#### Abstract

The new ring system pyrazolo[3,4-c][1,5]benzodiazocine was obtained through cyclization of the key intermediate of type 6a-d and $\mathbf{9}$, in refluxing toluene in presence of a catalytic amount of $p$ toluensulfonic acid, from moderate to high yields (45-85\%).

## Introduction

1,5-Diazocine system have received great attention because of their broad spectrum of biological properties. Also annelated 1,5-benzodiazocine have shown interesting activity. In particular Troger's base and analogues, containing a dibenzo-1,5-diazocine skeleton 1, posses intercalating capability between DNA base pairs. ${ }^{1-4}$ Due to the interesting biological activities, different analogues bearing heterocyclic rings have been prepared. ${ }^{5-7}$

In our effort to search for novel antitumor compounds, we became interested in the synthesis of the new ring system pyrazolo[3,4-c][1,5]benzodiazocine of type 2 with the aim of evaluating their antiproliferative activity.

## Figure1

In this paper we report the synthesis of pyrazolo[3,4-c][1,5]benzodiazocine derivatives of type 2 , in which the benzene moiety was replaced by a pyrazole ring.

## Results and Discussion

2-Amino-N-(5-benzoyl-1-ethyl-3-methyl-1H-pyrazol-4-yl)benzamide derivatives 6a-d appeared valuable and versatile intermediates for the synthesis of the new ring system pyrazolo[3,4c][1,5]benzodiazocine. We started our synthesis reacting 4-aminopyrazole $3^{8}$ with the substituted 2nitrobenzoyl chlorides 4a-d to give nitro derivatives 5a-d in good yields (62-65\%). Reduction of these latter with stannous chloride in hydrochloric acid led to the corresponding amines $\mathbf{6 a - d}$ in satisfactory yields (55-62\%).

Refluxing of amines 6a-d in presence of a catalytic amount of p-toluenesulfonic acid in toluene, using a Dean Stark apparatus, provided the expected new tricyclic system pyrazolo[3,4c][1,5]benzodiazocines 7a-d in reasonable yields (45-65\%). The treatment of the derivative 5a with potassium hydroxide and methyl iodide in acetone yielded the corresponding N -methyl derivative $\mathbf{8}$ ( $70 \%$ yield). Reduction of this latter afforded the amine 9 ( $65 \%$ ) which upon refluxing with a catalytic amount of $p$-toluenesulfonic acid in toluene led to the $N$-methylpyrazolo[3,4$c][1,5]$ benzodiazocine 10 in high yield ( $85 \%$ ). The structure of all compounds synthesized was confirmed by their analytical and spectral data (IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR). Pyrazolo[1,5]benzodiazocines 7a-c and 10 undergo partial ring opening to give 6a-c and 9 respectively at room temperature upon standing silica gel for 5 days acid catalysis or by refluxing in aqueous ethanol and acid catalysis.

In conclusion, we have provided a very simple way for the synthesis of the novel heterocycle ring system, pyrazolo[3,4-c][1,5]benzodiazocine, in good yields.

## Experimental Section

General Procedures. All melting points were taken on a Buchi-Tottoli capillary apparatus and are uncorrected; IR spectra were determined in bromoform with a Perkin-Elmer Infracord 137 spectrophotometer as nujol mulls.; ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were measured at 200 and 50.3 MHz respectively, using a Bruker AC series 200 MHz spectrometer (TMS as internal reference). Column chromatography was performed with Merck silica gel 230-400 Mesh ASTM. Mass spectra were recorded on a JEOL JMS-OI-SG-2 spectrometer at $75 \mathrm{eV}(100 \mu \mathrm{~A})$. Elemental analyses were within $\pm 0.4 \%$ of the theoretical values.

General procedure for the synthesis of 4 or 5 substituted 2-amino-N-(5-benzoyl-1-ethyl-3-methyl-1H-pyrazol-4-yl)benzamides (6a-d)
To a suspension of stannous chloride ( 3 mmol ) in hydrochloric acid $(36 \%, 3 \mathrm{~mL}$ ) a suitable 2nitrobenzamide derivative $5 \mathbf{a}-\mathbf{d}(3 \mathrm{mmol})$ was added dropwise with stirring at $-5^{\circ} \mathrm{C}$. The reaction mixture was stirred then for 20 h at room temperature.
The reaction mixture was poured into ice water and an aqueous solution of sodium hydroxide ( $40 \%$ ) was added until the tin salts was dissolved. The resulting solution was extracted with ethyl
acetate $(3 \times 30 \mathrm{~mL})$. The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated under reduced pressure to give a white solid which was recrystallized from ethanol.
