incomes, tax authorities in the Czech Republic are very likely to step up the pace of by higher assessment of additional tax and related penalties so as to maintain the state budget balanced. In accordance with the assumption mentioned above, the statistics indicate that the number of transfer pricing audits has been steadily increasing. Furthermore, tax audits focusing on specific tax issues have become more sophisticated. Based on annual reports published by General Financial Directorate, specialized tax audits have been initiated since 2000 including the inspection performed at companies with high turnover, organizations involved in unusual and specific areas and entities involved in the major supply chains whose activities evoked justified suspicions of extensive tax evasion. At the same time, specialized tax inspection involves subjects whose contribution to the amount of collected tax is of crucial importance and subjects with capital connection abroad (due to the possibility of transfer pricing issues). Particular attention is also paid to the taxpayers granted the investment incentives. In 2009 the financial offices focusing on specific tax audit imposed additional tax in the amount of CZK 736 million compared to CZK 240 million from the total amount of CZK 6,821 billion assessed in 2008. From organisational point of view, Special Financial Authority responsible for the specialized tax audits at large entities was established in January, 2012.

The paper examines the impact of transfer pricing regulation on companies granting investment incentives in the context of the Czech Republic using a case study as a research method.

A CHALLENGE TO BALANCE INTERESTS OF BUSINESS, STATE AND SOCIETY IN BRIC ECONOMIES

Belyaeva, Zhanna¹; Kazakov, Alexander²

¹ Associate professor, PhD(Econ), Ural Federal Yeltzin University, zhanna_belyaeva@yahoo.com

² Senior Researcher, Dr (Math), Irkutsk Branch of Russian Academy of Science

Abstract

Purpose: It is well-known; that national governments and businesses are still lacking sustainable social efficiency towards local and global communities, especially in the emerging markets. Hence a search for the working steady model of public-private partnership that would balance all the interested parties is still in progress. In our opinion, the defining frames of such a partnership should be based on the systematic approach to social responsibility which is substantially defined by institutional norms and economic culture of the state.

Although principles of (corporate) social responsibility are developed by the companies with its cross-national peculiarities of business vision, the national governments and international organisations play an essential role in this process. The international organizations and agreements provide coordinates for principles development, encourage activity and dialogue, and the national government can legislatively demand the execution.

The paper addresses the following major issues:

- To what extent the social responsibility of a business and a government refers to the interests of the local communities?
- What are the most effective cooperation strategies that could be developed in frames of public-private partnerships in the emerging markets? How to model the balancing interest between the Government and the Business?
- Whether BRICs group could be evaluated as a growing socially responsible market?

Design/Methodology/Approach A conceptual theoretic framework of business and government social responsibility interrelation is developed with reference to local conditions of BRICs. To measure global positioning and interests of the three major players (State, Business, Society) we have worked out a five-dimension model (integrated quantitative and qualitative approach), based on the world economics indices, and also a number of social, economic, political and cross-cultural factors.

The institutional contours of social responsibility in the studied segment seem to establish the essential types of ideological, economic, political and public work directed on harmonization of balance of interests of all stakeholders.

We use mathematical tools of game theory for coordination of the interests of business, society and government. Traditional antagonistic matrix zero-sum games are inapplicable here because of interests of the participants are not contradictory. Therefore, bimatrix games are

applied. We assume there are two players: a government (G) and a business (B), which choose different strategies to influence society. Each player has a certain set of strategies. This game is called bimatrix and can be described by the following system:

$R = \{I_B, I_G, H_B, H_G\}$. Here $I_B = \{1, \dots, m\}$ – is a *player's (B) pure strategy set*, $I_G = \{1, \dots, n\}$ – is a *player's (G) pure strategy set*. The value of game is determined for each pair of strategies and for each player: $H_G(i, j) = g_{ij}$ and $H_B(i, j) = b_{ij}$. As a result, we have two matrices $B = (b_{ij})$ and $G = (g_{ij})$. The goal for each player is to maximize own winning, the value of winning for another player is indifferent.

Findings The 5D analysis of the primary and secondary indicators in assessment of participants' CSR-activities of ideal model of a sustainable development of world economy is provided. Being based on the accepted classification, authors developed and formalized 16 basic conditional strategy cooperation between a Government and a Business which are based on similar parameters of economic growth, economic and business culture, and also model of corporate development. The pure strategy Nash equilibrium is found for studied problem.

Research limitations The quantitative part of the research is based on the open sources statistics and descriptors, the qualitative part is based on the survey of top-management in the selected countries and is limited by their approach to the problem, which might be not quite reflective the global corporate course. Strategies of interrelation of the state and a business are based on the approved national and international documentation in the field of economic and social development. It is also clear that a description of all existing CSR regional models within one concrete game isn't obviously possible at the moment.

Originality/Value Value of the presented model (with some further specifications) consists in the developed approach of measurement and forecasting of optimum balance of the state, corporate and public interests. The application of the national strategies with the game theory tools facilitates fresh and novel insights to understanding of SR in international setting.

Practical Implications The studied practice of introduction of CSR allowed to classify common problems of national social responsibility co-development, and also to suggest the general forecasting mechanism to adjust social responsibilities of the state and the business.

THE IMPORTANCE OF TRUST FOR CROSS CULTURAL COMMUNICATION IN LARGE CONSTRUCTION PROJECTS

Bengoa, Dolores Sanchez¹; Neuhauser, Andreas²

¹ International Business School, Vilnius University, Lithuania. Email: sanchezl@cytanet.com.cy

² Vorarlberger Kraftwerke AG, Austria. Email: andreas.neuhauser@vkw.at

Abstract

The increasing proliferation of international business co-operation of several nature, strategic alliances, foreign subsidiaries or international projects requires the best breed of intercultural skills development to be successfully managed. Team members coming from different cultural background need to create the somehow miraculous ability to work effectively together.

This paper aims to explore and to understand how trust is regarded as the cornerstone for cross cultural communication leading to the success in this large construction project.

In order to gain deep understanding of this trust phenomenon, the research methodology applies a qualitative stance, and it is based on a case study approach. The case study refers to an Austrian company operating in the field of electricity storage power plant construction. The construction project lasted 5 years involving hundreds of experts from different countries working together with local Austrian engineers. The research technique uses in-depth interviews, focus groups and participant/overt observation. The research sample relates to project managers, local engineers and foreign experts.

The paper presents the major challenges experienced during the project execution. It provides recommendations that can be taken by companies involved in large international construction projects to prepare their employees in advance before the actual work begins. Implementing these recommendations lead to create an environment that enforces the development of trustful relations being the basis for improving knowledge transfer that positively influences project costs and project quality.

**ECONOMIC DEVELOPMENT IN THE RURAL REGION OF THE WESTERN NEGEV
THE CLUSTER ANCHORED NETWORKED VALUE CHAIN MODEL:
THE CASE OF THE TOURISM SECTOR**

Bijaoui, Ilan¹; Regev, David²

¹ Ashkelon Academic College

² International Business and Innovation Institute

Abstract

Entrepreneurship in rural areas is challenging many developed countries. The European Commission indicates that despite various programs that encourage employment in the rural areas, they constitute only 17% of all areas of employment growth over the last decade. The percentage of the rural population in Israel is barely changing.

The proposed model is based on the cluster anchored to the value chains of supported and related industries. We focus our research on the Western Negev in the field of tourism and on the combination of agriculture and tourism: "agrotourism."

Keywords: cluster, value chain, networking, rural development

Introduction

Entrepreneurship in rural areas is challenging many developed countries. Because private farms require increasing means of production (land, water, etc.) to operate, the agricultural workforce is leaving the agricultural production cycle, which necessitates the development of initiatives in other areas. Rural population of the European Union decreased by 0.8% between 2010 and 2011, compared to the 5.8% growth of the urban population (Eurostat, 2012). To keep the balance between village and town, the EU initiated a program called Leader +, which aims to help develop projects that provide employment in rural areas. Dozens of projects have been approved to be implemented and supported by this program (program site). In a recent document the European Commission indicates that despite various programs that encourage employment in the rural areas, they constitute only 17% of all areas of employment growth over the last decade (2012, EU). Among the most affected populations are women and young people.

The percentage of the rural population in Israel is barely changing. In 1995, about 510,000 people lived in rural areas compared with about 640,000 in 2010, an increase of 25%. By contrast, urban population grew from 5.1 to 7.0 million, an increase of about 37%. In the south the situation is worse. Between 2009 and 2010, 72,000 people left the region, compared with 68,000 people who arrived (CBS, 2011), a net loss of 4,000 people.

Study objective

Existing rural entrepreneurship in the Western Negev is not capable of jump starting economic development. The share of earnings from agriculture in household income is decreasing. Industry creates almost no new employment. Tourism during the hot summer months is weak and highly dependent on the security situation in the region.

The objective of the current study is to propose a model of entrepreneurship that would promote economic development in a rural region as the Negev.

The proposed model is based the cluster anchored to the value chains of supported and related industries.

We focus our research on the Western Negev in the field of tourism and on the combination of agriculture and tourism: "agrotourism."

Entrepreneurial thinking

According to Schwab (2011), entrepreneurship is the innovative fuel that generates employment and economic growth. To promote entrepreneurship, it is necessary to combine economic, social, and cultural activities (Hart, 2003). Wennekers, Uhlaner, and Thurik (2002) and Peña et al. (2010) distinguished between activity at the level of the entrepreneur (supply side) and of the business environment (demand side). At the level of entrepreneur, they refer to the ability to establish and develop businesses and examine the entrepreneurs' priorities, education and training, skills, and knowledge. At the business environment level, they relate to environmental conditions that create opportunities for entrepreneurship, such as culture, taxation, R&D, capital, health, economic development, immigration, science and technology, and aid organizations.

The connection between the entrepreneur and business environment levels requires the implementation of a model that supports and encourages appropriate networking between entrepreneurs and a supportive and nurturing business environment.

First, we examine the studies that deal with the profile of the entrepreneur (supply side) and discuss ways to promote entrepreneurship that generates economic development. Next, we consider the business environment (demand side) and models implemented to promote economic development, and determine which model can combine the promotion of entrepreneurship with economic development.

Necessity entrepreneurship and business opportunity entrepreneurship

The literature on the entrepreneurs focuses on the aspect of their cognitive perceptual ability and the degree of risk they are willing to take (Pena et al., 2010). Craid (1992) referred to communication skills, analytical skills, knowledge, and the ambition of the entrepreneur. Kurilsky (2000) stressed the entrepreneurial spirit that directs the entrepreneurship. Shane and Venkataraman (2000) emphasized the importance of the combination of identifying an opportunity and realizing it, as a major factor in the success of entrepreneurship. According to

Wennekers and Thurik (1999), entrepreneurial ability becomes stronger with increasing intensity of activity, level of innovation, willingness to take risks, competitive aggressiveness, and desire for independence. The greater this capability, the better the business results (Keh et al., 2007; Stam & Elfring, 2008; Wiklund & Shepherd, 2005) and the stronger the business growth (Moreno & Casillas, 2008).

Understanding the environment is an important factor in the success of the initiative. Guiso, Sapienza, and Zingales (2004) showed that when local business opportunities are created, native entrepreneurs can take advantage of them better than entrepreneurs from outside. Gilad and Levine (1986), and Verheul et al. (2010) distinguished between necessity entrepreneurship, which they defined as “push theory,” and maintained that it affects economic development only slightly, and entrepreneurship that realizes a business opportunity aimed at a certain goal, which they defined as “pull theory” and which has a more meaningful effect on economic development.

Bonnet, Nelson, and Le Pape (2011) showed that in the 2007-2011 period 10% of initiatives accounted for 50% of new employment. This means that if we want new initiatives to have a greater impact on economic development, we must identify and encourage entrepreneurs who have a greater ability than others to influence economic development, in other words, entrepreneurs who create business opportunities. According to Verheul et al., the profiles of a business opportunity entrepreneur and of a survival entrepreneur are different. Business opportunity entrepreneurs are younger, with a higher level of education, more willing to take risks, more exposed to information, and with better access to funding.

Giacomin et al. (2011) examined common types of entrepreneurship in 27 countries and found that the share of business opportunity entrepreneurs among new businesses is largest in the Scandinavian countries (Sweden, Norway, Denmark, and Iceland) and in Anglo-Saxon countries (Britain, the U.S., and Ireland), followed by France, Germany, Italy, Belgium, and the Netherlands. Survival entrepreneurship is more characteristic of European Mediterranean and Eastern European countries.

Entrepreneurship education greatly affects the number of initiatives, in particular the number of entrepreneurial opportunities. Fayolle and Gailly (2009) demonstrated that the introduction of programs for entrepreneurial education to engineering schools increased the rate of entrepreneurship among students. Research by the Kauffman Center clearly shows that students who completed their entrepreneurship studies are more successful in sales and in the volume of employment they create.

Entrepreneurship education affects entrepreneurship capacity differently for different entrepreneur profiles. The Center for Entrepreneurship at Kingston University studied the effect of the Bright Future training program on the entrepreneurial capacity of trainees (Athayde, 2010). The enrichment program has significantly increased the desire of trainees to start a business: 71.4% of the participants in the training program were convinced that they have the skills to start a business, compared with 42.4% before the training. For trainees aged 20-30, the training program had a significantly positive effect on creativity and the willingness

to take risk. The desire to work in a team, however, was strengthened at the expense of readiness to lead, especially among those aged 31-44. Strengthening of creativity was particularly evident in trainees with education in social sciences and the arts.

The cluster model, linking between entrepreneurship and business environment

A cluster is defined as a “geographic concentration of competing, complementary, or supporting firms, that develop sale-purchase relationships, use the same pool of technologies, and share customers and existing human resources pools.” Firms in a cluster develop competitive advantages based on human capital, the knowledge generated in the environment, and the local and international demand (Porter, 1990, 1998). Below we examine the conditions that encourage cluster development.

Cluster formed as a result of creative private enterprise

The Silicon Valley cluster started as a technological incubator established by the University of Stanford, in the early 1950s. Creative enterprises such as HP and Intel were established there in 1967 by former Fairchild Semiconductors employees. The area became a point of attraction for small and large companies alike specializing in the same fields, such as Sun and Apple.

The biotechnology cluster in San Diego developed around the university and research institutes: the Salk Institute, Scripps, and the University of California, San Diego. The initiative began in 1965 with the establishment of the Institute for Research and Development of Torrey Pines Mesa for Science and Research, which operated as an incubator. The development of the area into a cluster began with the entrepreneur Ivor Royston, who in 1978 founded the company Hybritech, to be acquired in 1986 by Elli Lilly (Bennett, 2008). The success of the Silicon Valley and San Diego clusters is credited largely to the creative entrepreneurship of isolated individuals, at the beginning of their way, who persuaded developers and other firms to follow them.

Cluster created as a result of government policy

Cluster development in Europe is the result of government initiatives in cooperation with local authorities (European Union 2007). Programs such as EXIST and BioRegio in Germany are the result of federal and regional decisions to support the development of specialized clusters (Colovic-Lamotte & Tayanagi, 2004).

The Finnish government supported the networking program "Networking" as a first step, which later developed into specialized clusters in the field of communications in Turku and Oulu. Companies such as Nokia and ABB were part of the same network (TEKES, 2005). Since 2001, the Japanese government has implemented a new policy presented in the Industrial Cluster Plan (METI) and the Intellectual Cluster Plan (MEXT) (Colovic-Lamotte & Tayanagi, 2004). METI includes 19 projects in local clusters, including those dealing with metal parts for machines and parts for aircraft (Higashi Osaka), manufacturing of original equipment and

environmental industry (Hitachi-city), as well as clusters related to ceramics and metals. MEXT acted primarily to expand the budget for universities and to improve the infrastructure and human resources for technology transfer and patent strategy. According to Porter (1990), the following conditions are needed for cluster development:

- Inputs: the presence of raw materials or human capital
- Related industries belonging to the same product category.
- Supporting industries: industries required for development. These provide equipment, raw materials, subcontracting, or intermediate products.
- Supporting infrastructure, including commercial services, financial services, insurance services, transport services, and training, research, and technology transfer systems.
- Demand: existing local market that stimulates the development of industry
- Competitive environment: competition that creates challenges and encourages industrial development.

Ketels (2004) added the following conditions for the success of a cluster:

- Taking advantage of proximity for cooperation
- Linkages between the firms' activities to advance common goals
- Active interaction between the firms in the cluster
- Critical mass of firms required to accomplish significant achievement

Networking in selected clusters

Networking among firms is likely to improve the chances for the development of a cluster. A study of firms in Norway has shown that there were more groundbreaking firms in innovative thinking among firms that were in contact with a wide range of international partners than among firms that operated only on the local scale (Fitjar & Rodriguez-Pose, 2011). Below we address two networking initiatives in rural areas that have created conditions for the development of a cluster: one in a developed country (Denmark), and one in a developing country (India).

Danish cluster in the field of furniture

The Danish model in the field of furniture is defined as a village economy. With government assistance, small and medium-sized firms create an area networking where cooperation is based on the exchange of knowledge and on interactions within the shared business culture, which encourages assistance without creating conflicts of interest. A networking program in the field of furniture succeeded in creating the highest productivity in the EU despite the fact that it is not in the high-tech sector and not based on research and development (Maskell, 1998). The Danish Technological Institute functions as a program center. It assigned the

management of the process of cooperation between firms and the financing of the program to external, independent agents (brokers) (Neergaard & Ulhøi, 2006). The main reasons for the success of the enterprise were the Danish tradition of collective organization into business associations and unions, and of a negotiated economy (Maskell, 1998). Eighty percent of workers are union members and 55% of businesses are members of the business union (Anderson & Mailand, 2005). Every business sector in Denmark has its own financing mechanism that supports the activities of the sector (Christensen et al., 2010).

Howells and Hedemann (2008) critically analyzed the network in the field of furniture in Denmark and explained its success. They maintained that the network weakened after the subsidizing stopped, but the development of international markets caused a reawakening of the network.

The drive for cooperation developed because of business opportunities created abroad, an intensive professional training system, and numerous existing small family businesses (Kristensen, 1992, p. 170). According to Martin and Sunley (2003), trust, cooperation, and social networking (external economies) were no less important than international markets to the success of the Danish furniture industry.

Indian cluster in the field of textiles and clothing

In Tirupur, in the center of the cotton-growing belt in Tamil Nadu, in the south of India, a network of firms developed specializing in fields related to cotton processing: dyeing, finishing (curing), and weaving of products made of cotton cloth (Albu, 1998; Cawthorne, 1995). The first factories were established in 1930 and specialized in producing jackets for boys (Ramaswamy et al., 2003). During the 1940s, the local market provided the bulk of the demand. After a visit by an Italian manufacturer, in 1970, exports to Europe began (TEA, 2011), which flourished in the 1980s.

With the support by the federal government and of the local authorities the infrastructure was created: 23 professional associations, 13 vocational training institutions and 38 banks. One of the most significant organizations is the South Indian Textile Research Association (SITRA). It encourages the transfer of technology and knowledge, and is involved in international business activity (Ganguly, 1996).

The number of firms increased from 4,000 in 1995 to 6,250 in 2010. The cluster is based mainly on networking of small and medium-sized firms, between themselves and between them and the supporting infrastructure. Only 20 firms have an annual turnover exceeding \$25 million (Porter et al., 2011). The large firms also consist of many business units to be able to take advantage of variety: small series production at low cost. The local workforce receives an average hourly wage of \$0.38, compared to \$0.86 per hour in China (Porter et al., 2011). Despite the low added value of the products, especially cheap t-shirts, the cluster contributed significantly to local employment. In 2010, the cluster provided employment to about 350,000 employees and exported in the amount of 2.5 million dollars. Trading companies conducting

business operations on site assemble the orders and pressure local manufacturers to lower prices (Fairware foundation, 2004).

This market structure explains the low level of workers' income over time, but it also explains the development of the cluster, which would not have survived without the trade companies.

The environmental cost of the textile industry in Tirupur is high, especially in recent years. Fabric dyeing requires large quantities of chemicals that are not being handled properly. In Turkey the use of sand to create the worn appearance in stonewashed jeans has been banned recently because of the respiratory tract diseases it induces. These production processes have been transferred to Tirupur.

Networking in rural clusters

In the Lublin area in Poland farmers organized into 110 groups of related industries, and together they market their agricultural produce (fruits and vegetables) to retailers in Poland and the European Union (Walukiewicz, 2003). In the Lublin region eight different associations established related industries with various specializations, in the field of agricultural tourism, from hospitality industry with the flavor of local culture and folklore to manufacturing products such as local fabric for tourists.

The association, Ziemia Lubartowska (The Lubartow Country) combines agriculture and tourism and is based on numerous existing historical sites and forests in the area.

Maniwa, in the north of Okayama in Japan, is an area that is 80% covered by woods. In this region a cluster developed based on supporting industries : 34 timber plants, 16 plants for drying wood to related industries: dozens of factories producing furniture (Anbumozhi, 2007). As a result of the aging of the population and because the traditional industry was not renewing itself, a group of 20 people concerned about the future of the region initiated a think tank in 1992. Their goal was to establish ecological related industries based on wood-processing waste, producing ethanol for energy production, cellulose, and construction materials. About 75 small and medium-sized firms now specialize in these fields. The local university collaborates with the University of Tokyo in developing knowledge in the field of energy. The area became a center specializing in energy and attracted investments and other entrepreneurs.

In Udine, Italy, a cluster specialized in related industries manufacturing of wooden chairs in 11 local councils, consisting of more than 1,200 businesses. Most businesses employ fewer than 20 employees. A total of 14,000 workers are employed and 250 exporters operate in the cluster.

In 1865 in the U.S. state of Vermont, the first cooperative specializing in the production of cheddar cheese was established. Since then, cheese producers multiplied in the region. In 1998, the Vermont Cheese Council initiated related industries specialized on cheese. It supports their business activities through the Vermont Institute for Artisan Cheese. The local university supports the cluster by providing training, research, and technical services.

In the southeast of Ohio eight counties organized together and formed the Appalachian Center for Economic Networks (ACENet), for the purpose of developing a cluster based on

related industries in processing of agricultural products. From an initial number of about 12 specializations, today they have reached 100. The ACENet Development Center includes a kitchen incubator and a farmers' market. It created a common brand and helped find new markets. The opening program, Entrepreneurship in Action, funded by the Appalachian Regional Commission, allows expansion of the cluster into packaging, tourism, and the arts.

Cluster-anchored value chains of supporting and related industries

Networking between businesses in a cluster is generally initiated by businesses and by local authorities or public institutions: universities, research institutes, or professional associations. Because firms are not aware of the variety of activities and of possible initiatives within the cluster, a public agent who sees the big picture and is in touch with all businesses can identify the activities that would strengthen the network and enable the development of the cluster. Networking initiated from the top may extend the range of cluster cooperation and broaden its business activities.

Networking in the cases cited above was generally initiated by the businesses. Authorities participated in the organization and the promotion of the cluster, encouraged the activities of the businesses, and provided solutions in matters of training and technical or business knowledge. The degree of support by the authorities varies between cases. In the case of Maniwa Okynawa, 75 firms producing goods from waste wood decided to create a network. The main support from a public institution was provided by the local university in collaboration with the University of Tokyo.

In Udine, chair manufacturers have created a network of cooperation between themselves and co-opted the local authorities and public institutions to establish an appropriate supporting infrastructure. In Vermont the networking initiative originated with the cheese makers, and local authorities supported them through the establishment of the Cheese Committee. In Ohio eight local authorities self-organized and together formed a network of producers of processed agricultural products. The authorities also initiated the creation of a joint brand.

In these examples, only some of the firms belonging to the same value chain in each cluster participated in the networking. In Maniwa the focus was on bioecology, and the manufacturers of furniture and suppliers of waste products were not connected to the cluster. In Udine, neither tree suppliers and supporting industry, nor manufacturers of other furniture were incorporated into the cluster. In Vermont, breeders, dairy producers, and food industries that use cheese were not included in the cluster. Packaging manufacturers in Ohio joined the network only recently.

In the proposed model the role of local authorities is to encourage businesses to organize in the cluster the networking in and between firms belonging to the value chain of each related and supporting industries (Figure 1).

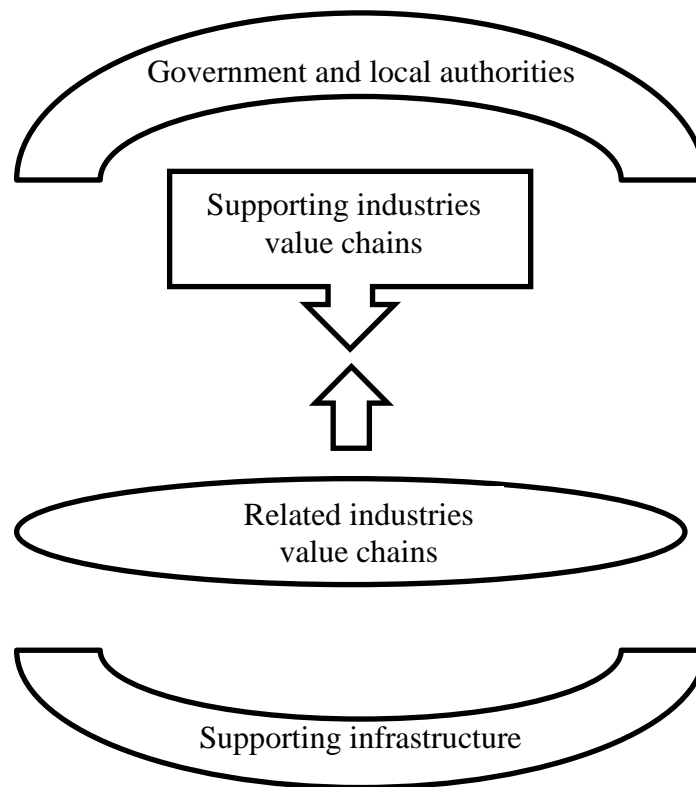

Figure 1: Structure of the cluster anchored networked value chains

Development of the cluster and networking throughout the the related and supporting industries value chains requires an organized and planned process that begins at the level of the local authority and with cooperation with related and supporting industries and supporting infrastructure.

- Mapping the related and supporting industries, and the supporting infrastructure in the cluster
- Creating a framework for communication between them
- Identifying interests common to network members
- Creating appropriate stimuli to encourage members to initiate collaborations
- Proposing projects and collaborations to companies in the network

Tourism cluster anchored in a networked value chain in the rural areas of the Western Negev

Crouch and Ritchie (1999) developed a complementary approach to the traditional approach to tourism based on local attractions (destination attractiveness) using the approach of destination competitiveness. This approach is based on four elements: qualifying determinants (location, dependence, safety, cost), destination management (sources, marketing, organization, information, service), core resources and attractors (physiography, culture and history, commercial ties, mix of activities, special events), supporting factors and resources (infrastructure, accessibility, supportive resources, and initiative).

Kim and Wicks (2010) distinguished between local, natural, and historical attractions (endowed resources), and centers that have evolved over time (created resources) such as festivals or other special events. These are the related industries of the cluster (Figure 2).

Below we discuss in greater detail the existing and potential related industries, (according to the analysis conducted at this state), and the existing and desired supporting industries and infrastructure of the tourism cluster in the Western Negev. We present the existing network and examine the possibilities for future development.

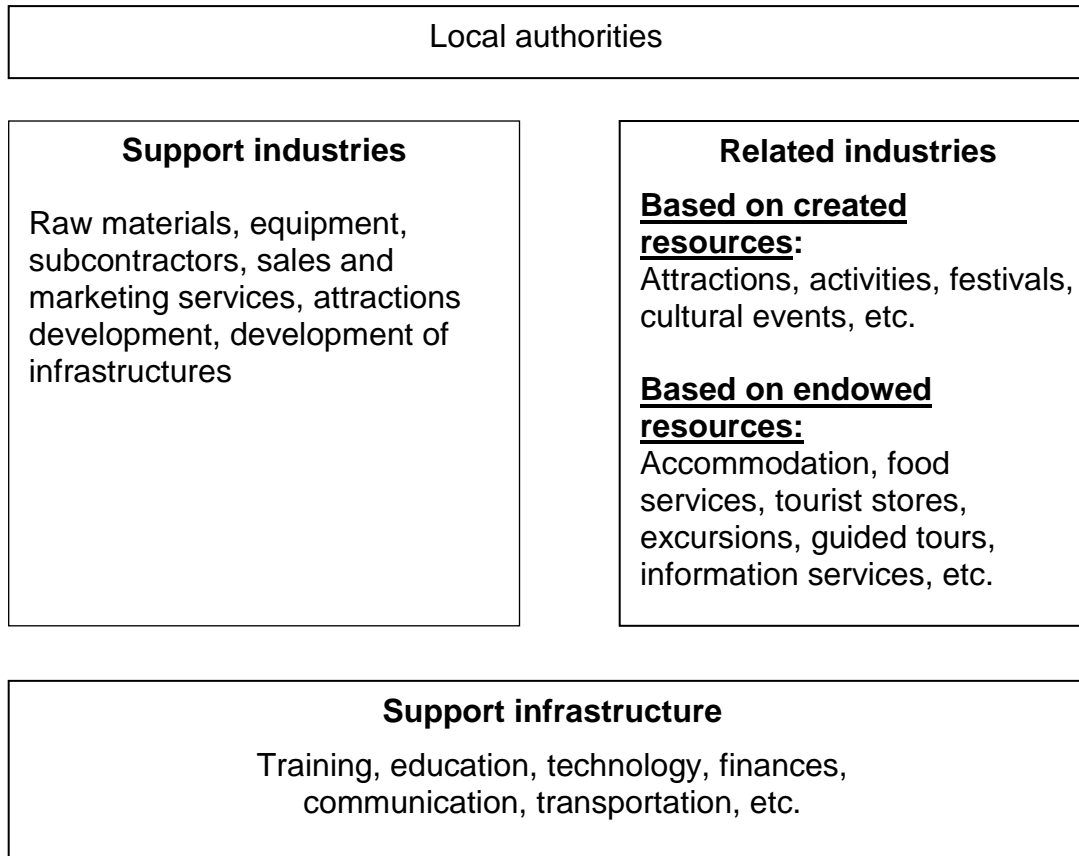

Figure 2: Structure and networking value chain of tourism cluster

Related industries

The hospitality area in the Western Negev evolved around three *endowed resources*: desert nature, historical sites, and religious sites. The *created resources* developed around the endowed resources as special events.

Endowed resources

Desert nature

A wide variety of changing landscapes over a small region, desert flora and fauna, many paths in the area that offer various field trips. At the edge of the area there are hot springs that create an environment of relaxation and the possibility to develop the paramedical treatment option.

History

The main historical sites are those of early Jewish settlement in the region and heritage sites connected to the battles of the War of Independence and its aftermath. At the edge of the area there are the ancient historical sites from the Nabatean and other periods.

Incense Route: a commercial route operated over long periods of history, which linked Saudi Arabia to Mediterranean ports, particularly the port of Gaza. The Nabateans, who controlled the route, left the remains of four cities in the Negev and several fortresses, khans, milestones, portions of ancient roads, remains of ancient agriculture, and waterworks that were declared a World Heritage Site. This route crossed the Western Negev, and some archaeological remains exist at the edges of the region.

In the area there are some remains of ancient waterworks and of some from the period of early Jewish settlement.

Religion

Netivot in the Western Negev has become a cultural and educational center of the ultra-Orthodox community, especially the Mizrachi, thanks to the activity and the graves of famous rabbis who made their residence there. The most famous among them are Baba Sali (Rabbi Israel Abuhatzaira), Baba Shalom (Rabbi Shalom Ifergan), and his son Rabbi Yaakov Ifergan (*Harentgen*). These centers have become a focus of attraction to a wide public.

Around these endowed resources various services developed, including hospitality businesses (guesthouses in kibbutzim and moshavim offer a variety of hosting services; some in addition offer paramedical treatments and desert trips), catering services, and organizations offering hiking, cycling, and other activities for visitors.

Combining created and endowed resources

Nature and the blooming season

February to mid-March is the blooming season in the Negev. The Red South Festival takes advantage of the period of the anemones in bloom and of the pleasant weather to offer a range of activities that attract domestic tourism to the Negev, including organized tours, open markets of local produce, including cheeses, fruits, and vegetables, music shows, and more.

Nature and agriculture

There are larger tracts of land in the Western Negev where potatoes are grown, which gave the impetus for a Potato Festival that takes place each year in April during Passover. The festival includes tours to the potato fields, cooking shows and demonstrations, activities and workshops for children, potato characters, street theater, and a farmers' market.

Religion

Many ultra-Orthodox choose to celebrate their festive occasions in this location. Numerous banquet halls have opened that offer a solution for this public and host thousands of ultra-Orthodox each year for holidays or for private events. Several yeshivas opened in Netivot and in the surrounding moshavim.

Potential created resources

Water and agriculture in the Negev

In recent decades, two water projects have changed the face of the Negev and helped it flourish: a water recycling project and a project that exploits a large pool of brackish water in the area. It is possible to develop visitor centers around these projects and to connect them with the history of early settlement and with ancient times in the context of the waterworks in the region.

Integrating history with experiential activity

Open spaces, unique and varied landscapes, the distance from urban areas, historical heritage spread over different periods, a variety of agriculture in the region, and pleasant weather, mainly in the fall and spring periods, provide a potential for developing diverse tourist, cultural, and educational attractions. The combination of experiential activity with historical legacy can produce such projects as a path that brings tourists to experience the Incense Route, possibly even in the form of a reality program involving a competitive track.

Supporting industries and infrastructure

Many supporting industries are actually related industries: transportation companies and airlines, restaurants, cheese makers and other agricultural producers, growers of vegetables and field crops, producers of activities and events. Supporting industries proper are also required, such as equipment suppliers and service providers in advertising, sales, and the construction of building. At this stage the scope of local activity in the field is usually too small to justify local specialization.

There is no supporting infrastructure in the field of tourism, such as training centers and research institutes, that can assist in the development of new tourist areas. Without transfer and enrichment of knowledge, it is not possible to develop supporting and related infrastructure.

Cluster Networking

In an attempt to promote tourism in the region, regional councils have initiated various activities and established an administrative body for this purpose. One of its tasks is to create a network of related industries in the entire area and a certain expansion of the supporting industry and infrastructure. A dedicated website supports this network and promotes its business. There is also a private initiative of a person who created a website for promoting tourism in the South for the benefit of the member businesses. The existing network allows partners to get to know each other better and through the initiative of network members or that of the administration to establish connections between members to promote joint activities. Only a few collaborations between members have emerged to date, and the site remains primarily a sales site.

Two major events, the Red South Festival, during the blooming of anemones, and The Potato Festival in the spring, as well as several other initiated events, have generated interest among network members and made it more active. Network members suggested other events to be integrated with the festivals. These initiatives create activity for only two months of the year.

Conclusions

The Western Negev has unique tourist attractions that combine landscapes, agriculture, history, and desert experiences, including the desert in bloom, thanks to the water sources developed in the area. There are several initiatives by private entrepreneurs in their respective fields, almost without any connection between them. There is an administration that tries to promote tourism but with small and insufficient effort. There is no agent to take responsibility for building a complete value chain in the field, to transform the existing network between businesses and make it more active and entrepreneurial. To achieve this, it is necessary to set development goals and to allocate resources and human capital.

Establishing an cluster anchored related and supporting industries value chains in the field of tourism in the Western Negev requires an active involvement of the local authorities by building/strengthening the cluster management, creating and operating a network, providing support for existing initiatives, and encouraging the establishment of new enterprises.

SMALL-ENTERPRISE NETWORKING IN NETIVOT AND THE PROXIMATE REGION: IMPLEMENTATION OF THE HYBRID OPEN INCUBATOR-TIPPING POINT MODEL IN THE JEWELRY SECTOR

Bijaoui, Ilan¹; Regev, David²

¹ Ashkelon Academic College

² International Business and Innovation Institute

Abstract

The growth of entrepreneurial economics is based on diversity of needs: new vs. old, innovation, and change. The tipping point model proposes to work with a small number of entrepreneurs who have the potential to innovate and influence others in a way that generates economic development virally.

The open incubator handles existing and new businesses that belong to the same business value chain. We propose to implement both models in the jewelry business in Netivot and the proximate region in order to generate economic development of small and medium enterprises in the region.

Introduction

The developed world is in transition from managerial to entrepreneurial economics (Bonnet, 2012). Managerial economics bases its growth on production efficiency, specialization, the existing market. Future trends are predictable, and there is a tendency toward uniformity of products that allows taking advantage of the large scale (Audretsch and Thürik, 2000, 2001; Thürik, 2008). By contrast, entrepreneurial economics bases its growth on the diversity of needs, new vs. old, innovation, and change. Stam (2008) and Philips (1985) illustrated this by pointing out the positive influence of the process of deregulation on industry in the U.S. A similar process occurred in the EU in the fields of communications and aviation, stimulating entrepreneurship and renewal through cooperation agreements, networking, partnerships, and mergers. Berkowitz and Holland (2001) showed the positive effect of the privatization process in Russia on the growing number of new firms.

Audretsch and Thürik (2004) pointed to the massive entry of young people, women, migrant workers, and retirees into the labor market as factors that require flexible employment, which is possible owing to the increase in the number of small businesses. The creation of new firms is vital to economic growth (Caree and Thurik, 2003), to increasing productivity (Holtz-Eakin and Chihwa Kao, 2003), and to reduced social gaps (Fairlie, 2004).

The study

The objective of the present study is to propose a model that promotes entrepreneurship in the jewelry business in Netivot and the proximal region, which will create new jobs and serve as an example for other potential business areas. We draw on the experience of other countries

in promoting entrepreneurship and developing regional economic models. To this end, we conduct interviews with entrepreneurs, experts, and service providers in the jewelry business: former diamond polishers, dealers, training and development firms, and business organizations in the field.

Entrepreneurship and the tipping point model

A necessity entrepreneur establishes a business to make a daily living for himself and his family. A business opportunity entrepreneur regards the business as a goal and a means of self-realization. Maclelland (1971) defined three levels of self-realization: (a) personal interest, (b) effect on the environment in order to gain appreciation, and (c) will power and leadership. According to Verheul et al. (2008), the profiles of the necessity and the business opportunity entrepreneurs are different. The opportunity entrepreneur is younger, has higher education, and is willing to take more risks. He has greater exposure to information and sources of funding. Bonnet, Nelson, and Le Pape (2011) showed in their study that between the years 2007 to 2011 approximately 10% of new initiatives were responsible for 50% of new employment.

This means that if we wish to increase the effect of entrepreneurship on economic development, it is necessary to identify and encourage entrepreneurs who want to influence the environment, accumulate power, and lead.

Personal attention to individual entrepreneurs, as implemented by the Small Business Administration (SBA) assistance program in the U.S. or by the business development centers in Israel (MATI), requires a large budget and a sizeable multidisciplinary professional team in order to have a positive effect on economic development. The tipping point model offers a different way: working with a small number of entrepreneurs who have been identified as having the potential to influence others in a way that generates economic development virally.

Gladwell (2000) argues that socio-economic phenomena can spread similarly to an epidemic. He identifies three rules, the combination of which makes this phenomenon possible: (a) the law of small numbers, (b) the stickiness factor, and (c) context.

The law of small numbers

The law of small numbers is based on three elements: mavens, connectors, and salesmen (Figure 1). A small group of mavens and connectors is likely to affect a large number of salesmen and through them create a viral process of economic development.

Mavens

A maven (a word that originates in Hebrew via Yiddish) is an expert, someone who has accumulated knowledge. According to Gladwell, an expert is knowledgeable in his field, which he is able to expand and deepen. The expert regards his knowledge as a means to improve his ability to achieve his goals. According to a study based on interviews of experts conducted by Annette Prince, a researcher at the Oklahoma Palliative Care Resource Center (see website), the expert benefits from accumulating knowledge and exercising it.

The profile of a Maven includes the following traits:

Able to accumulate knowledge

Active in collecting information

Connected with data banks

Willing to share knowledge

Lacks obvious persuasive abilities

Solves problems

Is a teacher and a student

The Wolverine firm, manufacturers of Hush Puppies shoes, was about to close in 1994. It was selling approximately 30,000 pairs of shoes a year, mainly in stores in small towns. Suddenly, without any initiative having been taken by the company, they sold some 430,000 pairs of shoes in 1995 and more than 1.7 million pairs in 1996.

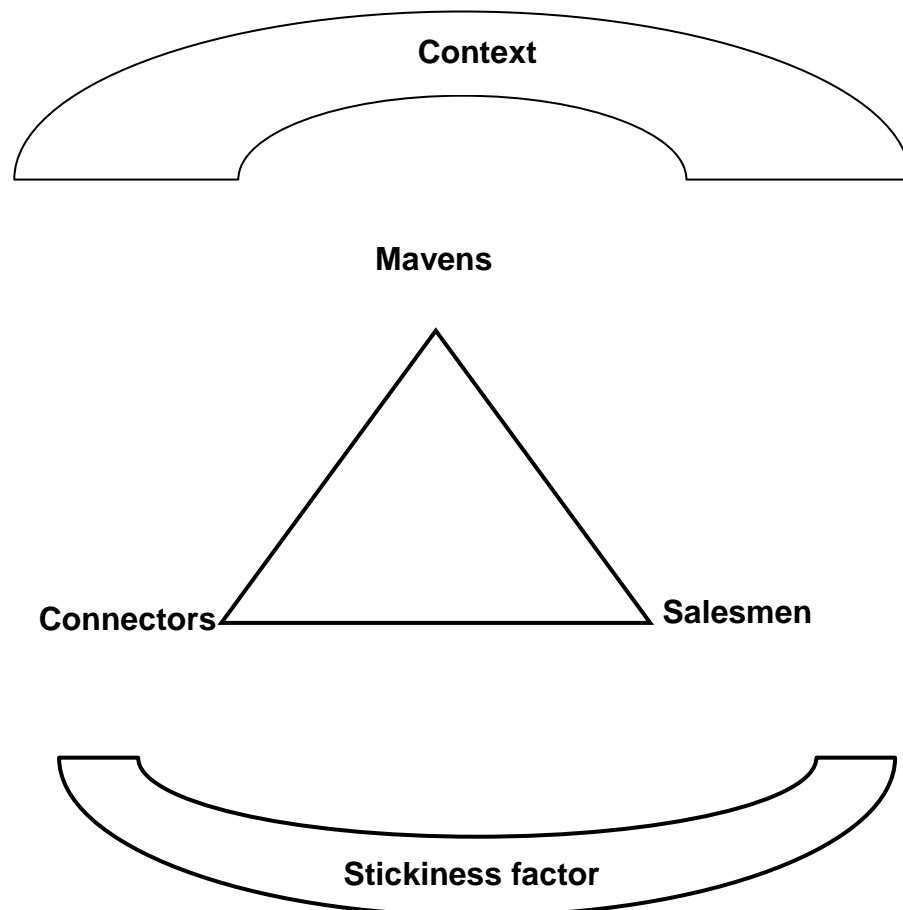

Figure 1: The tipping point model

It turned out that the mavens involved in the process were dozens of young people in the East Village and Soho who wanted to differentiate themselves by creating a retro fashion unique to them: wearing outdated Hush Puppies. They ignited the spark and the first core group of mavens formed around them, most consequential being designers John Bartlett and Joel Fitzgerald, who helped deepen the knowledge as professionals in the field of retro fashions.

Connectors

The connectors provide a link to people with the ability to absorb and transfer knowledge, and develop communication with people and between people. The connectors have a special gift for bringing the world together. They know "everyone" and make social connections easily. These connections are created irrespective of personal or specific interests. This is a character trait. Most of their connections are superficial but important, and numerous, allowing them to distribute knowledge widely.

Acting as a connector, Joel Fitzgerald contributed to the renewed success of Wolverine, owners of the Hush Puppies brand, when he initiated the installation of the Hush Puppies logo at the top of the Hollywood stores building and turned his gallery into a store selling Hush Puppies shoes. There were other connectors as well, such as actor Pee Wee Herman. In 1995, the Council of Fashion Designers in America named Hush Puppies its Accessory Product of the Year.

The profile of a connector includes the following traits:

Knows how to bring people together

Creates social ties easily

Enhances the value of an idea or product that passes through his hands

Works by word of mouth

Salesmen

The salesmen make up the wider circles. Each of them operates a network of additional salesmen and/or is connected with end-customers. The salesmen are the link that effectuates the viral distribution of the product through the networks they operate. The worldwide distribution system of Wolverine assumed the function of the salesman.

The profile of a Salesman includes the following traits:

Persuasive

Attends to matters large and small equally

Able to convey messages both verbally and non-verbally (by movement, physiognomy, silence)

Sets the pace of dialog

The Stickiness factor

The stickiness factor develops and sustains interest in the topic and maintains the links over time between the mavens, the connectors, the salesmen and the customers. In the case of Hush Puppies it was the designer, John Bartlett, who created the stickiness factor by designing classic patterns in bright, optimistic colors of gray, purple, and pink. An investment of \$10 million in advertising by the company supported the new fashion line.

When building a social network or a network of businesses, it is necessary to create the glue, an ongoing interest on the part of the partners, so that the network endures over time. The role of stick is to preserve and develop the interest in connection with the network.

The Context

Conditions prevalent in the environment affect the interest to a product or a service provided. In a neglected and polluted environment, where the windows of buildings are broken, people will behave accordingly: they pollute, do not observe the law, and crime develops. To reduce crime and provide secure civil services in New York in the 1980s, the city initially addressed issues in the environment: cleaning the walls in the subway, fixing environmental hazards and damages; they fined and taxed polluters, and imprisoned those who avoided payment. The positive change in the environment led to a reduction in crime, and the decline in the crime rates spread virally, allowing the provision of better and more secure civil services, such as underground transportation.

The environmental conditions that enabled Hush Puppies shoes to succeed have formed as a positive phenomenon around the development of the retro taste (the return of past fashions) in different areas. The phenomenon spread to the movies, music, clothing, and even food, and became in the words of Keith Naughton the “retro craze” (Naughton, 1995). Groups of young people could spread the new fashion of Hush Puppies because of the supportive environment of the retro fashion.

Economic development models

Models of economic development address two aspects of the tipping point model: creating the glue and creating a favourable context (environmental conditions) for developing the business sector in question. Below we discuss the incubator and industrial district models. Based on these models and on the tipping point model, we describe the open incubator model, which enables accelerated economic development

The incubator model

The business incubator model was developed in order to improve the chances of new entrepreneurs to succeed. The first business incubator was developed in 1956 in the U.S. by the business entity of the Mendoza family. The family purchased the facilities of Massey Ferguson, which had shut down, divided the buildings into small units, and rented them to small

businesses (Leblebici and Shah, 2004; O'Neal, 2005). It also created a supportive environment by providing consulting and capital-raising services. The incubator developed into the Batavia Industrial Park (BIP). Over five years of activity thousands of jobs were created and resulted in economic development for the city of Batavia.

The city of Chicago saw the incubator model as suitable for repairing the poor reputation of the industrial area north of the city, which became a center for drug trafficking. June Levelle, in her capacity as a director of the Industrial Council of Northwest Chicago, converted an area of 350,000 square feet in northwest Chicago into a business incubator that hosted new businesses.

At the federal level in the U.S., the business incubator model has been implemented in a series of regional conferences in the mid-1980s, initiated and funded the SBA (Allen and McCluskey, 1990). The US National Business Incubation Association (US NBIA) was established in 1985 through the initiative of 40 founders. The incubator guides the businesses in the fields of professional management, financing, technology, and marketing. In general, companies in the incubator are at a medium-to-high technological level (Allen and McCluskey, 1990; Aerts et al., 2007). The incubator model proved to be most effective. The percentage of successful businesses among new small businesses is four times higher in the incubators than the average in all of the U.S. (81% vs. 20%) (NBIA website; SBA website).

Since the 1990s, the incubator model spread also to developing countries such as China, Brazil, Malaysia, and Turkey (Leblebici and Shah, 2004). At the beginning of the 21st century, incubators in these countries accounted for 40% of incubators worldwide (European Commission, 2002). Between 2000 and 2005, their number in developed countries fell from 800 to 450, whereas in developing countries it increased from about 200 to 600.

Industrial district model

The role of the industrial district (ID) is to support business indirectly through the establishment of infrastructure and the provision of services in the relevant area. The ID model was first proposed by Marshall (1920) in his book *The Principles of Economics*. He argued that the focus on a single firm is not sufficient for economic development of the business area or region, which requires the integration of the industry within the social environment. He used the term "industrial atmosphere" for environmental conditions that create a positive context by establishing training, technology transfer, and business development centers.

In Italy, based on this model, textile and clothing industries were developed in Capri and Prato, furniture in Brianza and Cascina, and shoes in Vigevano. The ID model creates specializations and results in a deepening of the industrial fabric (Rabellotti, 1995; Schmitz, 1995; Rabelotti and Schmitz, 1999). The ID serves as the basis for varied cooperations between firms (Bellandi, 1996), resulting in social development based on a shared learning process and the accumulation of new capabilities and inputs (Dei Ottati, 1994).

The stages of development of the ID are as follows (Spaventa and Monni, 2007):

- Birth stage: the formation of a mass of small and medium enterprises along the value chain of the business sector in which it is possible to develop a local competitive advantage based on local employment and demand.
- Preconditions stage: an initial network of collaborations begins to form, from the joint purchase of raw acquisition to the shared use of commercial services.
- Takeoff stage: the authorities strengthen the existing institutions and are responsible for strengthening the existing network by assisting in the development of the knowledge acquisition areas, which improves the business abilities of the firms.
- Mature stage: the authorities strengthen the existing and new institutions and plan the entry into international markets.

The ID model was also implemented in California (Scott, 1996) and in Baden-Württemberg, Germany (Sabel, 1989; Herrigel, 1993).

The open incubator model

Regular incubators create a temporary framework for new small businesses and support a limited number of several dozen of them. The businesses belong to different business areas, and there is no basis for cooperation between them. At the end of the process, which lasts one or two years, every business must cope with the new business environment outside the incubator.

The open incubator handles existing and new businesses that belong to the same business area, located in their natural setting. It guides the individual business as a regular incubator would, and it supports the business sector along the entire value chain, as an industrial district would. At the level of the individual company, the open incubator helps streamline the various activities of the value chain of the business:

- Company infrastructure: strategy and goals
- Human resources: focus on professional needs
- Purchasing: dealing with the sources of material inputs/raw products, equipment, and required subcontractors
- Internal logistics: logistics of inputs
- Production process: manufacturing and subcontractors for manufacturing
- External logistics

At the level of the business sector, the open incubator supports businesses along the value chain of the business sector:

- Government and local authorities: public involvement in advancing the field
- Education and training: training by industries (companies specializing in training)

- Technology: companies specializing in the development and transfer of technologies and knowledge in the relevant field
- Procurement sources: companies supplying raw materials, equipment, and services
- Internal logistics: logistics of inputs from Israel and abroad
- Manufacturing: manufacturing specialties
- External logistics: transport and storage system
- Distribution: companies specializing in sales promotion
- Service: companies specializing in customer service
- Customer service: fostering customer loyalty

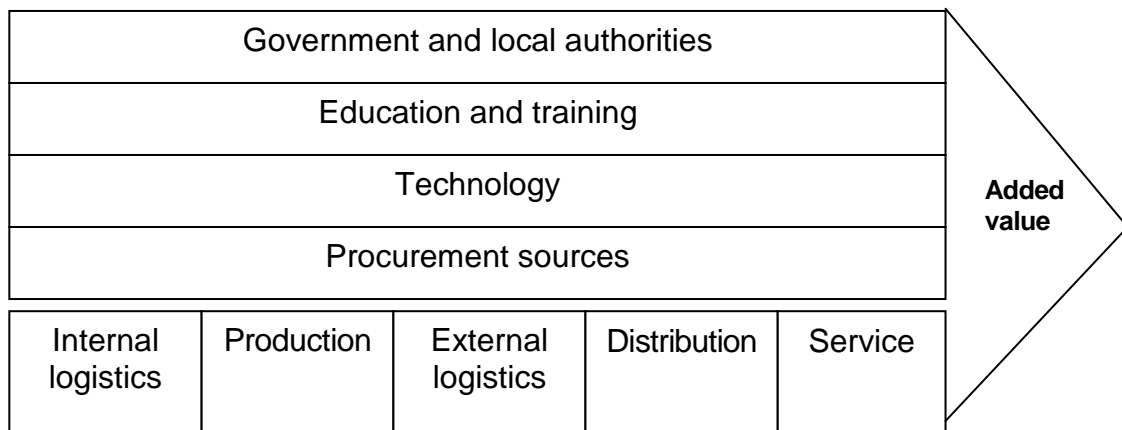

Figure 2: Structure of the value chain of the business sector

Expanding the activity from the individual businesses to the domain value chain enables early identification of opportunities and obstacles, and makes possible the provision of prompt solutions through the establishment of appropriate support centers, as in industrial districts. The open incubator is also responsible for providing the glue between the businesses, leading to networking between businesses, and for encouraging the development of common interests.

Giuliani & Pietrobelli (2011) define three types of networking:

- A small cliquish structure, with a weak connection between the companies, allows networking of necessity enterprises. The aim is to develop a social-economic fabric as a basis for cooperation. Figure 3 shows three cliques with a weak link among them.

Figure 3: The small cliquish structure style

- As the connection between the companies develops and cooperation is enhanced, it is possible to transition to a structure of single cohesive cliques, as shown in Figure 4.

Figure 4: The single cohesive clique style

- Scale-free networking, as shown in Figure 5. At the center of the network are the leaders, key and powerful players that bring about the development of other firms (Wasserman and Faust, 1994). These leaders are likely to combine mavens and connectors who will develop cooperation between themselves and the salesmen.

Figure 5: *The scale-free style*

If we can identify those leaders, the open incubator model allows the creation of an infrastructure that would cause the creation of a scale-free style network and the integration into the process of the three tipping point rules: (a) the law of small numbers, (b) mavens, connectors, salesmen, and glue, and (c) the creation of supportive environmental conditions (context). The process unfolds in stages through small cliques joining the developing network. If it is not possible to identify leaders, the single cohesive clique model is more appropriate.

The following are the steps involved in establishing an open incubator:

Stage 1: Identifying a creative field with business potential

Stage 2: Identifying the firms that make up the value chain of the field

Stage 3: Identifying the leading firms, and identifying Mavens, Connectors, and Salesmen within the firms and outside of them

Stage 4: Specifying and creating the foundations of the industrial district (the context)

Stage 5: Creating the network

Figure 6 shows the structure of an open incubator that incorporates the tipping point model.

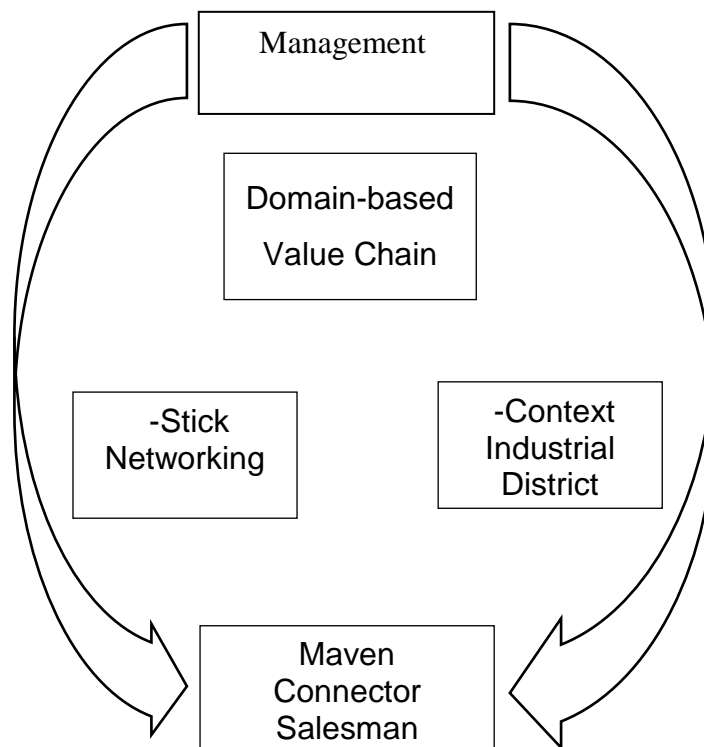

Figure 6. Incubator structure incorporating the tipping point model

Implementation of the model in the jewelry sector in the Netivot region

The London Development Agency (LDC) characterized the importance of creative industries as being capable of creating many small businesses and a commensurate number of jobs (LDA, 2006). Among the areas identified as creative are fashion, furniture, publishing, digital media, jewelry, tourism, and culture. At Netivot and the proximal area we identified capabilities and knowhow in jewelry that integrate with fashion and culture defined by the LDC as a creative industry.

In Israel the jewelry field developed primarily around the diamond-cutting industry, which was established in the early 1950s with the support of the Antwerp Diamond Exchange in Belgium. This industry was characterized by cyclic periods of crisis and prosperity, which changed the nature of the diamond-cutting field in Israel each time. In the 1960s, as a result of competition from India, which enjoyed cheap labor, non-competitive diamond-cutting firms were shut down. Market growth in the 1980s led to the weakening of the large diamond-cutting companies and to the proliferation of small diamond-cutting enterprises. In the 1990s, the market became more competitive, the role of brokers was reduced, and a direct relationship developed between manufacturers and customers. In the first decade of the 21st century, with

the privatization of De Beers, which was required by the European Union, competition increased, driving diamond cutters to specialize in work with high added value.

A large professional cadre experienced in the field of diamond cutting was left without employment in Israel. This was the case in Netivot, which was a center of diamond cutting. Some of these people retrained themselves in the jewelry trade and opened dozens of stores in the city. In parallel, in the last decade Jewish families immigrated from Djerba, in Tunisia, and settled in Netivot. Most of them had engaged for decades in the manufacturing of jewelry, Judaica art products, and various art products from precious metals (gold and silver), as well as less expensive metals.

The jewelry industry has strong roots in Jewish culture, and this remains so in Israel. Two academic institutions, Bezalel and Shenkar, train dozens of jewelry designers each year following a 4-year course of study. Many other basic training institutions train additional jewelry designers. Bezalel developed the study of jewelry already at the time of its founding, at the beginning of the 20th century.

The combination of the former diamond cutters, jewelry manufacturers from the community of Djerba, advanced diamond and jewelry industries that continue to develop in Israel, and of the research infrastructure and training that have developed around these industries serve as the basis for creating an open incubator in the jewelry sector in Netivot. Below we discuss the incubators and industrial districts established in London and in Tari in Italy in the jewelry business, and propose a suitable model for Netivot and the surrounding region.

The Hatton Garden and Tari industrial districts for jewelry business

The LDC research identified in Hatton Garden, North London, about 446 jewelry firms, providing employment to 2,139 people (TRB, 2005). Sixty eight percent of the firms employ fewer than 10 employees (ONS, 2003). Eighty five percent of these firms are concentrated in Hatton Garden, and it was therefore decided to develop the jewelry sector in this place (Bagwell, 2008).

In a survey conducted among the firms the following obstacles have been identified:

- Undeveloped domestic and international demand
- Shortage of skilled and business workers
- Shortage in the variety of specializations
- Limited competitiveness, especially in the international market
- Lack of cooperation and exchange of information
- Lack of leadership, manifest in a poor ability to represent the various businesses vis-à-vis the authorities

It was decided, therefore, to encourage high-quality demand for jewelry, create the ability to supply high-quality jewelry, and promote coordination and cooperation between businesses.

A plan of action was defined, the Jewellery Sector Investment Plan (JSIP), and consultants were recruited through a tender. Leaders were identified, who helped formulate and implement strategy. Training, manufacturing, and design centers in the jewelry sector were established, such as the London Jewelry School (<http://www.londonjewelleryschool.co.uk>).

The model is more like a classical incubator, similar to the one established in North Chicago, with a coordinator-manager and consultants working individually with each business. The main significant difference is that in Hatton Garden everyone was engaged in jewelry making and that some elements of an industrial district developed around them. There is no networking among businesses and no attention is paid to the entire value chain of the sector. Some of the leaders who were identified may have made it possible for the law of small numbers of the tipping point model to become operative.

In 1996, in Tari, near Naples, Italy, jewellers were organized, with the assistance of the local authority and later of the European Union, to create partnerships between businesses in the technological and business areas (OECD, 2005). Currently some 400 businesses operate in the Taricenter (Tari website) along the entire value chain of the sector. A permanent exhibition is held at the location. The jewelry is produced locally according to traditional methods, in combination with the most advanced technologies. A jewelry school trains the future generations in the areas of management, design, and computerized production. A wide range of jewelry products are manufactured, from gold and diamond jewelry to decorations for furniture design.

In recent years, following the economic crisis in the U.S. and Europe, the price of gold jumped, and as a result jewelry consumption, and with it the export of jewelry from Italy declined (CBI, 2011). To reduce costs, the Italian industry resorts to outsourcing in Eastern European countries such as Poland, and in East African countries. Moreover, Italians jewellers began using 9-karat gold and combining precious metals with simple metals, with emphasis on the value of the design. About 50% of the Italian market is controlled by three large companies: Bulgari (19.5%), Damiani (18%) and Richemont (16%). The rest of the market is in the hands of many small producers.

On the initiative of the local authority and of and companies along the value chain of the sector, Tari also organized an incubator. the European Union helped establish the infrastructure for an industrial district, including training, development, and trade centers. No networking model was determined, and cooperation between the businesses evolved as a result of their presence at the same location. The permanent exhibition is supposed to be the glue connecting between firms by attracting customers to the location. There is no reference to the law of small numbers of the tipping point model.

Model combining the principles of the tipping point with an open incubator at Netivot in the jewelry sector

We defined an open incubator model that incorporates the principles of the tipping point and is adapted to the jewelry sector in Netivot and the proximal region. In the course of the work

we interviewed three generations of jewellers from the Djerba immigrant community in Netivot and former diamond cutters in town, currently in the jewelry trade. We also collected data on the diamond sector, the activities of the Institute of Jewelry Technology, and of the Shenkar and Bezalel colleges, and we availed ourselves of the experience gained at Hatton Garden and Tari.

As part of the characterization process, we first identify the components of the business value chain in the sector and the activities that required assistance and support through the open incubator/ industrial district in order to create a positive context for the development of the sector and the formation of the glue that will allow building the right network between businesses. Moreover, we formulate and activate the factors that have the ability to promote the sector based on the law of small numbers of the tipping point model.

The value chain of the jewelry sector

Several groups of populations related to the jewelry sector in Netivot and the proximal region have joined together: (a) a generation of veteran diamond cutters who in the wake of the collapse of the industry turned to trade and opened jewelry stores, reflecting their expertise in diamonds and jewelry; (b) three generations of Jews from the community of Djerba in Tunisia, highly experienced in jewelry; (c) an intermediate generation (ages 30-50) that opened jewelry stores and continues partially in the manufacture and design of jewelry; and (d) a younger generation (aged 20-30) with practical experience in jewelry manufacturing, exposed to advanced technologies, modern design, and the global market (Figure 7). The latter group requires training, knowledge, and experience in promoting a productive business system in the domestic and international markets. The older generation of jewellers from the Djerba community, aged 50 and above, have not been integrated into the labor market because they do not have the certifications needed to be active in the field. For this reason, some remained in Djerba and continue to operate from there.

A young generation of jewellers, from Netivot and the proximal area, trained in educational and training institutions in Israel, are engaged in freelance manufacturing or work in companies specializing in the field. They entered the field of jewelry because of interests and abilities, and create a specialization in modern design.

The sector value chain must address three unique styles: oriental Islamic jewelry (from Tunisia), Judaica, and modern jewelry. It must develop competitive capabilities based on the combination of the three.

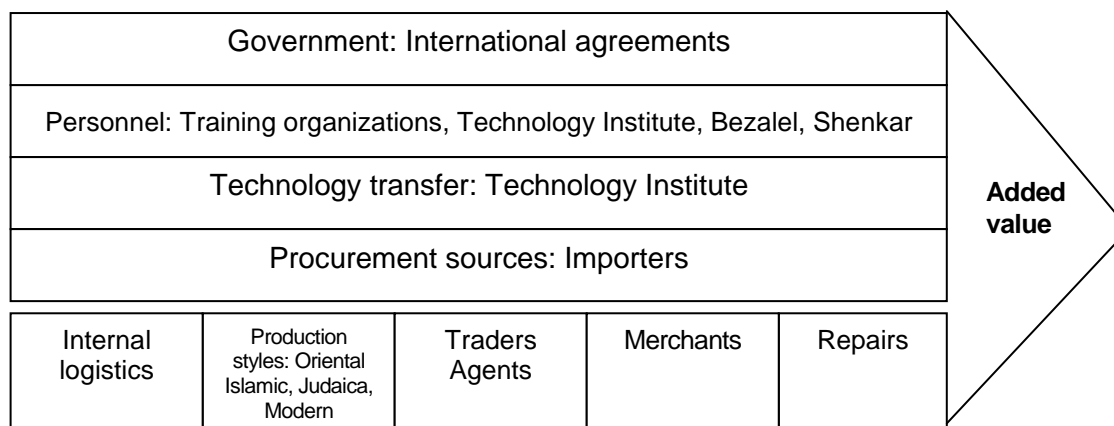

Figure 7: Structure of the value chain in the jewelry sector

- Government and local authorities: Public involvement in promoting the sector is present indirectly through free trade agreements signed with the EU and the U.S. Cancellation of customs on Israeli jewelry products provides an advantage to Israeli companies in those markets.
- Education and training: Professional personnel in production is trained by the Technological Jewelry Institute (at the technician level), and in design by the Bezalel and Shenkar colleges (at the academic level). There is a range of disciplines in jewelry that is not being addressed by existing training centers. Professionals with previous experience, such as jewellers from the Djerba community, have difficulty integrating in the training network either as trainees or as teachers.
- Technology: The Technological Jewelry Institute is only marginally concerned with technology transfer. It currently lacks the necessary equipment and funds, but it may become a suitable framework for technology transfer, particularly in the area of production.
- Purchasing sourcing and internal logistics: Procurement and internal logistics resources are shared by all production areas. The cost of precious metals requires studying the trends worldwide and working with lower carat gold, as well as integrating other metals in jewelry design in order to compete successfully in the domestic and international markets.
- Manufacturing: Combining the local styles (Islamic, Judaica, and modern Western) can serve as a point of differentiation in the competition against low-cost manufacturers from Italy, China, and India.
- External logistics: Transportation and storage of expensive jewels requires security arrangements when shipping jewelry within Israel and abroad.
- Marketing and distribution: Companies specializing in the promotion of ethnic jewelry styles mixed with modern styles, in Israel and abroad. Shops and networks specializing in jewelry distribution.

- Service: Companies specializing in repairing jewelry and adapting it to the customer.

Building a supportive context (industrial district)

Based on the characterization and analysis of the value chain, we can note several areas in which a support center is required to provide reinforcement (Figure 8).

In production: individual jewellers cannot afford to purchase expensive, advanced equipment used in manufacturing; the center is required to provide manufacturing services and help in the transfer of manufacturing technology.

In knowhow: the knowledge gained in jewelry by the Jews of the Djerba community has not been documented. It is important to take advantage of existing knowledge among the older generation and use it as a basis for developing expertise and enrichment. It will be possible to build training programs and to transfer technology and unique design styles based on this knowledge.

In design: the combination of Islamic and Jewish styles with modern jewelry making is unique and therefore requires appropriate training programs to create the necessary human capital. This combination can also enrich the variety of existing designs at the training centers.

In trading: establishment of commercial space, similar to the permanent exhibition at Tari, has the potential to transform Netivot into a professional, commercial, and tourist attraction.

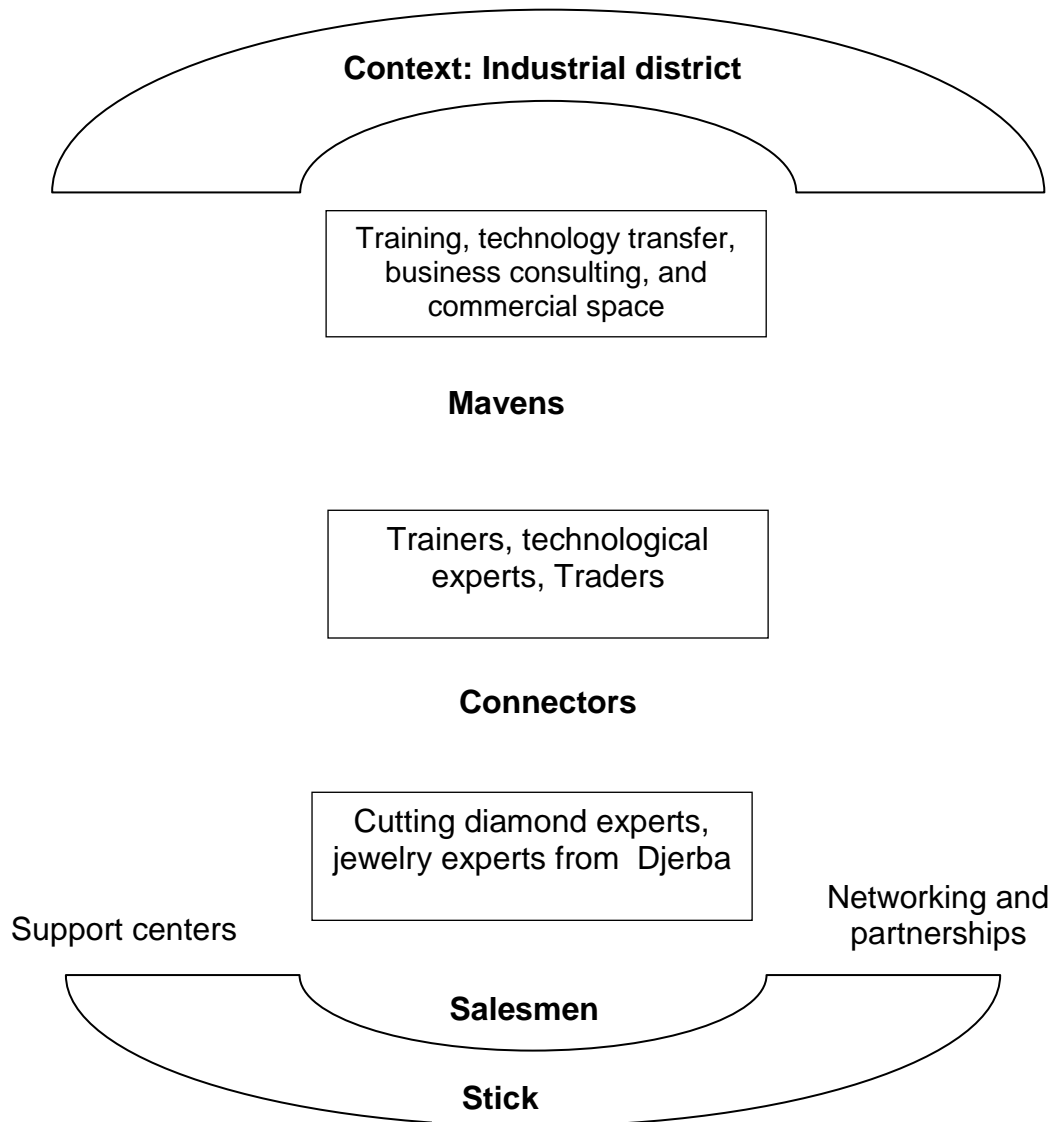

Figure 8. Open incubator in the jewelry business incorporating the tipping point model

The stick and the creation of networking between businesses

There is currently no cooperation between businesses: not between the former diamond cutters or between the various generations of the Djerba community, nor among the younger generation of local entrepreneurs. Because it is necessary to create such cooperation, business networking must be established. This can be accomplished in two phases:

Phase 1: Creating the initial glue based on the preliminary joint purchase of inputs (in order to reduce costs) and on a joint training system. Based on this initial glue, a minimum common denominator can be formulated for the three communities, with a loose connection between them, as proposed by the small cliquish structure.

Phase 2: Subsequently, some businesses will continue the loose connection and others will strengthen ties and form single cohesive cliques within which it will be possible to achieve joint production services, design joint catalogs, and even approach local and international markets jointly.

Mavens, connectors, and salesmen

The mavens are currently operating within the training and development institutions: the Jewelry Technology Institute, Bezalel College, and Shenkar College. Other mavens are working in industry. Opinion leaders from among the veterans of the Jewish community of Djerba in Netivot are likely to enrich the existing group of mavens.

Among the intermediate generation of the Jewish community of Djerba and among former diamond cutters it is possible to identify connectors, thanks to the extensive ties they have created in the course of their activity in the past and present (some of these act as consultants in Israel and abroad).

The younger generation of the Djerba community and the local people, currently engaged in commerce, are the initial nucleus of salesmen through which it will be possible to reach the customers at home and abroad.

Conclusions

We have found unique knowledge in the field of jewelry in Netivot. These form the basis for business development consistent with domestic and international demand, which seeks uniqueness. The uniqueness offered by Netivot is a combination of ethnic and western styles in jewelry.

The open incubator model that integrates the principles of the tipping point model may provide an opportunity for professionals in the field, some of whom are currently unemployed (or underemployed as merchants of imported jewelry), to become the driving force of a unique artistic-business activity.

Active public involvement may encourage networking between businesses and attract the mavens in the fields of technological development and training to establish branches in Netivot. The Jewish community in Djerba is active and capable of continuing to enrich the knowledge of the community in Israel.

BUSINESS MODEL CHARACTERISTICS AND EVOLUTION: THE CASE OF HIGH-TECH FIRMS FOR CULTURAL GOODS

Casprini, Elena¹; Pucci, Tommaso²; Zanni, Lorenzo³

¹ Istituto di Management, Scuola Superiore Sant' Anna. Email: e.casprini@sssup.it

² Dipartimento di Studi Aziendali e Sociali, Università degli Studi di Siena. Email: pucci14@unisi.it

³ Dipartimento di Studi Aziendali e Sociali, Università degli Studi di Siena. Email: zanni@unisi.it

Abstract

In the last two decades, literature has even more increased its attention on the business model concept, treating it as a mean for explaining the success or not of a firm and as an interesting unit of analysis. Even if a general consensus seems to arise on the fact that business models try to show how value is created and captured, acceptance has not yet been reached on its definition and components. Moreover, more recently, a new stream of research is trying to study it from another perspective, drawing business model not as a something fixed, but rather as something in continuous evolution.

In the light of these considerations, this paper analyzes the characteristics and the evolution of business models in a new, unexplored sector: that of high-tech firms for cultural goods.

Through a multiple case study approach based on 30 Tuscan firms, we have investigated how business models could change. Due to the recent interest shown by policy makers and the lack of a holistic framework of the sector, we have decided to investigate high-technology firms that operate in the cultural goods sector. The importance that this sector covers as a mean for local development has been especially recognized by a touristic point of view. Notwithstanding, a gap incurs when we analyze the firms that act on cultural goods. We have identified four main groups of actions that can be carried on cultural goods: two related to the discovery and the conservation of the cultural good, and other two more linked to the use of cultural good. The study of business models of these firms has allowed us to show some peculiarities of this new sector that is characterized by several types of firms with respect to strategies and technologies used.

A within-case analysis and a cross-case analysis have been conducted. The former has shown the peculiarities of each single firm, highlighting firm's general characteristics and its initial, intermediate and final business models. Then, in the cross-case analysis, we have compared the final business models of all the firms, looking for similarities with respect to the groups of actions. What has been arisen is that firms working in the first two groups of activities have tended to maintain the same business model, while firms that operate in the remaining two have been more likely to change it.

The aim of this paper is to concur to reduce some cognitive gaps existing in business model field of research, giving a theoretical contribution to issues referring to firms' development paths. Even if some research on business model evolution has been done at theoretical level,

few works have been done empirically. Moreover, the use of multiple case study has not been so well exploited, researchers having often preferred single case study approach. Nonetheless, we argue that the comparison within and between cases permits a deeper analysis, especially in such a variegated sector as that of high-technologies for cultural good. Hence, empirical analysis has allowed us not only to make suggestions regarding the way in which business models might be expected to evolve over time, but also to give some insights into the unexplored field of high-technology firms for cultural goods.

Finally, this article also develops an useful background that can help policy makers to draw industrial policies able to promote entrepreneurial development and competitiveness in the field of high-technology for cultural goods.

THE IMPLEMENTATION OF A TRANSNATIONAL STRATEGY OF INNOVATION: TOWARDS A MULTI-COUNTRY PROCESS

Chebbi, Hela¹; Yahiaoui, Dorra²

¹ EDC Paris – France. Email: Hela.chebbi@edcparis.edu

² Normandy Business School – France. Email: d.yahiaoui@em-normandie.fr

Abstract

This paper aims to explore the transnational strategies of large companies through the innovation process approach, by answering the following question: How the parent company and the subsidiaries collaborate to develop a transnational product to be launched simultaneously in several countries? In fact, more and more multinationals are developing transnational products to reduce costs and meet the needs of several markets. This leads to the combination of both global and multidomestic strategy (local). Although this concept is not new (Bartlett and Ghoshal, 1989), many researches continue exploring and highlighting the importance of transnational innovation process (Subramaniam, 2006). However, few researches have attempted to operationalize this process, which leads to a lack of knowledge on the development process of new products by both the parent company and its subsidiaries.

To answer this research question, several dimensions could be studied: the organization, the governance, the process, the culture, etc. For this paper, we choose to focus on the innovation process: the process structure, the activities and the content.

This study is carried out within a large French telecommunications group. After a long period of strategic change, OPERACOM challenges the restructuring of its innovation process. Therefore, we highlighted the transition from a centralized process at the parent company (France) to a “multi-country” process in which the relevant subsidiaries can participate in designing and developing a new telecommunication services for several countries.

This research is qualitative, based on a non-participant observation, semi-structured interviews with sixteen managers and a documentation analysis.

The data analysed through the Nvivo software highlight: the new activities to be integrated into the innovation process to develop a multi-country process, the knowledge to be exchanged between subsidiaries and parent company for each activity to design and develop a hybrid product. Implications for theory and research are discussed.

MARKET PERFORMANCE OF ORGANIC FOOD BRANDS IN DENMARK

Chrysochou, Polymeros¹; Vassilev, Boyan

¹ MAPP, Department of Business Administration, Aarhus University, Denmark

Abstract

Purpose – The market of organic products grows rapidly. Over the last decade, its value has more than tripled with global sales having increased from 18 billion USD in 2000 to 54.9 billion USD in 2009 (Sahota, 2011). Prior research has well documented consumers' preferences and perceptions about organic food products, as well as the profile of the organic consumer (Hughner et al., 2007). However, less is known about consumers' purchase behaviour towards organic food products and how the market has led to this growth. One assumption is that organic food brands are small and therefore behave as niche brands showing excess loyalty given their market share. However, niche brands rarely exist (Sharp, 2010), and other factors, such as lack of availability and competition from conventional brands, may have led organic brands to show higher switching rates. What holds true for organic food brands remains a question that this study aims to address. More specifically, the study aims to explore what has contributed to the growth of organic food market and whether organic food brands perform better than conventional brands.

Design/Methodology/Approach – Panel data provided by GfK in Denmark were analysed for 9 product categories across a series of 10 years (2001-2010). For each product category basic brand performance measures (i.e. market share, penetration and purchase frequency) were calculated, which were further used as input measures for estimating the NBD-Dirichlet model (Ehrenberg et al., 2004). The model was used as a benchmark tool to assess the overall performance and fit of the market, as well as provide estimates for the calculation of the polarisation index that was used as a measure of loyalty (Chrysochou et al., 2012).

Findings – In all categories analysed the market share of organic food brands showed a significant growth. This growth has been primarily driven by penetration rather than purchase frequency. This result suggests that growth of organic products is driven by increase of the customer base rather than share that each household gives to organic food products. As regards to loyalty, organic products showed lower or equal levels of loyalty to the overall category, thus showing characteristics of change of pace brands. Loyalty for organic products was never higher as one would expect to be if organic products were considered to perform as niche brands.

Research Implications – The results have several marketing and theoretical implications. From a theoretical perspective, growth of a market is led more by increase in the customer base rather than by increase in loyalty. The assumption that loyalty to organic products could increase is more a myth rather than reality. The organic food market can grow by targeting consumers who don't buy organic and therefore increase its customer base. However, one

crucial element toward this direction is availability of organic food products, and this needs to be taken into careful consideration by managers and retailers for a successful future growth.

Research Limitations – Although the data are rich in terms of time and number of categories, they come from only one country. Sales of organic products in Denmark take place primarily in supermarkets and discount stores, while the state promotes interventions stimulating consumption of organic products (e.g. state owned organic labelling scheme). Country-specific market conditions need to be considered for generalising these findings to different contexts.

Originality/Value - Few, if any, studies have explored performance of organic food brands using actual purchase behavioural data. This study further contributes to the on-going research on how brands grow.

THE EFFECT OF EMIRATI CULTURE ON COSMETICS BUYING DECISION: A STRATEGIC MARKETING ANALYSIS

Contardo, Ianna F.¹; Patwa, Nitin²

² S P Jain School of Global Management. Email: Nitin.patwa@spjain.org

Abstract

We study the effects of Emirati culture on the buying behavior of cosmetics for women in the UAE. Cultural categories act as stable parameters in which national identities are constructed by facilitating recognition and assimilation of established values. Little research, however, has been done in knowing what constitutes the process of institutionalization of new cultural categories or in other words, how new values enter traditional categories. We address this gap in research by offering an in-depth study of how Emirati women portray their identity through the use of cosmetics and more specifically Western brands.

In what Arnould and Thompson (2005) define as “consumer culture theory” (CCT), the foundations of the different perspectives in marketing research addressing the complexities and the dynamic relationships between consumer actions, organizational performance and cultural meanings are set as a conceptual framework of reference. The main tenet revolves around the heterogeneity rather than homogeneity of culture. Furthermore, several studies have addressed the positive effects of advertisement localization versus marketing globalization (Birnik, 2007; Barkho, 2007; Sheth et al., 2011). Yet the conditions under which soft and hard sell cosmetics ads are assimilated into new cultural categories for Emirati have not so far been investigated empirically.

Emirati culture is particularly interesting due to the fast economic and social upheaval the UAE country has experienced in the last decades. Provided cultural categories influence purchasing behavior, adapting advertising campaigns as well as marketing efforts to the local socio-cultural context accomplishes many things: it generates shared understanding about the identities of products and services and the group of consumers purchasing them (Baalbaki, & Malhotra, 1995; Jain, 1989; Ozsomer, 2004; Sorenson, 1975); it defines boundaries for inclusion that are more easily accessed by actors of the different industries depending on their generic business strategies (Shanklin & Griffith, 1996); and it sets the basic expectations of organizational success in complex markets where adoption rates may vary according to compatibility and relevance (Ozsomer, 2004).

We study the effect of traditional beautification of Emirati women on the purchasing decision for Western brands of cosmetics, showing that eventually Emirati women prefer to focus on aspects related to eye and lip make-up, following international trends while also remaining faithful to the predicaments of Islam. In Hypothesis #1 we state that: There is a positive relationship between the consumption of facial color cosmetics of an Emirati woman and the influence of her social circle. As a country founded on a group of tribally organized Arabian

Peninsula sheikhdoms, the importance of peers' opinion is highly ranked. Women in the UAE clearly favor cosmetics and make-up styles that have been recommended by friends, have been purchased with or along a group of other women, are approved by the family members and where the different women share agreement on the brand recognition.

Turning now to Hypothesis #2: There is a positive relationship between the consumption of facial color cosmetics of an Emirati woman and her perception about beauty portrayed through images, we prove that compared to other Middle Eastern nationals Emirati women prefer a make-up look that favors the smoky and kohl based eye make-up together with the strong emphasis on the lip-stick effect. Our research uses projective techniques showing magazine advertisements and proves to be favouring Western brands of cosmetics.

This research adds to the growing call for understanding the contemporary Arab consumers as markets where materialism is exhibited as much as in non-Arab settings (Al-Olayan & Karande, 2000) and where there exists a higher level of vanity expressed regarding physical appearance and concern for achievement (Cherrier, 2009). In a recent study by the Dubai Chamber of Commerce & Industry, women in the UAE spend 38% more on make-up than their counterparts in France, a market and a culture home to the biggest and most popular beauty brands. We stipulated Hypothesis #3 & #4 as: An advertisement that addresses the health concerns of a woman has a positive correlation with the consumption of facial color cosmetics; and There is a positive relationship between the spending on facial color cosmetics and ageing of woman. In fact women above 28 year old, tend to be more influenced by scientific claims in their purchasing of cosmetics while spending remains constant across the age brackets, even if color cosmetics are mainly consumed in the early stages of societal identity creation, that is in the first customer segment.

We conclude by highlighting how this study confirms the expectations regarding the relationship between the Emirati cosmetics consumption and the transitioning towards Global Consumer Culture Positioning (GCCP). Women of the UAE use Western brands which they know well and trust most through the hard sell approaches while favoring an all inclusive value system over the more niche oriented branding strategies adopted by competing rivals.

WIRELESS SENSOR TECHNOLOGY USED TO ENHANCE QUALITY OF LIFE AMONGST THE ELDERLY WITH DEMENTIA IN FRANCE AND SWITZERLAND: UNDERSTANDING CAREGIVER PERCEPTIONS TO IMPROVE TECHNOLOGY TAKE-UP AND BUSINESS MODELS

Delbreil, Elizabeth¹; Zvobgo, Gilbert²

¹ Glion Institute of Higher Education/Les Roches Gruyère University of Applied Sciences, Switzerland and Vigisense SA, 11 rue de Candolle, Geneva, Switzerland. Email: elizabeth.delbreil@glion.edu

Abstract

Purpose: Since the Ambient Intelligence (AmI) challenge was launched by the European Union in 2001, one of the prospective applications that has attracted attention is “the domestic care of elderly assisted living” (Sadri 2011). In addition, the World Health Organisation 2011 Global Observatory for eHealth also recognises a need to develop mobile applications to maintain patient autonomy and lighten caregiver burdens (WHO 2011). However, in some regions of the developed world, such as Switzerland in particular, technology adoption is acknowledged as slow (Joseph F. Coughlin and Jasmin Lau 2006, Corrado 2012). ICT for the aging is a high-potential, nascent market in which the technology-enabled solutions lack business models to make them readily available and easily-accepted (European Commission 2010).

This study examines health professionals’ recognition of sensor technology as a means to enhance quality of life (QoL) amongst elderly care recipients with dementia in Switzerland and France.

Methods: The methodology combines the two complementary approaches, qualitative and quantitative, currently considered as essential when studying technology adoption (Wu 2012). Preliminary qualitative research set the scene for a structured quantitative questionnaire completed by professional care-givers in institutions and homecare organisations in six cities around Lake Geneva in France and Switzerland. A case study approach revealed the nature of an existing company in the sector, the barriers to sustainable competitive advantage as well as the professional partnerships and alliances.

Results and Discussion: Qualitative and quantitative data show an acknowledged desire to enhance and preserve privacy amongst care recipients at all stages of cognitive difficulty. While, in theory, Health and Safety appear at the base of the pyramid in the hierarchy of needs; in research, they are not necessarily classified in the same position as potential gerontechnology benefits. In particular, wireless sensor networks are considered as enabling safety but not necessarily health. In France, gerontechnology is considered for its potential to support care networks while in Switzerland data suggests it is appreciated for facilitating psychological engagement. In both countries, the common perceived advantages of gerontechnology are its

ability to maintain relationships as well as individual decision-making and involvement in a normal daily routine.

It is relevant to note that the population is not technology averse and professionals working with the elderly consider gerontechnology as a sign of progress. We are confident that additional, forthcoming quantitative data will confirm these results and shed further light onto the role of gerontechnology in QoL.

Data collected led us to consider possible value propositions and channels at the centre of future business models. At present, this technology faces persistent major social and political obstacles (Somme and Saint-Jean 2011, Canton de Vaud 2012). These barriers need to be counteracted by innovation in organisational business model components that encompass support platforms, multi-discipline alliances and pressure groups to push for new policy. As in other context-aware mobile service areas, gerontechnology businesses need to innovate to increase usefulness and usability as well as provide a solid service component backed by strong technology and organisation (de Reuver and Haaker 2009). These innovations could include a something for free business model in order to increase awareness as well as encourage adoption and ultimately discretionary spending.

THE RELATIONSHIP BETWEEN WORK-FAMILY BALANCE AND CONTINUANCE COMMITMENT: ORGANIZATIONAL ENGAGEMENT AS A MEDIATOR

Dimitriades, Zoe¹; Gkorezis, Panagiotis²

¹ Department of Business Administration, University of Macedonia, Thessaloniki, Greece. E-mail: zd@uom.gr

² Department of Economics, Aristotle University of Thessaloniki, Thessaloniki, Greece. E-mail: pango3@econ.auth.gr

Abstract

Organizational commitment has been at the forefront of academic literature for many decades. The most well-known commitment model is the three component model (TCM) suggested by Meyer and Allen (1991). They argued that organizational commitment comprises three distinguishable components; namely affective (AC), normative (NC) and continuance (CC) commitment. Affective commitment reflects “an emotional attachment to, identification with, and involvement in the organization”; normative commitment refers to “a sense of obligation to remain”; whereas continuance commitment reflects “the perceived costs associated with leaving the organization” (Meyer et al, 2012, p. 226). Allen and Meyer (1990) developed 8-item measures of each component. These measures were subsequently revised to 6-item scales by Meyer, Allen and Smith (1993). In light of some evidence for the bi-dimensionality of the continuance commitment scale – one dimension reflecting “lack of alternatives” and the other reflecting “perceived costs of leaving” – refinements have also been made to this scale by Powell and Meyer (2004).

Although there has been an upsurge of empirical studies examining both antecedents and outcomes of affective and normative organizational commitment, there is a research dearth vis-à-vis continuance commitment (Vandenberghe, et. al., 2011). This gap may be attributed to inconsistent findings reported by researchers, both in Western and non-Western cultures, investigating continuance commitment in relation to job and organizational outcomes (e.g. Meyer et. al., 2002; Powell and Meyer, 2004; Taing et. al., 2011). The present study aims to contribute to continuance commitment research by conceptualizing CC as “perceived costs of leaving” and examining its relationships with work-family balance and organizational engagement within a positive organizational behavior (POB) framework.

Compared to dominant assumptions proposing that the absence of work-family conflict or the presence of work-family enrichment connotes work-family balance (Carlson et. al., 2009), Grzywacz and Carlson defined the latter as the “accomplishment of role-related expectations that are negotiated and shared between an individual and his/her role related partners in the work and family domains” (2007, p.458). Based on this definition, Carlson and her colleagues (2009) empirically demonstrated the conceptual distinction of work-family balance (WFB), work-family conflict (WFC), and work-family enrichment (WFE).

Prior studies have documented the relationship between important aspects of work-family balance and employee work engagement. For example, Siu et. al. (2010) demonstrated that family-friendly organizational policies positively influence employee engagement. Brummelhuis et. al. (2010) showed that work-family interference may attenuate employee work engagement. Whereas, Kahn (1990) claimed that physical, emotional and psychological resources are sine qua non for employees' engagement at work. Building on relevant theoretical arguments and previous empirical findings we posit that when employees perceive to have WFB they are more likely to experience higher levels of enthusiasm and self-involvement with their employing organization - that is, to experience organizational engagement.

Moreover, previous studies have argued that employee work engagement is positively associated with organizational commitment (Hakanen et. al., 2006; Richardsen et. al., 2006). Indeed, Saks (2006) revealed that both job and organizational engagement have a positive relationship with affective organizational commitment. Contrary to previous findings in other cultures (see, for example, the meta analyses of Fischer and Mansell, 2009; Meyer et al, 2012; and Meyer et al, 2002), in the Greek context continuance commitment has repeatedly found to be significantly, positively related to affective commitment (Markovits et al, 2008; Simosi and Xenikou, 2010). Therefore, we postulate that organizational engagement is likely to affect organizational continuance commitment in the Greek context.

As alluded to above, employees demonstrate elevated levels of continuance commitment when their organization provides them with favorable personal benefits and outcomes that they want to maintain (Johnson and Chang, 2006). Furthermore, it has been shown that WFB may result in increased levels of affective commitment (Muse et. al., 2008). Thus, we posit that work-family balance will exert a direct effect on continuance commitment.

Lastly, we propose that the relationship between work-family balance and continuance commitment will be partially mediated by organizational engagement. That is, perceptions of balancing 'work life' and 'family life' will enhance organizational engagement which, in turn, will result in a higher desire to maintain current organizational membership.

Drawing on the above theoretical argumentation and empirical research we propose the following hypotheses:

H1: *Work-family balance is positively related to organizational engagement.*

H2: *Organizational engagement is positively correlated with continuance commitment.*

H3: *Work-family balance is positively related to continuance commitment.*

H4: *The relationship between work-family balance and continuance commitment is partially mediated by organizational engagement.*

To test our hypotheses, we collected data from 262 nurses employed in 6 public hospitals in Northern Greece. Results supported all four hypotheses. As expected, work-family balance (WFB) was positively related to organizational engagement (beta = 0.501, Sign = 0.001). Moreover, organizational engagement had a moderate, positive effect on continuance commitment (beta = 0.633, Sign = 0.001). Likewise, WFB was significantly positively associated with continuance commitment (beta = 0.413, Sign = 0.001). Yet, when organizational engagement was also introduced in the equation the effect of work-family balance on continuance commitment was significantly reduced (beta = 0.128, Sign = 0.05) – indicating that organizational engagement is indeed a partial mediator of the work family balance – continuance commitment relationship. Current findings, relating to the **positive** association of organizational continuance commitment with WFB and organizational engagement, are in line with reported findings from previous studies on continuance commitment in the Greek context and its positive relationship to job satisfaction, organizational satisfaction and financial performance (Dimitriades and Papalexandris, 2011); as well as to organizational culture and transactional contingent reward (Simosi and Xenikou, 2010), indicating that Greek employees may experience continuance commitment differently from employees in other cultural contexts – particularly the US. In the same vein, our results seem to support Taing et al's (2011) theoretical claims -and empirical evidence- with respect to the multi-dimensional nature of continuance commitment; specifically their proposition that continuance commitment based on economic exchanges is favourably related to task performance and citizenship behaviours (p. 269).

Building on organizational commitment literature, the present study provides useful insights regarding the equivocal nature of organizational continuance commitment, suggesting that work-family balance and organizational engagement may constitute important predictors. Hence if organizations and practitioners wish to enhance organizational engagement and continuance commitment, they should focus upon management practices that will underpin employees' attempt to balance the burgeoning demands of both work and life spheres.

**INNOVATIONS IN BUSINESS EDUCATION FOR SUSTAINABILITY AND SYSTEMS
THINKING: THE USE OF PROBLEM-BASED CONSULTING PROJECTS**

Drew, Stephen¹; Segal, Gerry²

¹ Director of Executive Education and Professor of Business Strategy, Lutgert College of Business, Florida Gulf Coast University. E-mail: sdrew@fgcu.edu

² Associate Professor of Management, Lutgert College of Business, Florida Gulf Coast University. E-mail: gsegal@fgcu.edu

Abstract

There is growing interest amongst business school faculty, administrators and students in incorporating sustainable enterprise and systems thinking into undergraduate and MBA programs. The challenge is not only to deliver relevant knowledge and content but also to train students in the practices of systems and sustainable management which they will need for future careers in the field. This article describes the experience of launching two novel undergraduate electives at the AACSB accredited business school of a State University in the Florida system. Here the authors explain how a problem-based learning approach and cooperation with other schools and a University-based Small Business Development Center have added value to the course delivery and outcomes. Students develop competencies not only in green business practice but in consulting project management. This article provides a benchmark and guidelines for readers interested in implementing similar programs in their own institutions.

Keywords: problem-based learning, sustainable business, systems thinking

STRATEGIC LEADERSHIP FOR INNOVATIONS IN HEALTHCARE MANAGEMENT

Drew, Stephen¹

¹ Director of Executive Education and Professor of Business Strategy, Lutgert College of Business, Florida Gulf Coast University, Fort Myers, FL 33965. E-mail: sdrew@fgcu.edu

Abstract

Healthcare institutions worldwide are under multiple pressures for reform aimed at improvements in outcomes, service quality improvement, adoption of new technologies (e-Healthcare) and cost containment. The challenges for strategic leaders of hospitals, clinics and other healthcare providers are becoming extreme as population ages and future government ability to support programs such as Medicare comes into question. Few physicians are well trained in innovative managerial practices and have experience of change management on a transformational scale. IT and use of new technologies of all kind are often seen as is a major focus for renewal. However problems of value for money, IT design and implementation can stretch the governance capacity of healthcare CEOs, executives and boards who may have little related background or up-to-date knowledge to inform their decision-making. In such situations strategic leadership in healthcare must be supported by emphasis on organizational learning, continuous improvement and holistic approaches to performance management. The use of multi-perspective performance reporting systems (MPRS), such as the balanced scorecard (BSC), is becoming widespread in support of similar technology-intensive organizational change programs in many industries. In conjunction with such efforts organizations often implement continuous improvement systems (CIS) to increase efficiency and effectiveness. In many cases organizations adopting BSC's to achieve their strategic objectives increase the use of CIS's in support of efforts to become a learning organization and achieve greater synergies in use of resources. Earlier studies in manufacturing industries have found that the use of CIS by MPRS users is positively associated with increased organizational learning and performance. However few studies have been conducted on the use of MPRS in healthcare. This study reports on recent case study research conducted with large hospital systems in SW Florida which identifies success factors and best practices for strategic leadership of change management in healthcare. The research also helped identify directions for future research and for training of physician leaders.

MEASURING ETHICAL LEADERSHIP POTENTIAL AMONG HOSPITALITY STUDENTS

Ebersole, Jon¹

¹ STAR (Swiss Tourism Applied Research), Les Roches-Gruyère University of Applied Sciences, Rue de l'Ondine 20. Email: jon.ebersole@glion.edu

Abstract

Leadership is a much talked about and sought after capacity. In an increasingly integrated and globalized economy, leadership is needed just to keep pace, let alone be innovative and creative in an environment of increasingly rapid change.

The hospitality and tourism industry is intimately integrated and present in all areas of the globe, addressing almost all demographic profiles within the vastly diverse human family. Hospitality schools have the task of preparing young managers to enter a variety of situations with skills that will enable them to succeed. They will be required to establish priorities in ambiguous circumstances, and make decisions in the face of mounting environmental pressures that create increasingly complex ethical dilemmas.

In addition to industry-specific knowledge and the cognitive abilities, meeting these challenges requires something that may sound out of fashion: character. Our news sources seem to be full of fallen heroes, persons who provided leadership for a season only to lose their credibility through moral and ethical lapses in their judgment and behavior.

Developmental psychology based assessments of ethical judgment capacity (the Defining Issues Test, or DIT) and socio-emotional maturity (Subject-Object Interview, or SOI) provide well-known measures of these aspect of character development. Whereas the DIT is relatively easy and inexpensive to carry out, through a well-established questionnaire, the SOI requires a one-hour interview performed by a certified practitioner, and then an analysis of the verbatim interview transcript. The resultant scores can be seen as distributed over three basic levels, below.

	<i>SOI</i>	<i>DIT</i>
<i>Post-Conventional</i>	<i>self-authored & universal values</i>	<i>consensus & social cooperation</i>
<i>Conventional</i>	<i>other-centered</i>	<i>maintaining norms</i>
<i>Pre-Conventional</i>	<i>other dependent & ego-centric</i>	<i>obedience & personal interest</i>

Fig. 1. Categories of Developmental Scores

In contrast to the 'horizontal' or egalitarian nature majority of assessments currently in use, developmental assessments establish a hierarchy: more mature is better than less mature for business leadership roles; and higher ethical judgment capacity scores indicate a heightened ability to find solutions to complex ethical dilemmas. Though these static measures of capacity are incomplete predictors of behavior, some degree of correlation exists; DIT scores from prison inmates are on average lower than scores of persons on the outside.

This paper describes research focusing on hospitality and tourism students, including the analysis of data gathered in a pilot study using the DIT during the fall of 2010 (n=23) and a substantial sample (n=162) in the fall of 2011. Tentative conclusions from the pilot study were used to refine the supplemental questionnaire designed to identify various demographic factors that may influence the DIT scores.

In the 2011 sample, the geographic spread was highly diverse, and gender numbers showed about 12% more females. The age range was from 19 to 29, with the bulk in the 20 to 22 year old age range. Students were asked to indicate their age, gender, region of origin, and the relative importance of religion, philosophy, and feminism in their own life and in the life of their families of origin.

Findings from the larger sample, in 2011, indicate a significant difference between the two samples. Whereas the pilot study indicated a marked difference in DIT score according to gender, with females scoring significantly higher in the post-conventional category (8 points), data from the larger sample in the main study showed only a one point difference. In the conventional thinking category, males scored higher in both the pilot (11 points) and the main study (5 points). Additional findings will be discussed in the conference presentation.

As the title of this paper implies, we are hoping to find ways to predict ethical entrepreneurship ability among hospitality and tourism students. Rooke and Torpert (1998) found that persons scoring higher on the scale of personality growth show a higher success rate in leading organizational transformations. Results of the simple demographic factors studied provide a mere beginning in the search for factors that can advance our understanding of how to identify and foster student character growth. This data could serve as a baseline for a longitudinal study, where these factors and others could be examined for possible correlations with changing DIT scores and career success. Further, SOI testing could add the socio-emotional parameter in a search for factors that are crucial in career success.

Results of this research hold implications for the structure and content of leadership development programs in hospitality & tourism, and more generally in business degree programs, as well as recruitment and promotion policies and practices.

RESTRUCTURING AN AGRICULTURAL SECTOR - THE CASE OF FIELD CROPS IN ISRAEL

Edom, Sara¹

¹ Ashqelon Academic College

Abstract

Over the past century the agricultural sector changed from an industry dominated by small-scale, independent family farms to one of larger companies that are more tightly aligned across the production and distribution chain, the agricultural sector has become more concentrate and more integrated⁶¹.

The change in the economic environment led many farmers to reassess their business and to consider acquiring neighboring farmers, or merging with, as a strategy of continued growth and survival. In some cases, farmers established cooperatives in order to cope with the changing environment. Cooperatives are economic organizations, their success and growth are influenced by the economic environment; those that who adjust to new conditions survive. Typically, cooperatives neither dominate their competitors nor are dominated by them; their key role has always been to make agriculture market more orderly and competitive. Generally, cooperatives restructure to improve the use of scarce financial, physical and human resources⁶².

Over the last two decades, Israeli field crops sector has undergone a structural change, the size of the agriculture units increased and the number of the growers decreased. The structural change was result of merging agriculture business units, mainly in the kibbutzim.

In the mid-90's the business environment of agriculture in Israel changed, agriculture products price decreased, water price increased, government policy has changed (reduce direct subsidies to agriculture and to exposure local products to competing import). A social-economic crisis in the kibbutzim made it difficult to obtain capital for investment and professional employees. Under these circumstances many kibbutzim reassess their agri-businesses and consider merger with neighboring kibbutzim as strategy of survival.

When private firms merge, the decision makers are the owners. When public firms merge, decision makers are the directors, share holders are not involved, and they only hope the merged firm to become more profitable than the merging firms. In the cooperative case, it is not only a matter of joining two business firms; the merger is also between two cooperative societies, each of which owns business firms. A cooperative society is an organization for collective ownership of business firms. Hence, not only the board and management of the firm

⁶¹ Boehlje M. D., Hofing S. L. and Schroeder R.C. (1999) **Farming in the 21 century**. Department of agriculture economics Purdue University pp.1.

⁶² Williamson L. (1987). **The farmer's cooperative yardstick: cooperative mergers acquisitions and other forms of restricting**. University of Kentucky.

are involved, but also cooperative society members⁶³. Kibbutz is a cooperative, important decisions are made by the members' assembly. Kibbutz's economic sector model is of Multi-business Corporation, every agriculture domain is managed as a Business Unit (BU), the cash flow is managed by the central management.

As mentioned, the mergers were between two or more business units each of which was owned by another kibbutz. The merging process was led on two tracks: 1. the kibbutz's economic sector central management of the kibbutzim partners. 2. The managers of the merged business units.

Merger purposes:

- Improving the use of agricultural producing resources: land, water, capital and human resources.
- Using better the advantage of economic of scale.
- Preserving knowledge and experience, and upgrading professional and managerial capabilities.
- Creating professional and managerial challenge for young people in the peripheral areas.
- Maintaining the kibbutzim's soil cultivated by the kibbutzim.

Key principles of the process:

- Synchronizing between the two tracks of the process: the parents, the kibbutz's central management and the managers of the business units.
- Transparency for all partners involved.
- Planning process in advance with all involved: managers of the kibbutzim partners and managers of the merged BU, and then implements it.
- A multi-disciplinary consulting team: organizational-managerial, economic-financial and lawyer. The consultants' team should collaborate and should be coordinate.

Factors interfering to integration:

Owners' level – kibbutzim partners:

- Various interest of the kibbutzim partners in the merged business.
- Gap in the economic capabilities of the kibbutzim partners.
- Misunderstanding of the kibbutzim's managers the influence of the merger on the kibbutz's cash flow.
- Resistance of the kibbutzim's managers to loss control over a production asset.

⁶³ Jerker N. Modsen O. (2005) **Cross border mergers between agriculture co-operatives – governance respective**. Working paper. Pp.4

- Disagreement on fundamental stock components and its value.

Business units' level:

- Gaps in resources and capabilities of the merged business units.
- Organizational culture differences and disagreement on the merged cooperative desired culture.
- Resistance of the business units' managers to the merger.
- Resistance of the business units' managers to control and monitoring.
- Fear of business units' managers and key employees from change in their jobs, employment conditions and their status at work.

Key Success factors:

- A real joint of interests of the partners, which create a win-win situation.
- Mutual trust between all those involved: kibbutzim managers and business units' managers.
- Personal chemistry between the business units' managers.
- Enthusiasm of those involved from the opportunity inherent in the merger.
- Leadership in leading the merger, as in general in mergers between cooperatives⁶⁴.
- Transparency and sharing in all levels, managers and employees.
- Openness to discuss and solve problems that arise during the process.

Strategic dilemmas:

- What is the mission (main purpose) of the merged cooperative, only improving performance by economic efficiency or also expanding and diversification of activities?
- Location on the value chain: growing crops only? Post-harvest activities? Industry? Trade?
- What will be the core businesses of the merged cooperative? What are the core capabilities? What are core activities? What activities can be outsourcing?
- What will be the organizational culture and core values of the merged cooperative?
- What will be the main principals of human resources management? Will there be a preference for members of the kibbutzim partners as managers and key employees of the merged cooperative?
- What will be the relationship between the kibbutzim, the owners, and the merged cooperative?

⁶⁴ Jerker N. Madsen O. (2005) Cross border mergers between agriculture co-operatives – governance respective. Working paper. Pp. 10.

- What will be the financial arrangement between the kibbutzim, the owners, and the merged cooperative?

Conclusions

- As resources and organizational characteristics of the business units are more similar the more likely success merger.
- As economic situation of the kibbutzim partners is more similar the more likely success merger.
- As higher the dependence of a kibbutz partner in the revenues from the crops business, the lower the chance for a success merger.
- Prior agreement between all managers involved in the process of the "rules of the game", is necessary for a successful process.
- A leading team committed to the mission and acceptable of all the parties involved, is critical to an effective process.
- Participation of the business units' employees from the early stages of the process reduces the opposition to the merger.
- Giving special attention to organizational and human aspects, contributes to the success of the integration of the business units to one organization.
- If the managers of the business units opposed the merger, it will not happen, even if all the managers of the kibbutzim agree on it and decided to do it.
- To reduce conflicts between the kibbutzim owners, members of the board should be directors with suitable knowledge and experience (not the managers of kibbutz's business), representation of the kibbutzim-partners will be in the owners' meetings.

Summary

The challenge of such mergers is to integrate two or more business units, each of which belong to another kibbutz, without losing key employees, who have the knowledge and experience that are essential for growing crops and business success.

The current conditions of the business environment require continuing mergers and other structural changes that will provide economic of scale to agri-business as strategy of survival and growth.

Possible models for the agri-business of the kibbutzim:

- Creating large cooperatives by merging agri-business units of neighboring kibbutzim, and competing each other.
- Using the existing regional cooperative to create larger cooperatives, collaborate among them, to increase the advantage of the economy of scale.

- Creating a model of "network", collaborate in activities that have advantage of economy of scale and continue to act alone in other activities.

The presentation at the conference will include details of the different stages process on both tracks: kibbutzim owners' managements and business units' managers.

INFLUENCE OF LEADERSHIP STYLE ON THE USE OF ACCOUNTING INFORMATION SYSTEM

Ferreira-da-Silva, Amélia¹; Fernandez-Feijoo, Belen²; Rodriguez, Susana Gago³

¹ Institute of Accounting and Administration of Porto, Polytechnic Institute of Porto (Portugal), ameliafs@gmail.com,

³ Department of Business Administration, University Carlos III of Madrid (Spain), sgado@emp.uc3m.es

Abstract

Due to the many different ways in which the term organizational control has been employed, it is sometimes difficult to distinguish between control, leadership, influence and power, as well as other such concepts (Flamholtz et al, 1985). However, while organizational control is a very well documented theme in accounting literature, only little is known about how the leadership style of managers affects the use of accounting. (Jansen, 2010)

Healthcare sector face a myriad of challenges, the growing demand for healthcare services and quality improvements has been putting a lot of pressure in middle hospitals managers to control costs. In order to gain such challenges, hospitals need to involve professionals in the management process. It is therefore expect that doctor-managers became regular users of Accounting Information Systems (AIS).

The way in which managers use accounting information is related to their leadership styles (Hopwood 1974). In fact, effective leadership is essential to any organizational changing process, particularly when the change involves high-qualified professionals, such as doctors, and high politicized institutions, such as hospitals. (Abernethy and Vagnoni, 2004)

This paper investigates how the leadership style of Directors of Clinical Departments (DCD) is related with the way in which Directors of Clinical Services (DCS) use AIS on management decisions.

The authors collected data in 2009, using a written questionnaire that was sent to all DCS of two Portuguese large teaching hospitals, with the similar organizational characteristics and facing similar political, economic and regulatory environment.

Leadership styles and leadership outcomes were measured using Bass and Avolio's multifactor leadership questionnaire (MLQ). The data was analyzed using a regression analysis.

Results show that passive leadership significantly predicts participants' attitudes considering the use on AIS. The more passive DCS perceived their leader is, the more they use AIS. These results are unexpected to us.

Once the research was limited to two hospitals (N=69), it is possible that there is a sample bias. However, the results encourage us to proceed with future research. The replication of the methodology in other hospitals, in order to test the validity of the model and to compare results, can be interesting.

Because of the growing economic constrains health care organization are facing, middle hospital managers are a key issue in the actual reforms. However, factors influencing doctor-managers decisions and the role of AIS on their management decision are very unclear. This paper brings some light on that.

REGIONAL DIFFERENCES IN THE LINK BETWEEN EURO-MEDITERRANEAN MIGRATION AND BILATERAL TRADE

Fouad, Amir Alexander¹

¹ Master of Public Policy Candidate, Class of 2012, Georgetown University. Email: aaf45@georgetown.edu

Abstract

The growing consensus in economic literature is that international migration and bilateral trade are complementary, however, there is more than one way in which migration can positively affect trade. Furthermore, it is possible that migrants affect trade differently, depending on where they settle. The focus of this paper is to explore the question of how the Middle East and North African (MENA) migrant population in the European Union (EU) affects the level of trade between EU and MENA countries and how that effect might regionally differ. From an analytical standpoint, knowing which “channels” are at play in affecting trade outcomes has strong implications for trade policy.

The literature has established two distinct channels through which the trade-migration link is manifested: indirect channels, whereby migrants foster networks between their host and home countries, and direct channels whereby immigrant demand for products from their homeland (known as “native goods”) leads to the direct selling of those products in the host country. In the first scenario, the networking effects of immigrants working in their host countries—depending on their skill level, upward mobility and assimilation—amounts in the literature to a reduction in transaction costs, due to the increased simplicity of enforcing contracts and maintaining symmetric information. With regard to the second scenario, the notion that immigrants retain a preference for native goods is demonstrated by the large number of “ethnic enclave” businesses and shops that survive almost exclusively on this sentiment.

These phenomena certainly hold true for MENA migrants in the EU, though it is unclear if the differing skill compositions and varied geographic destinations of MENA migrants across Europe change the nature of the trade-migration link. Furthermore, this paper introduces the possibility of a third channel concentrated in the political sphere that may also be at play. Depending on immigrant influence in the host country’s domestic politics—and an argument can be made that this influence is growing as the demographics shift so profoundly within Europe—it is feasible that the migrant voice could spill into the policy realm and thus affect trade. In the case of the European Union, this potential impact is only as relevant and strong as the host country’s relative policymaking power within the EU. If this channel exists, it too gives the trade-migration link a regional edge.

This paper investigates these questions using a fixed effects analysis with panel data for MENA migrants in Europe from 1998-2010. The use of fixed effects accounts for unobservable bilateral factors and is a departure from the status quo of using cross-sectional data and OLS/Tobit specifications. The results suggest that homeland preferences slightly outweigh networking effects in understanding the elasticity of migration to trade in the EuroMed region.

In addition, they provide preliminary evidence that the migrant effect on trade is statistically significant for MENA imports from Europe's five largest countries. Thus, a smaller European country hoping to capitalize on the migration-trade effect from its largest migrant groups (i.e. by tapping the export markets of the sending countries) could encounter political obstacles if those migrant groups differ from the predominant migrant group in an EU powerhouse like France. Ultimately, European policymakers are at the mercy of their individual countries' relative political power and migrant demographics, while the ability of MENA policymakers to optimize their trade agenda vis-à-vis Europe is impacted by where their citizens choose to emigrate.

DISCRIMINANT ANALYSIS AND LOGISTIC REGRESSION IN PREDICTING BUSINESS FAILURE: A COMPARATIVE STUDY

Abstract

Business failure prediction has become an important research field in corporate finance literature and numerous studies have been developed, using a wide range of financial ratios as independent variables in statistical models obtained by a variety of methodologies, in order to predict failure.

The two most used statistical methods in this field have been discriminant analysis and logistic regression, which have shown their ability to predict business failure in samples corresponding to different periods and countries.

The aim of our study is to compare both methods regarding both the significant variables in predicting failure and the classification results. In order to do that, we select a sample of small and medium-sized firms with head offices located in the region of Castilla y León (Spain). Unlike most of the previous models, which have used a paired sample with the same number of failed and non-failed firms, a random sample based on the population size and composition is chosen.

The obtained results show that there are some differences in the variables which become significant in each model. Both methods are appropriate to predict business failure, but logistic regression analysis turns out to be somewhat better. In any case, the classification results are not as high as those achieved by the previous models estimated with paired samples, especially with regard to failed firms, due to its low proportion compared to the non-failed ones.

Introduction

The origin of the development of business failure prediction models is placed in Beaver's and Altman's work, which is considered to be pioneering in this field.

Whereas Beaver (1966) carried out his study from a univariate viewpoint, Altman (1968) began the application of multivariate methodologies (specifically discriminant analysis) in the prediction of business failure. His model has been the basis for a large list of studies developed over the last 40 years in the United States (Deakin, 1972; Edmister, 1972; Blum, 1974; Elam,

1975; Moyer, 1977; Dambolena & Khoury, 1980; Karels & Prakash, 1987; Grice & Ingram, 2001) and Europe (Taffler, 1982; Betts & Belhoul, 1987; Laitinen, 1991).

On the other hand, Ohlson (1980) is considered to be the pioneering in applying logistic regression in failure prediction field, but some other researchers have continued with this research stream, both in the United States (Zavgren, 1985; Casey *et al.*, 1986; Lau, 1987; Gilbert *et al.*, 1990; Mossman *et al.*, 1998) and all over the world (Keasey & Watson, 1987; Bahnson & Bartley, 1992; Laitinen & Laitinen, 1998; Jones & Hensher, 2004).

Provided these two statistical methods were widely applied in the prediction of business failures, a research line consisting of a comparison between their results has been developed (Martin, 1977; Hamer, 1983; Casey & Bartczak, 1985; Lo, 1986; Aziz *et al.*, 1988; McGurr & DeVaney, 1998).

Taking into consideration the presented context, the aim of our study is to compare discriminant and *logit* analyses regarding business failure prediction in a sample of firms operating in the region of Castilla y León (Spain), in order to identify whether there are differences in the significant variables and the classification results.

Data collection

The first step in the data collection is the selection of the sample. We focused on the region of Castilla y León (Spain) and applied a "mixed" sampling method, which combines the advantages of both random and non-random sampling.

First of all, we identified the failed^{xxi} firms in the database SABI, used to collect the information, with the requirement of availability of financial statements for three consecutive economic years. Taking into account our criterion for business failure, there were 59 failed firms, which were chosen to derive the failed sample.

Regarding the non-failed firms, the database included a total of 41,525 companies, and using the formulae appropriate to calculate the size for this group, it resulted in a sample size of 396 firms, which were selected from the same industry in which failed companies developed its activity.

Once the sample was selected, information from each firm was collected, regarding the independent variables to enter the prediction models. As a firm's failure mainly depends on the activity it develops and that is reflected in its financial statements, we selected a list of financial ratios, on the basis of their popularity in literature and their predictive success in previous research, as well as the information availability for the firms in our sample. In order to reduce the number of ratios chosen as potentially explanatory of failure, a Principal Components Analysis was applied, in which we removed the ratios that did not correlate with any of the extracted factors or contained redundant information, resulting in a final set of 15 financial ratios.

Empirical Results

In order to predict the failure of the sample firms discriminant analysis and logistic regression were applied.

The discriminant function included five significant variables, which basically measured the ability of the firm to generate resources internally, as well as some liquidity and activity issues.

In the logistic regression seven variables resulted significant, some of them also measured cash-flow and liquidity issues, together with equity.

Firms	Prediction model	
	Discriminant analysis	Logistic regression
Failed	22.81%	43.48%
Non-failed	98.87%	99.59%
Total	88.29%	90.69%

Table 1. Classification results.

The classification results achieved with both methods are shown in table 1, where it can be observed that the total hit rate is quite similar, although slightly higher in the logistic model. The percentage of correctly classified non-failed firms is very high, approaching 100% in both models. Regarding the failed firms, the correct classification percentage is not large, which can be explained by the sample composition, with a low percentage of failed firms compared to the non-failed ones. In any case, the percentage with the logistic model is higher than the one achieved with the discriminant function, which leads to the conclusion that logistic regression analysis is better than discriminant analysis in predicting business failure. Nevertheless, it is also important to take into account the number of variables in each model, as it has influence on the classification results.

TOURISM PLANNING, CULTURAL VALUES AND COMMUNICATION STYLE

Gerritsen, Marinel¹

¹ Full professor of Intercultural Communication, Radboud University Nijmegen, Business Communication Studies, Erasmusplein 1, 6525 HT Nijmegen, The Netherlands. E-mail M.Gerritsen@let.ru.nl

Abstract

This paper discusses how content and form of the communication a tourist area uses to persuade tourists to visit their area might help to increase the number of tourists. Traditionally such communication focuses on specific features of the area such as history, culture, scenery, food, and is hardly tailored to the target group of the tourist area in terms of content and form of the persuasive message. If it does, the content is tailored to specific target groups, such as youngsters, silvers, language studies, school excursions and/or the language used is adapted to the target group, for example advertising in German for the German speaking target group. Adaptation to the cultural values and the style of the target group is seldom taken into account (Manrai and Manrai 2011). This is surprising because it appears from a number of theories such as Byrne's similarity attraction theory and studies such as those by Litvin and Kar (2003) that congruity between the self-image of a person and the image of the destination is an important factor in tourist satisfaction. For that reason we can expect that tourists will prefer to visit areas that seem to be congruent with their own values and that this perceived congruity may play an important part in their decision to visit an area. In that perspective it seems important to use for the promotion of tourists areas communication that is as much as possible congruent with the target group with regard to content and form of the message. This paper discusses how tourist areas could call forth knowledge about the cultural values and the communicative conventions of their target groups to seduce them to come to their area.

A number of the cultural values as introduced by Geert Hofstede, Fons Trompenaars, Shalom Schwartz and Edward T. Hall will be discussed in this perspective.

Individualism versus collectivism. It is likely that people from individualistic countries will be attracted by communication about individual activities that are tailor made to the individual desires of the tourist, whereas people from collectivistic countries will be attracted with communication about the possibility to have a holiday with the whole (extended) family.

Power distance. People from high power distance cultures will probably be attracted by communication that shows that tourists will be received and treated like queens and kings, whereas people from low power distanced cultures will be attracted by communication about the fact that the population of the area is easily approachable.

Universalism-particularism. People from universalistic countries will be attracted by knowing that the population of the area keeps to appointments, whereas people from particularistic countries will be attracted by knowing that the inhabitants are flexible and that arrangements can be changed easily.

Femininity-masculinity. People from feminine countries are probably attracted to areas that show care for the environment and areas where they can as tourist do a kind of developing aid. People from masculine countries on the other hand will be attracted to areas where they can show achievement for example by practicing a sport or by a type of holiday that shows that they are financially sound.

Uncertainty Avoidance. Tourists from low uncertainty avoidance cultures are probably attracted to holidays with lots of unexpected new aspects and adventures, whereas people from high uncertainty avoidance culture are attracted by knowing that the environment is safe with no risks for health and crime and that they know beforehand what to expect, for example because they can stay in hotels of a well known chain.

Monochony-polychrony. People from monochronic cultures are probably attracted by communication that shows that everything will be organized in the way that is announced before, in time and that there be no changes in schedules. People from polychronic culture, on the other hand will probably be attracted by the fact that appointments can be changed easily and that time is flexible.

Past-present-future. People from cultures in which the past is very important and for whom the present is related to the past, historical aspects of an area are interesting and will probably attire them, whereas for people for whom present or future is more important than the past, historic aspects will be not of any interest and not be a reason to visit an area.

In view of the idea that congruity between a tourist area and a future tourist of that area could play a part in the decision to visit an area, the content of the communication to attract tourist should be as congruent as possible with the target group. It is a matter of fact, though, that a tourist area should never promise things that cannot be accomplished.

Apart of the content of the communication used to seduce people to come to an area, one should also reckon with the form that is used for the message and try to use a form that is congruent with the forms that the target group likes most. In this perspective the low and high context theory plays an important role. People from high context cultures should be addressed with messages in a high context style (implicit, indirect, flowery, narrative, poetry-like), whereas people from low context cultures should be attracted by messages in a low context style (explicit, direct, to the point, no waste of words). Besides, high and low context cultures differ in the media they appreciate most. Low context culture like media with a low information richness (email, letter), whereas people from a high context culture like media with a high information richness (face-to-face communication).

Albeit that communication tailor made to the target group might help to increase tourism, there is also a disadvantage: costs. In the first place there are the costs of the design of content and form of the messages. Regarding this aspect no reduction of costs are possible, unless one asks students to make these adaptations as part of their study. In the second place there is the dissemination of the materials which is more complicated and more costly for tailor made communication. Some reductions of those costs might be made by using new media such as the internet. Just as tourist areas have web sites in different language they could have sites for

different cultures. One should keep in mind, though, that cultures also differ in communication media they use and that especially high context cultures prefer information high media such as face to face communication.

Keywords: Tourism planning, persuasion, cultural values, form of message, tailor made tourist communication

Abstract

The purpose of this paper is to identify the characteristics and dimensions of an artistic and cultural consumption experience: the Salsa dance. An ethnomethodological approach is adopted, using participating observation and in-depth interviews, led with amateur dancers of salsa in Tunisia, an emergent country. Findings allowed identifying cognitive, emotional and social facets of the consumption experience. Particularly, the place of the experience appears to hold a important role in its valuation. Moreover, the salsa dance experience presents the characteristic of being, at the same time, lived and produced by the consumer.

Keywords: lived experience, produced experience, experiential places, artistic consumption.

Context and research objectives

The contemporary individual seems in permanent quest of pleasure, emotion and hedonic experience (Holbrook and Hirshman, 1982). Today, consumers try to “re-enchanted” their lives, and to escape monotony of daily life via consumption (Hetzl, 2002; Schmitt, 1999, 2003). The interest shown currently by individuals in some sports such as trekking, rafting (Holden and Sparrowhawk, 2002) and artistic activities (museums, Hip-Hop) (Arthur, 2006; Wort and Pettigrew, 2003; Goulding et al., 2001) can be explained by a desire to overcome a negative or stressful reality. Dance is generally recognized as an artistic activity which enables a self expression through body language, but also social interaction through dance partners or community.

In Tunisia, the Salsa dance gets in popularity in the last few years. Many gyms and dance clubs offer courses for amateurs, and organize Salsa events. Communities of salsa amateur dancers emerged and a commercial offer developed (restaurant, coffee-shops, music).

In artistic and cultural marketing research, little attention has been paid to the dance consumption experience. Yet, it presents some particularities. The search for pleasure, intellectual and sensory stimulation, self expression, and for social link are the consumption values the most frequently identified. However, in most research studies, the consumer plays the role of a spectator (Pulh et al., 2005) where his participation is only partial: visiting a museum or a monument (Bourgeon-Renault, 2006, Passebois and Aurier, 2004), attending a performing art or musical show (Pulh et al., 2005, Bourgeon-Renault et al., 2006).

Nevertheless, the experience of the dance as an artistic activity requires necessarily an active participation of the consumers. The consumer thus “lives” and “produces” his experience.

What are the specificities of such an experience? Are there particular consumption values that could be associated to the dance and to the Latino universe?

The purpose of this research is to explore and analyze the specific experience of the Salsa dance, as an artistic activity, and to identify and discuss the experience dimensions, and their specificities.

Methodology

An ethnographic approach is adopted. Dance is the expression of the body, but also the expression of a group. The ethnomethodological approach helps exploring individual motivations, but also understanding the group members' behaviors. A participating observation was led, supported by semi-structured interviews with a group of nineteen (19) amateurs of Salsa dancers in Tunis, the Tunisian capital. The participating observation lasts about one year: following amateur dancers while attending Salsa courses or special events, visiting internet websites and forums of discussion dedicated to the Salsa. It enabled developing an understanding of the cultural codes and rituals of the group of salsa dancers. All the interviews were recorded and fully transcribed. A thematic content analysis allowed analyzing collected qualitative data.

Results

The immersion in the salsa universe supported by interviews allowed identifying the main characteristics of this experience. The participant observation revealed that the salsa dance courses are attended mainly by women, which necessitates often a reorganization of the course considering the dance partners. The dancers, member of the community belong mainly to the upper social class. The courses are generally organized in gym clubs and fitness or in schools of dance. Some restaurants offer special programs, at least an evening per week to Latin music and to the Latin dances.

The interviews data analysis helped indentifying the main dimensions of the consumption experience. The salsa dance experience can be qualified as an "active experience" insofar it necessitates the active participation of the consumer to create and consume the experience.

The value of participation (Holbrook, 1994) can be considered as "total" and fully present in this experience.

The major experience dimensions identified are the cognitive one (dance learning, concentration, intellectual enrichment), the affective dimension (emotions, enthusiasm, happiness, sensorial stimulation, festive feeling) and the social dimension (dance partner, community interaction, shared experience). Two other dimensions, representing some specificities of the Salsa dance experience are the "artistic creation" dimension, and the "place" dimension.

In the Salsa dance experience, the consumer is an active actor, creating his experience, while, in most other cultural consumption experiences, the consumer plays the role of a spectator (Joy

and Sherry, 2003; Evrard, 2005). The artistic side of the dance makes the amateur feel like an artistic creator and contributes to the experience improvement by integrating a “creation” dimension.

The “place of the experience”, its central role and the attachment felt by the dance amateurs to this place is another feature of the salsa dance experience studied in the Tunisian context. In the cultural consumption literature, the “place of the experience” is generally considered in terms of “physical environment” (the lighting, the crowd), whereas the notion of “place attachment” is discussed in distribution and leisure consumption literature (Debenedetti, 2007). The results of the present study stressed the important role played by the place in the “Salseros” experience and its role in the maintaining of a close link between the community members.

Finally, the Salsa dance experience seems to cover a variety of experiences: The experience produced by the dancer, but also the experience “undergone” by other persons present in the experience place like friends accompanying dancers or servers in restaurants or cafés where the dancers enjoy dance events.

THE DETERMINANTS OF EXPOSURE AT DEFAULT: EVIDENCE FROM THE ITALIAN MARKET

Gibilaro, Lucia¹; Mattarocci, Gianluca²

1 Lecturer in Economics and Management of Financial Intermediaries, University of Bergamo – Faculty of Economics, Via dei Caniana 2 – 24127 Bergamo. E-mail: lucia.gibilaro@unibg.it

2 Lecturer in Economics and Management of Financial Intermediaries, University of Rome “Tor Vergata” – Faculty of Economics, Via Columbia 2 – 00133 Rome. E-mail: gianluca.mattarocci@uniroma2.it

Abstract

Aim and purpose: The paper aim to analyse the role of macro-economic determinants, lender and financial contract features in determining the EAD using a unique and comprehensive database on the overall Italian financial market.

Literature review: Exposure at default (hereinafter, EAD) is a key driver in the measurement of regulatory capital requirements, as is determines the amount of potential loss for the bank when the debtor enters the default status (Basel Committee on Banking Supervision, 2006). EAD depends on the features both of the economic cycle, the debtor and the facility (Basel Committee on Banking Supervision, 2005).

The EAD normally is affected by the economic cycle because any change in the economy framework could increase the need of liquidity for the debtors and/or impose more restrictive lending policies fo the lender (Zhao, Dwyer and Zhang, 2011).

Looking at customers' features, the lower the credit rating of the debtor the higher is the usage of credit lines (Asarnow and Marker, 1995). As banks develop relationships with firms, they acquire information that are not shared with other financial intermediaries (Lummer and McConnell, 1989), even though multiple banking relationships give the debtor the opportunity to advantage from the competition among banks on interest rates, while creditors experience the disadvantage to hold a limited and shared set of information to appraise debtor's credit risk (Foglia, Laviola e Marullo Reedtz, 1998). The structure of banking relationships influences the concentration/parcellization of debtor's exposure; as it results, debtors tend to finance their needs through more relationship banks, in order to avoid the risk of credit exposure reduction due to liquidity problems of one bank (Detragiache, Garella and Guiso, 2000).

Exposure at default is affected by the features of the financial contract like the presence or absence of guarantees and its duration. Normally the existence of a personal guarantee or collateral could affect positively the exposure at default due to the low level of monitoring adopted by the lender for this type of exposure (Jacobs, 2010) while the longer is the lag between the contract agreement and the higher is the usage of the credit lines given (Araten and Jacobs, 2001) and so, *ceteris paribus*, longer term contracts are normally those that could present an higher exposure at the time of default.

Empirical Analysis: We use a unique database provided by the Bank of Italy that considers all credit exposures for Italian firms respect to any financial intermediaries that defaults in the time period 2006-2010. The information collected includes all the information about the debt exposure of each debtor but due to the information disclosure rule, only some information on the bank and debtor characteristics are available.

Using descriptive statistics and a standard panel multivariate analysis, we analyze the role of each feature in explaining the magnitude of this driver of risk. Results demonstrate that the EAD is not only driven by the market cycle and the characteristics of the relationship and the debtor could affect significantly this driver of risk

Main Results: Results demonstrate that specific customers' and contracts' features are more useful in order to explain the EAD dynamics respect to the economic cycle. A key driver of this risk component is the relationship with the bank and there are some evidences that support the hypothesis debtors with exposures with multiple financial intermediaries are characterized by different behaviors in the EAD.

GEO-TEMPORAL TRACKING (GTT) OF TOURIST FLOWS USING MOBILE PHONE NETWORK DATA

Goedtkindt, Peter¹

¹ Les Roches-Gruyère, University of Applied Sciences Email: peter.goedtkindt@glion.edu

Abstract:

Purpose: This paper presents a conceptual framework for applications of Geo-Temporal Tracking (GTT) data collected by mobile phone operators to the leisure, hospitality, and tourism industry. GTT is storing a time series of the geographical locations of people or devices. Most existing tourist tracking studies use the Global Positioning System (GPS), which requires the cooperation of tourists. Furthermore, the location data available on the device needs to be transmitted to a central server, which induces transmission costs for tourists. The current study proposes a less invasive technology: the mobile phone's network data. This data contain all the information that allow for the location of any mobile phone registered on the network with an accuracy often better than 300 meter. In most countries, legislation was put in place to oblige network operators to transmit tracking information in the case of emergency calls. In criminal investigations, this information may also be requested from the operators available under simple subpoena or court order. Technical developments allow the tracking without the need for the user to make a phone call. As such, GTT data obtained through mobile phone networks require neither the user's approval nor special software or GPS equipment installed on the phone. The controversy is that the mobile phone users are not aware that his or her movements are being traced and do not have any control over the process. Very little research has been conducted in terms of GTT and tourist movements. Moreover, the amount, the precision, and the duration of the GTT data collected are rather limited and mostly for the purpose of demonstration. This study is to address key issues involved in the applicability and potential commercialization of GTT data collected via mobile phone operators in the leisure, hospitality, and tourism industry, i.e., customer relationship management, revenue management, event management, resort management, etc. The contribution of this research is to make stakeholders aware of a powerful method allowing more accurate understanding of customers' behaviours and thus, increasing revenue in a long-term basis.

Design/methodology/approach: The framework is presented based on analysis of technical and legal documents, academic literature and informal and personal conversations with experts in the field.

Findings: Network operators are getting aware of the value of the data that is stored in their network. Some operators are willing to collaborate with academia in order to develop models that might benefit the tourism industry. The procedure used to render the data anonymous is compatible with Swiss privacy regulations.

Practical implication: The framework opens the door to follow-up research: data collection of the flow of large amount of foreign visitors nation wide, analysis and comparison with other

data sources, development of real-time data collection and prediction of tourist movements and arrivals, prototyping and testing commercial applications and services to the industry.

Originality and value: Building tourism models based on GTT systems based on mobile phone networks requires the collaboration of interdisciplinary teams. The data produced with such a system is much larger than data collected using more traditional methods. This may lead to innovative basic and applied research.

Keywords: Tourist behavior; Mobile phone network; GIS; Geo-Temporal Tracking; Forecasting

CORPORATE SOCIAL RESPONSIBILITY IN CYPRIOT COMPANIES

Gorovaia, Nina¹

¹ Frederick University, Cyprus. E-mail: bus.gn@fit.ac.cy

Abstract

This research paper investigates how Cypriot companies understand corporate social responsibility and how they implement it.

I draw on the primary data collected with a help of standardized questionnaires from 56 Cypriot companies. The interviews were conducted by a group of University students, who were trained by the author in interviewing technique and were also knowledgeable on the subject. General managers and companies' owners were the main respondents of the survey. The questionnaires took about 1,5 hours to complete. Although more than 70 questionnaires were returned, only 56 were considered suitable for further use. Apart from 5 public companies in the survey, which I decided not to exclude, because the sample size was relatively small, the majority of the sample consisted of small and medium sized enterprises.

As the questionnaire contained a large number of similarly worded questions, I ran a principal component analysis to reduce the data set to a more manageable size while retaining as much of the original information as possible (Field, 2009). Some of the items appeared to be highly correlated; especially where a number of questions reflected the same underlying dimension. Performing a factor analysis allowed me to explain the maximum amount of common variance in the set of coded items using the smaller set of underlying variables. I used orthogonal rotation method – varimax- and retained factors with eigenvalues over one.

I proceed to report the results of the factor analysis. My data showed that the respondents perceived that the most important component of CSR in Cypriot companies were the employees of the company. The questions about employees revolved around employee welfare, gender rights, anti-discrimination, ethics, occupational health and safety. The second most important component of CSR in the opinion of Cypriot companies is care about the environment and community development.

The next question investigated was what drives CSR in Cypriot companies? The first factor can be described as a competitive driver, because it includes items like use of competitive advantage, access to new markets, pressure from overseas partners and operational efficiency. The second factor was the philosophy of founding fathers, business partners, enhanced shareholder value. The third factor was improved standing with the government and compliance with legislations, and finally the last factor can be described as improved relationship with local community. Cypriot companies are implementing CSR because realize that it could give a competitive advantage to the company, because it reflects the values and philosophy of the founding fathers and business partners. Finally, CSR is driven by regulations and legislation, and the relationship with local community.

The following question I investigated was which parameters impact the organization's social reputation. Altogether three factors emerged, and the first could be identified as community. It included items like support to community projects, strategic partnership with the community, environmental performance. The second factor was continual value delivery to customers. The third factor referred to transparency of business and good labor practices.

The main barrier for adoption of CSR according to my data is that companies do not fully understand what CSR is and that they do not have enough money, because implementation of CSR increases costs of doing business. The first factor includes items like diversity in definitions of CSR, dynamic nature of CSR, cultural and institutional differences in understanding of CSR. The second factor revolves around lack of opportunities to monetize CSR initiatives and focus on short-term gains and profitability. The third factor summarizes issues like lack of linkage to financial success and achieving the right balance between financial performance and CSR.

Finally, in order to create a more enabling environment for CSR, Cypriot companies indicate that a new tax legislation and new legal framework are needed. A more surprising finding is that less governmental intervention will be also beneficial for creating a better environment for CSR and, finally, reforms in labor laws and policy are necessary to encourage more companies to adopt CSR.

**“PERCEPTIONS AND DRIVERS OF INDIVIDUAL AND INSTITUTIONAL WINE
INVESTORS”**

Granier, Emmanuelle¹; Rios-Morales, Ruth², Huh, Pia³

² Deputy director of research and lecturer at LRG, University of Applied Sciences Switzerland, Rue de l’Ondine 20, CH 1630 Bulle, Switzerland. E-mail: ruth.riosmorales@glion.edu.

Abstract

Purpose: the purpose of this paper is comparatively analyzes perceptions and motives of individual and institutional wine investors, addressing decision-making drivers, assets’ selection and specificities, and variant approaches to investment’s risk and returns. The Capital Asset Pricing Model (CAPM) is used to appraise our results.

Design/methodology/approach: the survey method of research is used in this study. Based on issues identified through the literature review, questionnaires were designed to collect the required information from a sample composed of individual wine investors, collectors, and enthusiasts, and institutional wine experts.

Findings: from the analysis we found certain inconsistency in the purposes of individual respondents, whose motives significantly differ from institutional investors’ decision-making drivers. Although all investors definitely pay high attention to wine’s longevity for selecting holdings, home bias still strongly affects the selection’s process of individual wine investors. It is further determined that individuals do not perceive much difference between wine investment’s and other assets’ risk and returns.

Practical implications: the results of this study reveal investors’ inclination to predominantly selected wines having excellent longevity for maturation and long-term investment purposes. Home bias is moreover identified in individual investors’ selection of wine, due to favoured face-to-face interactions with 63 producers and better exploitation of local information.

Originality/value: Data and scholarly research on the topic of Perceptions and drivers of individual and institutional wine investors are limited. Since there is a growing interest in wine investment amongst individual and institutional investors this study has sought to particularly contribute to the understanding perceptions and motives of individual and institutional wine investors, addressing decision-making drivers, asset’s selection and specificities, and variant approaches to investment’s risk and returns.

Type of paper: research paper

SUSTAINABLE INITIATIVES IN EVENT MANAGEMENT AN ANALYSIS OF VISITORS' LEVEL OF ACCEPTANCE AND AWARENESS

Imboden, Alain¹

1 Les Roches Gruyère University of Applied Sciences Switzerland / Les Roches International School of Hotel Management

CH-3975 Bluche. Email: alain.imboden@lesroches.edu

Abstract

Although measures to adopt in order to make an event as sustainable as possible are well documented, how well these measures are recognised and adopted by visitors remains to a large extent a question mark. The aim of this paper is to evaluate the visitors' level of acceptance and awareness of a series of specific choices made by the organisers of an air show in Switzerland in terms of sustainable development.

This study relies on data gathered by questionnaires distributed to visitors attending the event. A total of 259 questionnaires were collected. The questionnaire covered three key dimensions: visitors' attributes and travel habits, awareness regarding sustainable measures taken by the organisers and finally the level of acceptance of these measures by the visitors. Information regarding the measures adopted was provided by the organizational committee of the air show as well as by Swissclimate, who that calculated the carbon footprint of the event.

The analysis shows a high level of acceptance among visitors regarding the measures adopted to make this event as sustainable as possible. Moreover, a majority of the visitors consider such a sustainable approach to event management as an essential responsibility of the organisers, a responsibility that they define as much environmental as social. However, variations occur depending on the characteristics of the respondents in terms of gender, income and choice of transportation. The study reveals as well the importance of communicating properly the efforts made by the organisers to plan an event as sustainable as possible. In particular, visitors showed limited awareness regarding efforts that were not directly tangible such as for example the compensation of CO₂ emissions caused by the airplanes participating in the show.

The sustainable message that an event carries contributes not only to its environmental impact but also to its image. This study has emphasised the need to consider not only the content of such a message and the measures associated to it, but as well the mediums used to its dissemination and their visibility. Such a requirement is particularly important in a time when, as the study shows, visitors expect event organisers to adopt a sustainable stance that is not anymore limited to visible environmental measures but covers the less tangible social and economical dimensions of sustainability.

MANAGING BUSINESS MODEL CREATION PROCESS: KIRZNERIAN ENTREPRENEURSHIP AND ROLES OF ORGANIZATION IN CASES OF A JAPANESE COMPANY

Abstract

Introduction

Business model innovation is critical for companies' competitiveness, so there have been a lot of researches on business model (Pohle and Chapman, 2006; Chesbrough, 2007; etc.). However, there is little understanding about the process of business model creation, although there are many studies about the components and structure of business model (Johnson *et al.*, 2008; etc.).

According to Afua (2004), theoretically there are three modes for the business model creation process: planning, adaptive and entrepreneurial. But there is little data available on the process of business model creation so that we do not know which mode is adequate for business model creation. We have little knowledge about how to manage business model creation.

This research has explored the process of business model creation and roles of organization in that process, in order to enhance the knowledge about how to create a business model effectively.

Research methods

The multiple case-study method for building theory was applied to this research (Eisenhardt, 1989; Yin, 2003). The samples are four business models which were developed at a company in Japan. We have gotten an opportunity to collect data on business model creation process at Sumitomo Corporation, one of the leading SOGO-SHOSYA in Japan. SOGO-SHOSYA's business, which used to be trading, has been expanded in various fields including media businesses as well as natural resource development in the past decades. A SOGO-SHOSYA does not develop a new product or service but business models. In 2009, we conducted interviews with people who were involved in the business model creation and also collected documents related to the process.

Findings

First, we found that the business model creation process was entrepreneurial process in all the cases and that those entrepreneurial activities were conducted based on not the Schumpeterian but the Kirznerian theory.

Entrepreneurship can be categorized into two types: Schumpeterian and Kirznerian (Shane, 2003). Schumpeterian entrepreneurship is the one driving the economy system away from equilibrium through entrepreneur's activities of creative destruction (Schumpeter, 1934). On the other hand, Kirznerian entrepreneurship is the one driving the system towards equilibrium through entrepreneur's alertness (Kirzner, 1973). We observed Kirznerian entrepreneurship in all the cases.

Secondly, we found that the organization played important roles in the four cases to encourage the Kirznerian entrepreneurship, which led to the creation of the business models. There were two common management practices. The first one was to assign people whose prior knowledge is very different at the projects. Second one was to provide enough freedom for them to do trial and error. Both practices have encouraged them to create business models through their *alertness*.

Based on those findings, we have proposed on how to manage the business model creation process effectively.

**SUSTAINABLE BUSINESS FUTURES FOR ADVENTURE TOURISM ACTORS IN UK'S
ENVIRONMENTALLY PROTECTED AREAS: THE CASE OF PEMBROKESHIRE COASTAL
AND BRECON NATIONAL PARKS**

Jenkins, Ian¹; Rios-Morales, Ruth²; Cevera, Ralph³

¹ STAR, Swiss Tourism Applied Research, Les Roches-Gruyère University Applied Sciences, Bulle, Switzerland.

² STAR, Swiss Tourism Applied Research, Les Roches-Gruyère University Applied Sciences, Bulle, Switzerland.

³ STAR, Swiss Tourism Applied Research, Les Roches-Gruyère University Applied Sciences, Bulle, Switzerland.

Abstract

Purpose: The purpose of this research was to investigate business sustainability in two UK national parks, using adventure tourism businesses as indicators of sustainable measures taken. This research is part of a proposed 3 staged research project, which expects to compare its findings with the Swiss and USA national park networks. The current research targets the Brecon Beacon National Park and the Pembrokeshire Coast National Park in Wales, UK (Travis 2011). The notion was to illicit data from tourism actors about the strategies and actions that they have taken to ensure that National Parks in the UK develop a sustainable future and development (Travis 2011, Eagles & McCool 2000). Adventure tourism has been seen as a growth market (Swarbroke et al. 2003, Shepherd & Evans 2005) and this is certainly so in the UK and especially within national parks. Hence, Adventure Tourism can be seen as an indicator for business development and how it conforms with sustainable development. Much has been written about sustainability and the word is plagued with a number of varying definitions which do not always concur with an applied business perspective (Hunter 2002 Goddle et al. 2000). Hence, the research was designed to investigate whether the theoretical understanding of sustainability was actually being initiated by businesses. It must also be noted that understanding of the main principles of sustainability varies and the research has taken the Brundt Report definition as a foundation with which to measure business actors' responses to sustainability within their businesses.

Design/methodology/approach: As mentioned earlier, the design was based upon a research premise: To what extent are UK national parks delivering sustainable measures? The research was framed around qualitative methods of data collection, as this was deemed to be the most efficient way (Flick 2007) to collect the data; it has also provided the research with enriched data compared to a more quantitative survey (Robson 2006, Flick 2007) The sampling framework was based upon two aspects: that of judgment sampling and snowballing techniques.

Ten interviews were carried out with tourism actors in the two national parks and as explained above the selection process involved both a judgment sampling and snowballing

technique. The aim was to try and achieve a balance between the two national parks in terms of the number of tourism actors that were selected. The organisations that were contacted ranged from National Park Authority officers to business and retail outlets providing for tourists in the two National Parks.

The analysis involved using Discourse and Content methods (Robson 2006) of data. The texts were then transformed and coded into key themes, where matrix tables (Robson 2006) were used to display the main findings identified by each tourism actor. These were then distilled into a summary matrix so that the data could be used to evaluate what real measures were being taken by businesses and whether they followed the main strategies that National Park Authorities were expecting them to follow.

Findings: The findings indicate a mixed response from tourism businesses. It is evident that both National Parks do have sustainable policies that should be implemented but that not all actors necessarily agree with them or actually have the same ideas of sustainability. Sustainability could actually simply mean the survival of the business before considering the four axioms of sustainability (environment, economic, social and cultural). It is often overlooked that businesses are primarily developed to make money for their owners, with sustainability often being a secondary priority. However, it was also evident that it is possible to produce businesses within national parks that can actually achieve both (profit and sustainability). One business has actually based its entire business plan upon sustainable principles and has seen an exponential growth in profits. The development of a business forum and a voluntary code of practice have been very effective in the protection of the environment in the Pembrokeshire National Park and is perhaps a model that could be emulated by other national parks. The overall implications are that most businesses do adhere to the principles of sustainable development in one form or another, however, the main difference is reflected in the emphasis upon particular aspects of sustainability. Most businesses use the resources of the National Park and therefore recognise that their survival depends upon a sustainable environment. However, in terms of energy resources and employment practices there are mixed responses with a variety of strategies being taken to address these issues.

Practical implications: This research has a number of practical applications, as it can be viewed as a benchmark for identifying whether business and tourism actors are in effect following the strategic directives of the National Park Authorities. It is also believed to be one of the first studies to attempt staged research in three different countries. Once the three stages have been completed it will be interesting to look at cultural attitudes to sustainability across the three countries and the implications for business practices.

ENTREPRENEURIAL MARKETING: A SMALL BUSINESS PERSPECTIVE

Jones, Rosalind¹; Suoranta, Mari²

¹ Glyndwr University, Wrexham, UK. Email: drrosalindjones@hotmail.ac.uk

² University of Jyväskylä, Jyväskylä, Finland / University of California, Berkeley, US. Email: mari.suoranta@berkeley.edu

Introduction

This paper contributes to the entrepreneurial marketing (EM) literature by examining entrepreneurial marketing orientation (EMO) in the context of small businesses, using small software technology firms (SSTFs). Two purposive samples of UK and US firms are interviewed using the 'EMICO' framework (Jones and Rowley, 2009) which identifies 15 dimensions of EMO. The paper reports on EM activities within SSTFs in relation to firm growth. The developing paradigm of EM offers new dimensions that reflect the way in which small entrepreneurial technology firms market. This is because EM research explores the interface between marketing, entrepreneurship and innovation (Hills et al., 2008) and recognizes the value of networks as contributing to firm performance and growth, also a feature of SME research (Carson et al., 1995; Collinson and Shaw, 2001). EM literature also acknowledges customer relationships and creation of customer value, identified as a value creation process which emerges when the customer uses what is required, as part of a co-creation process whilst leading customers and using marketing tactics that are often two-way with customers (Schindehutte et al., 2009).

Methodology

The UK based study included 21 interviews in six SSTFs and the US sample included 12 interviews in 6 firms. Semi-structured interviews were carried out with in both samples using a card-game methodology and the 'EMICO' framework dimensions to extrapolate opinions from informants. The SSTF samples were chosen using purposive sampling procedures (Shaw 1999) and four criterion: firm age (over 3 years old); size (micro and small firms with under 50 employees); offering both a software product and service support; and, in the same geographic area. A semi-structured interview protocol and card methodology (Müthel and Högl 2007) was used during interviews. Data was analysed using coding matrices and 'en vivo' statements of participants (Miles and Huberman, 1994).

Findings and conclusion

Comparison of the US and UK firms showed that there were clear similarities and differences. Both sample groups viewed research and development as fundamental to all other firm activities. However, US firms had much greater focus on speed to market compared to the UK sample with US firms taking a leadership stance and UK firms, a collaborative stance. US firms had a higher propensity towards risk, while UK firms were risk adverse. Networks were essential for start-ups, at and before inception of the firm and for firm growth- ie partnerships

with larger firms, in both samples. US firms exhibited Schumpeterian behavior, provoking market changes through radical innovations while UK firms were customer oriented, developing incremental innovations. Being so focused on customers limited UK firm's ability to innovate while, an understanding of 'value' for customers was considered essential by all firms. There was an aggressive focus on sales and a strong engineering-sales relationship in US firms and, higher growth. In contrast the slower growth micro UK firms relied upon word-of-mouth recommendation. Implications of this research include the following: UK SSTFs are customer and innovation oriented while the US sample are entrepreneurial oriented and innovation oriented. Both samples have much less focus on competitors and more focus on creating customer value via innovations. Use of networks and relationships are prevalent: for informal market intelligence gathering; customer relationships and; partnering with large firms.

Abstract

In Germany, more than 95% of the credit institutions report their regulatory capital requirements for counterparty risk by means of the credit risk standardized approach (CRSA) instead of the more sophisticated internal rating based approach (IRBA). Though the CRSA allows a partially risk sensitive calculation of the banks' regulatory capital German CRSA-banks cannot benefit from this provision as only around 100 non-financial companies have the required published agency rating on hand. The authors examine, whether the upcoming re-regulation of the banking business Basel III is a driver for both CRSA-banks and their preponderantly medium-sized corporate borrowers to push the use of external corporate ratings. Evaluating a unique sample of 26,025 data sets of German medium-sized companies, the results indicate that under the provisions of Basel III CRSA-banks may experience only minor savings of about 0.5 billion euros in their regulatory capital if their corporate customers had a supervisory recognized rating available. Projected to the total population of German corporates, the exposures of around 9,000 of them potentially qualify for lower risk weights within the CRSA, while estimated 200 are eligible for financial benefits that match or even overcompensate the incurred costs of an external rating. Respectively, for the majority of German companies the benefits of such ratings rather reflect improvements in strategic management issues than lower financing costs.

Abstract

In a globalized wine world, the growing consumers' interest for wine matters is leading to an increased need for knowledge (Collins, 2005). Research points out that extrinsic attributes such as price, packaging, and label are important criteria when assessing the purchase of wine; nonetheless, the country of origin appears to be more influential (Balestrini and Gamble, 2006). Besides, intrinsic attributes such as varietal, colour, and alcohol content are not always assessed correctly by consumers (Veale, 2008). It has, conversely, been found that knowledge obtained through wine-related courses provides significant objective wine expertise, whereby subjective knowledge - what the consumers think they know - was not adapted (Taylor et al., 2008).

Wine labels and bottles are the first *signals* consumers will use to make up their choice among the products available for purchase (Rocchi and Stefani, 2005), therefore, the understanding of the wine labels is an important assignment in the appreciation of wine. Labels are the only cues to assess objectively the quality of a wine without tasting it. The information they provide - sometimes by omission, and often limited to not much more than the geographical origin - forces the wine novice to look for other label features such as logos, pictures, awards, colour schemes, or what might be identified as the brand. For the non-expert, labels are often very confusing, and purchase choices are often empirical or guided by subjective criteria such as the label colour scheme (Teague, 2004). Espejel and Fandos (2009) are of the opinion that quality stamps, PDO (protected designations of origin), and other elements facilitating the differentiation of quality should imperatively be stated on labels.

The purpose of this study is to investigate to which extent a taught entry level wine course is likely to modify the perception by novices of the quality of the wines they are assessing visually for purchase and identify any change in their assessment strategy. The study postulates that the limited knowledge and experience acquired prior to enrolling in the wine module will lead to a purchase decision and an appreciation of the value and quality of the wine mostly on the basis of the label design features and country of origin; however, after having taken the module, students will appraise the wine more objectively and accurately, in priority on the basis of more precise geographical label details, grape variety, and AOC (appellation d'origine contrôlée). The survey method of research is used in this study. Based on issues identified through the literature review, questionnaires were designed to collect the required information from a sample of students enrolled in a foundation wine course. Since

there is a growing interest in the topic of wine education this study has sought to particularly contribute to the hospitality curriculum. This piece of research will contribute to developing the limited existing knowledge in the new topic of wine marketing research. A better understanding of the phenomenon driving customers' purchase decisions will put students in the position of improving their wine lists, their wine sales and, consequently, profits. Finally, the study could be replicated in other "wine course" contexts, or be extended to the "wine amateurs" market so as to propose wine producers and merchants with research-based recommendations for label design.

EXPLORING THE IMPACT OF AN ADVENTURE TRAINING PROGRAM ON LEADERSHIP AND TEAMWORK COMPETENCIES OF BANK TOP SENIOR MANAGERS

Kourtesopoulou, Anna¹; Papaioannou, Alkistis² ; Kriemadis, Thanos³; Dalakis, Antonis⁴

¹ PhD candidate, Department of Sport Management, University of Peloponnese, Greece. Email: akourtes@hotmail.com

² Lecturer. Department of Sport Management, University of Peloponnese, Greece. Email: alkistisp@uop.gr

³ Professor. Department of Sport Management, University of Peloponnese, Greece. Email: thanosk@uop.gr

⁴ Research Associate. Department of Physical Education and Sport Science, Democritus University of Thrace, Greece. Email: forest@otenet.gr

Abstract

Purpose: There are many types of training methods offered by large corporations, but this particular study will focus on adventure training, which represents a method applying to outdoor activities using experiential learning, through participation. Greenaway (2002) specified that it is based on the claim of learning by doing with reflection. Indicative findings from financial sector prove that adventure training had positive effects on teamwork (Gass & Priest, 2006; Priest & Lesperance, 1994), considerable expectations and greater accountability of members of an organization (O' Bannon, 2000) and improvement in leadership behaviors such as challenging the process, clarifying the vision and encouraging a climate of sharing ideas (Bryan & Starr, 2005). The primary purpose of this study was to ascertain: (1) whether were any changes in senior managers' perceptions and outcomes of leadership after their participation in an adventure training program, (2) whether were any changes in teamwork effectiveness in senior managers' perceptions after their participation in an adventure training program.

Design/methodology/approach: The study was a quasi-experimental study, with a single group retrospective pretest-posttest design. The sample consisted of nineteen senior managers from a private bank in Greece, with an average age of 44.4 years. The participants took part in an adventure training program which included a variety of outdoor activities, designed to enhance their level of teamwork and leadership skills. The whole intervention lasted 4-days, including small group activities with progressive level of difficulty. Leadership behavior was measured by Bass and Avolio's (1997) Multifactor Leadership Questionnaire (MLQ-self evaluation form 5x). This instrument contains 45 self-report items that participants rate on a 5-point Likert-type scale, ranging from 0 (Not at all) to 4 (Frequently if not always). Perceptions of team effectiveness were measured with the short version of the Team Development Indicator (TDI-s) consisted of 10-items, developed by Bronson (1991). The participants were asked to score each item on a 5-point Likert-type scale, ranging from 1 (poor) to 5 (exceptional). Estimating the internal-consistency reliability with N = 19, the alpha coefficients were .92 and .94 for the MLQ (45-items) and TDI (10-items) instruments, respectively.

Findings: The nonparametric Wilcoxon Signed Ranks Test was used to analyze the variance of differences between pre and post scores in both leadership and teamwork perceptions of the

participants. Transformational leadership was increased significantly ($z = -2.01, p = .044$), with the median of pre test being 3.15 (SD = .70) and post test being 3.40 (SD = .73). Also, significant changes were found in transactional leadership ($z = -2.20, p = .028$) with pre test median of 2.88 (SD = .52) and post test median of 3.40 (SD = .73). According to the outcomes of leadership, only the factor 'extra effort' showed a significant change ($z = -2.59, p = .010$), with pretest median 2.91 (SD = .59) and posttest median 3.14 (SD = .69). Additionally, it was noticed a significant ($z = -2.19, p = .028$) change in total teamwork, with pretest median 3.90 (SD = .78) and posttest median 4.10 (SD = .72). More specifically, the participants increased significantly: (1) their listening with sensitivity and understanding ($z = -2.24, p = .025$) and (2) the recognition and reward of team efforts ($z = -1.99, p = .046$).

In conclusion, it was found a major improvement in bank managers' listening competency, as also their attitude of recognition and reward of team efforts. Some positive changes were also attained in both transformational and transactional levels. Transformational leaders expected to build trust, act with integrity, inspire their followers, encourage innovative thinking and coach people. Respectively, a manager within a transactional orientation targets on following the standards, provides monitoring advices and identify the mistakes to prevent or to resolve them. Lastly, it was acquired an increase of extra effort, which is associated with a wish of followers to prompt superior performance by contradicting objectives and obtain positive auxiliary behaviors.

Research limitations: By using self-evaluation questionnaires, we cannot confirm whether the improvements found in this study were due to the intervention program or other common causes. This paper was limited to studying one particular private bank, for this reason the findings cannot be generalized to the private banking sector.

Originality/value: This study provides support that adventure training can contribute to the improvement of both leadership and teamwork competencies, as also evidence for its effectiveness in the corporate world, where the existing research is still limited.

Abstract

Purpose: Governments recognize the need to compete on a worldwide scale due to economic globalization, and the increase in international trade. In order to assist local industries, initiatives have been launched in identifying key factors of success and disseminate these factors to businesses. A survival in global competition requires improvement to world-class status, and thus, governments have encouraged and sponsored National Quality Awards or Excellence Awards. Businesses use the Awards evaluation criteria as a guideline to measure their progress to excellence and quality. Powell (as cited in Gary L. Stading & Robert J. Vokurka, 2003) believes that companies that implement Total Quality Management practices have used Quality Awards as models for benchmarking, self-assessment and continuous improvement.

The European Foundation for Quality Management's (EFQM) -with the endorsement of the European Commission- main objective was to improve the competitiveness of European industry and for that reason introduced two missions for European corporations: (a) to accept the quality improvement as a strategy in order to achieve global competitive advantage, and (b) to develop and implement quality improvement activities (Ghobadian and Hong Seng Woo, 1996).

The purpose of this study is to present and examine the criteria of the EFQM Excellence Model (EFQM, 2012) and propose indicative methods for meeting those criteria in order to achieve excellence in the development of an effective strategic planning process.

Design/methodology/approach: This is a qualitative study. Interviews were conducted with managers from EFQM.

- Interviews with managers of companies participated in the assessment process of the European Excellence Award.
- Review of Training materials of EFQM.

Findings: 1st criterion of EFQM Excellence Model: Strategy should be based on the present and future needs and expectations of all stakeholders.

Indicative Methods:

- Identifying market trends, executing market surveys, exploring customers' profile, needs and expectations.
- Competition analysis.
- Measuring customer satisfaction, customer complaints and customer suggestions, and after sales support.
- Measuring employees' satisfaction and employees' complaints.
- Measuring suppliers and external partners performance.

2nd criterion of EFQM Excellence Model: Strategy is based on information from performance measurement, research, learning and creativity related activities

Indicative Methods:

- Self-assessment (internal performance indicators, analysis of strengths and weaknesses, benchmarking).
- Evaluation of Political/Legal issues, Economic issues, Social matters and Demographic Trends and indicators, Environmental issues, Technological issues.

3rd criterion of EFQM Excellence Model: Strategy is developed, reviewed and updated

Indicative Methods:

- Strategy should be based on the EFQM Excellence Model.
- Development of Corporate strategy
- Development of Business (SBUs) strategies
- Development of Functional strategies (marketing strategy, human resource strategy, production strategy, quality management strategy, financial management strategy, etc.)
- Processes for review and update the above mentioned strategies

4th criterion of EFQM Excellence Model: Strategy is deployed through a framework of key processes

Indicative Methods:

<i>KEY PROCESS OWNERS</i>	
<i>Indicative Process Owners</i>	<i>Indicative Processes</i>
<i>General Manager</i>	<i>Development of the company's strategy (including the EFQM Excellence Model)</i> <i>Monitoring the strategy implementation (including the EFQM Excellence Model)</i> <i>Evaluation and continuous improvement of the company's strategy</i>
<i>Quality Manager</i>	<i>Development of the Quality strategy</i> <i>Self-assessment based on the EFQM Excellence Model</i> <i>Processes control</i>
<i>Marketing Manager</i>	<i>Evaluation of market and industry trends</i> <i>Development of the marketing plan</i> <i>Development of the promotion plan</i>

5th criterion of EFQM Excellence Model: Strategy is communicated and implemented

Indicative Methods:

- The top management should communicate to all staff the Quality policy and strategy, and it should encourage two-way communication as well as horizontal communication.
- All levels of management should introduce "open" methods of communication such as maintaining open offices, being accessible to all employees and participating in day-to-day interactions (Oakland, 2003).

Originality/Value: TQM is too often considered as a distinct program within a company. This paper suggests that if the company wants to achieve excellence, the EFQM Excellence model criteria (which are based on the TQM system) should be taken into account in the development of its strategic planning process.

Keywords: Excellence, Total Quality Management, Strategic quality planning, EFQM Excellence model.

TRANSNATIONAL EDUCATION AND CROSS CULTURAL TRAINING: A CASE STUDY OF A BUSINESS SCHOOL IN THE UK

Kyriakidou, Niki¹; Mahtab, Nehal²; Nisa Shakiya³

¹ Senior Lecturer in HRM/OB, Leeds Metropolitan University, Faculty of Business and Law. Email: n.kyriakidou@leedsmet.ac.uk

² Senior Lecturer in HRM/OB, Leeds Metropolitan University, Faculty of Business and Law

³ Senior Lecturer in HRM/OB, Leeds Metropolitan University, Faculty of Business and Law

Abstract

The internationalization of the curriculum (named Transnational Education: TNE) makes the need for cross cultural capability skills in the workforce increasingly vital for the competitiveness of business and industry (OECD, 2008). Programme mobility rather than student mobility provides the new format of international strategy in HE sector (Skidmore, and Longbottom, 2011). The Higher Education sector has experienced an increasing trend in the internationalisation through the diversification of delivery modes such as the offshore deliver where academics fly in to the country and deliver a block program of study and the fly back out (Drew, et al., 2008). In this context, cross cultural training (CCT) is an essential element for successful interactions in a diverse culture (Littrell et al., 2006) and different educational systems. In regard to the UK, higher educational institutes provided training programs to the academics and other support staff who re directly involved in offsite delivery. But on the other hand, it has been found that, some do not and there is no universal system for best practice of CCT that has been established in UK higher education. No much thought and consideration goes in to the training and development of building awareness of working internationally through cross cultural training programmes. Staffs are usually briefed about the teaching, location and commit to a number of hours teaching. The main purpose of this paper is to investigate the importance and enhance the relevance of CCT for academics and support staff who works in different capacities e.g. international collaborations or partnerships on behalf of the UK educational institutes; by taking the Business School of one of the largest and popular UK based University as a sample.

A small scale research project was conducted to examine the current pre-departure cross-cultural training taking place in one of the largest British Business Schools, in order to gain a better understanding of the adequacy of the support given to academics teaching offshore. The research strategy adopted is a case study approach. Face-to-face semi-structured interviews were conducted to twenty staff involved in offshore education- including academics with considerable offshore teaching experience and senior academic managers- to explore the importance of cross cultural training in the education sector regarding staff involvement in overseas delivery, negotiation of contracts combined with direct observation by the researchers themselves, as well as a review of some documents around this research.

The work is still in progress. Preliminary findings reveals that, while academics involved in off shore delivery have identified areas for ongoing fine tuning at the institutional level, most of them have felt that even there was not a sophisticated CCT training available to them, the offshore teaching experience had helped them to expand their global outlooks and facilitate a more internationalised curriculum planning and delivery. However, respondents have reported that up to date there was not any developed mechanisms to support the work of academics participating in off shore deliveries and/or enhanced effectively the capacity for international collaborations and encourage staff mobility.

Based on challenges faced and expertise gained by academics when delivering programs with transnational partners, the outcomes of this project will identify, support and recognise cross cultural capability skills and CCT needs amongst academics at on and off-shore UK campuses.

INTRAPRENEURSHIP AS A PRECONDITION FOR ENTREPRENEURSHIP: CONCEPTUAL CONSIDERATIONS

Abstract

Purpose: Entrepreneurship of the country's population leads to innovations that create the added value in the market and contributes to a public welfare and the country's international competitiveness. Promotion of entrepreneurship is one of the most important strategic priorities of Lithuania. However, both strategic documents, Lithuanian economy development until 2015 and Lithuanian Innovation Strategy 2010-2020, indicate that there is the lack of entrepreneurship in Lithuania and there is no a proper business culture for the development of entrepreneurship. A relatively high proportion of the society is not proactive and is waiting for the governmental support for their business development. However, the recent Global Entrepreneurship Monitor (2011) data shows that Lithuania is among countries with a high level of intrapreneurship.

Inrapreneurship is a frequent analysis object within a set of modern economy theories. Many representatives of the neoclassical theory scrutinize problems related to the relation between management of the rational decision making process and co-ordination of entrepreneurial activities, innovative ideas, the risk and uncertainty (Barreto, 1989). Business individuals are typically described as tolerating risk (Cantillon, 1755; Knight, 1921), successfully reaching a higher productivity via managing resources (Say, 1803) or coordinating innovative processes (Schumpeter, 1942).

The global researchers (Gartner, 1990; Stevenson & Jarillo, 1990; Pavia, 1991; Minniti & Bygrave, 1999; Shane & Venkataraman, 2000; Busenitz et al., 2003; Acs & Varga, 2005; Veciana, 2007 et al.) and the Lithuanian scholars (Stačiokas, 1995; Lydeka, 1996; Melnikas, 2001; Baršauskas, 2002; Strazdiene & Garalis, 2006; Kriščiūnas & Greblikaite, 2007; Duobiene & Pundziene, 2007 et al.) tackle entrepreneurship at three levels: personal, organizational and macro. The ingenious scientific literature analysis on entrepreneurship points at the fact that entrepreneurship is often analyzed at the organizational level: over the last decades there are more authors who examine entrepreneurship inside organizations (Pinchot, 1985; Kanter, 1988; Kao, 1991; Lumpkin and Dess, 1996; Crant, 2000; Shane, 2003; Lumpkin, 2007; Parker & Collins, 2010). This phenomenon is called 'Organizational entrepreneurship', 'Creating new businesses inside organizations' or 'Intrapreneurship'. The last term of Intrapreneurship could be defined

as a specific business type which is related to employees' initiatives to start new business activities inside of organizations.

Sharma & Chrisman (1999) and Antoncic & Hisrich (2003) draw the separating line between intrapreneurship and organizational entrepreneurship. According to these authors, organizational entrepreneurship is analyzed at the organizational level and intrapreneurship at the personal level. Organizational entrepreneurship uses the decision-making process 'From Top to Bottom', to wit, implement business strategies oriented to employees' initiatives and efforts to apply novelties and develop new entrepreneurial ideas. Meanwhile, intrapreneurship is related to the decision-making process 'From Bottom to Top', in addition to proactive employees' initiatives to apply novelties and develop new entrepreneurial ideas.

Many scholars argue that the organizational culture plays a crucial role in the development of entrepreneurial activities. Therefore, it gets important to know whether intrapreneurs would maintain their intrapreneurs' features and motivation without supporting the organizational environment. Would they be able to become independent businessmen?

The **purpose** of the present work is to discuss the intrapreneurship phenomenon and distinguish features of entrepreneurship with the aim to create a conceptual model for the measurement of preconditions for intrapreneurs' conversion to entrepreneurs.

Practical Implications: In recent years both the Ministry of Economy and the Ministry of Education and Science of the Republic of Lithuania execute many programs enhancing entrepreneurship; however, there is still no system established for the measurement of effects of these programs. Thus, within the framework of the present project the occurring changes in entrepreneurship among Lithuanian citizens could be observed and relations of these changes to policies encouraging entrepreneurship in Lithuania examined. It will be possible to underline the main issues and possibilities in developing Lithuanian entrepreneurship and intrapreneurship activities as well as to position them in global markets. Based on the research results, recommendations will be proposed to foster entrepreneurship and intrapreneurship activities in Lithuania.

ANALYZING EFFICIENCY AND PRODUCTIVITY CHARACTERISTICS OF BANK BRANCHES: EVIDENCE FROM GREECE

Lemonakis, Christos¹; Voulgaris, Fotini²

¹ Technological Educational Institute of Crete, Department of Finance and Insurance and Cooperative Bank of Crete, culemon2004@yahoo.gr

² Technological Educational Institute of Crete, Department of Finance and Insurance, fvoulgari@staff.teicrete.gr

Abstract

Purpose: The paper investigates the major factors that affect efficiency and productivity of Banks on a branch level.

Design/methodology: Following the relevant literature, the DEA analysis is used to estimate the efficiency level of a bank branch network. We calculate the technical and scale efficiency (SE) scores which are obtained through an input-oriented DEA model. As Coelli et al. (1999) point out the input-oriented technical efficiency measures address the question how much can input quantities be proportionally reduced without changing the output quantities produced. DEA can be implemented by assuming CRS or VRS. For the research study, we use a sample of 49 branches of a Greek bank, operating in 4 regions of Greece over the period 2008-2010. First a classification technique is used to classify firms with common characteristics and the score of the most important variables used will become inputs to Data envelopment analysis to explore the efficiency and productivity of the branches. Secondly fixed and random effects models are used to determine the impact of internal and external factors on the efficiency and productivity scores.

Findings: Since this is an ongoing research, we do not have results. Nevertheless it is expected that the inclusion of loan loss provisions as an input variable increases the efficiency score. Some other remarks are that number and quality of personnel plus the per capita income in the local market have, a significant impact on efficiency, while the loans to total assets ratio has a significant impact on pure technical efficiency. Also, the return on assets as well as the loans to deposit ratio, are expected to have a positive and statistically significant impact on overall efficiency based on theory and literature.

Practical Implications: The main contribution of this work is a better understanding of various factors that may affect the bank branch efficiency and insolvency. This will provide important implications for managers and policy makers for the better apprehension of profitability and productivity issues in the Greek banking system. Furthermore, the findings will contribute to the relevant literature on the fact that it covers bank performance in economic crisis. Furthermore, the time span of the research will reveal the most critical factors for a bank's variability and efficiency in times of both economic upturn and recess.

Originality/Value: To the best of our knowledge, although this issue is researched in other regions, minimal academic work exists on this subject in the Greek banking industry. A novelty

of the work is the use of the Malmquist index for allocating productivity changes using distance functions and the use of advanced classification techniques in combination with DEA and econometric analysis.

CRITICAL FACTORS AFFECTING BANK PROFITABILITY AND FINANCIAL STABILITY: THE CASE OF THE MIDDLE EAST AND NORTH AFRICA COUNTRIES

Lemonakis, Christos¹; Voulgaris, Fotini²

¹ Technological Educational Institute of Crete, Department of Finance and Insurance and Cooperative Bank of Crete, culemon2004@yahoo.gr

² Professor Technological Educational Institute of Crete, Department of Finance and Insurance, fvoulgari@staff.teicrete.gr

Abstract

Purpose: The purpose of this paper is to identify the major factors affecting commercial banks' performance in the Middle East and North African (MENA) region, based on factor and econometric analysis techniques. Generally, most of the previous studies on this subject for developing countries, were concentrated on one country, examining either only external variables (as inflation and GDP) or only internal variables (such as ROA and ROE). In this study, we combine both internal and external factors affecting commercial banks in MENA countries, adding a new variable (z-score) to our study for credit risk, which has not been used before.

Design/methodology: The research is based on a sample of 48 banking institutions from various countries of Middle East and North Africa, i.e.: ALGERIA, BAHRAIN, EGYPT, ISRAEL, JORDAN, KUWAIT, LEBANON, LIBYAN ARAB JAMAHIRIYA, MOROCCO, OMAN, QATAR, SAUDI ARABIA, SYRIA, UNITED ARAB EMIRATES. The time span of the research covers 5 years, from 2005-2009, in order to detect effects of risk taking and profitability issues. Financial data used are derived from the Bankscope data base, while World Bank and International Monetary Fund databases are used for macro and legal regulations data.

The variables used consist of ten micro variables accounting for banks' financial performance, four macro variables, plus three variables accounting for regulatory and legal environment. Using factor analysis (Principal Components Analysis), we extract the most important variables determining a banks' performance. We run a Least Square Regression (OLS) to detect the relation between banks performance in terms of profitability and its explanatory variables for the MENA countries banks. Additionally, on a second level we focus on a z-score ratio as a measure of risk, expected to be inversely related to the probability and bank insolvency. We examine also each bank's volatility of earnings, of ROA, ROE, and capital-asset ratio.

The model used is as follows:

$$\text{[Model 1]: } Z_{i,t} = b_{oi,t} + b_{mi,t} Y_{mi,t} + b_{dj,t} Y_{di,t} + \varepsilon$$

Where: i refers to an individual bank; t refers to year; j refers to the country in which bank i operates; $z_{i,t}$ the dependent variable that refers to the return on average assets (ROAA) and is the observation of a bank i in a particular year t ; Y_m represents the internal

factors/determinants of a bank; Yd represents the external factors/determinants of a bank; ε is an error term.

And

$$\text{[Model 2]} \quad Z\text{-score}_{i,t} = a_0 + a_1 BSV_{i,t} + a_2 NBSD_{j,t} + a_3 Macros_{j,t} + \varepsilon$$

Where: i refers to an individual bank; t refers to year; j refers to the country in which bank i operates; BSV refers to bank specific variables from bank balance sheets and profit and loss accounts. NBSD refers to national banking sector data and Macros refers to macroeconomic variables.

Findings: Since this is an ongoing research, we do not yet have final results. It is expected that despite bank risk management, credit risk, measured by the ratio of *loan loss provisions to net interest income*, decreases the *z-score* ratio in the banking institutions of MENA countries. A possible explanation for this is that Islamic banks in those countries tend to have trouble in monitoring credit risk. This is also demonstrated by the fact that diversification of income is also a factor of insolvency for banks in the MENA countries.

Practical Implications: The main contribution of this work is a better understanding of various factors that may affect banks' efficiency and insolvency in MENA countries. This will provide important implications for bank managers and policy makers for the better understanding of risks and profitability characteristics in the MENA countries financial sector. Furthermore, the findings will contribute to the relevant literature on the MENA countries banking sector.

Originality/Value: To the best of our knowledge, although this issue is researched in other regions, minimal academic work exists on the subject in the banking institutions of MENA countries. A novelty of the work is also the use of bank level data together with macro and regulatory data.

Keywords: Banks' financial performance, legal environment, factor analysis, MENA countries, profitability

THE EFFECTS OF TELEWORK ON NON-TELEWORKERS: AN EXPLORATORY CASE IN FRANCE

Lewis, Robert A.¹

¹ Les Roches Gruyère University of Applied Sciences, Switzerland. Email : Robert.Lewis@lesroches.edu

Abstract

Despite its predicted growth, telework has not developed in the French public sector. Telework refers to work carried out away from the usual place of business, often via electronic means. This investigation provides a unique contribution to the lack of empirical studies on the effects of telework on non-teleworking colleagues in France. This study uses role set analysis to assess the experiences of non-teleworking colleagues of part-time teleworkers (who telework on average two days per week as part of their full-time schedules) at the Conseil Général du Finistère, or CGF, a regional government in Brittany, France. Role set analysis claims that the expectations of role set holders can be evaluated. In this exploratory case study, role set holders are represented by teleworkers and their non-teleworking colleagues. Questionnaires, containing attitude scales and open-ended questions, were distributed to each group of role set holders to gather data. Quantitative data was used to complement qualitative findings. The use of frequency tables and the extraction of Meaning Units, or MUs, indicated perceived advantages and disadvantages of telework, which were revealed through the lenses of role expectations. Teleworkers's non-teleworking colleagues experienced more disadvantages due to increased role expectations: working with part-time teleworkers generated increased logistical and co-ordination difficulties. This paper reveals unknown effects of telework on non-teleworkers in a French cultural context. Moreover, it uses role set analysis to extend current knowledge on the expectations of non-teleworking colleagues. For example, non-teleworkers experienced increased burdens due to increased spatial and temporal flexibility of teleworkers in their departments. From an academic viewpoint, the analysis of role sets through a tripartite perspective brings to light thresholds which regulate perceived advantages and disadvantages of telework and reveals that role set holders do not interact in a static fashion. In terms of business practice, the findings argue that telework upsets work relationships in the French context because it relies on less face-to-face contact.

Keywords : France, non-teleworkers, role set analysis, telework, teleworkers

SUCCESSFUL TRANSFORMATION OF SMALL COUNTRIES: THE CASES OF ESTONIA AND SLOVENIA

Listra, Enn¹

¹ Tallinn University of Technology, enn.listra@tseba.ttu.ee

Note: A support from Estonian Science Foundation is acknowledged

Abstract

Slovenia and Estonia are located in very different parts of Europe and have relatively low level of political and economic contacts. They still share similar historical experience of separation from bigger conglomeration of countries and similar basic pattern of transformation from old to new structures of societies.

The earlier economic contacts were broken in both countries inside of falling apart states to which they belonged. In addition, they had to establish new ones turning face from East to West and to re-establish older earlier ones later during the transformation process. Both belong to the more successful among the countries from the earlier Eastern block, are members of European Union and use common currency. The euro was introduced in Slovenia by 2007 and in Estonia by 2011 (European Central Bank, 2012). The question is earlier studied by Buchen (2005).

Both similarities and differences exist between these countries that are worth of studying in attempt of finding some policy advices that may be useful to the other countries in earlier phases of transformation. First, both countries have made their choices mostly domestically based on at least partly on their similar historical background on non-market societies. Second, both have used international advice and benchmarking to develop their societies but the closest partners have been different coming in the case of Estonia from Nordic and in the case of Slovenia from Central and Southern Europe. Third, both have moved towards market based societies but the levels of liberalization and maybe openness has been different in these countries. Fourth, the economic geography matters for the development of regions countries, as mentioned by Mersch (2003).

The paper analyses comparatively political developments, economic policy making, economic and business developments that have influenced or that have occurred in the real and financial sectors of the two countries.

First, a comparative overview of current economic conditions and earlier developments in two countries is given both to set the stage and to make explicit major similarities and differences in economic systems of the countries.

Second, main political developments are analysed that may have had influence on the determination of the path and outcomes of economic development and the overview is given of the international influences on the development of the countries.

Third, the structural particularities of the real business sector are analysed paying special attention on the factors affecting the competitiveness of the countries and their business entities. The analysis will follow at least partly that of Porter (2008) building on Bain's structure-conduct-performance approach but also in connection to the financial developments in these countries.

Fourth, the financial sector that is less studied in this setting of comparative analysis, is the central topic of the paper drawing from earlier comparative studies (for example Bakker and Gross, 2003, and other studies of the special issue).

The coinciding and divergent approaches to and outcomes from transition are clearly described in the paper and policy and business advices are put forward to take advantage of future opportunities arising for the countries in European Union.

HOW MANAGERS USE MANAGEMENT TOOLS TO IMPROVE PERFORMANCE IN PUBLIC HOSPITALS: EMPIRICAL EVIDENCE FROM PORTUGAL

Macedo, Isabel Maria¹; Silva, Anabela Martins²

¹ School of Economics and Management, University of Minho, Campus de Gualtar, 4710-057 Braga, Portugal. Email: imacedo@eeg.uminho.pt

² School of Economics and Management, University of Minho, Campus de Gualtar, 4710-057 Braga, Portugal. Email: anabela@eeg.uminho.pt

Abstract

Purpose: The purpose of this study is to examine the level of adoption, use and implementation of a set of performance management tools, in public hospitals while assessing its potential value to effectively enhance performance.

Over the past several decades, the health systems of most developed countries have been under severe pressure to overcome structural deficiencies and to improve quality, organisational performance and efficiency ratios. Such goals, although far from being accomplished have gained a renewed visibility in the face of the current financial and economic crisis. At the political level, most countries have undertaken reforms mostly directed at enhancing coordination and efficient use of resources, and to improve the organisation's financial sustainability. To this end, a wide range of organisational and institutional arrangements have been put forward with particular emphasis being placed on the transposition of private oriented management tools and frameworks to public health care organisations. This trend has resulted in the conception of increasingly complex performance management systems which have posed significant challenges to the hospital boards and general managers, particularly in what concerns the way performance tools and frameworks have been implemented and effectively used. Although there is a large body of literature which addresses issues related with the adoption and implementation of a wide range of management tools in the health care setting, the extent to which hospital managers use such tools in a meaningful way remains somehow unclear. Justification for this derives mainly from the fact that most studies have focused on a particular tool per se, failing to provide an holistic view regarding the implementation of systematic performance management tools and frameworks.

Design/Methodology/Approach: Consistent with a positivist orientation, the study adopts a predominately quantitative methodological design, in which a survey was applied to a sample of Hospital units operating in Portugal. This methodological approach was also complemented by qualitative methods, in which interviews were undertaken in the exploratory and confirmatory stages of this research.

Findings: The findings of this study suggest that although hospital boards evidence much concern with improving organisational performance, in general terms the implementation of performance management tools and frameworks has not resulted in an effective and systematic use of such tools. Moreover, the study also demonstrates that hospital managers tend to favour

management tools which yield immediate results and therefore complex management frameworks and tools which require more coordination, resources and time are somehow less considered.

Practical Implications: Findings of the present study may assist healthcare managers as well as public policy makers in the design of policies to encourage the adequate and meaningful use of management tools in order to meet efficiency and effectiveness goals.

Originality/Value: This research contributes to uncover some of the assumptions of NPM, according to which the adoption of private based models and management tools would result in effective improvements in the performance management. Therefore, this research adds to existing literature in the field of hospital management by empirically testing the relevance of widely assumed assumptions associated with New Public Management principles in the specific context of hospital organizations.

CONTRIBUTION TO THE THEORY OF CORPORATE GOVERNANCE OF NON-PROFIT ORGANIZATIONS (CASE OF HOSPITALS IN THE CZECH REPUBLIC)

Maly, Milan¹

¹ University of Economics, Prague, Czech Republic. Email: maly@vse.cz

Abstract

Governance (CG) theory today is concentrated mostly on organizations which were established to generate profit. Non-profit organizations and their role in the national economy are highly important and very often underestimated; they create their own theoretical framework for corporate governance and its application. The main aim of this paper is to contribute to the development of the theory of corporate governance (CG) of non-profit organizations.

The methodology is based on comparison of the main CG parameters of for-profit vs. non-profit organizations. The main parameters were extracted from the basic literature sources describing the CG systems of for-profit organizations as well as their characteristics.

The characteristics of the parameters for non-profit organizations were refined from the author's own research. Our statistical sample is represented by 192 public hospitals in the Czech Republic. They were analyzed as representatives of non-profit organizations.

We indicated the following main parameters characterizing the system of corporate governance:

- ways of collecting capital resources
- characteristics of ownership structure
- application of agency theory
- application of transaction cost theory
- application of stakeholders theory
- board structure and composition

Our findings are concentrated into conclusions for different parameters.

Capital resources

Non-profit organizations do not rely on capital market and accumulation of capital by IPO. The usual method of obtaining initial investment capital is through founding organizations, sponsorship and charity, and rarely through bank loans.

Ownership structure

In for-profit organizations, the most common situation is that of so-called majority owner(s); it is the decisive factor for strategic decision-making. There are two variants of majority owner;

either he or she is closely connected with the bank or institutional investor and is heavily influenced by the external owners, or the shareholders (owners) are broadly dispersed and all power is concentrated in the hands of the chief executive officers or managing director together with the whole board of directors. State ownership is rare, and is concentrated in a few monopolized companies (railway, post, sometimes strategic energy).

In non-profit organizations, the definition of a real owner is often very difficult; the owner is vague or simply does not exist. In these cases, it is substituted by a so-called Administrative Owner, who is represented by special bodies (Board of Trustees, Board of Governors).

Agency theory

In non-profit organizations our findings come to the conclusion that the situation is substantially different from for-profit organizations. Here generating profit is not the priority goal but there is usually a set of goals, mostly social and partly economic, but as a rule, difficult to quantify.

Transaction cost theory

In CG of non-profit organizations, as backed by the empirical results from our survey, we can state that the agency costs are relatively low compared to for-profit organizations, and the supervising role is underestimated. The typical consequence of lower costs could be defalcation. Our findings have not found any attempts to do it in Czech hospitals. A possible explanation of the absence of fraudulent behavior of top managers (contrary to the other sectors of a transition economy) is stewardship theory, implemented broadly in the non-profit organizations. The same situation with lower agency costs exists with the problem of incomplete contracting, where the ratio of unpredictable situations is much higher. The reason is that non-profit organizations operate in a less stable environment with more complicated relationships and often unpredictable behavior of political bodies on a governmental level.

Stakeholder theory

Non-profit organizations prefer stakeholder theory. The main reason for this application is the broad diversity of strategic goals, fulfilling the expectations of different participants.

Board structure

In non-profit organizations we can find versatile structures as well as other bodies which usually do not exist in the for-profit sector, for example board of trustees or governors. We can formulate the following tendencies for board architecture:

We observe an increasing role of monitoring efficiency of managerial activities and the increasing role of supervision and control. In two-tier systems we can indicate an increasing role of supervisory boards as well as implementation of an audit committee as the body assisting the management board or board of trustees or governors.

In conclusion, we can state that in some parameters we observe converging tendencies between non-profit organizations and for-profit ones (board structure); however, in other parameters, there is divergence (ownership structure, application of stakeholder theory).

MISSED OPPORTUNITIES: HOW EVENT SPONSORS OVERLOOK POTENTIAL TARGET CUSTOMERS

Marshall, Thomas¹; Mottier, Ewa²

¹ Les Roches-Gruyère University of Applied Sciences, Switzerland. Email: Thomas.Marshall@lesroches.edu

² Les Roches-Gruyère University of Applied Sciences, Switzerland. Email: Ewa.Mottier@lesroches.edu

Abstract

A great deal of research has been devoted to correctly matching the image of a sporting event with the image of the sponsoring organization. In addition, identifying the target audience that will respond to this image match of sponsor and event organizer is critical to maximizing the return on the sponsorship investment. Traditional approaches have focused on customers attending the event. This is natural since the attendees are seen as the major target customer. However, there is a large, untapped potential audience, namely the temporary workers under the employ of the event organizer. These workers, who are oftentimes invisible not only to sponsors but to the general public, are nevertheless crucial to the success of the event and should be included in the calculation of target audience. This study attempts to do just that by investigating the level of awareness of the sponsor of temporary workers of a sporting event and the level of attention shown them by the sponsor.

The event selected was an international air show held in Switzerland and sponsored by a luxury watch manufacturer. A local hospitality school was asked by the event organizer to provide the temporary help needed for catering services. Eight students were chosen by the school at random and had no prior association with or knowledge of the three-day event. In-depth interviews explored student impressions of both the event and the sponsor. The results showed only two students could correctly identify the sponsor. Only one was familiar with their product category and product offering. The majority were unsure of the sponsor's image and of its relationship to the show. No attempt was made by the sponsor's representatives to include the students in their on-site displays. The event organizer was mistaken by some students as the sponsor.

The study highlights a major sub-section of event attendees that has been overlooked and underestimated as to their role not only as potential customers but as ambassadors for the brand while serving at the event. A small investment of attention to this unrealized target audience could significantly improve both sponsor awareness and image match. Further research is called for, as is incorporating event workers into the sponsorship awareness model.

**THE EFFECT OF INTERACTION QUALITY ON PERCEIVED PERFORMANCE
EXCELLENCE AND LOYALTY**

Melanthiou, Yioula¹; Ioannou, Myria²; Korombilias, Demetris³

¹ School of Business, University of Nicosia, Cyprus

² Business School, European University, Cyprus

³ University of Nicosia, Cyprus

Abstract

It is well documented in existing literature that service excellence can create customer relationships and offer the organization a competitive advantage (Parasuraman et al, 1985, Christopher et al, 1991). Subsequent research has further refined these assertions by investigating separately the effect of the service process and the service outcome on customer trust and commitment, relationship building and loyalty. In fact, it is widely argued that the quality of the service process, named as functional quality (Gronroos, 1982) or interactive quality (Lehtinen and Lehtinen, 1982) is largely responsible for overall service quality evaluations since (a) it is very important in its own right but (b) also shapes the service outcome. This should not be surprising given the characteristics of services and especially the inseparability and variability of service performances.

The present research enriches this body of knowledge by investigating the effect of interaction quality and loyalty on two variables: (i) perceived performance excellence (or core service performance) which in the words of Auh (2005) it is “the customer’s perception of the hair care provider’s ability to perform a quality haircut (p.83) and (ii) trust.

For the purpose of the research, interaction quality was defined as “the positive outcome derived from exchange of conversational and verbal information between the service provider and the customer” (Auh, 2005). The study used a high-contact service (i.e. hair salon provider) and Cyprus as the empirical base. A convenience, non-probability sample was used, of 150 Cypriots (a 92% confidence interval), aged 15 and above. This is because it was important for respondents to have the freedom to choose the hair salon provider on their own.

The questionnaire utilized a 7 point Likert scale and was designed with the aim of identifying the gender of the participants so as to divide interviewees by gender and reveal possible gender differences.

In fact, the findings revealed significant gender differences. That is, for men interaction quality has a stronger and more direct relationship with loyalty. Overall, with respect to the relationship between interaction quality and perceived performance excellence the results concur with existing literature indicating a strong effect of interaction quality on perceived performance excellence, with trust serving as an important mediating factor. On the contrary, the findings suggest that perceived performance excellence has an indirect relationship with

loyalty. Finally a strong and direct relationship between interaction quality and trust was reported.

EMOTIONS, PATIENT BEHAVIOR AND THE MODERATORS TO IMPACT OF SOCIAL SUPPORT ON EMOTIONS AMONG CONSUMERS OF HEALTHCARE SERVICES

Mesquita e Noronha, Aruna¹; Mekoth, Nandakumar²

¹Assistant Professor, S.S. Dempo College of Commerce & Economics, Panaji, Goa, India. Email: angelmescquita@yahoo.com

²Professor & Head, Department of Management Studies, Goa University, Goa, India. Email: nmekoth@rediffmail.com nmekoth@unigoa.ac.in

Abstract

Purpose: This paper is an attempt to understand the role of emotions in the decision of patients to consult a health care facility, continue with the facility and, to identify the moderators to the impact of social systems and social support on the emotions.

Design/Methodology/Approach: Depth Interviews have been conducted to collect stories of pre-consumption and consumption emotions of fourteen customers of healthcare facilities. The collected stories have been analyzed to capture the role of emotions in selection and switching of health care facility and to identify the moderators of impact of social systems and social support on emotions.

Findings: Health awareness, symptomatic nature, having dependents, type of social system, trust and uncertainty of outcome were found to moderate the relation between social support and emotions. While the intensity of pre-consumption negative emotion was found to influence the speed of choice of facility the persistence or aggravation of negative consumption emotions impact the continuance commitment to the facility. Also it was found that the expectation of non hospital support was higher in the pre-consumption stage where as that of hospital support was higher during the consumption stage.

Research Limitations / Implications: Further research work should focus on statistically testing the hypotheses developed in this exploratory research using descriptive designs. Implications for healthcare facilities needs to be identified and methods to manage the implications are to be identified.

Originality / Value: This paper identifies differential impacts of healthcare related variables on the impact of social support on emotions which have implications for healthcare facilities.

Keywords: Emotion, Social Systems, Social Support

THE CHALLENGES OF INITIATING DISTANCE LEARNING IN HIGHER EDUCATION

Miri, Barak¹

¹ Technion – Israel Institute of Technology. Email: bmiriam@technion.ac.il

Abstract

Nowadays, DE is an educational innovation that many universities are starting to adopt for attracting and retaining students. However, studies report that the integration of DE in higher education faces a wide range of problems. This study aimed at identifying the challenges of initiating DE, in an attempt to provide some optional solutions. The study was based on the qualitative grounded theory approach, conducting in depth, semi-structured interviews among twelve lecturers. Findings indicated a range of assertions about DE. Some lecturers expressed positive attitudes, approving the innovative project, but some expressed negative attitudes, claiming it is a waste of resources. Content analysis of the interviews raised "DE killer sentences" grouped into five categories. Findings also indicated four major misconceptions about DE. In order for the DE initiative to be more effective and widely spread among Master Degree programs in the university, it requires the integrated efforts of all stakeholders, including: administrators, faculty, students, and support staff. The absence or underinvolvement of a critical participant group risks the integrated efforts of the others. A collaborative, systemic, and creative thinking of all stakeholders may provide solutions for effectively assimilating DE, while dismantling the resistance of faculty who still believe in traditional teaching.

Keywords: Distance learning, Higher education, Organizational changes

Introduction

In the global economy of the 21st century, organizations and companies are under increasing pressure to enhance lifelong learning among their employees, contributing to their professional development and productivity. At a time when keeping employees away from their jobs is no longer an option, universities reach out to them by launching distance Education (DE) programs (Moore, 2007). Nowadays, DE is an educational innovation that many universities are starting to adopt for attracting and retaining students (Martinez-Caro, 2009). However, studies report that the integration of DE in higher education faces a wide range of problems (Bonk et al., 2003).

Research Goal and Method

This study aimed at identifying the challenges of initiating DE, in an attempt to provide some optional solutions. The study was based on the qualitative grounded theory approach (Glaser and Strauss, 1967). In depth, semi-structured interviews were conducted among twelve lecturers. Their assertions about DE were audiotaped, transcribed, and gradually analyzed

from a constructivist and interpretative perspective (Smith 2004) by two experts, establishing full consent.

Findings

Findings indicated a range of assertions about DE. Some lecturers expressed positive attitudes, approving the innovative project, but some expressed negative attitudes, claiming it is a waste of resources (i.e. time, manpower, and money). Content analysis of the interviews raised "DE killer sentences" grouped into five categories:

1. Work overload

It will take me too much work and effort to modifying the lectures to meet DE requirements. I will not have time to read all the discussions in the online forums.

2. Intellectual property rights

I am not interested in sharing my lecture notes and presentations. If all my lectures will be recorded, I might not be needed.

3. Interactions with students

I believe that learning can only be conducted when students are sitting in the same classroom, shoulder to shoulder.

4. Contribution to the workplace

Distance learning does not contribute to the skills and knowledge needed in the workplace.

5. Camera shyness

I am not photogenic, I do not feel comfortable being recorded by video cameras.

Findings also indicated four major misconceptions about DE:

1. Preparing and teaching a distance learning course is easy. A common misconception maintains that there is no need for special preparation for teaching a course in distance.

2. DE downgrades the lecturer's role. Some believe that once DE courses are produced, there will be no need for the lecturer's role, since all the learning materials are written, narrated and video-taped.

3. Learning from distance is effortless. A common misconception is that all a student has to do is listen to the lecture videos and learn a few days before the final test. The general thought is that learning a course at a distance will be easier, because students can work on their own pace.

4. DE students do not interact with the lecturer or other students. Students who hesitate to enroll to DE courses explain it by their fear of not being able to communicate with fellow learners and the instructor.

Finding indicated that if the culture of traditional teaching is dominant among faculty and students, they tend to doubt the worth of DE, and there is little chance that DE programs will

be initiated. However, in cases where the dean and faculty were supportive, the DE initiative was successful in terms of the number of DE courses delivered, the lecturers' motivation to collaborate, and the students' satisfaction.

Summary and Lessons Learned

After two years, the DE courses are considered as "islands of innovation" in which only few lecturers are involved. Those who are involved, the "DE pioneers", are willing to spend much time and effort in changing the culture of traditional teaching to a culture of student-centered pedagogy. Some of the lecturers' common misconception is that DE equals the use of Internet technologies. This leads many to believe that by making materials available to students on the web, the job is done. On the contrary, access to data does not automatically expand student's knowledge and the availability of information does not inherently promote their thinking skills (Barak 2012). While designing, developing, and delivering a DE course, lecturers are advised to pay attention to the course contents and pedagogy and not only to the technology. Hence, the DE pioneers, center on promoting students' conceptual understanding, thinking skills, and lifelong learning skills. In order for the DE initiative to be more effective and widely spread among Master Degree programs in the university, it requires the integrated efforts of all stakeholders, including: administrators, faculty, students, and support staff. The absence or under-involvement of a critical participant group risks the integrated efforts of the others. A collaborative, systemic, and creative thinking of all stakeholders may provide solutions for effectively assimilating DE, while dismantling the resistance of faculty who still believe in traditional teaching.

THE USE OF CLOUD APPLICATIONS FOR IDENTIFYING 21ST CENTURY SKILLS IN HIGHER EDUCATION

Miri, Barak¹; Sigal, Morad²

¹ Technion – Israel Institute of Technology. Email: bmiriam@technion.ac.il

² Beit Berl Academic College. Email: sigalm@beitberl.ac.il

Abstract

In recent years, cloud applications are integrated into work, daily-life, and the academia. Our goal was to examine the use of cloud applications for educational purposes and identify key skills necessary in the 21st century. The study included 114 lecturers (N=45) and students (N=69) from two higher education institutions. The Mix Method Research model was applied in the collection and analysis of online-questionnaires and semi-structured interviews. Findings indicated that in the context of higher education, it seems that cloud computing is not only a model for delivering ICT services, but it may change the way lecturers perceive their teaching and students perceive their learning. In addition to the necessary skills that were indicated in the 20th decade, we identified four new skills and competences needed for work, citizenship, and self-actualization in the 21st century. Those skills are: a. Acclimatizing to frequent changes and uncertain situations, b. Decision-making in decentralized and nonhierarchical systems, c. Collaborating and communicating in digital environments, d. Generating data and managing information overload.

Keywords: 21st century skills, Cloud applications, Higher education, Innovative pedagogy, Web 2.0

Introduction

Cloud computing is a model for delivering ICT services, enabling ubiquitous, on-demand network access to a shared pool of computing resources (Mell and Grance, 2011). Today, numerous cloud applications can be found on the Web. Google Apps, Microsoft's Live@Edu, Prezi, and services of 'Social networking' are only few examples that can be thought of as the next generation of Web 2.0 tools. In recent years, cloud applications are evermore integrated into our daily life and they have become an important tool for knowledge construction and collaboration in higher education. However, does the use of these applications require new and necessary skills for work, daily-life and learning?

Research Goal and Method

This study was conducted as a pilot for a longitudinal study, examining the use of cloud technologies for educational purposes and identifying key skills for the 21st century. The study included lecturers (N=45) and students (N=69) from two higher education institutions in Israel. The Mix Method Research model (Johnston and Onwuegbuzie 2004) was employed by using both quantitative and qualitative methodologies in the analysis and interpretation of data. The

research tools included online questionnaires ($\alpha=0.78$) as well as semi-structured interviews (N=12) that were analyzed via the qualitative-interpretive approach (Smith 2004).

Findings

The percentages of participants' who voted 4-agree and 5-definitely agree (on a 1-to-5 scale test) on embedding ICT and cloud applications in teaching are presented in Figure 1. Finding indicated that lecturers and graduate students feel that they acquired new skills in the 21st century, compared to the undergraduate students ($X^2=23.4$, $p<0.001$). This can be explained due to the fact that the undergraduate students are more computer oriented and that they are already familiar with these tools.

Figure 1. Lecturers and students' perceptions about ICT and cloud applications

Analysis of the lecturers' interviews indicated two types: *Skeptics* and *Advocates* of the existence of new skills in the 21st century. The *Skeptics* (N=4) asserted that there is no such thing as '21st century skills'. They claimed that skills such as problem solving, critical and creative thinking, and collaboration, that are related to the 21st century skills (Griffin and McGaw, 2012), have always been taught and that "*nothing is new under the sun*".

Contrary to this, the *Advocates* (N=8), believe that the 21st century introduces challenging changes and indicated four new key skills needed in today's academia, enterprises and daily lives (Table 1).

<i>Key skills</i>	<i>Examples of lecturers' assertions</i>
<i>Acclimatizing to frequent changes and uncertain situations</i>	<i>Today we need to work in changing environments. Look at the cloud model for example. The service provider can upgrade the version of the application you are working on without notice. It happened to my students while they were working with Google Apps... they had no choice but to adapt.</i>
<i>Decision-making in decentralized and nonhierarchical systems</i>	<i>... if you ask me, decision-making is one of the most important key skills my students should acquire. More and more computer applications have the "share" button. However, working together, at the same time, all at once on the same document can be confusing and chaotic. For effective outcomes, people need to know how to administrate their work in nonhierarchical systems.</i>
<i>Collaborating and communicating in digital environments</i>	<i>I believe that the 21st century generation need to master different types of communication and knowledge transfer methods, all digital... Skype, Chat, Video conferences. Cloud technologies of today, such as Google Docs, Prezi, and others, enable sharing. My students must learn to share textual, and visual ideas.</i>
<i>Generating data and managing information overload</i>	<i>As we all know, information is growing in an exponential way. Today, in order to succeed in the workplace, it is not enough to manage data. My students will also need to generate data, manage it, and disseminate it, using the most up-to-date tools, either social networks or other means.</i>

Discussion and Further Study

The understanding of the important role of ICT, not only for business and economics, but also for education, has already been signified (Barak, 2012; Barak et al., 2009). In this study, findings indicated that in the context of higher education, it seems that cloud computing is not only a model for delivering ICT services, but it changes the way lecturer perceive their teaching and students perceive their learning. In addition to the skills that were indicated in the previous decade (problem solving, critical thinking, creativity, innovation, etc.), we identified four new skills and competences needed for work, learning, and self-actualization in the 21st century. Those skills are: a. Acclimatizing to frequent changes and uncertain situations, b. Decision-making in decentralized and nonhierarchical systems, c. Collaborating and communicating in digital environments, d. Generating data and managing information overload.

Cloud technologies can provide learning environments that are present anywhere at once (omnipresent) and that can promote students' interactivity through a variety of modalities. The preliminary results of our study raise several questions, such as: Do we, as lecturers in higher education, have the required skills for teaching in the 21st century? How can we enhance the four skills among ourselves and our students? Etc. Further research on these important questions will promote the growing body of knowledge on cloud technologies, 21st century skills, and innovative pedagogy, generating a new trend: 'cloud pedagogy'.

A FRAMEWORK FOR IDENTIFICATION OF DYNAMIC CAPABILITIES

Mohammadi, Hanieh¹; Mashayekhi, Ali N.²; Arasti, Mohammadreza³

¹ Master of Business administration Student - Sharif University of Technology. Email: Mohammadi.Hanieh@gmail.com

² The Professor of Sharif University of Technology. Email: Mashayek@sharif.edu

³ The Assistant Professor of Sharif University of Technology. Email: Arasti@Sahrif.edu

Abstract

The strategic importance of Dynamic Capability (DC) has been a central theme in Strategic Management literature since Teece article released in 1997. But, relatively little attention has been given to the operationalization of the concept in organizations. In this paper we propose a framework based on Pavlo and Daneel researches to identify DC in an organization. Through a in-depth case study in dairy industry we explore the detail component of our framework. With a series of interviews with managers and experts of an Iranian dairy producing company, we first confirmed the framework as a whole and then we conclude that the process of DC introduced by Pavlo can have different interpretation in different modes of changes in organizations and introduce some elements of DC specifically in different change modes.

SOCIAL RESPONSIBILITY AND THE O-ZONE EXPERIENCE OF A LUXURY HOTEL IN BANGKOK, THAILAND

Mottier, Ewa¹; Lewis, Robert A.²

¹ Les Roches-Gruyère University of Applied Sciences, Switzerland. Email : Ewa.Mottier@lesroches.edu

² Les Roches-Gruyère University of Applied Sciences, Switzerland. Email : Robert.Lewis@lesroches.edu

Abstract

Purpose: This study aims to evaluate the experiences of the Mandarin Oriental Bangkok to show how the new employee centre called the “O-Zone” contributes toward social responsibility. This investigation is supported by studies in the literature which reveal the importance of corporate social responsibility (CSR) in the hospitality industry. Social awareness is compared and contrasted with employee perspectives in order to reveal the perceived importance of the O-Zone experience. The study also explores variables including gender and length of employment.

Design/methodology/approach: Questionnaires, containing attitude scales and open-ended questions were filled out by 164 employees. Attitude scales were useful since they provided numerical values for behaviour. The study proposed the use of a summated rating scale: a set of attitude items, all of which are considered to be of approximately equal attitude value. The summated rating scale used in questionnaires included a range of replies from ‘very low to very strong’. Quantitative data from questionnaires entered into SPSS and Excel tables. Likert scale findings were evaluated according to skewness, based on mean and mode. For qualitative data, NVivo was used for analyzing open-ended survey questions. In addition, researchers conducted interviews in September 2011 at the O-Zone employee centre to capture employees’ experiences related to social responsibility.

Findings: The creation of the O-Zone employee centre increased positive perceptions of employee facilities in the hotel. O-Zone activities positively affected employee awareness in terms of social responsibility, particularly ‘GO Green’ Campaign. The results of this research also revealed that having the O-Zone centre in the Mandarin Oriental in Bangkok makes employees perceive a contribution toward social responsibility.

Practical implications: The Mandarin Oriental Bangkok with the new employee centre opened in 2010 became a socially responsible partner of the local community. It creates a new benchmark in the luxury hotel industry in terms of connecting corporate social responsibility with traditional hospitality values of Thai culture.

Originality/value: This research is particularly beneficial for other luxury hotels interested in becoming a socially responsible partner of the local community. This study also contributes to a better understanding of hotel employees’ social awareness in the Thai context.

Keywords: corporate social responsibility, emerging markets, luxury hotels, social responsibility

BUSINESS MODEL THINKING: A STRATEGIC FRAMEWORK FOR ACADEMICIANS AND PRACTITIONERS

Newth, Francine¹

¹ Associate Professor of Strategy, School of Business, Providence College, Providence, Rhode Island, USA

Abstract

This paper offers an approach to strategic thinking that is simple and powerful. Its value is in business model thinking. It attempts to build a meeting of the minds between practitioners and academicians by providing a strategic framework displaying the essential components of a business model and the embedded relationships. It brings together the best contributions of academe and industry to narrow the gap and develop graduates/managers with a business model mind set. It adds a business model level to the traditional strategic management process that is more consistent with current “real-world” practices in strategic thinking and analysis. It takes the reader into the intricacies of what constitutes a business model and how current strategy revolves around it. It is based on the premise that strategies cannot be formulated without first understanding the fundamental elements of a business model.

The dialogue of some scholars (Zott et al., 2012) includes business models as a new unit of analysis which seeks to explain how value is created and emphasizes system level approach. Others (Baden-Fuller and Morgan, 2010) see the importance of business models for both academics and managers by understanding the multiple roles that business models play (i.e. describing and classifying businesses, recipes for creative management). The discussion also entails authors who speak of dynamic capabilities within the process of strategic renewal (Augier and Teece, 2009).

The dialogue of practitioners addresses the viability, sustainability and competitiveness of a business model including the role of the CEO in reinventing the company’s business model (Govindarajan and Trimble, 2011).

The concept of a business model is being defined by academicians as a profit model, a business delivery system and a learning system (Itami and Noshino, 2010), a mechanism for turning ideas into revenue at reasonable cost (Gambardella and McGahan, 2010), and how a firm delivers the way a company operates using its competency foundation to achieve financial viability. For the purpose of bridging theoretical and practice-based views, I propose a new framework to bring business models at the center of strategic analysis and as the first step to help practitioners formulate good strategy. This approach differs from the traditional strategic management analytical framework which spans from industry analysis to company analysis (SWOT) to strategy formulation, implementation, and evaluation. A graphic representation is presented below (Figure 1) which encapsulates 7 distinct areas and is offered as an academic analysis and consulting tool. The 7 areas of business model thinking include: 1. value proposition, 2. strategic resources, 3. dynamic capabilities, 4. revenue streams, 5. cost structure, 6. strategic direction (mission, vision, objectives and strategy), 7. performance management

(financial and operational objectives with key metrics as drivers of performance). Understanding these elements can lead a company to the right value chain, competencies, and competitive advantages.

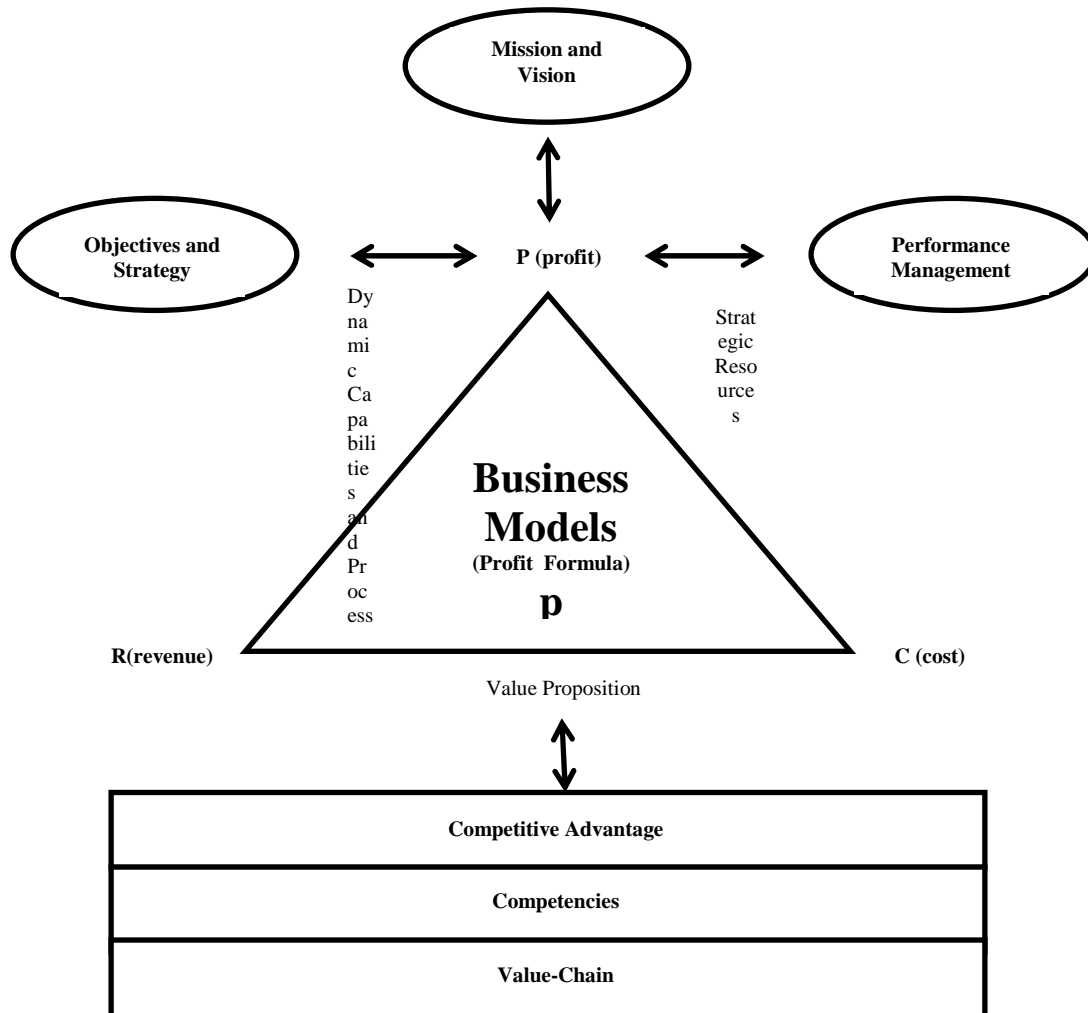

FIGURE 1. Business Model Framework for Strategic Management

INTERNATIONAL SERVICES MARKETING STRATEGIES: CUSTOMER ATTITUDES TOWARDS CASHFREE BANKING

Nilvander, Frida¹

¹ University of Galve, Kungsbackavaden, Galve, Sweden. Email: franir@hig.se

Purpose: The question of whether a business should pursue a marketing strategy that is standardized across national borders or adapted to individual markets has long troubled practicing managers and academics. This study aims to describe international marketing strategies of cashfree bank office services in two countries. Seen from the perspective of the bank, customer attitudes are analyzed through the TAM (Technology acceptance model) and this study brings forward what customers think about cash free bank offices and how they intend to use them.

The study is based on the research question: Is there a difference between countries in terms of technology acceptance of cash free banking? -And how can banks deal with that in terms of standardization versus adaptation of marketing strategies?

Research Design and Methodology: An empirical study is conducted to determine customer acceptance and intention to use cash free bank offices. By using a questionnaire based on the TAM model private customers in Vilnius Stockholm and Timrå (Northern Sweden) will answer questions regarding technology acceptance of cash free banking. The results will be analyzed and compared using through the TAM model, and these results can later be used as managerial implications in order for the bank to take well grounded decisions regarding standardization versus adaptation of marketing strategies. The analyzing and comparison between the countries is not finished yet, 100 questionnaires from the Baltic region are gathered and the next phase is to gather the same information in Sweden. (Deadline June 2012) We hope that the results will help to find the difference if there is such in customer acceptance of cash free bank offices.

Proposed Findings: In line with Siralova and Angelis 2006 we argue to carefully decide on the degree of standardization of the separate elements of the marketing strategy. Consumer technology acceptance can be used as a guideline for banks in order to take well grounded marketing strategy decisions. From the empirical material we hope to find differences and similarities between the customers in different countries and cities. However this study brings forward what customers think about cashfree bank offices and how they intend to use them in the future. By analyzing internal factors, external factors and standardization/adaptation with the results from the technology acceptance questionnaire we hope to find out where marketing adaptations are needed and where standardization is favoured.

Originality: Researchers (Siralova, Angelis 2006, Jain 1989, Schuh 2000, Lewitt 1983, Porter 1986, Poulis and Poulis 2011, Vrontil et al 2009) have theoretically and empirically demonstrated how firms can deal with standardization versus adaptation when exporting to a culturally distant country. This study makes a unique contribution building on the process of standardization/ adaptation of international services marketing in a culturally distant country

by adding customer technology acceptance into a model developed by Hyder, Nilvander 2012. This study also sheds light on cash free banking and a less cash dependent society. Past research has overlooked the role consumers' technology readiness plays in adaption of technology-based service encounter (Lin and Chang 2011, Kros et al 2011, Lewis and Hoel 1987, Akturan and Teczan 2012). This study builds on extant research by conducting a comparative study on the attitude of bank customers towards cash free bankoffices in Sweden and Lithuania and their willingness to accept cashfree banking strategy introduced in their countries.

Keywords: Services marketing, customer acceptance, payment services, marketing strategy, cultural differences, marketing mix content

TECHNOLOGY ACCEPTANCE ATTITUDES TOWARDS CASHFREE BANKING

Nilvander, Frida¹

¹ University of Galve, Kungsbackvaden, Galve, Sweden. Email: franir@hig.se

Abstract

Purpose: The extent to which marketing programmes and processes should be standardized or adapted as well as technology acceptance propensity across national boundaries have received significant research attention in international marketing. That notwithstanding, past research has overlooked the consumers technology acceptance (TA) plays in adoption of cash free banking business model. Do consumers in different countries differ in their willingness to adopt new technology-based business model? What are the implications of their level of technology acceptance for financial services industry? To answer this question, this study uses a Technology Acceptance Model (TAM) as an analytical device in order to build on extant research. This is accomplished by conducting a comparative study on the attitude of bank customers towards cash free bank offices in Sweden and Lithuania and their willingness to accept cash free banking business model introduced in their countries.

Research Design and Methodology: An empirical study is conducted to determine customer acceptance and intention to use cash free bank offices. By using a questionnaire based on the TAM model private customers in Vilnius (Lithuania) and Stockholm (Sweden) will answer questions regarding technology acceptance of cash free banking. The results will be analyzed and compared using the TAM model. The analyzing and comparison between the countries is ongoing, 100 questionnaires from the Baltic region are gathered and the next phase is to gather the same information in Sweden. (Deadline June 2012) We hope that the results will help to find the difference if there is such in customer acceptance of cash free bank offices. With help of four hypotheses we will try to find out which attitudes that is dependent when it comes to technology acceptance of cash free bank offices. **Proposed Findings:** In line with Siralova and Angelis 2006 we argue to carefully decide on the degree of standardization of the separate elements of the marketing strategy. Consumer technology acceptance can be used as a guideline for banks in order to take well grounded marketing strategy decisions. From the empirical material we hope to find differences and similarities between the customers in different countries and cities. However this study brings forward what customers think about cash free bank offices and how they intend to use them in the future. By analyzing internal- and external factors with the results from the technology acceptance questionnaire we hope to find dependent variables for attitude that can be used for the best possible understanding how to best design, promote and manage new technologies in order to have the best possible chance of customer acceptance.

Originality: This study sheds light on cash free banking and a less cash dependent society. Past research has overlooked the role consumers' technology acceptance plays in adaption of technology-based service encounter (Lin and Chang 2011, Kros et al 2011, Lewis and Hoel 1987,

Akturan and Teczan 2012). This study builds on extant research by conducting a comparative study on the attitude of bank customers towards cash free bank offices in Sweden and Lithuania and their willingness to accept cash free banking strategy introduced in their countries.

A HYBRID CURRICULUM DEVELOPMENT

Orphanidou, Yianna¹; Melanthiou, Yioula²

¹ Associate Head, Hospitality, Tourism and Sports Management Department, School of Business, University of Nicosia, Cyprus. Email: orphanidou.y@unic.ac.cy

² Assistant Professor, Marketing Department, School of Business University of Nicosia, Cyprus. Email: melanthiou.y@unic.ac.cy

Abstract

The purpose of this study is to analyze the structure of the hybrid curriculum development of a Tourism undergraduate programme at the University of Nicosia. The research presented in this paper is the result of a two years process using a hybrid curriculum in enhancing student educational experience. Curriculum literature review, focus groups, online technology and in-depth interviews were implemented for the needs of this research study. The combination of face to face teaching, e-learning environment, tutoring and industry placement provide a blend of learning attributes that can equipped the tourism graduate of the third millennium. Educational institutions should produce graduated students who meet the requirements and expectations of firms with respect to competences of students (Collins, 2002), by providing specific courses (Dale and Robinson, 2001), without superficiality of education and training (Weber, 2006). Curriculum experts tend to interpret the need of a new curriculum and lack of competencies to strong vocational character curriculums. Grubb and Lazerson (2005:16) contend that this "narrow vocationalism" is pervasive throughout higher education "undermines genuine occupational preparation and also impoverishes the intellectual and civic roles that higher education can play". The massive changes in the Higher Education (HE) and the socio-economic environment have had considerable implications on graduate employment in both obtaining and retaining careers in traditional occupations. Hybrid curriculum would enhance student's capabilities allowing the flexibility in HE to include means of accessible learning environment into the traditional face to face teaching environment.

Keywords: Hybrid curriculum design, Higher education, competencies, capabilities, graduates employability

Abstract

Empowerment of employees has come to be seen as a vital strategy for the success and improvement of organizational performance, and job satisfaction of frontline staff in the banking sector (Yavas, Karatepe, Avci, & Tekinkus, 2003). Moreover, research has suggested that human resource empowerment has a positive effect on employee well being, productivity, performance, service quality and customer satisfaction in the banking sector (Geralis & Terziowski, 2003; Chigozirim, and Mazdarani 2008; Tutar, Altinoz, and Cakiroglu 2011). Human resource empowerment refers to a change strategy with the objective of improving both the individual's and the organization's ability to act and to operate more effectively in an extremely competitive environment (Papaioannou, et al., 2009). The primary purposes of this study were: (a) to determine the extent to which human resource empowerment is applied to a private Bank, and (b) to examine the relationship between human resource empowerment used by the private Bank and business performance (profit, ROI, sales volume and market share).

The study was a quantitative design and the analysis was exploratory in nature. Descriptive statistics and Spearman correlation were used to examine the purpose of the study, using SPSS software. A sample of 19 senior bank managers (from 19 different branches) of a private bank in the western region of Attica (26 branches of the private bank recognized by the official web site of the bank) was surveyed using a 30-item questionnaire, (developed by Vogt & Murrell, 1990), in order to provide information on how senior bank managers see themselves in terms of the human resource empowerment process and demographic characteristics, using a five point Likert scale. The scales represented three different managerial styles which were: (a) the "empowering style" of management, (b) the "middle-ground style" of management and (c) the "controlling style" of management. In the first case the manager has a managerial style that reflects the manager who creates and shares power. In the second case the manager has a managerial style that combines the two styles of controlling and empowering in equal proportions, and in the third case, the manager is concerned with control or seldom shares, creates or empowers subordinates. The reliability of the scale was found to be: $\alpha = .97$. Also, the particular research used the subjective way of measuring performance, including four criteria two financial (profit and ROI) and to market based (sales volume and market share).

From the analysis it is shown that senior bank managers used 63.2% “empowering style”, 10.5% “middle-ground style” and 26.3% “controlling style” in the six key factors of human resource empowerment (Total of all Managerial functions). Also, there were significant relationships between the key factors of human resource empowerment and business performance of the private bank.

More specifically, there was found a significant and positive relationship among empowering style and profit (satisfaction in relation to current year's objectives) with a correlation of $r = .673$, $df = 17$, $p = .002$, market share (satisfaction in relation to current year's objectives) with a correlation of $r = .459$, $df = 17$, $p = .048$, market share (satisfaction in relation to their last financial years' objectives) with a correlation of $r = .534$, $df = 17$, $p = .019$, ROI (satisfaction in relation to competitors' objectives) with a correlation of $r = .484$, $df = 17$, $p = .036$, market share (satisfaction in relation to competitors' objectives) with a correlation of $r = .484$, $df = 17$, $p = .036$. This result is consistent with previous studies on empowerment and organizational performance, in the banking sector (Geralis & Terziovski, 2003; Yavas, Karatepe, Avci, & Tekinkus, 2003), and shows that the empowering style which senior bank managers exercised in the private bank is related to the bank's business performance (profit, market share, & ROI).

Almost the majority of the branches of the private bank participated in this study (73% of the branches of the bank participated and thus we can generalize our result for this particular bank). The study was also delimited to a questionnaire designed to collect data regarding human resource empowerment according to Vogt and Murrell (1990).

The following were acknowledged as the limitations of the study:

- The honesty, accuracy, and objectivity of the respondents when completing the questionnaire
- The respondent's level of understanding of the empowerment vocabulary.

A useful investigation might be undertaken to research if human resource empowerment affects public banks' performance. Areas of further research could also include measuring the impact of human resource empowerment on the loyalty of customers.

This study is useful in extending the concept of human resource empowerment to the banking sector. The study will be useful in helping bank managers to their further understanding of the human resource empowerment process in their respective organization.

Keywords: Human Resource Empowerment, business performance, banking sector.

A CROSS-CULTURAL ANALYSIS ABOUT WHY YOUNG PEOPLE DRINK ALCOHOL

Pertejo, Ana R. ¹; Kaufmann, Hans Ruediger²; Santos, Carmen³

¹ Faculty of Economics and Business, University of León

³ Faculty of Economics and Business, University of Leon

Abstract

Purpose – The aim of this study was to investigate the motives for young people to drink alcoholic beverages. The research results contribute to establishing prevention efforts since excessive and harmful drinking occur in this life period. From a review of the literature a growing concern is apparent when analysing the reasons why young people consume alcohol. People drink in order to attain certain valued outcomes. Golding et al. (1992) argue that there are many reasons for people to drink alcohol, but they can be summarized in two main categories: social and individual. Motives are seen as an effective tool to better understand young people, and the identification of similarities and differences among them permitting the development of products more suited to their needs and health (i.e. with less alcohol) as well as more appropriate and effective communication campaigns.

Design/methodology/approach – In carrying out this investigation, use was made of data from an international survey on drinking consumer behaviour embracing 30 European countries performed by the COConsumer BEHAVIOUR Erasmus Network (COBEREN). Cluster Analysis was applied to identify the motives of young people in the diverse European cultures.

Findings - The study demonstrated that some significant differences of drinking patterns exist, hence, calling to differentiate drinking behaviour as to different European cultures. The study also found that traditional cultural models (i.e. Hofstede's categorizations) do not suffice to explain the different motives.

Research limitations – This study was limited to the analysis of motives. A future investigation including the respective contexts and situations would permit more complete results on cultural differences to be obtained.

Practical implications – The ultimate objective was to provide information relevant to innovative segmentation approaches as well as to the development of products and communication strategies applied by enterprises and public institutions aimed at limiting premature and excessive drinking among young adults.

Originality / value – In a review of the literature, only a few references were found which researched the influence of motives of alcohol consumption of the youth segment, and, compounding the matter, those refer to one unique market only and not to the European market. This finding urgently called for the COBEREN research

THE DE-INTERNATIONALIZATION PROCESS: EVIDENCES FROM PORTUGUESE FIRMS**Pinho, Hélder¹; Meneses, Raquel²**¹ Faculdade de Economia, Universidade do Porto, Portugal. E-Mail: helder.miguel.pinho23@gmail.com² Faculdade de Economia, Universidade do Porto, Portugal. E-Mail: raquelm@fep.up.pt**Abstract**

Actually some firms are disinvesting in foreign markets; however, there is not an explanation to this phenomenon in the literature. According with the Uppsala Model (Johanson and Vahlne, 1977), firms tend to invest and expand in countries with a short psychic distance to the home country. This similarity with the domestic market reduces the uncertainty of the internationalization, because the firm has the experience of work at its country. With the accumulation of experiential knowledge in these markets, the firm tends to invest in farthest countries. Nevertheless, some studies did not verify this approach and Johanson and Vahlne (2003) revise their theory, suggesting that "business networks" are important sources of knowledge too, acting as facilitators of internationalization. Internationalization is a self-feeding process: it allows knowledge and networks which favour internationalization. Schweizer et al. (2010) include the entrepreneur to the business network internationalization process model of Johanson and Vahlne (2009), because the opportunity recognition results from the discovery of the entrepreneurial alertness, and from a promptness to be surprised. One more time, an international entrepreneur facilitates the internationalization process. According with the "Born Global" approach advocated by Rennie (1993) and developed by Chetty and Campbell-Hunt (2004) some companies can internationalize almost the inception and the growth of internationalization is rapid.

So, all this theories consider a dynamic process resulting of decisions based on accumulated knowledge over time. These theories state that firms tend to internationalize gradually or abruptly but always in an increasing way so this is an automatic self-feeding process. No model has the possibility of exit from an international market, so they preview successful in all markets that firms entry. Therefore, traditional models do not consider the process of de-internationalization and international divestment.

The first literature considering de-internationalization appears in the end of the 20th century, for Benito (1997) and after Mellahi (2003). Welch and Welch (2009) present one theory that preview the possibility of failure in internationalization process. They call the phenomenon of re-internationalization and it is defined as a process involving a period of international business activity, then exit from international operations, followed by a time-out period of some duration, then a process of international re-entry. So, the international divestment and de-internationalization literature is meagre and scanty.

With this research, we try to find a better definition for international disinvestment, presenting the motives leading companies to this process. Our research question is as simple as unexplored: "What are the reasons to de-internationalization?"

Because there is not a well accepted theory, we develop an exploratory study, using the Grounded Theory. Our framework is based in a purposive sample of Portuguese firms that already have an international disinvestment. We want to interview these firms and understand the reasons for the throwback of internationalization. After obtaining these answers, we want to compare them with the theoretical approach. We expect with that to create a model that expands the international literature including not only the step forward but also the steps back too.

Keywords: Internationalization process theory – De-Internationalization – international divestment

COOPERATION IN WINE TOURISM AND ITS ROLE IN THE DEVELOPMENT OF DISADVANTAGED AND ISOLATED AREAS

Pitoska, Electra¹; Charitoudi, Georgia²

¹ Assistant Professor, Financial Applications Department, School of Management & Economics, Technological Education Institute of Western Macedonia, KOZANI, GREECE. E-mail: ilpitoska@yahoo.gr

² Associate Professor, Department of Business Administration, School of Management & Economics, Technological Education Institute of Western Macedonia, KOZANI, GREECE. E-mail: tm00039@kozani.teiko.gr

Abstract

Wine-tourism is an important resource of income when it comes to organized wine producing countries such as France, Germany, Spain, Italy, U.S.A, Argentina, Chile, Australia and New Zealand. In these countries enjoying wine is a significant part of culture and daily life. Winetourism in Greece emerged and developed only during the last twenty years and it's far from being a well-organized industry.

The foundation of the "Wine producers' Association of the Macedonian Vineyard" with the trade name "Wine Roads of Northern Greece" in November 1993 by 15 wine producers has played a decisive role in the introduction of Winetourism in Greece. They made important decisions and created an innovatory for Greek standards collective project that would reform and pre-empt any progress in wine-related activities. They established common goals and effectively addressed the challenges of the international market. They created and they suggest specific routes that go through the most picturesque points of a winery zone.

Nowadays, 37 members of the Association suggest 41 wineries open to visitors in 8 routes. The agenda also includes notable restaurants, taverns, inns and hotels, traditional products stores and places that offer alternative activities. All these businesses are members of the Wine Roads of Northern Greece and have been evaluated according to specific qualitative criteria and are thus distinguished by a special seal of approval. One of the suggested routes is the "Wine Route of the Lakes", which includes a large part of the Municipality of Amyntaio in the prefecture of Florina.

In December of 2011 a field empirical research with questionnaires was realized in order to record the contribution of Winetourism in the local development of a distant area. The study took place in the Municipality of Amyntaio, which is a large part of the "Wine Routes of the Lakes". Furthermore, 11 wineries, hotels, restaurants, Environmental Centre (Arcturos), alternative activities offices operate in Amyntaio. All the businesses are intra-connected through their participation in the "Eco-touristic Company of Vitsi".

Conclusions can be extracted by the analysis of the answers concerning the contribution of wine-tourism in the local Wine industry, the local community and the touristic businesses. Conclusions can also be drawn for the contribution of the "Wine Roads of Northern Greece" in local entrepreneurship. The study also records the restraining factors for further development.

Abstract

The international financial crunch has started in 2007 and it has brought the Greek economy into a period of deep recession. This situation is reflected on the microeconomics of the country. Entrepreneurial activity in Greece has been severely affected by the economic recession and the rising uncertainty for the results of the current fiscal crisis. The present work is a field study which was realized in order to delineate the profile of entrepreneurship and entrepreneurs of the peripheral districts in Greece. In January 2012 an empirical research was carried out in order to delineate the profile of entrepreneurship and entrepreneurs of the peripheral districts in Greece. The field of study is the Municipality of Ioannina which is considered to be a reliable representative of a peripheral-local economy. A catalogue of all the enterprises operating in the Municipality of Ioannina was created for the needs of the research. All the data of the catalogue came from the electronic professional guide. The catalogue includes 969 enterprises. Using the method of random sampling, one every twenty-five enterprises was chosen. As a result, 39 enterprises of different activity were chosen. The choice of 39 enterprises was followed by 39 visits-personal interviews and 39 completed questionnaires. The questionnaire includes nine both open-ended and closed-ended questions.

The crisis of entrepreneurship is apparent on a national level but this empirical research shows that it shares the same characteristics even when it comes to local economies of peripheral districts. Small and medium enterprises in the countryside are not satisfied by the state programs that concern the enhancement of entrepreneurship and consider that Greek entrepreneurs face more difficulties when establishing a new enterprise compares to European entrepreneurs.

THE EXPORT MARKETING OF GREEK AGRICULTURE PRODUCTS: THE CASE OF "FETA" CHEESE.

Pitoska, Electra¹

¹ Assistant Professor, Financial Applications Department, School of Management & Economics, Technological Education Institute of Western Macedonia, KOZANI, GREECE. E-mail: ilpitoska@yahoo.gr

Abstract

The marketing of agricultural products has not been fully exploited by neither Greek enterprises or associations and national commissions. This paper presents the characteristics of the cheese making industry and the indication of Greek feta as Protected Designation of Origin (PDO) product. The paper also records the producers' expectations from the Protected Designation of Origin (PDO) indication as well as their competitors and attempts for imitation. Furthermore, there is an analysis of the stages of marketing the Greek feta, the exports, the destination countries, the evolvments and the expectations.

A presentation of the field study that was realized in March 2012 follows: The study was carried out towards three directions and on two levels. Initially, several interviews were realized based on structured questionnaires addressed to small feta producers and members of organized cheese making enterprises in Western Macedonia. The questionnaires addressed to the producers include open and closed-type questions, structured in units. The questions record the demographic characteristics (age, sex, years of entrepreneurial activity), the difficulties, the degree of satisfaction from cheese production and assessments for perspective exports and raise in the level of marketing.

On a second level, several other questionnaires were completed electronically by importers-whole sellers of feta from Germany, Sweden, England and Italy. These are the main destination countries of the Greek feta exports. The questionnaires include open and closed-type questions that record their opinion for the image of the Greek feta in their local markets, the effectiveness of marketing and the perspectives for development.

The answers are statistically processed in order to extract the findings of each research. Afterwards, the findings of the three individual researches are associated in order to reach general conclusions.

THREE SEGMENTATION METHODS OF ORGANIC PRODUCTS CONSUMERS - ROMANIA CASE STUDY

Roșca, Mihai Ioan¹; Tănase, Laura Daniela²

¹ The Bucharest Academy of Economic Studies. Email: miroasca@ase.ro

² The Bucharest Academy of Economic Studies. Email: lora.rosca@gmail.com

Abstract

Specialized markets are very sensitive to economic change. Such a market, from Romania being in its early development is the ecological products market.

The problem we tried to resolve is to describe how this particular market segmentation is looking in the time of crises. In order to resolve this we capture the characteristics of this market using three different methods.

The scientific problem to be solved was to better view the differences between the segments given by using different methods of segmentation and in the end choosing the one that fits the best the need of this particular market.

The first method was to divide the consumers after an important classification criterion because after developing a group of qualitative and quantitative researches we identify 2 different types of ecological consumers, the ones that buys and consumes certified products and the ones that consume uncertified products. With the help of bivariate analysis and the χ square statistical significance test we identify the most important variables that influence the buying decision.

The second method used was the multivariate analysis. Neither economical phenomenon is being caused by a single factor. For this typological classification we used the hierarchical analysis method.

The third method used was a research over the ecological products consumers that included a psychographic module. The consumers were divided into three categories depending on the place of purchase of organic products.

Keywords: eco-marketing, consumer behavior, segmentation methods, organic products, Romania.

Introduction

Specialized markets are very sensitive to economic change. (Allen P. and Kovach M., 2000),(Lubieniechi, 2002). Research of green product purchase behavior was made (Bahn, K. and, Wright N., 2001) but not this conduct in time of crises, research taking place in 2011. The goal was to better see the differences between the segments identified with three different methods. (Wedel M., Kamakura W.A., 2000), (Roberts, J., 1996)

Segmentation Based on Bivariate Analysis

The first method was to divide the consumers after an important classification criterion (Loureiro M and Hine S, 2001) and resulted 2 types of consumers.

Certified products

After implementing a survey and analysis (Wedel M. and Kamakura W.A., 2000) of variables influence the buying behavior of organic products labeled we noticed that several variables did not significantly influence the buying decision. Among these were the respondent's sex, age, last school graduate, income, family size, number of children in care, employment and residence area. The analysis suggests that only the residence, type of dwelling, type of ownership influences the buying behavior of certified organic products.

Uncertified products

As in the case of products labeled we noticed that several variables have not statistically significantly influence on the purchase decision. These include: respondent's gender, age, income, the last school or area of residence. From the analysis result that only the marital status and occupation, influence the purchase decision of unlabeled organic products.

Segmentation Based on a Multivariate Analysis Method

For typological analysis (Chinnici G, D'Amico M, Pecorino B, 2002) we used hierarchical analysis (Roberts J. H., 2000) methodology proposed by Marian Popa (Popa M., 2010) using demographic variables as criteria for grouping, between-groups linkage as clustering method and squared Euclidean distance as the distance measurement method and transformation values in the data standardized variables Z. Following this method results a series of dendrogram from which the main types were chosen.

Have been identified 4 major types of consumers.

Sophisticated-ecologists

The first consists of people up in 35 years with master degree, specialists with intellectual and scientific occupations, with an income of over 1,200 euro per household, living with their partner without being married, living in a block of the kind constructed before 89 and without children in care.

Producers

The second segment is composed of people who have finished high school, with earnings rather up to 2000 lei on average, married, with a higher incidence of persons who live in rural areas and of those who live in a house.

Attention to silhouette

The third group consists of people aged 26-55 years, with a higher incidence among women with faculty, with revenues between 1000 and 5000 lei with a higher incidence of single people living in new residential complex.

Married-traditionalist

The fourth type is composed of persons over 36 years with a greater incidence of between 36 and 55 years, with very high incomes, over 7,000 lei on average, married, living in houses or houses in new residential neighborhoods with one or two children in the care being Senior civil servants, Directors, Managers and highly intellectuals and scientific occupations specialists.

Segmentation Based on a Behavioral Variable – Place of Purchase

The third and the last segmentation taken was the one involving behavioral variables into the analysis and the results were (Emma L, and Worsley T, 2005):

SuperEco buyers are those who buy products both from modern retail stores system and also from fairs of eco products.

Hypermarket environmentalists are those who buy ecological products only from modern retail system.

Traditional buyers are those who buy green products from traditional fairs.

Conclusions

As expected, it can be seen that each factor has a certain influence on purchasing decisions. In terms of applying different statistical tools we get different descriptions of these segments. Although, the bivariate methods give clear results, have the gap of only showing the influence of a single variable on the item under study. Multivariate analysis, although extract from a complex of factors the most important, it has its errors. Neither the observational method, based on a single behavioral factor, is not one wrong and brings up valuable information. Although we expected that the second method, the most complex one, to provide the most satisfactory results, we note that other methods are applicable on this market. Also specify that all methods are scientifically valid and can be used by those interested to get closer to target segments and better satisfy their needs.

MERGERS AND ACQUISITIONS: REVISITING THE ISSUE OF VALUE CREATION FOR TARGET COMPANIES FROM NEW EUROPEAN UNION MEMBER STATES

Saikevičius, Darius¹

¹ Vilnius University, Faculty of Economics, Saulėtekio al. 9-II, LT-10222 Vilnius. E-mail:

d.saikevicius@gmail.com

Abstract

During the last takeover wave in the period of 2001-2009 both the volume and the value of merger and acquisition transactions reached record heights. Nevertheless, the question of whether mergers and acquisitions create surplus value has never been more relevant than during the same period of 2001-2009 as well. It turned out that numerous transactions which were structured during the recent wave destroyed total combined shareholder value instead of increasing it. The issue is even more crucial in the fast developing countries located in Eastern Europe, namely the twelve new Member States of the enlarged European Union, where plentiful privatizations boosted the number of merger and acquisition transactions during the last decade.

The general issue of value creation in merger and acquisition transactions which took place in the twelve new Member States of enlarged European Union countries is analysed in the study. Furthermore, concentrating beyond the basic issue of surplus value creation, two important questions surrounding the issue are addressed: the paper examines whether value creation differs in domestic and cross-border transactions and what is the effect of timing of merger and acquisition transactions in terms of economic cycle. Namely, value creation in pre-crisis, crisis and post-crisis periods is being analysed and compared in the study.

For the purpose of the study a database of merger and acquisition transactions which took place in the new Member States of European Union during the period of 2004-2011 has been employed. The empirical data has been obtained from Bloomberg market data system. Stock price change has been selected as the main metric to measure gains and losses of a transaction. For this reason only those transactions in which both of the companies (acquirer and target) are listed on a stock exchange were eligible for the study. Taking efficient market hypothesis into consideration, stock market prices adjust instantly to the news of a merger or acquisition transaction and thus the altered valuations of both target's and acquirer's shares reflect the surplus value created in a transaction. By employing this logic author of the study has been able to capture the value changes in merger and acquisition transaction in the new Member States of European Union.

The results of the study suggest that in case of the target companies from new Member States of European Union material value creation occurs in the event of an acquisition transaction—according to the study weekly stock returns on average increased by 3,8%. There is no statistically significant evidence found that transactions concluded during crisis period create more value than those at the pre-crisis timeframe. The results of the paper support the

conclusions of previous studies by academics that cross-border mergers and acquisitions create more value than domestic transactions.

Keywords: mergers and acquisitions, takeovers, takeover waves, market timing, takeover value creation.

SOCIAL PROTESTS IN ISRAEL IN 2011 AND THEIR EFFECTS ON THE ISRAELI ECONOMY

Schein, Andrew¹

¹ Netany Academic College, Netany, Israel. Email: ajayschein@gmail.com

Abstract:

In 2011, Time magazine's person of the year was the protestor, as protests rocked the world especially in the Middle East. Most of these protests in the Middle East were political protests with the goal being to change the regime, but in Israel the protests were social and economic to improve the economic fortunes of the people.

There were two stages to the protests in Israel. The first began in June 2011 when a person named Yitzhak Alrov launched a protest page on Facebook about the price of cottage cheese. This led to a consumer boycott of the main producer of cottage cheese in Israel, Tnuva, until the firm lowered its price. This protest led to a focus on the lack of competition in the Israeli economy since in the case of the dairy industry there is one dominant firm, Tnuva, and a high level of tariffs to make imports prohibitive.

The second stage of the protests began a month later in July 2011, when a person named Daphni Leef launched a protest again in Facebook and also pitched a tent in public grounds in Tel Aviv to protest against high housing costs, and more specifically rental rates in Tel Aviv. This protest quickly gained many followers who also pitched tents in Tel Aviv and various cities throughout Israel. In addition, rallies were had in various cities that were attended by hundreds of thousands of Israelis demanding action by the government to make housing, education and public health more accessible and affordable.

The response of the government was to appoint a committee, called the Trajtenebrg committee, after the head of the committee Manuel Trajtenberg, to offer recommendations as to what the government could do to meet the demands of the protestors. After just fifty days, in September 2011, the Trajtenberg committee proposed numerous changes with regard to tax rates, education, labor laws, housing reform, anti-trust regulation, transportation and health spending, and the Israeli government adopted many of the recommendations. In addition, since the protests in the summer of 2011 there has been a greater awareness in the consumer's consciousness of prices, which as of May 2012 has apparently led to a fall in the prices of food, furniture, education and culture, but not in rental rates in Tel Aviv. Yet, these declines in prices can be just temporary unless there is a structural change in the Israeli economy.

Two economists, Daron Acemoglu and James Robinson, in their recent book, "Why nations fail," argue that economies can be divided into two categories based on the economic institutions of the country, either exclusive or inclusive economic institutions. If an economy has exclusive institutions, then a select few, elite, control the economy, and garner the profits of the economy. On the other hand, inclusive economic institutions "are those that allow and encourage participation by the great mass of people in economic activities that make best use of

their talents and skills and that enable individuals to make the choices they wish." Acemoglu and Robinson argue that economies that have inclusive institutions will flourish, while exclusive economies might grow in the short run but in the long run, the standard of living will decline in the country.

In this paper we apply this dichotomy of inclusive versus exclusive economic institutions to analyze the protests in Israel and the effects of these protests. Many have noted that the reason for the high prices in Israel is due to the lack of competition and high level of economic concentration in the economy, which are symptomatic of exclusive economic institutions. Thus, our understanding of the protests is that they were protesting against the exclusive economic institutions in the country.

In the paper we review the economic institutions in Israel, and we argue that the protestors were correct that in many sectors of the Israeli economy there are exclusive economic institutions. However, we believe that the Israeli economy has not become more exclusive in the recent years, as for example Tnuva has always dominated the dairy market since the founding of the state. Instead, we argue, that the protests developed because of the technology of Facebook, which enabled consumers to form a unified front against the large firms, and also the protests in the neighboring Arab countries galvanized Israelis to protest.

The question of the true effectiveness of the protests is whether they will be able to move the economic institutions in the Israeli economy to be more inclusive. Acemoglu and Robinson argue that changes in the types of economic institutions derive from the level of political institutions in the country, whether they are inclusive or exclusive. We adopt this argument in our paper, and argue that for the protests of 2011 to succeed this will require a change in the political system to be more inclusive.

CORPORATE FINANCIAL DISTRESS IN THE EUROPEAN CONSTRUCTION INDUSTRY: A LOGIT APPROACH

Abstract

Since the seminal work of Altman (1968), the prediction of corporate financial default has been the subject of many studies. In this paper we empirically study determinants of corporate financial distress of firms operating in the European construction sector. The focus on a single industry, allow us to identify such determinants avoiding the shortcomings due to inter-sectoral heterogeneity. Using a dataset of Italian, French, German and Spanish firms for the period 2004-2010, we estimate the impact of both financial indicators and macroeconomic variables on the probabilities of multiple states of financial distress by using several specifications and extensions of the logit model. The forecasting performances of the models show the validity of the used approach against alternative methodologies.

A COMPARISON OF FACTORS INFLUENCING MALE AND FEMALE STUDENTS' ENTREPRENEURIAL INTENTIONS

Shneor, Rotem¹; Jenssen, Jan Inge²

¹ Kristiansand School of Management, Faculty of Economics and Social Sciences, University of Agder, Norway. E-Mail: rotem.shneor@uia.no

² Head of Institute, Kristiansand School of Management, Faculty of Economics and Social Sciences, University of Agder, Norway. E-Mail: jan.i.jenssen@uia.no

Abstract

The paper identifies commonalities and differences between women and men in terms of eleven key factors' impact on the formation of entrepreneurial intentions (EIs) among Norwegian students. The analysis is based on a sample of 1,782 Norwegian students from a variety of faculties and degree programs. A path analysis methodological approach is used, while being based on multiple regressions so as to gradually refine model complexities. Findings show that common to both sexes are the effects of entrepreneurial experience, social norms, self-efficacy, and age. The direct effects of role models and taking an economics major are only evident among males. The direct effect of entrepreneurship education and risk perceptions are only evident among females. Moreover, the study identifies the criticality of role models and an economics major in the overall network of effects in the case of male students, as well as the critical role of entrepreneurial education in the overall network of effects in the case of female students. Overall, our study supports the literature on differences between the sexes in terms of EIs' formation.

Keywords: Entrepreneurial Intentions, Entrepreneurship, Sex, Gender, Students.

Introduction

The growing interest in women entrepreneurship in recent decades has produced interesting studies, mainly highlighting women's greater tendency to concentrate in service and retail sectors (Hisrich and Brush, 1983, Neider, 1987), to experience challenges in access to finance (Carter and Rosa, 1998, Coleman, 2000), and to achieve more moderate results in terms of business growth and long term performance (Cliff, 1998, Boden and Nucci, 2000, Rosa et al., 1994). However, when placed in the context of the theory of planned behavior (Ajzen, 1991), it must be acknowledged that most studies examined women and men at stages of active entrepreneurial engagements, rather than at earlier intention formation stage.

Therefore, the current paper will attempt to identify commonalities and differences between men and women with respect to various factors assumed to influence their intentions to establish an entrepreneurial venture and/or being self-employed, hereafter referred to as 'EIs'.

Methodology

The study of EIs requires an examination of entrepreneurial phenomena before they occur, while also including non-entrepreneurial intending subjects. Therefore, samples of students have been popular, as they reveal vocational preferences of individuals at a time when they face important career decisions (Krueger et al., 2000). Moreover, Norway has been consistently recognized in Global Entrepreneurship Monitor (GEM) reports as an innovation-driven economy with a favorable environment for entrepreneurial development. Accordingly, we focus our analysis on university students from Norway.

More specifically, data was collected from students from the University of Agder (UiA) in Norway during September to October 2009. Our final dataset included 1,728 students, where 42 percent of which were male and 58 percent were female respondents.

Measures employed in the current study have been adopted from earlier studies, with minimal occasional adaptations. Multiple item constructs were assessed based on a principal component analysis, scores of four factor solution with clean loadings were saved and checked for reliability using Cronbach's alphas.

Dependent variable – Entrepreneurial Intentions

Independent variables - Drawing on findings from earlier studies, we have adopted a number of variables that were frequently used, deemed relevant for student EIs, and exhibited relative inconsistencies in terms of their impact on EIs in the different studies. These include: Self-efficacy (belief in own abilities to become an entrepreneur), Social norm (social support for entrepreneurial career), Motivation to comply (willingness to adhere with social views), Risk perception (risk associated with entrepreneurship) Exposure to role models (knowing a successful entrepreneur), Entrepreneurial experience (prior entrepreneurial engagement), Entrepreneurial status (current entrepreneurial engagement), Year of study (in years), Entrepreneurial education (participation in entrepreneurial training), Economics major (economics vs. other major), and Age (in years).

The current study uses path analysis, as it is suitable for the purpose of identifying parsimonious models where one has at least an implicit causal ordering and most variables are correlated (Asher, 1983). We opted for using multiple regressions, gradually refining the model, while pruning out all non-significant paths, as suggested by Asher (1983), and already applied earlier in an EIs research by Kreuger (1993).

Furthermore, in order to ensure that those indirect paths included are those where mediation effects are evident, we tested for mediation effects. We followed Baron & Kenny's (1986) procedures in the cases where regressions involved continuous variables as both dependent and mediator, and adjusted procedures in line with MacKinnon & Dwyre (1993), when the mediator was a dichotomous variable.

Findings

Our findings support the view that when studying EIs one must acknowledge a complex network of relations between the various variables. This presents a shift from the common practice of mostly using hierarchical regressions in similar analyses. For full summary of findings see table 1, which highlights direct, indirect and loop effects.

Conclusions

The current study contributes to our understanding of entrepreneurial intentions in the context of a complex network of relationships between variables, identifies the important moderating role of gender on these relationships, as well as highlights critical variables, which play influential roles in the network of relations between variables in each group. In this sense, we support the earlier findings that different factors' influence EIs in different ways across sexes (Pejvak et al., 2009, Yordanova and Tarrazon, 2010, Walter et al., Forthcoming/ 2011, Kickul et al., 2008, Vinogradov and Gabelko, 2010).

Type of effect	Common to both Sexes	Unique to Males	Unique to Females
Direct effects	<ul style="list-style-type: none"> -Positive effect of social norm (Effect magnitude higher in females) -Positive effect of self-efficacy (Effect magnitude higher in males) -Positive effect of entrep. ANALYZING THE IMPACT OF CULTURE ON AVERAGE TIME SPENT ON SOCIAL NETWORKING SITES

Shneor, Rotem¹; Efrat, Kalanit²

¹ Faculty of Economics and Social Sciences, University of Agder, Norway. E-Mail: rotem.shneor@uia.no

² Department of Business Administration, Ruppin Academic Centre, Israel. E-Mail: kalanite@ruppin.ac.il

Abstract

The study examines the influence of cultural dimensions on national averages of time spent (ATS) on the world's largest Social Networking Sites (SNSs) - Facebook, Twitter, and LinkedIn. In doing so, it highlights relevant cultural dimensions to be accounted for in adaptation efforts of international marketers. The analysis follows a multiple regression for assessing the impact of cultural dimensions, adopted from both the works of Hofstede and Schwartz, on national ATS on leading SNSs, while controlling for country e-readiness levels.

Findings show that intellectual autonomy has a negative effect on ATS, and egalitarianism has a positive effect on ATS on all three SNSs. Individualism has a negative effect on ATS on Facebook and Twitter, but not on LinkedIn. Uncertainty avoidance has a negative effect on ATS on Twitter and LinkedIn, but not on Facebook. Masculinity has a positive effect on ATS on Facebook, but not on Twitter and LinkedIn. Power distance and mastery have no impact on ATS on any of the SNSs studied.

Keywords: Virtual Communities, Social Networking Sites, Culture, Facebook, Twitter, LinkedIn

Introduction

E-Marketing is on the rise, with marketing investments directed at SNSs growing from USD 7 billion in 2010 to an estimated USD 38 billion in 2015 (Marketingcharts.com, 2010). Such growth prospects correspond well with indications that most marketing managers pursue social technology applications for marketing, with 95 percent of them planning to either maintain or increase their investments (Li and Bernoff, 2009). Such interest by practitioners may be justified by the effectiveness at which information about community members may be obtained (Gil-Or, 2010, Kozinetz, 1999, Maclaran and Catterall, 2002, Spaulding, 2010), the ability to create stronger brands (Gil-Or, 2010, McWilliam, 2002) and enhance brand loyalty (Casaló et al., 2010, Spaulding, 2010). Here, by tapping into "powerful, emotional relationships people have with brands and with each other" (Li and Bernoff, 2009, p. vii) marketers can strengthen their brands.

In particular, international firms must account for cultural characteristics of target markets (Steenkamp, 2001, de Mooij, 2000, de Mooij and Hofstede, 2002) in both their offline and online marketing activities. Various studies show that cultural adaptation of websites and online promotions is associated with enhanced customer preferences (Singh et al., 2004) and purchase intentions (Singh et al., 2006).

Accordingly, the current research seeks to aid companies in identifying those cultural dimensions most relevant for their strategic adaptation and localization efforts of SNS-based marketing activities. Earlier, it was shown that level of engagement in social media positively impacts attitudes towards social media based marketing (Akar and Topcu, 2011). Therefore, the study identifies cultural dimensions that are associated with higher engagement levels in SNSs. And, as such, answers earlier calls for research into the little explored area linking culture and SNS engagement levels (Fong and Burton, 2008, Boyd and Ellison, 2007, Choi et al., 2011)

Method

Multiple regression analyses based on national level data spanning 42 countries, representing 33% of all nations classified by the World Bank as either 'High Income' or 'Upper Middle Income' (The World Bank, 2011).

Dependent variable - Average amount of time spent on specific SNSs by country during May 2011. Data was collected manually for Facebook, Twitter and LinkedIn from the statistics provided by the 'Google Doubleclick Ad Planner' (Google.com, 2011).

Control variable – National 2010 e-readiness scores (The Economist Intelligence Unit, 2010).

Independent variables - Country scores of Hofstede's original four cultural dimensions - power distance, individualism, masculinity, and uncertainty avoidance as reported in the original study (Hofstede, 2001). In addition, three of Schwartz's (1994, 1999, 2007) cultural domains were included – mastery, intellectual autonomy, and egalitarianism; while dropping the remaining four for avoiding duplications and redundancies.

Findings

The results show that levels of intellectual autonomy negatively correlate with ATS on SNSs and levels of egalitarianism positively correlate with ATS on SNSs, both regardless of the SNS concerned. Levels of individualism have a negative effect on ATS on SNSs with respect to Facebook and Twitter, but not LinkedIn. Uncertainty avoidance levels have a negative effect on ATS on Twitter and LinkedIn, but not on Facebook. Masculinity levels have a positive effect on ATS only with respect to Facebook, but not Twitter and LinkedIn. Power distance and mastery did not correlate with ATS on SNSs.

Surprisingly, however, when accounting for cultural dimensions, results show that levels of e-readiness have no effect on ATS on Facebook and LinkedIn, while exhibiting a negative effect on ATS on Twitter; hence, completely rejecting the assumptions concerning the effects of the control variable.

Table 1 Parameter estimates and regression results

Conclusion

The study supports earlier claims that culture is an element driving the use of SNSs, while reflecting the prevalent values and norms of members' culture of origin (Choi et al., 2011, Fong and Burton, 2008). In particular, intellectual autonomy and egalitarianism emerge as the most prominent cultural dimensions impacting time spent on SNSs in general.

THE IMPACT OF THE SOCIAL PROTEST ON CONSUMER BEHAVIOR

Shuv-Ami, Avichai¹

¹ Chairman of the Marketing & Advertising Department, The College of Management, 7 Yizhak Rabin Blvd. Rishon Lezion 75190 ISRAEL. E-mail: shuvami@gmail.com or aviami@colman.ac.il

Abstract

Social protests in Israel and around the world rose mostly due to social- economical issues. Those social protests during the year of 2011 and especially during the summer of 2011 were ignited by the social media. Israel was not different. A protest against the increasing prices of cottage cheese that started thru the social media brought thousands of people to the streets of Tel – Aviv. This incident led to a massive boycott of cottage cheese that ended at the end of the summer with a demonstration of more than two hundred and fifty thousand people, possibly the largest social protest in the history of Israel.

Such protests in Europe, for example, are changing governments and maybe will change the social-economical systems. In France the social movement replaced the republican government with a social one (Ancelovici, 2011). Protests in Greece brought down government and protests are still occurring in England, Portugal, Spain and other European Union (EU) countries which are raising the question of the future of the EU all together (Koos 2012). The success of the public demonstrations in Egypt, ignited protests in the Arab world (Tunisia, Yemen, Labia, Syria and other countries (Al-Abdeh 2012, Bogaert and Emperador 2011, Kamphoefner 2011, Wolin 2011). The 15M Movement in Spain and the Occupy Wall Street were protests against the social and economic inequality and cost of life (Engler 2011, Hughes 2011).

In Israel a major part of the protest was against the prices of basic products of leading commercial companies, especially cellular and food companies. The current study examines the impact of the social protest on consumers' on behavior, specifically on their commitment to brands, brand involvement, satisfaction, loyalty and the perception of their brand relative performance to competing brands. The current research hypothesized that the impact of the social protest will increase involvement and decrease commitment, satisfaction, loyalty and the perception of brand performance.

The current research tested the impact of the social protest in the cellular industry, one of the most entrusted industries in Israel. Two studies among cellular users were conducted one before the protest in May 2011 (n = 1005) and the other after the protest during March 2012 (n = 1019). All variables (commitment, involvement, satisfaction, loyalty and performance) were measured exactly in the same way and found to be highly reliable. Both samples represented the Israeli population and were drawn from an internet panel.

As hypothesized and using ANOVA to test the differences, the results show that there is a significant difference in consumer's behavior before and after the protest. The consumer involvement with the cellular provider has increased (F = 39.7 and P < .00), satisfaction has decreased (F = 17.0 and P < .00), loyalty (F = 27.1 and P < .00) and also the perception of brand performance have been decreased (F = 38.8 and P < .00).

CO-CREATION OF VALUE FROM THE CUSTOMER VIEWPOINT: EMPIRICAL AND THEORETICAL CONSIDERATIONS

Silva, Joaquim¹; Simões, Cláudia²

¹ University of Minho, Portugal. Email: josilva@eeg.uminho.pt

² Open University, UK.

Abstract

Customer co-creation of value is presented in the literature as a key for competitiveness. Service-Dominant Logic presents a comprehensive and holistic view of customer co-creation, based on the application of knowledge and skills (operant resources) for the benefit of an entity. However, although the customer is placed at the centre of all co-creation activities, knowledge of this creative process is still limited. The research contribution reported in this article focuses on this gap, proposing a customer-oriented approach, which relates the practices and the configuration of resources with the co-creation and determination of value. The research approach is drawn from the literature review on Service-Dominant Logic and from exploratory data analysis collected in a qualitative study with users of a tangible product. Preliminary findings suggest that customer practices are essential for value creation and that such creative activity is performed within collaborative and interactive networks managed both by customers and by the company. Findings further reveal the dominant role of customers in co-creation.

Keywords: Service-Dominant Logic; Customer's value co-creation; Operant resources; Tangible product.

Introduction

Marketing theory and practice are changing as a consequence of technological advances that bear the dimensions of knowledge and its dissemination in the market enhancing customers' involvement in collaborative and dynamic processes that generate competitive advantages for companies (Pralhad and Ramaswamy, 2004). In the past three and a half decades many theoretical and practical contributions sought to integrate this new reality, proposing more interactive, individualized and experiential approaches. Service-Dominant Logic of Marketing (SDLogic), presented by Lusch and Vargo (2004), is one of the most comprehensive perspectives proposing an holistic mindset that seeks to understand more clearly the value creation process, the exchange, the markets and marketing (Vargo and Lusch, 2008; Lusch and Vargo, 2006).

According to Vargo and Lusch (2004), the fundamental unit of exchange in all economies is service, defined as "...the application of specialized competences (knowledge and skills) [operant resources] through deeds, processes, and performances for the benefit of another entity or the entity itself" (p.2). Service focuses on the experience and on the customer, who actively applies and integrates resources and competences during her/his consumption

processes. Yet, although SDLogic emphasizes the customer viewpoint, its vision is essentially theoretical without empirical evidence about customers' daily practices and the configuration of resources that they apply and integrate when consuming a product (Zhang and Chen, 2008; Payne et al., 2008; Arnould et al., 2006; Woodruff and Flint, 2006).

This research aims at studying how the customer co-creates value through the application and integration of resources during the consumption experience. Based on contributions from SDLogic we aim at better understand the customer's practices that create value and contribute to value determination. Proposing a customer-oriented approach, we relate customer practices and resources with co-creation and determination of value.

The object of the study is the customer and the unit of analysis are the consumption practices, understood as "...procedures, tasks, activities and interactions that support the co-creation of value" (Payne et al, 2008:85). The study's theoretical framework and propositions (see Appendix) give centrality to customer practices and consider the processes and dynamics of the customer's co-creation of value developed to accomplish her/his goals.

We conducted a qualitative exploratory study through 14 in-depth interviews with users of a product and 2 participant observations. We intended, in particular, to understand: (1) how the customer uses a particular product in her/his daily life, (2) what is the nature of the resources that are used and integrated in consumption practices, (3) how the customer evaluates her/his consumption experience and how s/he determines value. The product chosen was a market leader food processor (Thermomix), which is mainly understood by the company and its customers as a distribution mechanism for service provision. We also analysed written documents about the product and the company and consumer experiences in newspapers, magazines and electronic publications; social networking applications on the Internet, in particular forums, blogs and Facebook pages from the company and from customers. From the Internet we referred 21 sources of which 18 were managed by customers.

Preliminary findings are consistent with the theoretical framework presented and its propositions. In fact, we observed that value-in-use and value-in-context are essential for customer value determination. Customers effectively co-create value by integrating and sharing physical, cultural and social resources. Conversely to what is advocated in existing frameworks, the company has a secondary role in resource sharing and co-creation processes. The Internet is a driving platform allowing customers to co-create value from the interactions among them and marginally with the company. Such findings advance current frameworks by putting customers at the heart of value co-creation.

The research is at an exploratory stage, and more data is being collected and analysed. Although findings are limited to one product, we expect to extend the framework to other cases, studying both tangible and intangible products.

The focus on customers' practices is pivotal to understand how they can be creative, adapting products to their specific needs, objectives and contexts, through resource application and integration. Such knowledge is essential for companies operating in a business reality dominated by information. The knowledge, resources and practices co-created by customers

are a new source of sustainable competitive advantage that must be co-opted by companies (Prahalad and Ramaswamy, 2000).

Appendix

Figure 1: Theoretical framework

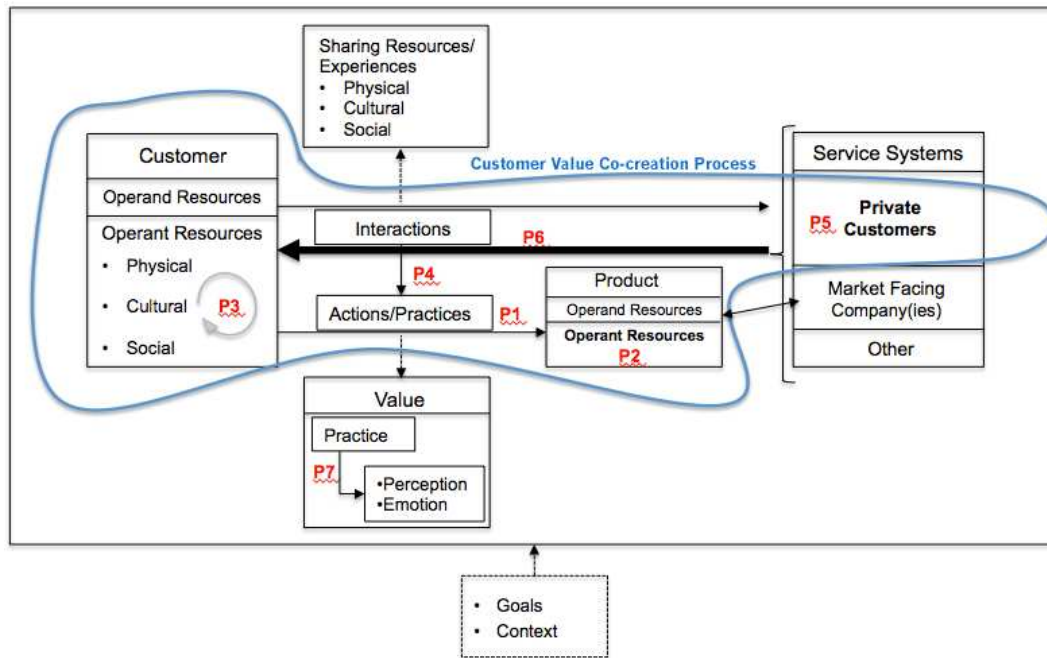

Table 1: Theoretical propositions

Propositions	Description
P 1	When consuming a product, the customer performs a series of actions and interactions that adapt the product to her/his needs and contexts of use
P 2	Co-creation activities are enhanced when the product is understood as an operant resource, open to a creative intervention.
P 3	In her/his practices the customer integrates a set of interrelated physical, social and cultural resources that s/he possesses and obtains from interactions with service systems
P 4	The easy access to operant resources through social resources increases the use of the product, and consequently enhances the value for the customer.
P 5	In their co-creative activities, the customer interacts more with other customers' service systems than with the company.
P 6	The customer varies in her/his propensity for collaborative dialogue and sharing of experiences, becoming a more a resource receiver than a source of resources.
P 7	The practice [through the application of operant resources] is an essential aspect of value determination by the customer.

THE AGED WORKER: AN ADDED VALUE IN THE PRIVATE AND IN THE PUBLIC SECTOR

Spanò, Isabella¹

¹ Borgo Della Salnitrra 3-43100, Parma, Italy. Email: ispano@lavoro.gov.it

Abstract

Purpose: The European countries have to deal with the economic global crisis and at the same time to face the ageing population. The active ageing was defined, by the World Health Organization (WHO), the process of optimizing opportunities for health, participation and security in order to improve the quality of life in people as they age; and, incidentally, the ageing society is the society in which it becomes more and more predominant the elderly population. The EU institutions, together with the International Labour Organization (ILO), often stressed the importance of the challenge that are ageing citizens. So, 2012 has been proclaimed the European Year for Active Ageing and Solidarity between Generations. Also non-governmental organizations as the European Older People's Platform (AGE) focused on the creation of an age-friendly European Union by 2020. In this context, in the field of labour, as pension ages are rising, senior workers are increasing, too. This research has the goal of demonstrating that such older workers represent an "added value" both in the private and in the public sector and therefore need to be supported providing them with adequate motivation, assuring a "good work" - not only, starting from the ILO keywords, a "decent" one - until their retirement.

Design/Methodology/Approach: In the premise of the paper (first part) the approach is general and theoretical, since the focus is on the problem itself of the aging of workers in this period of economic downturn, with reference to Europe. Behavioural differences among EU member States are shown. In the second part the paper highlights the reasons for attributing to older workers the characteristic of "added value". In the third part the paper analyzes the empirical methods of action to promote seniors' motivation in the corporate and in the public organizations, and in particular how to reconcile the various organizational needs with the need to maximize active ageing. The conclusions consist in a global evaluation of the previous findings and in a general reflexion about the necessity of an evolution towards a new "corporate social cohesion", notably between the different generations.

Findings: The research demonstrates the great importance of the senior workers, not only from the ethical point of view, but also, e.g., to develop corporate competitiveness, and the different ways and means to reach the aim of promoting their job satisfaction.

Originality/Value: The originality of this research lies in the fact that provides a review of the reasons. and the current methods to ensure a real job satisfaction to older workers. In addition, it provides a critical approach to the problem of aged working people in front of the world of labour.

Keywords: Active ageing, senior workers, organizational behaviour, motivation, job satisfaction, added value.

**THE ACTION-REACTION IN THE GLOBAL TRADE: THE HIGHLY TRADE-RESTRICTED
GLOBAL AGRO-FOOD MARKET IN DEVELOPED COUNTRIES IS THE CAUSE OF THE
STRONG SUPPORT FROM DEVELOPING COUNTRIES' GOVERNMENTS FOR THEIR
LOCAL AGRO-FOOD SECTORS**

Suthikorn, Kingkaew¹

¹ Thammasat Business School, 2 Prachan Road Bangkok 10200. Email: suthikorn@tbs.tu.ac.th

Abstract

This study examines the linkage between MNCs from emerging economies and their home state governments using the case of developing country firms in the global agro-food industry. It aims to bridge the gap in the literature about developing country firms and their institutional and political environments particularly the role of government in supporting local firms to expand overseas (Dunning 2004, Nölke and Taylor 2010, Nölke 2011, Peng 2008, Ramamurti 2008). This study collected primary data through semi-structured interviews with key informants in the industry as well as secondary data from public domain such as Agricultural Market Access Database (AMAD). It observes that the agro-food markets in developed countries are highly protected; despite various international agreements, many measures such as anti-dumping, farm subsidy, high standard requirement and preferential import tariff are still put in place to restrict the flow of products into these countries and support their local agro-food industry (Ahmed 2006, Burfisher 2001, Cramer 1999, Cramer 2003, Peng 2006, Vogel 1995). The high level of protection is making it difficult for developing country firms to expand in these markets. This thus necessitates the responses by home governments to support their local firms. This study observes the direct correlation between level of import restrictions for certain agro-food products in developed markets including the US, EU and Japan, and subsequent reactions by developing country governments in negotiating for better global, regional and national regulations for their firms. The need for this support also fosters a strong tie between agro-food companies from developing countries and their government agencies. This results in direct correlation between level of import restriction and level of coordination between export firms and their national governments. This paper also observes that large domestic firms receive better supports from their governments as they have higher ability to formulate formal and informal relationship with government officials and relevant agencies in their home countries.

WORK AND FAMILY ARTICULATION : WORK-LIFE CHALLENGES IN LAWYERS'S CAREERS

Tremblay, Diane-Gabrielle¹; Mascova, Elena²

¹ télug –university of Québec. Email : dgtrembl@telug.ca

² télug –university of Québec

Abstract

My paper will present the results of a research done with a group of lawyers, which aimed at determining the main obstacles to work-life articulation in this professional group. The research is a qualitative research based on interviews with some 40 lawyers, which were then studied by thematic analysis. We present elements on lawyers' work which shows how « face time », requirements of clients and of large law firms establish norms that are difficult to reconcile with family life. We address the specific challenges of lawyers as regards work-family, highlighting the particularities of large offices and the challenges related to becoming an associate, but also the challenges found in self-employment, where clients take an important place. We see that work-life challenges concern mainly women lawyers, and highlight the particular challenges that women lawyers face, a kind of "professional telescoping" with family obligations, where work requirements come in very strong at the same time as women might consider founding a family. Men are not so taken with the work-family challenge, although some young men would like to reduce the amount of billable hours in large firms. Men and women who seek for a better balance often leave for other forms of work environments, either self-employment, a small office, the legal service of a private firm, or the public sector. The theoretical perspective of the "gender contract" is used to highlight the overinvestment of women in their work if they want to succeed as a lawyer, and the challenges this poses to women's careers, something which is also starting to touch some young male lawyers. We observe that there are important inequalities between the situation experienced by female lawyers and by male lawyers, although young men also want to invest the family sphere and sometimes resent the situation and time constraints imposed upon them in the large law firms. Our analysis highlights the mediating role of the professional ethos and rules in the analysis of work-family issues, showing this is a useful addition to work done from the point of view of the organization or the individual.

**GENDER AND CULTURAL STEREOTYPES ON ENTREPRENEURIAL REQUISITE
CHARACTERISTICS: AN EMPIRICAL STUDY AMONG BUSINESS STUDENTS IN GREECE.**

Tsoukatos, Evangelos¹

¹ Technological Educational Institute of Crete, Department of Finance and Insurance, P.O.Box 128, 72100, Agios Nikolaos, Greece. E-mail: tsoukat@staff.teicrete.gr

Abstract

Defined as the *“opportunistic pursuit of economic wealth within an uncertain environment ...”* (Hwee-Nga and Shamuganathan, 2010, p. 259), entrepreneurship is long considered as a major driver of economic growth and social development, capable of providing millions of jobs, new goods and services, introducing innovation and creating new knowledge (Carree and Thurik, 2010; Minniti and Lévesque, 2010; Fairlie and Holleran, 2011). In the current era of global financial meltdown, entrepreneurship is seen by world leaders as capable of providing a deadlock outlet (Alibaygi and Pouya, 2011). Even though the crisis itself was initially triggered by relentless entrepreneurship, entrepreneurial activity and spirit is considered capable of providing the means for combating the spiral effects of fiscal shocks on employment and wages, ongoing downsizing and recession.

Principal ideas underlying the concept of entrepreneurship are: “new entry” and/or “new value creation” (Wiklund and Shepherd, 2008; Slevin and Terjesen, 2011). “New entry” is about entering new or established markets or launching new business ventures (Lumpkin and Dess, 1996). “New value creation” is related to generating new value out of improving existing business operations (Slevin and Terjesen, 2011). Related to but not matching entrepreneurship is the notion of entrepreneurial orientation denoting the process of acting entrepreneurially (Miller, 1983; Covin and Slevin, 1989, 1991; Slevin and Terjesen, 2011). Entrepreneurial orientation comprises the means, ways and policymaking involved in acting entrepreneurially (Okhomina, 2007). That is, entrepreneurship has the “new entry” or “new value creation” act at its core whereas entrepreneurial orientation describes what it takes for “new entry” or/and “new value creation” to be undertaken (Lumpkin and Dess, 1996).

Considering entrepreneurship solely under the perspective of economic theory would certainly lead to systematic error. Economic theory worships the “rational man” model which by definition fails to recognize individual personality traits and cultural influences shaping human behaviour (Baumol, 1968; Loasby, 2007). Thus, economic theory ignores variations between individuals in values, norms, skills, experiences and will power (Loasby, 2007; Hwee Nga and Shamuganatha, 2010).

Alternatively entrepreneurship is approached under the “individual” and/or the “environmental/conceptual” perspectives (Lee and Peterson, 2000), both attempting to overcome the aforementioned limitations of the “rational man” model that economic theory takes for granted. While the “individual” perspective attributes entrepreneurship on specific personality traits and sociological characteristics of individual entrepreneurs, the

“environmental/conceptual” perspective assumes a more macro viewpoint. Although it does not totally overlook personality, it considers entrepreneurship as a response to specific socioeconomic conditions, such as culture, political and economic surroundings etc. that can either nourish or hamper entrepreneurial activity (Manolova et al., 2007; Malecki, 2009). An all-round perspective of examining entrepreneurship should encompass both the individual personality and external environment, standpoints. It should also consider the interconnections between the two.

The objective of this study was twofold: first, to disclose people’s perceptions of what entrepreneurial personality traits should be; second, to examine the interrelationships between respondents’ personality traits and previously exposed entrepreneurial idiosyncrasy. Both legs of this study were undertaken under the light of respondents’ specific sociological characteristics such as gender and culture. A quantitative survey methodology was adopted for the study’s empirical part while the implications of findings were derived through theoretical triangulation. As is recurrently the case in such studies (e.g. Ruda et al., 2009, Aghazamani and Roozikhah, 2010), evidence was drawn from a student sample of undergraduate business students of a public tertiary education institute in Greece.

As of its subject and setting there certainly is a great deal of topicality in this study. In the frames of the current gloomy socio-economic scenery in Greece of enduring fiscal cuts, recession, escalating unemployment, persistent business downsizing and uncertainty, new job opportunities in the country become scarce. As the end of the tunnel is not visible yet, and is not expected to be so soon, salaried work opportunities for youngsters may be scarce for quite some years to come. For many of them, pursuing entrepreneurial activity might provide the means of untying their personal Gordian knots (Ofstad, 2008; Ruda et al., 2009). Understanding students’ outlook of key entrepreneurial idiosyncrasy traits and the extent to which they consider themselves as matching perceived entrepreneurial profile is critical for policy makers, in government and education, in trying to accordingly construct/modify study curricula and offer appropriate guidance and motivation.

A brief summary of the study’s finding includes the following:

- The Big Five personality traits’ paradigm is partially supported
- There is no variation between genders as to their entrepreneurial personality perceptions
- Individual cultural profiles affect entrepreneurial personality perceptions
- Women identify their personality closer to perceived entrepreneurial personality than men

DETERMINANTS OF USER ADOPTION OF E-GOVERNMENT SERVICES: THE CASE OF GREEK LOCAL GOVERNMENT

Voutinioti, Anastasia¹

¹ Assistant professor, Technological Educational Institution of Kalamata. E-mail: avoutinioti@teikal.gr

Abstract

The aim of this research is to investigate e-government users' behaviour. The ultimate aim is to contribute to the understanding of the user's intention drivers or barriers at the local government level that have not been sufficiently explored, building a theory and proposing a validation research framework. At the practical level, the project aims to provide guidelines and recommendations that would help e-government policy decision makers and web designers to better plan their e-government services, design and implement policies and strategies to increase the take up of e-government services.

Research in IS, in the topic of e-government has done much to improve the e-government adoption by the end users. Recently, various theories and models have emerged on new technology and e-government dissemination and explain adequately the phenomenon under investigation (i.e., DTPB). However, there are remaining determinants not fully explored to be applicable for the Greek context. The reason is that e-government acceptance depends on various factors that differentiate among different group members, particularly with regard to expectations, cultural variations, language, level of use and interaction, perception of website quality, and commitment to the e-government initiatives. In other words, it should not be assumed that what works in one national or cultural setting will transfer directly into another and work. Thus further research is needed. Researchers postulate that evaluating e-government at local government level is crucial because succeeding at the local level is imperative for the success of the e-government initiative at national level.

We propose an extended DTPB theoretical model to be more appropriate in the context of Greek local government. Objective of the research is to refine the model by conducting exploratory research and then confirm or disconfirm the hypothesized model using relevant data from Greece. To test the final model empirically the Structural Equation Modeling (SEM) approach will be used.

Positive impacts are expected from this research project. Findings will contribute to theory, by understanding the drivers of e-government adoption in local government level. The research is going to develop a model that enriches current research by offering specification, justification, and empirical validation of a set of interrelationships between important factors that tend to be associated with dissemination of e-government services in Greece.

Moreover, contributions to IS research methodology are expected. Given the complexity of the situation, a variety of methods will be deployed and integrated into the research framework.

Finally, there will be contributions to practice. This research is expected to have practical implications for practitioners, policy makers and web designers by providing written materials with guidelines to the ways in which e-government users might increase their willingness to interact online. It is anticipated that it will stimulate discussion among the e-government research community, particularly in Greece but also in other countries with similar characteristics across key variables, in the planning of e-government uptake. For the stakeholders of this project, the research and instrument will be freely available to use along with written materials for improving their e-government services.

Keywords: e-government adoption, information technology adoption, user behavior, trust, risk perception, theory of planned behavior.

THE IMPACT OF ERP SYSTEMS ON FIRM PERFORMANCE: THE CASE OF THE GREEK MANUFACTURING INDUSTRY

Voulgaris, Fotini¹, Papoutsakis, Emmanouil²; Lemonakis, Christos³

¹ Technological Educational Institute of Crete, Department of Finance and Insurance, fvoulgari@staff.teicrete.gr

² MSc University of Portsmouth, Department of Economics, paputsak@hotmail.com

³ Technological Educational Institute of Crete, Department of Finance and Insurance and Cooperative Bank of Crete, culemon2004@yahoo.gr

Abstract

Purpose: The study intends to identify the benefits from the implementation of ERP systems on the financial performance of the Greek manufacturing firms. Until today, previous research abroad has shown a mixed relationship between ERP Systems and business performance. The purpose of this research is to identify, among other factors, the effect of ERP Systems to firm financial performance in the manufacturing sector in Greece.

Design/methodology: IT Systems and specifically ERP Systems are expected to be used mainly by large manufacturing firms in Greece. Therefore, the sample used in this study consists of the 300 largest listed and non-listed Greek manufacturing firms. The time span of the research covers 10 years, from 200-2010, in order to detect long-run effects of the ERP Systems implementation. Financial quantitative data used are derived from the ICAP, a Greek private data base, and qualitative data through questionnaires addressed to managers of the sample firms.

The sample is divided into adopters and non-adopters of ERP Systems, in order to check for significant differences in their financial performance. Additionally, the research tries to identify the effect the implementation of ERP Systems on firms' profitability, cost effectiveness and competitiveness, measured in terms of ROA, ROS, market share and sales increase.

One model used is based on Hunton et al.(2002):

Post_Ratio = $a_0 + a_1\text{Pre_Ratio} + a_2\text{ERP_Adoption} + e$, where Post_Ratio is the firm performance after the ERP implementation, Pre_Ratio is the firm performance before the ERP implementation, ERP_Adoption is a dummy variable that takes the value 1 if the firm has adopted an ERP system and the value 0 if the firm has not. We use this model for each of the five ratios, ROA, ROS, ROE, ATO, COGS, measuring firm performance.

Additionally, in order to detect the significance of ERP application on the operational and strategic performance of Greek manufacturing firms, we use econometric analysis based on the total sample, with a panel data fixed effect model and with dependent variable ATO and ROS and with independent variables the adoption or non adoption of ERP Systems and control variables, labour productivity, financial leverage, size, age, etc. Since the ICAP base does not include data on the implementation of ERP or IT systems, a questionnaire is addressed to the

top management of the sample firms. One important variable is the needed implementation time for the firm performance improvement, which comprises one of the aims of this research.

Findings: Since this is an on going research, we do not yet have results, given that the response rate to the questionnaire takes time to be completed. It is expected that we will accept the hypothesis testing, i.e. that a positive and significant relation exists between the ERP application and Greek manufacturing firms performance.

Practical Implications: The findings will confirm theory and empirical findings abroad for the Greek manufacturing industry, i.e that the implementation of ERP Systems leads to increase in profitability, cost control and overall better financial performance. This will provide important implications for managers for the discretionary allocation of the scarce resources to investments in IT and ERP Systems. Furthermore, the findings will contribute to the Greek literature on the area of IT effect on firm performance. Another important contribution of the study will be the creation of a unique research dataset through a questionnaire based survey.

Originality/Value: Although this issue is extensively researched in other countries, minimal academic work exists on the subject in the Greek literature. A novelty of the work is also the use of firm level financial and qualitative data.

Keywords: ITechnology, ERP Systems, Greek manufacture, profitability, firm performance

REVIEWING THE RELATIONSHIP BETWEEN INDIVIDUAL IDENTITY, VOICE CONTRIBUTION AND MENTORING

Whitehead, Lisa¹

¹ Research Fellow - International Management, Economics & Business Administration, Faculty of Economics & Social Sciences, University of Agder, Postboks 422, N- 4604 Kristiansand, Norway. Email: lisa.whitehead@uia.no

Abstract

The overall aim of this paper will be to review current research relating to how the individual constructs their identity (Alvesson et al., 2008) to either contribute voice (Morrison, 2011) or remain silent (Morrison and Milliken, 2003) within business arenas. The main area of discussion will be how multiple categories of identity such as; "gender, race, ethnicity, disability, sexuality, class, age and nationality" (Knudsen, 2006, p. 61) might relate to and impact on an individual team members' voice (Morrison, 2011) within business arenas in which the individual is involved as part of their daily work-related roles. The influence of mentoring (Høigaard and Mathisen, 2009; Mathisen, 2011), particularly on leader identity development (Muir, 2011), but also on either increased voice or silence will also be covered.

This paper will detail Alvesson et al. (2008)'s review paper on Identity Construction in Organization Studies over the past twenty years. Here, the authors position most existing research into three metatheoretical orientations; a) functionalist, b) interpretivist and c) critical, with three related cognitive or knowledge-constitutive interests that underlie human inquiry Habermas' (1972): a) technical, b) practical-hermeneutic and c) emancipatory. The paper will explore research gaps and contributions that can be made from pursuing an interpretivist orientation and practical-hermeneutic cognitive interest to research within the relationships proposed. Relevant publications are defined here as general organisations and management literature but also specifically in terms of international management.

DRIVING (ORGANIZATIONAL) BRAND REPUTATION FROM INSIDE-OUT: STRATEGIC HUMAN RESOURCE MANAGEMENT IN AN EMERGENT ECONOMY

Yüksel, Müberra¹

¹ Assistant Professor at Kadir Has University, Faculty of Communication. Email: muberray@khas.edu.tr

Abstract

Both reputation and brand management has been dominated by marketing and communications though there is an emerging consensus that organizational reputation, good governance with organizational trust are built from the inside-out. In this study, I will draw on our previous research from often disparate bodies of literature to develop a model of the links between strategic human resource management (SHRM) and corporate and brand reputation through “employer branding.”

The implications for a holistic model suggest convergence of interest, but also highlight some ethical dilemmas for organizations in balancing best practices of SHRM. Particularly important to our framework is that notion that it is through top management actions (or inactions, i.e. leadership role modelling behaviors) that employees understand and experience the organization’s culture and identity and rather than through mission or vision statements and other pronouncements such as codes of conduct or competencies.

This paper will also attempt to define organizational reputation as a multidimensional, temporally stable, evaluative judgment about a corporation that is shared by multiple constituencies, and can provide the organization with an intangible asset that affects subsequent performance. Based on literature review on organizational reputation that is cumulative in quantity and quality, and there is a bilateral relationship between the concepts of corporate reputation and corporate image-the latter is limited perception from the outside which will be overlooked in this research. My focus will be on internal stakeholders particularly employees and potential employees as “internal customers” of the organization.

Recently, the need for further refinements of conceptualization and methodology on reputation as a strategic resource in communications and management studies with a normative stakeholder framework has been agreed upon in both communication and management studies. The ultimate goal is to provide conceptual and methodological clarities for future research that seeks to develop a better understanding of both organizational reputation and branding in the context of interdisciplinary understanding and practice. Reputation is normative and subjective; different stakeholders may perceive reputations of the same company differently based on their own economic, social, and personal background. Reputation should also be assessed from the organization’s perspective-from inside. Thus, “product and service” as well as “social and environmental responsibility” are often regarded as the two most significant dimensions.

By and large, investment in social capital (e.g., trust, team-building, networking and identification) which often stem out of value-based talent management and employer branding are prerequisites for building the foundations for humanistic organization with good reputation particularly for employees. Based on Sparrow's theory of employer branding and employee communications, this relationship between reputation, branding and HRM represents a potentially fruitful area of further critical research since such policy-relevant research will focus on governance and strategic leadership of HR. However, such an interdisciplinary inquiry also questions both methodology and discourse of strategic management and communication.

I will attempt to reframe and rebuild organizational reputation with respect to employer branding in the context of emerging economies which are facing crises continually, if not continuously. I will also look into a case study as an example of best practice from an emergent economy. By using structured interviews of selected employees of that company and comparing my qualitative findings with the quantitative analysis of university campus surveys about the student expectations' of that particular company that year, I will try to link the theoretical framework with the empirical findings, while making suggestions for further query
