

II ADVANCED COURSE

Innovative wastewater treatment and mathematical modeling

Palermo, 16-19 May 2016

Edited by: Giorgio Mannina

AdCourse Organizers

Course Chair

Prof. Giorgio Mannina - Palermo University

Other Members of the Organizing Committee

Katerina Babikova - Palermo University

Donatella Caniani - Basilicata University

Marco Capodici - Palermo University

Santo Fabio Corsino - Palermo University

Alida Cosenza - Palermo University

Daniele Di Trapani - Palermo University

Prof. Giovanni Esposito - Cassino e Lazio Meridionale University

Prof. Riccardo Gori - Florence University

Taissa Silva Deoliveira

Arianna Tuttolomondo

Prof. Michele Torregrossa - Palermo University

Prof. Gaspare Viviani - Palermo University

This course forms a part of the PRIN2012 project on green house gas emissions.

The course is co-organized by four Universities: Palermo (venue), Basilicata, Cassino-Lazio Meridionale, Firenze.

The course is supported by

Main course sponsors

LECTURERS

George Ekama

Professor Water Quality Engineering University of Cape Town
Rondebosch 7700 Cape South Africa
E-mail: george.ekama@uct.ac.za

Giorgio Mannina

Dipartimento di Ingegneria Civile, Ambientale, Aerospaziale, dei Materiali (DICAM) - Università degli Studi di Palermo
E-mail: giorgio.mannina@unipa.it

Halvard Ødegaard

Department of hydraulic and environmental engineering,
Norwegian University of Science and Technology (NTNU), N-
7491 Trondheim, Norway
E-mail: hallvard.odegaard@ntnu.no

Gustaf Olsson

Lund University
E-mail: Gustaf.olsson@iea.lth.se

Peter Vanrolleghem

modelEAU - Université Laval, Quebec, QC, G1V 0A6, Canada
E-mail: peter.vanrolleghem@gci.ulaval.ca

Jiri Wanner

Department of Water Technology and Environmental Engineering University of Chemistry and Technology, Prague,
Technická 5, CZ-166 28 Prague 6, Czech Republic
E-mail: jiri.wanner@vscht.cz

Presentazione

5

JIRI WANNER,

- *Biochemical principles of removal of C, N and P compounds from wastewater (types of organic substrates, processes like nitrification, denitrification, nitritation and anammox process, enhanced bio-P removal, chemical P precipitation)* 7
- *Microbiology and microbial ecology of activated sludge (principal microorganisms, identification techniques, microbial ecology population dynamics, growth forms, use of the knowledge in design and operation of activated sludge systems)* 13
- *Membrane bioreactors: key elements and basics of models* 19
- *Innovated processes for nitrogen removal* 25
- *Nitrification, denitrification, nitritation and anammox processes; enhance bio-P removal and chemical P precipitation* 35

HALVARD ØDEGAARD

- *Biofilm systems* 49
- *The moving bed biofilm reactor (MBBR) processes* 55
- *Integrated fixed-film activated sludge systems (IFAS)* 71
- *Pro's and con's of MBR systems* 91
- *A road-map for the design of energy-neutral WWTP's for the future* 97

GEORGE EKAMA

- *A COD, N and P mass balanced steady state model for suspended growth single sludge biological nitrogen and phosphorus removal activated sludge systems* 113

GUSTAF OLSSON

- *Fundamentals of dynamical modelling – the purpose of the model* 327
- *Basic dynamic modelling* 331
- *Control principles* 335
- *Instrumentation, control and automation (ICA) in wastewater treatment* 337
- *Signal analysis and monitoring* 345

GIORGIO MANNINA

- *Sensitivity analysis: fundamentals* 349
- *Mathematical protocols for calibration of wastewater treatment models* 361
- *The fouling phenomenon in membrane bioreactors: model description and strategies for energy saving* 373
- *Mathematical modelling of Membrane Bioreactors* 387

Introduction

Over the past years, the knowledge and understanding of biological wastewater treatment has advanced extensively and moved away from empirically-based approaches to a fundamentally-based 'first principles' approach that embrace: bio-chemistry, microbiology, mathematics, and physical, chemical and bioprocess engineering. Also, the wastewater treatment plant of the future will be a water resource recovery facility (WRRF), implying attention for quite different aspects of these large scale technologies.

Many of these advances have matured to a degree that they have been codified into mathematical models able to describe and simulate diverse systems under different environmental conditions at either steady or dynamic state. For a new generation of scientists and engineers entering the wastewater treatment profession, the quantity, complexity and diversity of these new developments can be overwhelming, particularly to those from developing countries where access to advanced courses in wastewater treatment is not readily available.

This second edition of the *Advanced Course on Innovative wastewater treatment processes and mathematical modelling* will provide a comprehensive overview and a discussion platform for recent advances and trends currently under development in the context of wastewater treatment. This course is aimed at professionals (Master, PhD or equivalent experience) in wastewater treatment and mathematical modelling with a basic working knowledge of the two other disciplines. The course is primarily aimed at those already employed in industry who wish to update their theoretical knowledge and practical insight in this field.

The Course Chair
Giorgio Mannina
